The Thomson sounding machine for great depths is similar to the small one, but has a special form of brake which adjusts the tension in accordance with Captain Shortland's rule, and has of course a much greater length of line. The Sigsbee machine is much used in the United States navy. It differs from the Thomson chiefly in having an automatic spring governor to ease the strain on the wire due to the motion of the ship; though there are other points of dissimilarity. It is the invention of Admiral C. D. Sigsbee, of the United States navy, who did much deep-sea, depth, and current work in the Atlantic and Gulf of Mexico. See BATHOMETER; DEEP-SEA EXPLORATION; HYDROGRAPHY; OCEANOGRAPHY.

**SOUP-FIN SHARK.** See OIL SHARK.

**SOURCES, GEORGE.** See ROMANIC LITERATURE.

**SOUR GUM.** See BLACK GUM; GUM TREE.

**SOUR SOP.** See CUSTARD APPLE.

**SOUSA, sô'zà, FREI LUIZ DE (MANOEL DE SOUSA COUTINHO) (1555-1632).** A celebrated Portuguese monk and a writer of polished prose. He belonged to the powerful family of Sousa

Coutinho. Without finishing his studies at the University of Coimbra, he joined the Order of Malta, saw service against the Moorish pirates in the Mediterranean, and was sent a prisoner to Argel. After reaching home again he spent the years 1584-99 quietly in literary pursuits and military duties; but national disasters drove him into exile for some years, and domestic sorrows finally (1613) led him to join the Dominican Order. His principal works are the *Historia de S. Domingos* and *Annaes d'el rei D. João terceiro*. Consult Sousa Viterbo, *Manoel de Sousa Coutinho* (Lisbon, 1902).

**SOUSA, sô'zà, JOHN PHILIP (1854- )**. An American bandmaster and composer. He was born in Washington, D. C., and was educated there. He held the position of bandmaster of the United States Marine Corps at Washington from 1880 until 1892, and during that period made the organization one of the finest military bands in America. In 1892, in conjunction with David Blakely, he formed the organization now known as Sousa's Band, with which he toured the United States and Europe. In 1910-11 he made a tour of the world, meeting with phenomenal success everywhere. During the season of 1915-16 he played at the New York Hippodrome. His compositions, both operatic and instrumental, have been eminently successful. His ability as a composer of marches soon secured for him the popular title of "The March King." His compositions include the following operas: *The Smugglers* (1879), *Désirée* (1884), *The Queen of Hearts* (1886), *El Capitán* (1893), *The Bride Elect* (1897), *The Charlatan* (1898), *Chris and the Wonderful Lamp* (1900); five suites; a symphonic poem; and numerous stirring marches, which have become immensely popular. His collection of arranged "National, Patriotic, and Typical Airs of All Countries" has been officially adopted by the United States Navy Department, and is in the collection of service bands throughout the civilized world.

**SOUSA, sô'zà, or SOUZA, MARTIM AFFONSO DE (c.1500-64).** A Portuguese colonizer and administrator, born at Bragança, Province of Trás-os-Montes. In 1530 he was sent with five ships and a force of 400 to explore the coast of New Lusitania (Brazil), of which he was appointed Governor, and to found there a colony and distribute land. It has been said that he was the discoverer of the bay which he entered on Jan. 1, 1531, and which, supposing it to be a river, he named Rio de Janeiro. (The same story is told in connection with the supposed discovery by André Gonçalves, on Jan. 1, 1502.) Sousa surveyed the coast, and on Jan. 22, 1532, founded on São Vicente Island, near the present Santos, the first Portuguese colony in Brazil. The Colony of Piratininga, the present São Paulo, on the bank of the Piratininga River, was founded under his direction. In 1533 he returned to Portugal, where he received São Vicente, the foremost of the captaincies into which Brazil was divided. This he ruled as absentee proprietor.

**SOUTER, sou'ter, ALEXANDER (1873- )**. A British classical scholar, born at Perth, Scotland. He was educated at Robert Gordon's College, Aberdeen University, and Gonville and Caius College, Cambridge. At Aberdeen University he held various positions, after 1911 being regius professor of humanity and after 1913 lecturer in mediæval paleography. In

1903-11 he served as Yates professor of New Testament Greek and exegesis at Mansfield College, Oxford. Besides editions of Robert Ogilvie's *Horæ Latine* (1901) and, with George Middleton, of Livy, Book XXVIII (1902), he published *De Codicibus Manuscriptis Augustini Quæstionum* (1905); *A Study of Ambrosiaster* (1905); *The Commentary of Pelagius on the Epistles of Paul* (1907); *Novum Testamentum Græce* (1910); *Text and Canon of the New Testament* (1913).

**SOUTH, SIR JAMES** (1785-1867). An English astronomer, born in Southwark. He was a member of the College of Surgeons and displayed great professional abilities, but later inclined to astronomy. In conjunction with the younger Herschel (q.v.) he undertook a series of observations which were presented to the Royal Society in a memoir containing micro-metrical measurements of 380 double stars, and confirming the elder Herschel's inferences regarding orbital motion. For this he received the gold medal of the Astronomical Society in 1826. In the same year he was also awarded the Copley medal of the Royal Society. In 1835 he removed his observatory to Passy, near Paris. Here he made a series of observations on 458 compound stars, of which 160 were new, and convinced Laplace of the reality of revolving stars. South was one of the founders of the Astronomical Society and its first president. He was knighted in 1830. He observed Encke's comet (1828 and 1838), Mauvais's (1844), and Vico's (1845). His observation of a sharp occultation by Mars of a small star in Leo disproved the existence of an extensive Martian atmosphere.

**SOUTH, ROBERT** (1634-1716). An Anglican preacher, born at Hackney. In 1663 he was promoted to a prebendal stall at Westminster, and in 1670 became a canon of Christ Church, Oxford, and was later chaplain in ordinary to Charles II. When the revolution of 1688 was accomplished he gave his adhesion to it, but refused preferment. A staunch adherent of the Church of England, he waged unsparing war against Romanism and against Puritanism and other forms of dissent. He is now chiefly remembered by his sermons, masterpieces of vigorous sense and sound English, abounding in lively and witty matter. The best edition of his sermons is that by W. G. T. Shedd (New York, 1866-71), with a memoir. Consult also W. C. Lake, "South the Rhetorician" in *Classic Preachers of the English Church* (London, 1877).

**SOUTH, UNIVERSITY OF THE.** An institution for higher education founded at Sewanee, Tennessee, in 1857 under the auspices of the Protestant Episcopal church in the South. A tract of 8000 acres was secured as a site, \$500,000 was subscribed for an endowment fund, and the corner stone of the central building was laid just previous to the Civil War. At the end of the war the pledges of the endowment could not be realized, but funds were secured to begin the institution on a small scale, and it was opened in 1868 with a grammar school and an academic department. A theological department was opened about 1878, a medical department in 1892, and a law department in 1893. The two latter were discontinued in 1910. The college domain, mostly covered with virgin forests, is situated on a plateau of the Cumberland Mountains, about 100 feet above the surrounding valleys. The permanent buildings,

12 in number, stand in a reserve of 100 acres, and are valued at \$800,000. The degrees conferred by the university are B.A. (20 courses), M.A. (15 courses), B.C.E., C.E., and in theology, B.D. The work is mostly prescribed. All students who have passed a certain number of university examinations, and are of sufficient maturity in age and character are formed into a body of gownsmen, distinguished by the academic dress, and enjoy certain privileges and immunities. In 1915 the faculty numbered 26, and the student body 273. The library contained 41,000 volumes. The president in 1916 was Right Rev. A. W. Knight, D.D.

**SOUTH AFRICA.** The part of Africa south of the Zambezi River; an area with so much in common in the character of the physical features, the climate, and the circumstances determining the economic development that it is conveniently considered a distinct unit. With an area of 1,100,000 square miles and a seaboard of more than 3000 miles, it is commercially a single trade region. Its collective commerce is known technically as the "Cape trade." The colonies and protectorates which are wholly or in part in South Africa are Portuguese East Africa, German Southwest Africa, and the British possessions, the Union of South Africa comprising the provinces of the Cape of Good Hope, Natal, the Orange Free State and the Transvaal, the Bechuanaland Protectorate, Basutoland, and Rhodesia (Southern) (qq.v.). For Map see AFRICA.

**Topography.** The coasts, like those of the rest of Africa, are chiefly straight and unbroken. They are deficient in harbors and thus beaten by never-ceasing ocean surf. The west shore is different in aspect from the south and east, it being low and sandy and the lands behind are barren and dismal. The south and east shores, though on the whole as regular and unbroken as the west coast, are attractive in appearance, with evergreen slopes, picturesque bays, and wooded kloofs. All west coast ports are roadsteads excepting Saldanha Bay, a splendid natural harbor but lacking a hinterland and therefore undeveloped, and Cape Town, which, at enormous expense, has been made safe for shipping. On the south coast Port Elizabeth and East London have been made available for large trade by artificial improvements, but the strong southeasterly summer winds often prevent large ships from lying alongside the ends of the piers, especially at the former port. The east coast has in Delagoa Bay the only first-class harbor in Africa, and one of the finest in the world. The port of Durban on this coast has been rendered good artificially, and the port of Beira and the Chinde branch of the Zambezi delta are also available for large shipping. Most of the interior of South Africa consists of high plateaus, elevated so far above the sea level that the influences of the temperate zone are extended hundreds of miles to the north of the Tropic of Capricorn. The high elevation of the most of South Africa is the chief element in its geographic unity. It is estimated that the area of the region which, in respect of temperature, is well adapted to become a home of the white race, is one-fifth as large as the area of the United States (exclusive of Alaska).

The rise of the surface from the coast of all South Africa to considerable altitudes in the interior is rapid. From the western half of the south coast, the ascent is made in well-

marked terraces, the innermost of which form table-lands of 3000 feet or more in height, known as Karroos. The Southern Karroo and the Bokkeveld are 1000 to 2000 feet high. Next come the Great Karroo (average, 3000 feet); then the loftiest of the Cape plateaus, the Northern Karroo (2700 to 6000 feet); then the diamond fields country and the wide plains of the Orange Free State Province (4000 to 5000 feet); the still more extensive plateau of the Transvaal (5000 to 7000 feet); and the more diversified uplands of the Matabeleland and Mashonaland region at a little lower level, sloping gradually to the plain of the Zambezi. In the west the irregular highlands of Damaraland and Namaqualand rise steeply from the Atlantic coast plain, and merge indefinitely with the vast central plains of Bechuanaland and the dreary expanse of the Kalahari Desert, once the floor of an inland sea and now about 4000 feet above the sea level. In the east and southeast the lowlands of Portuguese East Africa and the coast plain and plateau of Natal are skirted inland precipitously by the mighty rampart of the Drakensberg and other ranges that wall the lofty interior plateaus. Many of the mountains at the edge of the plateaus or rising within them have an altitude of 6000 to 10,000 feet. The culminating points appear to be the Montaux Sources (11,150 feet), Cathkin Peak (12,000), and Giant's Castle (11,000).

**Hydrography.** The Zambezi alone is important for navigation although it is interrupted by falls and its mouth is checked with sand. The Orange is the only other river of any length but is navigable only a few miles up. The smaller rivers are not navigable excepting the Buffalo River, which with great difficulty has been made available for ocean steamers to East London, near its mouth. The Zambezi is navigable for about 260 miles from the sea. The north central portion of the region is an area of interior drainage; the waters disappear in many "salt pans," where evaporation leaves an incrustation of salt on the surface.

**Climate.** There are only two seasons: summer (October to March) and winter (April to September). Except in the south and east coastal regions the low average of atmospheric humidity is a marked characteristic. Pulmonary invalids from Europe prolong their lives in the dry, bracing air of the plateaus. January is usually the hottest month, with average maximum temperatures of 82° F. to 100° F. July is usually the coldest month, with temperatures ranging from 20° F. to 10° F. The Transvaal Province, although partly within the tropics, stands so high above the sea that the mean annual temperature is only 68.64° F., or only about 6.30° above the mean summer temperature of England. Although entirely within the tropics, the annual temperature range in Matabeleland and Mashonaland is from 36 to 86 degrees, so that these regions are by no means tropical. The Zambezi valley and Portuguese East Africa are low, moist, and very unhealthy. More than half of South Africa is deficient in rainfall. The semiarid region includes the entire western half of the country, which is dry because South Africa depends for most of its rain upon the winds of the Indian Ocean, and the east coastlands and highlands receive the larger part of the precipitation, as the winds move westward. The Great Karroo and Great Namaqualand have less than 6 inches of rain

in the year. With the exception of the Portuguese coastlands and the Zambezi belt, South Africa is one of the most healthful and salubrious regions in the world.

**Flora.** The veldt and the karroo are the distinctive features of South Africa. The word veldt (= field) is applied to the enormous areas of rolling pasture lands found in the provinces of the Cape of Good Hope, the Orange Free State and the Transvaal, and parts of Bechuanaland, covered with rough scrubby grass, mimosa, acacia, and other bushes; also to the herbage itself, as the sweet veldt and the sour veldt. The name karroo is taken from the little karroo plant, relished by sheep and goats and the best kind of bush for the domesticated ostrich. The largest tract of karroo is a region about two-thirds as large as Scotland, in the interior of the Cape of Good Hope Province. All South African plains and plateaus that are intermediate between the grass and bush-covered veldt and absolute desert are karroos. Both the karroo and the Kalahari desert need only the rain that sometimes falls on them to be quickly clothed with grass and shrubs. The plant life common to deserts and the vegetation of the veldt and the karroo are the distinctive features of the flora; to which are to be added the tropical vegetation which girdles South Africa along its low, hot north and east fringes, and the belt of European flora, including the northern cereals and the vine, across the south end of Africa.

**Fauna.** The animal life is perhaps matchless, and is certainly unsurpassed. It includes the lion, elephant, hippopotamus, rhinoceros (black and white), buffalo, zebra, numerous varieties of antelope, the giraffe, wart hog, hyena, and jackal. Slaughter of wild animals has been ruthless all over the settled parts of the country, but there are still wide areas known as "sportsmen's paradises." In the Cape of Good Hope Province is the greatest centre of ostrich farming, and during 1912 a yield of over \$10,000,000 in feathers was realized.

For further information, see the component parts of South Africa; also UNION OF SOUTH AFRICA.

**SOUTH AFRICA COMPANY, BRITISH.** See RHODES, CECIL; RHODESIA.

**SOUTH AFRICAN REPUBLIC.** A former republic of South Africa, since 1910 a province (the Transvaal) of the Union of South Africa. See TRANSVAAL.

**SOUTH AFRICAN WAR.** The conflict for supremacy in South Africa between Great Britain and the Boer republics of the Transvaal

and the Orange Free State from 1899 to 1902. For the causes that led to the struggle and the diplomatic negotiations preceding its outbreak, see *TRANSVAAL*. The following account deals exclusively with its military operations and the terms of peace at its end. On the outbreak of war, Oct. 11, 1899, the British strength in South Africa comprised a body of about 12,000 men in Natal; 2500 at Kimberley, on the western frontier of the Orange Free State; 1000 at Mafeking, on the Bechuanaland border; and about 1000 on the Rhodesian frontier. The railway crossings on the Orange River and the northern part of Cape Colony were guarded by some 5000 men. The number of Boers mobilized on the Natal frontier in early October, 1899, was about 20,000. On the day following the declaration of war Transvaal and Orange Free State forces entered Natal. Laing's Nek and Ingogo Heights, in the extreme north of the colony, were seized and the Boers pressed down the Durban railway and attacked the British line from Ladysmith to Dundee. On October 20 the British drove a Boer force from Talana Hill, near Dundee, and the next day they routed the Boers at Elaan'slaagte, but on October 30 they met a serious reverse at Nicholson's Nek, and by November 2 the Boers, under Petrus Joubert (q.v.), had completely invested Ladysmith, which was held by about 9000 troops under Sir George White. At the same time Kimberley was besieged by a Boer force of 6000 under Prinsloo, and 1000 British under Colonel Baden-Powell were locked up in Mafeking by Cronje (q.v.) with 6000 men. The early progress of the war aroused alarm in Great Britain, and preparations were made for carrying on a struggle which now appeared to be of a serious nature. Large reinforcements were dispatched to South Africa under command of Sir Redvers Buller, who with 16,000 men was intrusted with the task of relieving Ladysmith, while Lord Methuen with 9500 was to make his way to Kimberley from the south, and some 5000 men under General French and 4500 men under General Gatacre were sent to operate against the Boers in the north of Cape Colony. On November 23 Lord Methuen defeated the Boers at Belmont, and on the 25th he won a victory at Enslin or Graspan, but on the 28th he suffered severely in his attempt to cross the Modder River near the Riet, and on December 11 was decisively defeated by Cronje in trying to storm the Boer position at Magersfontein. On December 10 General Gatacre met with a setback at Stormberg Junction, in Cape Colony. The most obstinate fighting, however, occurred around Ladysmith, and at Colenso on December 15 the British encountered severe reverses.

This succession of disasters spurred the British authorities to greater exertions. Late in December Lord Roberts of Kandahar was ordered to Africa as commander in chief, with Lord Kitchener of Khartum as chief of staff. The fighting had revealed on the part of the British officers great ignorance of the nature of the country and of the enemy. The Boers were excellent marksmen, many of them were mounted, and they combined rapidity of cavalry with stability of infantry. The British were handicapped by the absence of cavalry, and for want of adequate transport facilities were compelled to cling to the lines of railway, thus narrowing their field. Before the end of January, 1900,

British forces in South Africa were estimated at about 130,000 men. Lord Roberts and Kitchener arrived at Cape Town January 10, and a month was devoted to organizing newly landed troops and establishing the transport and train on an adequate basis. The cavalry was made an important arm and much attention given to the mounted infantry, composed of volunteers from Australia, New Zealand, and Canada. The new plan provided for the invasion of the Orange Free State by the main army under Lord Roberts, which, after relieving Kimberley, was to advance upon Bloemfontein. At the same time three smaller forces setting out from Cape Colony were to advance northward across the Orange River and to converge on Bloemfontein. The Boer forces, crowded in the northern part of the Orange Free State, were then to be driven across the Vaal and surrounded in the mountains of eastern Transvaal. No attempt was made greatly to reinforce the troops operating around Ladysmith, for it was thought a successful advance on Bloemfontein and Pretoria would compel the Boers to raise the siege of that town. At Ladysmith, meanwhile, desperate fighting had taken place during January. On the 6th the Boers made an assault on the redoubts near the town, but were repulsed. On the 11th Sir Redvers Buller began a great flanking movement westward along the Tugela River, to compel the Boers to abandon their position on the north side of the stream and south of Ladysmith. On the 18th a division under General Warren crossed the Tugela, and on the night of the 23d-24th stormed Spion Kop, which was considered the key of the enemy's position. While encamped on the hill, however, the British were exposed to a fire from surrounding hills, and at evening on the 24th were compelled to abandon the position, losing 1700 men. On the 27th General Warren recrossed the Tugela.

Lord Roberts's advance on Kimberley began on February 11. He had about 23,000 infantry, 11,000 mounted men, and 98 guns. On the 13th of February the cavalry under General French passed the Modder River, and on the 15th entered Kimberley. Cronje, now in danger of being cut off from Bloemfontein, abandoned his position at Magersfontein, and retreated to the northeast, pursued by the British cavalry and mounted infantry; from the 16th to the 18th he carried on a fierce rear-guard fight. On the 19th he was brought to a standstill at Paardeberg on the Modder River. There the Boers entrenched themselves in the bed of the stream. From the 19th to the 27th their position was bombarded by the British artillery, and Cronje's men found shelter by burrowing into the banks of the river. The British lines were advanced until within 85 yards of the Boer position, and on the morning of the 27th Cronje surrendered with 4000 men and six guns. British advance on Bloemfontein was quickly begun, the cavalry and mounted infantry operating in advance and on the wings, the infantry holding the centre. On the level of the veldt British numbers were decisive, and the Boers could make no effective stand. On March 7 they offered battle at Poplar Grove, 60 miles west of Bloemfontein, but were outflanked and driven from their intrenchments. On March 10 a hard fight occurred at Driefontein, about 30 miles from Bloemfontein. On March 13 Roberts entered the capital, President Steyn having fled to Kroonstadt. For about six weeks Lord Roberts

remained at Bloemfontein before resuming the advance upon Pretoria, his reason being lack of horses. The Boers for a time made no demonstration in force, but contented themselves with active guerrilla warfare with considerable loss to their opponents. On May 1 the Pretoria advance began. On May 12 the British entered Kroonstadt after encountering the Boers under General Botha on the Vet River May 5, and on the Zand May 10. From Kroonstadt the British advanced in the form of a crescent 40 miles across, driving the Boers before them. The Vaal River was crossed between the 24th and 27th of May, Johannesburg entered on May 31, and June 5 Pretoria was occupied. President Kruger fled to Machadodorp, while General Botha with 8000 men took up a strong position 15 miles east of the capital. On June 11-12 he was attacked by the British advance guard and slowly driven back. On July 23 Lord Roberts set out from Pretoria for the final campaign.

In Natal, meanwhile, General Buller on February 5 had made a third attempt to cross the Tugela and break the Boer lines. He failed and on the 7th was driven back across the river. On the 14th the fourth and final dash for Ladysmith began. The Boer positions at Horsar Hill, Cingolo, Monte Cristo, Hlongwane, and Colenso were taken between the 14th and the 20th, the Tugela crossed on the 21st; Peter's Hill, the key of the enemy's position, was taken on the 27th; and the next day the British cavalry entered Ladysmith. General Buller's forces advanced northward into the Transvaal, where they coöperated with Lord Roberts in the final campaign. On May 18 Mafeking, the last of the three towns invested by the Boers at the outbreak of the war, was relieved.

In the eastern Transvaal the main Boer force under General Botha was driven into the mountains on the Portuguese frontier. They made a desperate stand at Bergendal August 27, but were driven from their position by General Buller. At Spitzkop, southeast of Lydenberg, General Botha fought the last set battle of the war, September 8, but was defeated, and the greater part of the Boers, about 3000, crossed into Portuguese territory on September 14 and surrendered to the authorities there. On October 19 President Kruger sailed for Holland from Lourenço Marques on a Dutch man-of-war.

From this time until the war's end, May, 1902, the struggle of the Boers took the form of a desperate resistance by guerrilla bands against superior forces and inevitable defeat. It was the task of the British under Lord Kitchener, who succeeded Lord Roberts in the command of the British, Nov. 29, 1900, to pacify the country they had overrun, and he employed a plan of campaign adapted to the conditions under which the conflict was now to be fought out. Flying columns traversed the Orange Free State and the western Transvaal in an effort to hunt down the Boer commandos, which, under leaders like Christian De Wet and Jacobus Hendrick De la Rey (qq.v.), caused the British forces much annoyance, if not actual harm. De Wet evinced splendid talents as a leader, and his astonishing rapidity of movement, boldness, and good fortune in eluding capture served to make the end of the South African War dramatic.

The activity of the Boers was limited to the repeated capture of isolated outposts or of small

detachments of the enemy, whom they were usually compelled to release for lack of facilities to keep them captive. At times the danger of a rising among the Dutch inhabitants of Cape Colony seemed imminent, as when a number of Boer commandos entered Cape Colony in the winter of 1900-01 and threw the inhabitants of Cape Town into alarm. The struggle ultimately resolved itself into a campaign of so-called "attrition" on the part of the British, a process, e.g., of steadily weeding out the enemy by unceasing pursuit and capture of one Boer commando after another. Their task was made more difficult by the active assistance rendered the Boers by the non-belligerent population, and because of this concentration camps were established in the Transvaal, Cape Colony, and the Orange River Colony, into which were gathered all Boer noncombatants as well as British loyalists who desired the protection of the authorities. The high rate of mortality that prevailed among the children in these camps aroused bitter criticism of British methods in the foreign press.

The uselessness of protracting the struggle was recognized by a number of the Boer leaders before the beginning of 1902, and negotiations for peace were begun in January of that year. The British government declined to take into consideration the question of the independence of the Boer states, and the articles of peace as signed at Pretoria on May 30 were substantially those offered by the government in 1901. By the terms of the treaty the Boers in the field agreed to lay down their arms and to acknowledge allegiance to Great Britain, on condition that no burgher should be deprived of liberty or property, or be subjected to civil or criminal proceedings for acts during the war. It was provided that the Dutch language be taught in the public schools and its use permitted in the courts. Military administration in the colony was to be succeeded by civil rule at the earliest opportunity, to be followed by representative government. No special tax was to be imposed on landed property to defray the expenses of the war. The number of Boers who surrendered after the conclusion of peace was more than 20,000.

Figures issued by the War Office showed that the British forces engaged in South Africa during the war numbered nearly 450,000, of which number 9940 were in South Africa on Aug. 1, 1899. The reinforcements after that date dispatched to South Africa from Great Britain included nearly 247,000 regular troops and 110,000 volunteers, militia, and yeomanry. The number of volunteers from the British colonies was nearly 31,000, and more than 52,000 men were raised in South Africa. The casualties were 1100 officers and 22,800 men killed, wounded, or missing, and 3116 officers and 40,500 men sent home as invalids. The cost of the war was placed at £206,224,000. The Boer enlistment, according to estimates of Lord Kitchener, was approximately 95,000. Their casualties were placed at 3700 killed and 40,000 prisoners.

**SOUTH AMBOY.** A city in Middlesex Co., N. J., on the Raritan River and Bay, at their confluence with Staten Island Sound, directly opposite Perth Amboy, and on the Pennsylvania, the Central of New Jersey, and the Raritan River railroads (Map: New Jersey, D 3). A railroad bridge and a trolley bridge connect it with Perth Amboy. The city is important as the centre of a region containing large quantities of sand and clay. Pottery, terra cotta, asphaltum, clothing, underwear, cigars, and brick are the most important manufactures. Coal is extensively shipped from this port by the Pennsylvania Railroad. Pop., 1900, 6349; 1910, 7007.

**SOUTH AMERICA.** See AMERICA.

**SOUTHAMPTON**, south-ämp'ton. A county borough, parliamentary borough, and a seaport in the south of Hampshire, England, 79 miles southwest of London (Map: England, E 6). The town occupies a peninsula near the head of Southampton Water, between the estuary of the Test or Anton on the west and south and the mouth of the Itchen on the east.

The Domus Dei, or God's house, dates from the end of the twelfth century, and is one of the oldest hospitals in England. In the vicinity are picturesque ruins of Netley Abbey, a Cistercian foundation of the thirteenth century, and the Netley Military Hospital accommodating 1000 patients. Southampton was incorporated by Henry I and received several privileges confirmed by subsequent monarchs. Henry VI constituted the town a county in itself, and its area included a "little" place called Portsmouth. The guild merchants controlled affairs and the municipal transactions are recorded in the famous "oak book," the most treasured object in the town archives. The town has owned its markets since its incorporation, and the water supply since 1420 and its slaughter houses since 1698. The borough's boundaries were extended in 1895, since when much economic progress has been made. Artisans' dwellings and a municipal lodging house have been built, sewage and draining works carried out, and an electric-lighting plant and street railways acquired. The town maintains a large isolation hospital, fine public baths, a free public library, a cemetery, and extensive parks, and makes abundant provision for technical instruction.

Yacht building, shipbuilding, and engine making are actively carried on, and there is an extensive general trade. Southampton is a fashionable summer resort. It owes its importance to its sheltered harbor and to the phenomenon of double tides, which prolong high water for three hours. (See ENGLISH CHANNEL.) There is considerable traffic between Southampton and the Channel Islands and French coast, and also a large cattle trade with Spain and Portugal. Its docks include six large dry docks, two tidal basins (16 and 18 acres in area), and a closed dock. The total tonnage entered and cleared, excluding coastwise vessels, was 11,797,973 in 1913.

Southampton supplanted the ancient *Clau-sentum*, which stood one mile to the northeast, and its foundation is ascribed to the Anglo-Saxons. A great part of it was burned by the

combined French, Spanish, and Genoese fleets in 1338, and in the following year its defenses were strengthened. Pop., 1901, 104,824; 1911, 119,012. Area, 4604 acres. Consult Davies, *History of Southampton* (Southampton, 1883).

**SOUTHAMPTON.** A village in Suffolk Co., N. Y., 92 miles by rail east of New York City, on the Atlantic Ocean and on the Long Island Railroad (Map: New York, C 2). It is an attractive and popular summer resort, having a fine beach, excellent fishing, and many beautiful residences. There are also a new high school and the Rogers Memorial Library. Pop., 1900, 2289; 1910, 2509.

**SOUTHAMPTON.** Another name for the English county of Hampshire (q.v.).

**SOUTHAMPTON**, HENRY WRIOTHESLEY, third EARL OF (1573-1624). An English statesman, the patron of Shakespeare. He was born at Cowdray House, near Midhurst, educated at St. John's College, Cambridge, and studied law at Gray's Inn. He was attached to Queen Elizabeth's suite, and received the dedications of various poets, including Shakespeare, who in 1593 addressed to him *Venus and Adonis* and next year *The Rape of Lucrece*. He is also supposed by some to be the anonymous patron of Shakespeare's *Sonnets*. He was a friend of the Earl of Essex, taking part in Essex's insurrection and was condemned to death. His sentence was commuted to imprisonment for life, and this was reversed by Parliament early in the reign of James I. In 1605 he became active in the colonization of America, being Governor of the Virginia Company from 1620 until its dissolution in 1624. In 1621 he was imprisoned in the Tower for opposing Charles I. After his release he commanded a regiment for the Dutch against the Spanish, and both he and his son died of fever contracted in the Netherlands.

**SOUTHAMPTON INSURRECTION.** See TURNER, NAT.

**SOUTHARD**, süth'ärd, SAMUEL LEWIS (1787-1842). An American legislator and cabinet officer, born at Basking Ridge, N. J. He graduated at Princeton in 1804, and was admitted to the bar in 1809. In 1811 he settled in Flemington, N. J. From 1814 to 1819 he was a justice of the Supreme Court of New Jersey, and in 1821 was elected to the United States Senate. In 1823 he resigned to become Secretary of the Navy, holding the position throughout J. Q. Adams's administration. In 1830 he was elected Attorney-General of New Jersey and in 1832 Governor. From 1833 until just before his death, he was again a member of the United States Senate. In the 27th Congress (1841-43) until his resignation he was president pro tem., and presided over the Senate after Vice President Tyler had succeeded President William H. Harrison. He published *Reports of the Supreme Court of New Jersey, 1816-20* (1820); *Centennial Address* (1832); and *Discourse on William Wirt* (1834).

**SOUTH AUSTRALIA.** A state of the Commonwealth of Australia occupying the central part of the southern portion of the continent, extending from the 26° S. parallel to the Indian Ocean, with a width of about 700 miles. Its area is 380,070 square miles. On Jan. 1, 1911, the Northern Territory (q.v.) was transferred to the Commonwealth.

**Physical Features.** The state lies in three provinces of Australia: a small area in the ex-

trene southeast drained mostly by the Murray; an extensive area from the south coast reaching to lat. 20° S. of interior drainage; and a smaller area in the north, well drained, with rivers flowing to the northern waters. The whole is a vast plain of no great elevation, in some places, as about Lake Eyre, lying below sea level. Many short ranges of mountains are distributed over the state, culminating in the south in the Flinders Range (3000 feet) and in the interior in the Baget, Stuart, and Musgrave ranges. In the interior there are a number of river courses, which are dry for a great part of the year, and even in the wet season are lost in marshes or salt lakes. Several of these lakes, the largest being found in the depression north of Spencer Gulf, are over 100 miles in length. They are brackish and shallow, being reduced during the dry season to marshes or mud flats covered with salt crusts.

**Climate, Soil, and Flora.** Though the state has a range of nearly 13 degrees of latitude, its climate is remarkably uniform. It is in general hot and dry; the temperature even on the south coast may remain at 110° F. or 115° F. for days. The annual rainfall in the southeast, at Adelaide, is about 24 inches, but sometimes falls to 15 inches. In the interior it is always scanty, 5 to 11 inches per year; at the head of Spencer Gulf it averages 9 inches, and at Eucla, on the west coast, 11 inches. Rain is generally confined to the winter, which is mild. There are areas of good agricultural and pastoral land in the south. The interior consists largely of treeless plains, in some parts absolutely barren, stony or sandy, or covered with scrub, but here and there producing good pasture grass during the wet season. Large areas are covered with spiny grass unfit for pasture. Trees are found only near the mountains or larger river courses, but the hilly region east of the southern range is well timbered. The flora is not so rich as that of the eastern states. The prevailing timber trees of South Australia are eucalyptus and acacia, with some pines, while *Pandanus* and palms are found in the north.

**Fossils and Fauna.** The remains of many hugh extinct marsupials have been found, as the *Diprotodon*, the *Macropus*, the *Titan*, etc. The marsupial mole (q.v.), a new animal, discovered in 1890, is found in the state.

**Geology.** The greater part of the surface is covered with recent formations, Cretaceous in the east, but in the main Tertiary. There are, however, numerous outcrops and extensive areas of ancient rocks. Thus the mountain region from Spencer Gulf northward and the greater part of Eyre's Peninsula consist mainly of Silurian strata. Granite crops out in the mountains of the interior. No active volcanoes are known to exist in Australia, but in the extreme southeastern section of this state there are evidences of recent action, which increase eastward.

**Mining.** The mineral deposits thus far developed are chiefly copper, gold, and silver, the principal being copper, the production in 1913 being valued at £461,500. In the same year the gold output was valued at £28,000, and the total value of minerals produced was £634,318. Iron, lead, and bismuth are also found in considerable quantities.

**Agriculture.** South Australia ranks second among the Commonwealth states in acreage under cultivation. It amounted in 1913-14 to 4,679,500. Of this, 2,267,800 acres, producing

16,938,988 bushels, were under wheat, the chief source of wealth. In the same year there were 90,552 acres of barley, 116,732 of oats, 568,550 of hay, 10,809 of potatoes. Vine cultivation is a prosperous industry, the area having increased from 12,314 acres in 1891 to 26,208 in 1913, the wine production amounting to 2,759,665 gallons. The small rainfall confines farming mainly to the southeast. The state has adopted the policy of repurchasing large estates and selling them to farmers in blocks of convenient size. Some progress has been made in irrigation, the water being drawn from both rivers and artesian wells. The number of sheep declined from about 7,000,000 in 1890 to 5,073,057 in 1913. The wool product in 1913 was 48,035,906 pounds, valued at £1,809,517. The cattle in the year numbered 359,905. There were 283,641 horses.

**Manufactures.** In 1913 there were 1353 factories, employing 28,511 hands, with salaries and wages amounting to £3,034,537 and an output of £13,998,370. The manufacturing industry is confined mainly to production for local consumption or of food products, especially flour, for export.

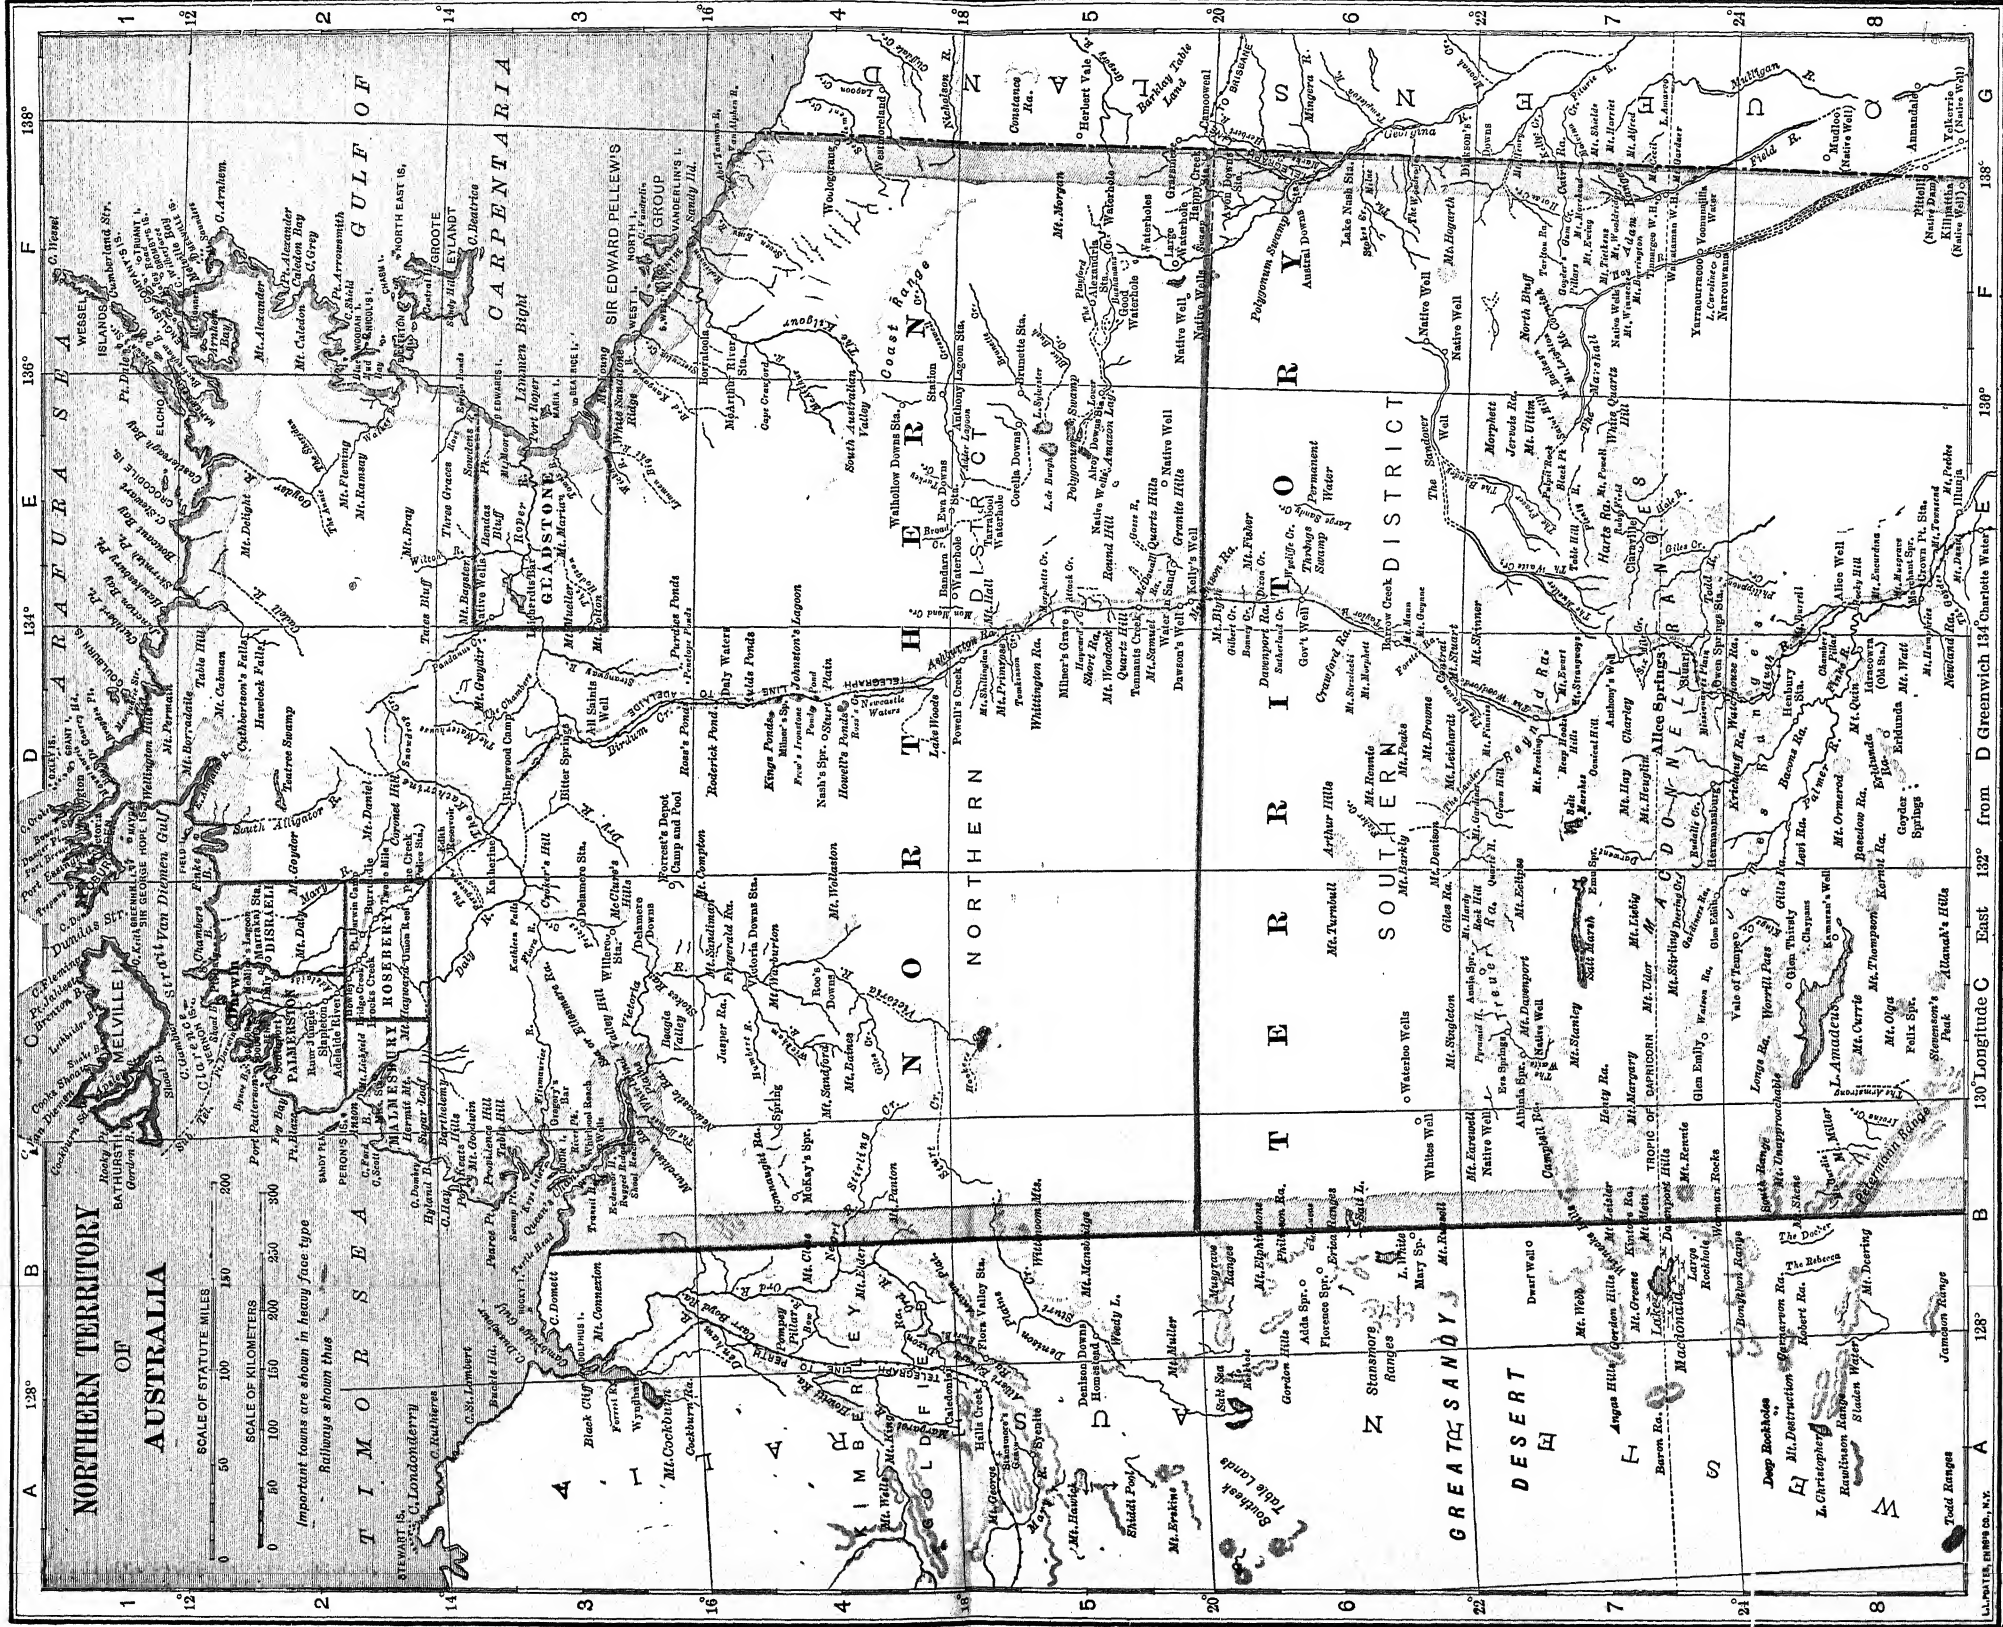

**Commerce.** Almost from the beginning railroads were constructed and operated by the government, and practically all of the 1845 total mileage belongs to the state. The government realizes a profit of about 4 per cent upon its railways. A transcontinental line is being constructed between Port Augusta in South Australia and Kalgoorlie in Western Australia, and about 450 miles of this will be in South Australia. When completed it will connect Brisbane on the east coast with Kalgoorlie. The imports in 1913 amounted to £7,348,340 and the exports to £9,809,763. Adelaide, the chief port, ranks third among the Australian ports. The exports of domestic produce in 1913 amounted to £9,809,673. The principal articles exported were grain and flour, wool, silver, lead, spelter (these two latter items are principally the produce of the Broken Hill Mines in New South Wales), and bullion and coin. The other Australian states and the United Kingdom handle nearly all the trade.

**Government.** The Governor is appointed by the British government. The Executive Council is composed of six responsible ministers and the Chief Justice of the Supreme Court. The Legislature consists of a Legislative Council of 18 elected members and a House of Assembly of 40 elected members. The state has extended the right of suffrage to women.

**Finance.** The total revenue in 1914 was £4,822,766; expenditure, £4,604,129; balance of Commonwealth revenue returned to the state, £540,113. Most of the revenue is from territorial receipts, railways, and inland revenue. The public debt of the state was, in 1914, £33,564,332, of which about one-half was for the construction of railways, telegraphs, and water works.

**State Activities.** The government has been very progressive with enterprises that are generally left to private initiative. The state has tried to foster industries by the establishment of produce depots, by performing the function of agent in the marketing of produce, and also by the establishment of cyanide works and smelters. A state bank supplies capital to farmers on easy terms. Laws have been passed to secure the compulsory settlement of industrial disputes.

**Population.** The population increased from 14,600 in 1840 to 319,145 in 1890 and 408,558 in 1911. The majority are in the southeastern part of the state. Nearly the whole population is of British origin. In 1913 Adelaide and its suburbs had a population of 200,117.

**Religion.** In 1911 the membership of the principal churches was: Church of England, 113,781; Roman Catholic, 50,964; Methodist, 100,402; Lutheran, 26,681; Baptist, 21,863; Presbyterian, 22,567; Congregationalist, 13,357.

**Education.** Primary education is free, and is compulsory between the ages of 7 and 13. Religious instruction may be given, but not during ordinary school hours. In 1913 there were 815 state schools, with an enrollment of 58,656. There is a secondary school for girls at Adelaide, and fees are charged. All other secondary schools are private or denominational. In 1913 there were 11,012 scholars enrolled in 168 private schools. The University of Adelaide and a number of technical schools are aided by the state.

**History.** The explorations of Flinders in 1802 and of Stuart in 1830 first called attention to South Australia. Its real settlement was due to an association formed to put into operation the colonization theories of Edward Gibbon Wakefield (q.v.). In 1834 permission was given for the formation of the province on condition that no expense should attach to the home government. In 1836 settlers landed and founded the town of Adelaide, which was incorporated in 1840—the first proclaimed city of Australia. South Australia became a crown colony in 1841. The early basis for the prosperity of South Australia was agricultural, though in 1838 galena deposits were discovered and in 1842 copper. When Governor Grey assumed office in 1841 the population was 14,562; when he left in 1845 it had increased to 21,759. The Torrens land system was adopted in 1857. The first representative constitution was proclaimed in February, 1851. Responsible government was proclaimed in 1856. The explorations of Eyre in 1839 opened up the cattle region of the interior, and those of Stuart in 1859–62 the way to the Indian Ocean. The Northern Territory was annexed in 1863. The telegraph line, opened in 1872, followed substantially the line of Stuart's explorations and first gave Australia cable communication with the rest of the world.

**SOUTH BEND.** A city and the county seat of St. Joseph Co., Ind., 84 miles east by south of Chicago, Ill., on the St. Joseph River, and on the New York Central, the New Jersey,

Indiana, and Illinois, the Lake Erie and Western, the Grand Trunk, the Vandalia, and the Michigan Central railroads (Map: Indiana, E 1). It is the seat of the University of Notre Dame (q.v.), of St. Mary's Academy, and of St. Joseph's Academy. Noteworthy are the courthouse, city hall, Oliver Hotel, public library, orphan asylum, historical society, Epworth Hospital, and St. Joseph's Hospital. South Bend is the centre of a rich farming region and is an important industrial city. In 1909 its 218 industrial establishments represented an invested capital of \$41,467,000 and an output valued at \$27,855,000. There are large wagon, automobile, and carriage works, an enormous plow factory, lumber and flouring mills, foundries and machine shops, wood-turning plants, and manufactories of shirts, sewing machines, agricultural implements, toys, patent medicines, woollens, clover hullers, underwear, boilers, furniture, concrete machinery, cutlery, electrical appliances, harness, lathes, ranges, linseed oil, varnish, steel skeins, sheet iron products, spark arresters, and other industries. Pop., 1900, 35,999; 1910, 53,684; 1915 (U. S. est.), 67,030; 1920, 70,983.

The site of South Bend was occupied by the Miami and Potawatami Indians. In 1824 Alexis Coquillard established a trading post here; in 1831 a town was laid out, which in 1835 was incorporated.

**SOUTH BERWICK,** bĕr'wĭk. A town in York Co., Me., 40 miles southwest of Portland, on the Boston and Maine Railroad (Map: Maine, B 5). Interesting features are the Berwick Academy, an institution which was founded in 1791, and the Fogg Memorial Library. The chief manufactured products are shoes, woollen goods, and horse blankets. Pop., 1900, 3188; 1910, 2935.

**SOUTH BETHLEHEM.** A borough in Northampton Co., Pa., 57 miles by rail north by west of Philadelphia, on the Lehigh Canal, on the Lehigh River, opposite Bethlehem, and on the Lehigh Valley, the Central of New Jersey, and the Philadelphia and Reading railroads (Map: Pennsylvania, L 6). Lehigh University (q.v.) occupies a site overlooking the borough. Other noteworthy institutions are the Bishopthorpe Manor (a school for girls); Moravian College for Women; Moravian Theological Seminary; and St. Luke's Hospital. South Bethlehem is known for its iron and steel manufactures. The total capital invested in the various industries in 1909 was \$41,121,000, and the value of their output was \$26,417,000. There are the large establishment of the Bethlehem Steel Company, and brass works, foundries and machine shops, coke works, zinc works, and manufactories of silk, knit goods, brick, etc. Pop., 1900, 13,241; 1910, 19,973; 1915 (U. S. est.), 23,522.

**SOUTH BEVELAND.** See BEVELAND.

**SOUTHBIDGE.** A town, including two villages, in Worcester Co., Mass., 20 miles south by west of Worcester, on the Quinebaug River, and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, D 4). It has large optical works and manufactories of shuttles and shuttle-irons, knives, and cotton and woollen goods. Pop., 1900, 10,025; 1910, 12,592; 1915, 14,202; 1920, 14,245. Originally a part of Charlton, and popularly called "Honest Town," it was incorporated as a town, under its present name, in 1816. Consult Davis, A

*Historical Sketch of Sturbridge and Southbridge* (Brookfield, 1856).

**SOUTH CAROLINA** (popularly called the "Palmetto State"). A South Atlantic State of the United States, lying between lat.  $32^{\circ} 2'$  and  $35^{\circ} 13' N.$ , and between long.  $78^{\circ} 33'$  and  $83^{\circ} 21' W.$ , roughly triangular in shape, with a base extending 190 miles in a straight line along the Atlantic shore and a somewhat blunted apex resting upon the summit of the Blue Ridge, 240 miles to the northwest. Its area is 30,989 square miles, of which 30,495 square miles are land surface. It ranks as the thirty-sixth State in size.

**Topography.** The State extends across the coastal plain and the piedmont plateau, two well-marked topographic belts which are separated from each other by an old shore line crossing the middle of the State, parallel to the present shore. This old shore line passes through Augusta, Ga., Columbia, Camden, and Cheraw. The width of the coastal plain is about 125 miles and that of the piedmont plateau is nearly as great. Two-thirds of the State is included in the coastal plain, the remainder is in the piedmont plateau. From the North Carolina line southwest to Winyah Bay the shore has an unbroken sandy beach. South of that point the shore becomes more and more broken by inlets and estuaries and is fringed with low, sandy islands (the Sea Islands) that in the Port Royal region form tiers three or four deep, separated by irregular cross channels bordered with salt marshes. The outer part of the coastal plain is low and flat with large areas of swamp. Inland, the coastal plain surface rises slowly for the first 100 miles, reaching an elevation of only 150 to 250 feet, but in the remaining 25 miles of its width the rise is much more rapid and an average elevation of 500 feet is reached along its inner edge, which is marked by a belt of sand hills, partly of dune origin, but now fixed and covered with pines. To the west the transition to the piedmont plateau is gradual, and its surface rises gently from an elevation of 500 feet along its eastern margin to 1000 or 1200 feet in the extreme northwest, where an eastward-facing escarpment rises abruptly 2000 feet to the summit of the Blue Ridge, which forms the northwest boundary. Rich Mountain, on this boundary, 3569 feet in elevation, is the highest point in the State.

**Hydrography.** The general course of rivers is to the southeast. The longer ones rise in the mountains of North Carolina. The Great Pedee, with the Waccamaw, Little Pedee, and Lynch's as tributaries, flows into Winyah Bay in the east; the Santee, formed by the Wateree and Congaree, is in the centre; and the Savannah forms the southwest boundary. The largest river entirely within the State is the Edisto. It is between the Santee and the Savannah and is confined to the coastal plain. The waters of the piedmont streams are usually turbid with red clay, while those of the coastal plain are either clear or are darkened by the decaying vegetation of the swamps. The streams of the piedmont have numerous rapids where they cross upturned ledges of hard rocks. Their descent from the hard rocks of the piedmont to the soft sands of the coastal plain is also marked by rapids and is known as the fall line. These rapids afford much water power. The larger rivers are navigable only across the coastal plain to the fall line.

**Climate.** The climate ranges from a semi-tropical one on the south Sea Islands to cold-temperate along the Blue Ridge. The mean annual temperature of the State varies from  $58^{\circ} F.$  at Greenville to  $66^{\circ} F.$  at Beaufort. The mean summer and winter temperatures at Greenville are  $85^{\circ} F.$  and  $52^{\circ} F.$ ; and at Beaufort  $89^{\circ} F.$  and  $59^{\circ} F.$  respectively. The temperature of the coast is somewhat more equable than the rest of the State. The annual rainfall is about 49 inches and its distribution by localities and seasons is fairly uniform. Light snow sometimes falls along the coast, but it very rarely accumulates. In the middle and western sections of the State several snows each 5 to 10 inches deep may occur in a winter and may remain on the ground from a few days to a week or more. Hurricanes from the West Indies occasionally visit the coast, especially in the autumn, and are sometimes destructive.

**Soils.** The soils of the piedmont have resulted from the deep weathering of the crystalline and metamorphic rocks of that region. The most common soil is a red clay, though sandy and gravelly soils also occur abundantly, and there are occasional dark clay soils from the weathering of trap and similar igneous rocks. Along the inner edge of the coastal plain there is a belt, 10 to 30 miles wide, of very poor, white, sandy soil known as the Sand Hills. Southeast of this there is a somewhat narrower, broken belt of red, sandy clay soil; while the soil of the middle and outer part of the coastal plain is a light-colored sand or loam of moderate fertility, with swampy muck and clayey soils along the rivers and on the Sea Islands.

**Vegetation.** The vegetation of the Sea Islands is semitropical in aspect, the palmetto, live oak, and magnolia being characteristic. On the outer part of the coastal plain cypress and gum characterize the swamps, and long-leaf pine and oak the uplands. On the inner part of the coastal plain short-leaf pine, hickory, poplar, elm, and oak appear, and on the piedmont plateau, these, with chestnut, locust, walnut, persimmon, maple, and other hard woods, become dominant. Wild grapes, strawberries, and various small fruits are abundant.

**Geology.** The rocks of the piedmont are almost all of Pre-Cambrian age. A few schists and slates with narrow included belts of marble are probably Cambrian. Some trap dikes and a small area of red sandstone of Triassic age also occur. The rocks of the coastal plain are unconsolidated sands and clays and soft limestones and marls. The oldest are Cretaceous, the younger are of Tertiary and recent age.

**Mineral Resources.** Phosphate rock was, until 1912, the leading mineral product, production declining since because of the exhaustion of the river beds and the growing scarcity of land deposits. The State ranks next to Florida and Tennessee in the output of phosphate rock, in 1914 amounting to 106,919 tons, valued at \$415,039. In 1913 clay products took first place in the value of production among the State's mineral resources, the main output being common brick, and most of the rest "paper clay," used by paper manufacturers. The total value of the clay products (raw and derived) was \$701,696 in 1914. The output of stone, almost entirely granite, was valued at \$357,657 in 1914. The exhaustion of the Hails mine has about ended South Carolina's career as a gold-producing State, production in 1914 being valued

at only \$7360. Other mineral products in order of value of output are mineral waters, sand and gravel, tin, occasional gems, barytes, and fuller's earth. The total value of all mineral products in 1914 was \$1,414,294.

**Agriculture.** The land area of South Carolina in 1910 was approximately 19,516,800 acres, of which 13,512,028 acres were in farms, 6,097,999 acres in improved land. There were 176,434 farms, averaging 76.6 acres each. The total value of farm property, including land, buildings, implements and machinery, domestic animals, poultry, and bees, was \$392,128,314. The average value of land per acre in that year was \$19.89 and the average value per farm including implements was \$2223. In 1910, 65,213 farms were operated by owners and managers, and 111,221 by tenants. There were 79,636 white farmers (34,926 tenants) and 96,798 nonwhites (76,295 tenants), all but 26 of whom were negroes. The acreage owned and operated by whites was 7,458,417, and by nonwhites, 1,140,498. The land operated by tenants measured 2,113,135 and 2,799,978 acres, for whites and nonwhites respectively. Of the white farmers 212 were foreign born, 101 of them Germans.

The following table shows the acreage, production, and value of some of the principal crops as estimated by the United States Department of Agriculture in 1915.

PRODUCT	Acreage	Prod. bu.	Value
Cotton .....	2,400,000	*1,160,000	\$62,578,000
Corn ..	2,155,000	35,558,000	30,935,000
Wheat .....	225,000	2,430,000	3,353,000
Oats ..	525,000	9,975,000	6,683,000
Potatoes .....	11,000	880,000	1,012,000
Sweet potatoes ..	65,000	6,825,000	4,436,000
Hay ..	220,000	†286,000	4,462,000
Tobacco .....	65,000	†37,700,000	2,639,000
Rice .....	3,700	90,000	\$1,000

\* Bales of 500 pounds gross weight. † Pounds. ‡ Tons.

The total value of crops in 1909 was \$141,983,354 and the combined acreage of crops for which acreage was reported, 5,182,845, about 84.5 per cent of the total improved land. The leading crops in order of their importance were cotton, corn, cotton seed, oats, hay and forage, sweet potatoes and yams, and tobacco. Cotton is the predominant crop, not only in agriculture, but also in South Carolina's industrial, commercial, and financial activities. In 1909 the acreage devoted to cotton was 2,556,467, producing 1,279,866 bales, valued at \$80,337,945, and 639,933 tons of cotton seed, valued at \$16,043,122. In 1909 14,573 bales of the valuable long-fibred Sea Island cotton, grown mostly in the counties of Beaufort and Charleston, were ginned. The farmers have realized the advantage of diversifying crops, and corn is receiving more attention every year, bidding fair to rival cotton both in acreage and value. In 1909 the area under corn was 1,565,832 acres, which produced 20,871,946 bushels, valued at \$20,682,632. The acreage devoted to oats in 1909 was 324,180 and the production amounted to 5,745,291 bushels, valued at \$3,809,345. To hay and forage were devoted 209,767 acres, producing 186,131 tons, valued at \$3,189,122. Sweet potatoes and yams had an acreage of 48,878 in 1909, the production was 4,319,926 bushels, valued at \$2,606,606. In 1909, 30,082 acres of tobacco were harvested, producing 25,583,049 pounds,

valued at \$2,123,576. (See table above for 1915 figures.) At one time among the largest producers of rice in the United States, South Carolina farmers are gradually permitting this crop to languish. The acreage in 1909 was 19,491, and the production 541,570 bushels, valued at \$520,000. Sugar and sorghum cane and their products are important; in 1909 the acreage devoted to sugar crops was 15,498, the production 87,477 tons, and the total value of products, including cane, sugar, sirup, molasses, etc., was \$619,992. To vegetables other than potatoes and sweet potatoes and yams were devoted 51,994 acres, producing crops valued at \$3,705,991.

Peaches, apples, pears, plums, and prunes are the State's most important orchard fruits, the total value of the orchard products being \$956,376 in 1909. Small fruits had a total production of 1,408,099 quarts, valued at \$113,254. The most important of these were strawberries and blackberries and dewberries.

**Live Stock and Dairy Products.** The total number of domestic animals on farms in 1910 was reported as 162,846, valued at \$43,790,143. The number and value of various classes of live stock on farms on Jan. 1, 1916, were estimated by the United States Department of Agriculture to be: horses, 84,000, value \$11,340,000; mules, 171,000, value \$27,531,000; milch cows, 189,000, value \$6,520,000; cattle other than milch cows, 215,000, value \$3,311,000; sheep, 30,000, value \$81,000; swine, 817,000, value \$7,794,400. The total value of dairy products, exclusive of milk and cream used on the producing farms, was \$2,801,000 in 1909. The milk sold amounted to 919,745 gallons; butter to 1,752,209 pounds, and cream to 11,282 gallons. The total number of fowls reported in 1910 was 146,855, and the eggs produced amounted to 9,722,160 dozen, valued at \$1,902,993. Honey produced on farms amounted to 653,119 pounds, valued at \$75,941, and wax to 12,440 pounds of \$2995 value.

**Fisheries.** The fisheries products of South Carolina are less in value than any other of the South Atlantic States, the total value of all fishing products in 1908 being only \$288,000. Shad is the most important species caught. In 1908 the total number of persons employed in fisheries was 2559, and the capital invested, \$113,000.

**Forest Products.** In 1908 the area of forest land in South Carolina was 18,750 square miles. Lumbering activity increases with the distance on each side of the "Fall line," the swamp lands near the coast containing the largest stands of virgin forest, chiefly cypress. The mountains at the other extreme contain forests of oak, chestnut, black locust, and short-leaf pine. The most important species is the yellow pine. In 1913, 497 mills reported having cut 752,184 M feet board measure, of which over 550,000 M feet were yellow pine. (See paragraph on *Manufactures*.) In 1909, forest products produced on farms were valued at \$4,513,092, of which \$3,092,453 were used on the farms themselves.

**Manufactures.** In value of manufactured products South Carolina ranked thirty-second among the States in 1909, with a per capita value of products of \$75. The following table gives the most important figures relative to manufactures for the 10 leading industries in 1909 and 1904, as given by the United States Bureau of the Census.

In 1914 the aggregate capital invested was \$161,889,384, the value of products was \$135,

270,872, the average number of employees, 75,629, of which 3089 were salaried. Cotton holds the dominating position in manufactures, South Carolina ranking third among the States in the value of cotton products in 1909. In point of value, cotton contributed 58.2 per cent of all manufactured products. In that year there were consumed 324,385,778 pounds of raw cotton, costing \$35,533,209. The most important product was plain cloth, of which were produced 561,861,267 square yards, valued at \$26,848,377. The number of spindles was reported at 3,754,251 in 1909, the number of looms, 94,205. Lumber and timber products rank second in importance. Great quantities of timber are imported,

among the cities of the State, and in 1914, 71 establishments employed 2228 wage earners, and produced products valued at \$6,735,000. Spartanburg and Greenville rank third and fourth, respectively, among the cities of the State. See also articles on these cities.

**Transportation.** The Savannah River, navigable for 202 miles and connecting Savannah with Augusta, Ga., is the most important inland waterway. Considerable sums have been spent for the general improvement of navigation. The total mileage of first track of steam railways in 1914 was 3686. The principal roads and their mileage of first track in that year were the Southern, 1122; the Atlantic Coast

## SUMMARY OF MANUFACTURES FOR 1909 AND 1904

## THE STATE — TEN LEADING INDUSTRIES

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of products	Value added by manufacture
			Total	Wage earners (average number)				
Expressed in thousands

	1904	150	985	623	945	268	1,038	824

saw and planing mills utilizing about seven-eighths of the timber consumed. It is estimated that the wood-working industries of South Carolina consume about 423,670 M feet board measure annually. No inconsiderable products of the pine forests of South Carolina are used in the manufacture of naval stores. The State has long been one of the chief sources of turpentine and resin, and is one of the leading States in the distillation of soft wood. In 1909, 460,000 gallons of turpentine, valued at \$205,000, and 15,000 barrels of resin, valued at \$199,000, were produced. The manufacture of cotton-seed oil and cake ranks third in importance, and in 1909 produced 15,745,552 gallons of oil, and 156,729 tons of meal and cake.

In 1909 there were 56,264 male wage earners, and 16,782 female, 9405 under 16 years of age. For the great majority of wage earners the prevailing hours of labor were 60 a week. A comparatively small percentage of the manufacturing industries are located in the large cities. There were four cities in 1909 with a population of over 10,000, and from these were reported but 16.1 per cent of the total value of products. In 1914 wage earners in Charleston, the largest city, numbered 2739, employed in 120 establishments which reported products valued at \$5,852,000. Columbia ranks second

Line, 886; the Seaboard Air Line, 363; the Charleston and Western Carolina, 319; and the Carolina Atlantic and Western (Seaboard Air Line), 187.

**Banks.** The State Bank of South Carolina had an exceptionally successful career. It was established in 1812 to remedy the financial disturbances caused by the impending war with England. It was entirely under State control, and its president and directors were chosen by the Legislature. The capital was furnished by the State, and the bank was the repository for all State funds. In 1852 its charter was renewed and it continued to do a most satisfactory business until 1870, when it was put in liquidation. The table on the following page gives the State banking statistics, as reported, as to principal items in 1914.

**Government.** The present constitution was enacted in 1895, and has been since amended in unimportant particulars. Concurrence of two-thirds of the members elected to each house of two successive legislatures, and a majority of the electors is necessary to carry an amendment. A constitutional convention may be convened by a vote of two-thirds of the members elected to each branch of the General Assembly, if a majority of the voters approve at the next election. The seat of government is situated at Columbia.

*Executive.*—The department consists of the Governor, in whom is vested supreme executive authority, the Lieutenant-Governor, the Secretary of State, Comptroller General, State Superintendent of Education, Commissioner of Agriculture, Commerce and Industries, Adjutant and Inspector General, State Treasurer, and Attorney-General, all elected at the same time as the Governor, and holding office for the same period, viz., two years.

*Legislative.*—The legislative power is vested in the Senate and House of Representatives, which together form the General Assembly. The House of Representatives consists of 124 members. The Senate is composed of one member from each county, elected for a term of four years. The senators must be at least 25, and the representatives at least 21 years of age. Members of both houses are biennially elected. The General Assembly convenes annually on the second Tuesday in January.

*Judiciary.*—The judicial power is vested in

millions of dollars, and may not be less than 400 square miles in size. No city or town shall be organized without the consent of the majority of the electors, entitled by law to vote within the district proposed to be incorporated.

*Miscellaneous Constitutional and Statutory Provisions.*—Every corporation organized and doing business, except religious, educational, and benevolent associations, and corporations selling by sample, must have and maintain at least one agent upon whom process may be served, and at least one business office. No discrimination in charges for the facilities and transportation on the same classes of freight and passengers, or for the transmission of intelligence within the State, or coming from or going into any other State, may be made. Divorce is not permitted.

No person who denies the existence of the Supreme Being may hold office under the Constitution. The hours of employment in cotton and woolen establishments are limited to 10 a

a supreme court, two circuit courts, which comprise a court of common pleas, and a court of general sessions, established by the Legislature. The supreme court consists of one chief justice, and four associate justices. They are elected by the General Assembly, for a term of 10 years. The State is divided into judicial circuits, and for each of these a judge (holding office for four years) is elected by vote of the General Assembly.

*Suffrage and Elections.*—Voters must have resided in the State for two years, in the county for one year, and in the polling precinct for four months, and have paid a poll tax six months before any election. Ministers in the service of an organized church, and teachers of schools are entitled to vote after six months residence in the State, if otherwise qualified. Electors must be enrolled once in every 10 years. All persons of voting age who applied for registration up to Jan. 1, 1898, and who could read any section in the Constitution submitted to them, or understand or explain it when read, are entitled to subsequent registration. Any person who applies for registration after that date must be able to read and write any section of the Constitution submitted to him, or show that he owns and has paid taxes, collectable during the previous year, on property in the State assessed at \$300 or more. General elections for Federal, State, and county officers are held in each second year of even date on the Tuesday following the first Monday in November. It is unlawful for any person to sell, barter, or give away to any voters intoxicating liquor within one mile of any voting precinct during any primary or any election day.

*Local and Municipal Government.*—Each county must contain at least one hundred and twenty-fourth part of the population, must have assessed taxable property of at least 1½

day with certain exceptions. On Sept. 14, 1915, an amendment effective Jan. 1, 1916, providing for State-wide prohibition was adopted.

*Finances.* The debt of South Carolina at the outbreak of the Civil War amounted to \$3,814,862. In 1870 it was \$6,314,000. There were also outstanding against the State bonds to the amount of \$20,827,608, and a railroad debt of \$6,787,608. In 1880 the debt amounted to \$7,175,454, and in 1915 it was \$5,673,085. On Dec. 31, 1914, there was a cash balance of \$352,718, the disbursements during the year amounted to \$3,447,423, and the receipts to \$3,645,363, leaving a total cash balance on Dec. 31, 1915, of \$550,658.

*Militia.* The number of males of militia age, in 1910, was 276,188. The organized militia on Jan. 1, 1914, included 1794 enlisted men and 164 officers, and was composed of a brigade of three regiments of infantry, and sanitary troops which included a field hospital.

*Population.* The population in certain census years was as follows: 1790, 249,073; 1810, 415,115; 1830, 581,185; 1850, 668,507; 1870, 705,608; 1890, 1,151,149; 1900, 1,340,316; 1910, 1,515,400. In 1915 the population was estimated to be 1,607,745; 1920, 1,683,724. In 1910 South Carolina ranked twenty-sixth, with 49.7 per square mile. There were 679,161 whites and 835,843 negroes. Native-born whites numbered 673,107 and foreign-born whites 6054. The urban population in 1910 was 224,832, and rural 1,290,568. There were 751,842 males and 763,558 females. Of the natives, 94.8 per cent were born in South Carolina, 2.8 per cent in North Carolina, and 1.1 per cent in Georgia. The number of males of voting age was 335,046 in 1910; of these 165,769 were white. There are six cities of over 8000; these with their populations in 1910, and estimated for 1915, were: Charleston, 58,833 and 60,427; Columbia, 26,319 and 34,058;

Spartanburg, 17,517 and 20,745; Greenville, 15,741 and 17,788; Anderson, 9654 and 11,845; Sumter, 8109 and 9392.

**Education.** South Carolina has a very large negro population, and the widely scattered rural schools offer problems difficult to solve. As a result the State had, in 1910, a higher percentage of illiterates than any other State, with the exception of Louisiana. Of the total population of the age of 10 years or over 276,980 or 25.7 per cent were illiterates. In 1900 the percentage was 35.9. This percentage, however, is not limited to the negro population. Among whites of native parentage the percentage was 10.5, which is exceeded only by four other States. Among the negroes the percentage of illiteracy was 38.7. In 1900 it was 52.8. The total population, ages 6 to 20, in 1910 was 564,260. Of these 291,307 attended school. Among native whites the school population was 229,204, and among negroes 331,429. According to the report of the State Superintendent of Public Instruction, the total enrollment in the schools in 1914-15 was 372,841. The average daily attendance was 256,685. In the same year the teachers numbered 8070. The total expenditures for educational purposes amounted to \$3,295,506. White teachers number about 4500 and the colored teachers about 2800. The average annual salary of white male teachers is \$530.28, and of women teachers, \$382.48. The average annual salary of male colored teachers is \$126.87, and of women, \$123.90.

The administration of the educational system is in the hands of a State Board of Education. Each county has a superintendent, a board of education, and a supervisor of schools. The normal schools are the Winthrop Normal College at Rock Hill, and the Colored Normal Industrial, Agricultural, and Mechanical College of South Carolina at Orangeburg. The institutions of collegiate rank include the University of South Carolina (coeducational), at Columbia, College of Charleston at Charleston, Clemson Agricultural College at Clemson College, Furman University at Greenville, Wofford College at Spartanburg, Presbyterian College of South Carolina at Clinton (coeducational), Erskine College at Due West (coeducational), Newberry College at Newberry (coeducational), Columbia College at Columbia (women), College for Women at Columbia, Women's College at Due West, Chicora College (women) at Greenville, Greenville Female College at Greenville, Lander College (women) at Greenwood, Coker College for Women at Hartsville, Converse College for Women at Spartanburg. Colleges for colored students are Allen University at Columbia, Benedict College at Columbia, Claflin University at Orangeburg, Ferguson-Williams College at Abbeville, Friendship College at Rock Hill, Harbison College at Ermo, and Vorhees College at Denmark.

**Charities and Corrections.** The Legislature of 1915 created a State Board of Charities and Corrections. The State penal institutions are the Penitentiary at Columbia, the Reformatory for Negro Boys at Columbia, the Farm at Boykin, and the South Carolina Industrial School at Florence. The charitable institutions are the State Hospital for the Insane and the Confederate Infirmary, both at Columbia.

**Religion.** In the religious census of 1906 about half of those reporting were Baptists, closely followed in numbers by the Methodists,

which denominations constitute the bulk of the church membership.

**History.** In 1562 Jean Ribaut (q.v.), acting for Admiral Coligny, attempted to form a colony of French Huguenots at Port Royal. This was abandoned the next year, and other attempts were made farther south. Charles I granted in 1630 to Sir Robert Heath all the territory between 31° and 36° extending from sea to sea. No settlement was made, and in 1663 Charles II granted the same to eight Lords Proprietors, favorites at court. In 1665 the limits were extended to 29° and 36° 30', and proprietary rights were given, but the Proprietors were to legislate "by and with the advice, assent, and approbation of the freemen." Permission to grant religious freedom was given, and subinfeudation was allowed. The terms to settlers were at first liberal, but in 1669 the attempt was made to put into effect the "Fundamental Constitution" drawn by John Locke. (See NORTH CAROLINA.) An expedition consisting of 200 persons under William Sayle settled upon the Ashley River in 1670. A "parliament" consisting of the five deputies of the Proprietors and 20 members elected by the freeholders was established in 1671. In 1680 the settlement was removed to the present site of Charleston. Immigration was rapid, and by 1700 the colony contained 5500 inhabitants.

The colony was turbulent. It refused to adopt the Fundamental Constitution, quarreled over quitrents, and in 1693 secured the right of initiative in legislation. In May, 1704, the Proprietors ordered the enforcement of the Test Act requiring conformity to the Church of England, but an appeal to the Whig House of Lords led to the annulment of the Test Act in 1706, though the Church was still established. The colony was divided into North and South Carolina in 1710. The Yemassee Indians, instigated by the Spanish at St. Augustine, attacked the settlements in 1715, and the Proprietors refused to grant aid. When appeal was made to the crown it was shown that no aid could be given unless the government was vested in the King. Numerous other grievances led to the assembling of a convention which assumed government, and James Moore (q.v.) was chosen to act as Governor until the King's pleasure was known. The Royal Governor, Sir Francis Nicholson, arrived in 1721 and in 1729 the crown purchased the proprietary rights. From this time the assembly never relinquished a single right it gained, and before the Revolution claimed all the rights and privileges of the British Parliament. The first printing press was set up in 1730, and the *South Carolina Gazette* established two years later. The colony joined Oglethorpe's unsuccessful expedition against the Spaniards in 1740, and was occupied with Indian troubles in 1755, 1760, and 1765. The Cherokees ceded their lands in 1755, and the Scotch-Irish began to fill them up. The colony was prompt in its resistance to the Stamp Act, and troops were quartered in Charleston. It agreed to the nonimportation agreement in 1769-70, and sent money and supplies to Boston in 1774. Delegates were sent to the Continental Congress in 1774 and the Provincial Congress met Jan. 11, 1775. At the second session in June, 1775, troops were voted, and Lord William Campbell tried in vain to restore royal authority. In March, 1776, sovereignty was claimed and a government established. Fort Moultrie

(q.v.) was unsuccessfully attacked by the British, June 28. Several battles (among them Camden, King's Mountain, Cowpens, and Eutaw Springs) were fought within the State during the Revolution. Famous leaders of irregular bands of patriots were Sumter and Marion. Charleston was captured by the British in 1780 and held until 1782. The State adopted the Federal Constitution May 23, 1788, Columbia was made the capital in 1790, and a new constitution adopted, giving the Legislature practically all power. Differences began between sections. The eastern part of the State had the wealth and was strongly Federalist. The western part had the population and was strongly Anti-Federalist. In 1808 a compromise was effected which lasted until 1868. By its terms the Lower House of the Legislature was to consist of 124 members, 62 to represent population and 62 wealth. Each district was given as many representatives as it had sixty-seconds of population and wealth. With the adoption of this compromise State politics ceased to trouble.

The State early became dissatisfied with the tariff policy of the general government, and as early as 1828 the "South Carolina Exposition" was adopted by the Legislature. On the passage of the Clay Tariff Bill in 1832 a convention was called which declared, November 24, that no duties should be collected after Feb. 1, 1833. President Jackson was resolved to enforce the law, but an actual conflict was averted by a compromise. (See CALHOUN, JOHN C.; NULLIFICATION.) On the election of President Lincoln in 1860 a convention was called on December 20, which unanimously passed an ordinance of secession. The attack on Fort Sumter in April, 1861, precipitated the Civil War. (See CIVIL WAR.) The State furnished 60,000 soldiers to the Confederate armies, though her voting population was only about 47,000. Charleston withstood the Federal attacks until February, 1865, when the Confederates were finally compelled to evacuate it. South Carolina suffered from Sherman's march northward. A provisional governor was appointed at the close of the war and a new constitution adopted. On the refusal of the State to ratify the Fourteenth Amendment a military government was established. In 1868 another constitution allowing negro suffrage was adopted and the State was readmitted June 25. The next years were full of corruption. Illiterate negroes and carpetbaggers filled high offices and the debt increased from \$5,407,306 in 1868 to \$20,333,901 in 1873. The campaign of 1876 was bitter, with intimidation and bloodshed. Both sides claimed victory, and there were for a time rival State governments. When President Hayes withdrew the Federal troops from the State the Republican claimant, Governor Chamberlain, gave up the contest and Wade Hampton (q.v.) was recognized as Governor. Several of the State officers were tried on charges of malfeasance and sentenced to imprisonment. Since this time the negro majority in the State has been powerless in elections. A severe earthquake, of which Charleston seemed to be the centre, destroyed property valued at \$8,000,000, Aug. 31, 1886. In 1893 a great storm on the coast caused the loss of more than 1000 lives. The growth and development of the Farmers' Alliance led to the capture of the Democratic party in 1890, when B. R. Tillman was elected Governor after

a campaign of bitterness second only to that of 1876. In 1901-02 the South Carolina Interstate and West Indian Exposition was held at Charleston. Largely owing to charges of corruption, the Legislature in 1907 passed measures permitting the abolition of the State liquor dispensaries, which had entire charge of the sale of liquors prior to that time. In the election of November, 1908, Governor Ansel was re-elected. For president, Bryan received 62,288 votes, and Taft 3963. Prohibition was the chief issue in the campaign of 1910, but Coleman L. Blease, an antiprohibitionist, was elected Governor. Shortly after his accession to the office he came into conflict with the State Supreme Court over the appointment of special judges. Blease declared that he would not commission judges who were not his friends, and refused commissions to the nominees of the court. Chief Justice Jones resigned from his office and became a candidate for Governor against Blease in 1912. In 1911 Governor Blease began pardoning convicts on a large scale, continuing this practice throughout his term. He also vetoed more acts of the Legislature than had been vetoed in the previous 20 years. Most of these were passed over the veto. In his annual message to the Legislature in 1912 he took a strong stand against negro education and urged a law to prevent white persons from teaching negroes. He also indirectly defended lynching. In spite of a strong feeling against him throughout the State he was renominated and elected for a second term, defeating Judge Jones by about 3000 votes. In the presidential election of this year Wilson received 348,355 votes, Roosevelt 1293, and Taft 4764. There was no Republican nominee for Governor. Governor Blease continued his notorious course by a wordy war with the Legislature and by wholesale pardoning of prisoners. On Jan. 9, 1915, he issued a blanket pardon for 1100 convicts, whom he had previously paroled (total number of pardons during his four years' term nearly 3000). On January 11 he disbanded the organized militia of the State, over which he had differences with the Federal War Departments, and on the following day resigned, giving no reason. Richard I. Manning, Democratic Governor-elect, took office on January 19 and at once reversed the disbanding order of Governor Blease. In the elections held in this year the State voted for prohibition. In national elections the State has been always Democratic, except in 1792, when the Federalists secured the electors, and during the Reconstruction period, 1868-76, when the vote was given for the Republican candidates. See ELECTORAL COMMISSION.

## GOVERNORS OF SOUTH CAROLINA

### UNDER THE PROPRIETORS

Sir John Yeamans, Lieutenant General and Gov....	1665
William Sayle.....	1669-70
Joseph West (acting).....	1670-72
Sir John Yeamans.....	1672-74
Joseph West.....	1674-82
Joseph Morton.....	1682-84
Richard Kyrle.....	1684
Robert Quarry (acting).....	1684-85
Joseph West.....	1685
Joseph Morton.....	1685-86
James Colleton.....	1686-90
Seth Sothell (Southwell).....	1690-91
Philip Ludwell.....	1691-93
Thomas Smith.....	1693-94
Joseph Blake (acting).....	1694
John Archdale.....	1694-96
Joseph Blake.....	1696-1700

## GOVERNORS OF SOUTH CAROLINA—Continued

James Moore (acting).....	1700-02
Sir Nathaniel Johnson .....	1702-08
Edward Tynte .....	1708-09
Robert Gibbs (acting).....	1709-12
Charles Craven .....	1712-16
Robert Daniel (acting).....	1716-17
Robert Johnson .....	1717-19
James Moore (chosen by convention).....	1719-21

## UNDER THE CROWN

Sir Francis Nicholson .....	1721-25
Arthur Middleton (acting) .....	1725-30
Robert Johnson .....	1730-35
Thomas Broughton (Lieutenant Governor).....	1735-37
William Bull (acting and Lieutenant Governor).....	1737-43
James Glen .....	1743-56
William Henry Littleton .....	1756-60
William Bull, 2d (Lieutenant Governor).....	1760-61
Thomas Boone .....	1761-64
William Bull, 2d (Lieutenant Governor).....	1764-66
Lord Charles Greville Montagu .....	1766-68
William Bull, 2d (Lieutenant Governor).....	1768
Lord Charles Greville Montagu .....	1768-69
William Bull, 2d (Lieutenant Governor).....	1769-71
Lord Charles Greville Montagu .....	1771-73
William Bull, 2d (Lieutenant Governor).....	1773-75
Lord William Campbell.....	1775

## STATE

John Rutledge .....	President .....	1776-78
Rawlins Lowndes .....	.....	1778-79
John Rutledge .....	Governor .....	1779-82
John Mathews .....	.....	1782-83
Benjamin Guerard .....	.....	1783-85
William Moultrie .....	.....	1785-87
Thomas Pinckney .....	Democrat-Republican .....	1787-89
Charles Pinckney .....	.....	1789-92
Arnoldus Vanderhorst .....	.....	1792-94
William Moultrie .....	.....	1794-96
Charles Pinckney .....	Democrat-Republican .....	1796-98
Edward Rutledge .....	Federalist .....	1798-1800
John Drayton .....	Democrat-Republican .....	1800-02
James B. Richardson .....	.....	1802-04
Paul Hamilton .....	.....	1804-06
Charles Pinckney .....	.....	1806-08
John Drayton .....	.....	1808-10
Henry Middleton .....	.....	1810-12
Joseph Alston .....	.....	1812-14
David R. Williams .....	.....	1814-16
Andrew Pickens .....	.....	1816-18

**SOUTH CAROLINA, UNIVERSITY OF.** A co-educational nonsectarian institution, chartered in Columbia, South Carolina, in 1801, and opened in 1805. It was closed in 1863 during the Civil War, but reopened in 1866 under its present name. In 1878 the university was divided into two branches: one the South Carolina College, the other Claflin College for Negroes at Orangeburg. Its charter was amended in 1870 and in 1890. In 1894 women were admitted to all courses. In connection with the university is a system of accredited schools, their certificate admitting students without examination. The university has departments of law and of engineering. The total attendance in 1915-16 was 540, and the faculty numbered 33. The library contained in the same year 55,000 volumes, and the annual income was about \$104,000. The president in 1916 was William S. Surrall.

**SOUTH CAROLINA INTERSTATE AND WEST INDIAN EXPOSITION.** An exposition held in Charleston, S. C., from Dec. 1, 1901, to June 2, 1902, the site covering about 250 acres. The principal buildings were: Administration, Agriculture, Art, Auditorium, Commerce, Cotton Palace, Fisheries, Machinery, Mines and Forestry, Negro, Transportation, and Women's. The larger buildings were constructed in Spanish Renaissance style, and finished in staff, coated with a dull white. State buildings of Illinois, Maryland, Missouri, New York, and Pennsylvania, city buildings representing Cincinnati and Philadelphia, and structures for exhibits of Cuba, Porto Rico, and Guatemala were erected. The total attendance was 674,086; the cost of the exposition was \$1,250,000, while the receipts were \$313,000.

**SOUTH/COTT, JOANNA** (1750-1814). An English religious visionary, born at Gittisham, Devonshire, of humble parentage. In youth she was a domestic servant, chiefly in Exeter. In 1792 she declared herself to be the woman driven into the wilderness (Rev. xii. 6), and began to claim the gift of prophecy. She gave forth predictions and, though illiterate, wrote many pamphlets. Her followers were numerous, and the sect lasted for about 50 years after her death. Her writings include *The Strange*

*Effects of Faith* (1801), with continuations (1802-20); books of *Prophecies and Visions* (1803); *Letters* (1804); *The True Explanation of the Bible* (1804-10); the *Book of Wonders* (1813-14). Several *Lives* were published in 1814 and 1815. Consult also her *Memoirs* (London, 1814), and Alice Seymour, *The Express: containing the Life and Divine Writings of Joanna Southcott* (2 vols., ib., 1909).

**SOUTH DAKOTA.** A north central State of the United States. It is 380 miles long by 200 miles wide. The Missouri River, entering the State near the middle of the north boundary, runs nearly straight south to the centre, and then flows to the extreme southeast corner, where it receives the waters of the Big Sioux, thus dividing the State into two parts, of which the western is slightly larger than the eastern. The latter portion, however, because of the evenness of its prairies and the more copious rainfall, contains most of the population. The total area is 77,615 square miles, of which all but about 747 square miles are land surface. South Dakota is fourteenth in size among the States of the Union.

**Topography and Hydrography.** The James River traverses the State from north to south, joining the Missouri about 50 miles above its junction with the Big Sioux; and cuts the eastern part into two nearly equal portions. The broad valley thus formed, like that of the Big Sioux, is gently rolling—all except a small territory about lakes Traverse and Big Stone being between 1000 and 1400 feet above sea level. West of the Missouri the country is much more rugged, with many swift streams. The largest of these is the Cheyenne, which, with its main branch, the Belle Fourche, incloses the Black Hills (q.v.) in the extreme southwest, that rise to a height of over 7000 feet. It then flows northeast, dividing this part of the State into two nearly equal portions. The southern of these sections is divided equally by the White River, and the northern portion is cut into thirds by the Grand and Moreau rivers. The various tributaries of these four rivers have cut the surface into deep ravines, and in places left high ridges and buttes. Between the headwaters of the White and those of the Cheyenne are the famous Bad Lands, giant masses of bare rock and clay destitute of vegetation. The Missouri, receiving the silt carried by streams from the west, is colored a deep yellow, and flows in a very tortuous channel. Its valley rises in terraces, in contrast to the broad slopes of the James and the Big Sioux. South Dakota has few lakes, and they are all in the extreme eastern part of the State.

**Climate.** The annual temperature is about 44.3° F. For July the mean is 72.2° F. and for January 15° F. The first settlers were terrified by the blizzards, storms of fine snow driven by the north wind, but now that the roads are well marked these storms are regarded as incidental. Really they are infrequent occurrences; it is a common thing for cattle to feed out all the winter. The annual rainfall averages 20 inches. Because there is little winter precipitation, and little rain when the frost leaves the ground, seeding is accomplished in South Dakota earlier and easier than in some eastern States.

**Soil.** The soil of South Dakota, excepting a few barren spots in the butte country, is a rich loam overlying the glacial subsoil, itself

overlaid by vegetable mold. The Missouri River bottom lands are especially fertile. Settlers found South Dakota a treeless country, except in the Black Hills, where pine is growing above an altitude of 4000 feet, and along the banks of the streams and lakes, where cottonwood, ash, elm, and maple abound. But they proceeded to plant trees, and now many of the towns are buried in green, and farmhouses well protected against severe weather by groves of cottonwood, box elder, or elm.

**Geology.** Nearly every geological age is represented in South Dakota. The earliest rocks (Archean) are observed in three places. The first is a ridge extending from Sioux Falls to the James River, composed of quartzite; the second a small area near Big Stone Lake, of granite; the third, the centre of the Black Hills, where is exposed a granite core. Around this core are the narrow bands of the various ages of the secondary formations—sandstone (Potsdam) and two kinds of limestone (Silurian and Carboniferous). About this last appear sandstone, limestone, clays, and marls of the earliest secondary period, and about the whole is the Cretaceous or latest system of the secondary period which covers the whole State. Nearly all of the eastern half is covered by what is called the Colorado formation of this Cretaceous system, consisting of marl, clay, and limestone. The Laramie formation occupies the northwest quarter, and Dakota sandstone underlies the valley of the James. In the southwest quarter occur clay and conglomerate of the Tertiary period (Miocene). Over all of these older formations in the eastern part is the drift left by the glaciers. West of the Missouri running water has deposited some of the Pleistocene, or most recent, formations. The sandstone underlying the James River valley is a water-bearing stratum supplying powerful artesian wells; these wells have been utilized for many purposes.

**Mineral Resources.** Gold, the most important mineral product of South Dakota, occurs mainly in the Black Hills region in Lawrence County and was discovered by members of Custer's expedition in 1874. The Federal census of 1880 gave the population of the mining camps as 16,447. In 1914 the production amounted to 354,758 fine ounces, valued at \$7,333,508. The greater part of the output came from the famous Homestake Mine. In 1913 there were produced 172,642 fine ounces of silver, valued at \$97,683. The value of the output of stone in 1914 was \$156,907. South Dakota is the only source of lithium ore in the United States. This is found in Custer and Pennington counties, but production is small. Other minerals found in varying, and as a rule small, quantities are clays, lime, mica, tin, lead, copper, gypsum, natural gas, tungsten, and occasional gems. The total value of the mineral production of South Dakota in 1914 was \$7,861,601.

**Agriculture.** South Dakota is essentially agricultural. Rainfall is sufficient to grow large grain crops without irrigation, though a small area in the Black Hills region is so treated. Of a total area of approximately 49,195,000 acres, 26,016,892 were in farms in 1910, these numbering 77,644 in that year. The acreage of improved land in farms was 15,827,208; average acres per farm, 335. The total value of all farm property, including land, buildings,

implements and machinery was \$1,166,096,980 in 1910, and the average value of land per acre. \$34.69. The number of farms operated by owners and managers in 1910 was 58,413. In that year native-born white farmers numbered 49,360, foreign-born white 25,476, and the non-whites, 2808. Of the foreign-born farmers, 6523 were born in Germany, 5381 in Norway, and 3240 in Russia.

The following table shows acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture for 1915.

PRODUCT	Acreage	Prod. in bushels	Value
Corn . . . . .	3,250,000	94,250,000	\$46,182,000
Wheat . . . . .	3,725,000	63,762,000	54,835,000
Oats . . . . .	1,725,000	72,450,000	20,286,000
Hay and forage . . . . .	610,000	*1,220,000	6,466,000
Barley . . . . .	750,000	24,000,000	11,040,000
Flaxseed . . . . .	150,000	1,650,000	2,756,000

\* Tons.

The total value of all crops in 1909 was \$125,507,249, and the total area of all those reporting such was 12,226,772 acres. In order of importance the principal products were wheat, corn, oats, hay and forage, barley, flaxseed, emmer and spelt, and potatoes. Wheat is the leading crop, and, compared with other States, South Dakota ranked fourth in acreage and fifth in value in 1909, holding the same relative ranks in 1915. The acreage devoted to this crop was 3,217,255, with a production of 47,059,590 bushels, valued at \$42,878,223. Of corn, the next in rank, were harvested 2,037,658

all States in this crop. In 1909 the State ranked second in the Union in acreage and value of production of flaxseed. The area devoted to this crop in that year was 518,566 acres, producing 4,759,794 bushels, valued at \$7,001,717. The acreage under flaxseed has been steadily decreasing and in 1915 South Dakota ranked fourth in its production. The production of potatoes on 50,052 acres planted in 1909 amounted to 3,441,692 bushels, valued at \$1,967,550. Other vegetables in that year had an acreage of 15,150 and a production valued at \$1,033,163. In 1909 the total value of orchard fruits, of which apples were the most important, was \$209,339. The production of small fruits was valued at \$47,263, strawberries predominating.

**Live Stock and Dairy Products.** The total value of live stock on farms in 1910 was \$127,229,000. This includes domestic animals and bees, the former contributing \$124,841,000. The number and value of the various domestic animals on farms as estimated by the United States Department of Agriculture in 1916 were: horses, 759,000, \$70,587,000; mules, 15,000, \$1,635,000; milch cows, 485,000, \$28,615,000; cattle, 1,064,000, \$40,858,000; sheep, 604,000, \$3,141,000; swine, 1,314,000, \$13,271,000. The total value of fowls of all kinds in 1910 was \$2,356,465. Eggs produced in 1909 were reported at 22,396,021 dozens, valued at \$3,791,973. In 1909 the value of dairy products sold was estimated at \$6,193,000. The milk produced was reported at 82,428,514 gallons, and the butter made at 13,629,647 pounds.

**Manufactures.** In 1909 South Dakota ranked forty-sixth in value of manufactured products. The following table gives the most important

#### SUMMARY OF MANUFACTURES FOR 1914, 1909, 1904

##### THE STATE—FIVE LEADING INDUSTRIES

INDUSTRY	Census	Num-ber of estab-lish-ments	PERSONS ENGAGED IN INDUSTRY		Capital	Wages	Value of prod- ucts	Value added by manu- fac- ture
			Total	Wage earn- ers (aver- age num- ber)				
Expressed in thousands								
All industries. . . . .	1914	898	5,346	3,788	\$15,060	\$2,628	\$24,139	\$7,060
	1909	1,020	5,226	3,602	13,018	2,298	17,870	6,394
	1904	686	3,582	2,492	7,585	1,422	13,085	4,388
Bread and other bakery products. . .	1909	92	431	286	500	151	1,161	440
	1904	32	169	116	170	49	388	170
Butter, cheese, and condensed milk	1909	95	252	139	633	112	2,686	378
	1904	97	350	192	484	125	2,183	350
Flour-mill and gristmill products. . .	1909	95	454	285	2,873	187	6,208	872
	1904	96	521	347	2,428	293	6,519	1,161
Lumber and timber products. . . . .	1909	58	534	451	941	301	945	596
	1904	26	227	191	244	114	377	280
Printing and publishing. . . . .	1909	392	1,387	825	2,159	493	1,976	1,520
	1904	279	1,001	592	1,344	312	1,222	980

acres, which produced 55,558,737 bushels, valued at \$26,395,985. In that year, oats had an acreage of 1,558,643 and a production of 43,565,676 bushels, valued at \$16,044,785. The area under hay and forage in 1909 was 3,435,656 acres, producing 3,651,024 tons, valued at \$15,243,664. Barley had an acreage of 1,114,531 and a production of 22,396,130 bushels, valued at \$10,873,522. Emmer and spelt (a species of wheat used almost entirely for fodder) had an acreage of 259,611, and a production of 6,098,982 bushels, valued at \$2,627,533; South Dakota led

data regarding manufactures, for 1914, 1909, and 1904 for the State and for five leading industries. In 1909 there were produced 962,840 barrels of white flour valued at \$5,041,149. Of the total number of wage earners engaged in industry, 3145 were male and 457 female in 1909. There were only 46 wage earners under 16 years of age, all male. For a large majority of wage earners, the prevailing hours of labor were 60 per week. Aberdeen and Sioux Falls (qq.v.) were the only cities of over 10,000 in population in 1910. In the former 37 establishments em-

ployed 295 wage earners and turned out products valued at \$1,575,000. In the latter, 83 establishments employed 174 wage earners and produced material valued at \$2,889,000.

**Transportation.** Adequate railroad transportation is afforded the region east of the Missouri River and the Black Hills mining section in the extreme southwest. Except for the two roads (the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul), crossing the State from east to west, the intermediate portion is comparatively lacking in steam railway communication. The total mileage of first track in 1914 was 4240. The principal roads with their mileage in that year are the Chicago, Milwaukee, and St. Paul, 1795; the Chicago and Northwestern, 1063; the Chicago, Burlington, and Quincy, 281; the Minneapolis and St. Louis, 260; the Great Northern, 262; the Pierre, Rapid City, and Northwestern, 165; the Chicago, St. Paul, Minneapolis, and Omaha (Chicago and Northwestern), 88; the Chicago, Rock Island, and Pacific, 83; the Minneapolis, St. Paul, and Sault Ste. Marie, 34.

**Banking.** In 1872 the first national bank was organized in Yankton. In the following 20 years banks multiplied, and in 1889, when division came and the Territory was organized as a State, South Dakota had 33 national and over 100 private banks, which figures included also the banks organized under the general incorporation law. In 1891 the first banking law of the State was passed, making the shareholders responsible for an amount equal to their stock in addition to their actual investment, allowing dividends on net profits only, etc. In 1915 further legislation provided for a guarantee system of deposits. The condition of the banks in 1915 was as follows:

ITEMS	National banks	State banks
Number	117	523
Capital.....	\$5,010,000	\$8,295,000
Surplus.....	1,631,000	2,030,000
Cash, etc.....	1,097,000	1,092,000
Deposits.....	47,698,000	63,299,000
Loans.....	36,037,000	52,155,000

**Government.** The constitution was adopted by popular vote on Oct. 1, 1889, and has been amended in important details. Concurrence of a majority of the members of each branch of the State Legislature and the voters is necessary for amendment.

**Executive.**—The executive department consists of the Governor, Secretary of State, auditor, treasurer, superintendent of public instruction, commissioner of schools and public lands, and Attorney-General. All hold office for two years.

**Legislative.**—The legislative power is vested in the Senate and House of Representatives. The initiative and referendum are in full force. Senators and Representatives must be at least 25 years of age. Regular sessions of the Legislature must not exceed 60 days, except in cases of impeachment.

**Judiciary.**—Judicial power is vested in the supreme court, circuit courts, county courts, and justices of the peace. The supreme court consists of five judges, elected for a term of six years. There are 12 judicial circuits. A county judge is elected in each county for a term of two years.

**Suffrage and Elections.**—Every male resident of the age of 21 years, who is a citizen of the United States, or a person of foreign birth who has declared his intention to become a citizen, has the right to vote, provided he has resided in the United States for one year, in the state for six months, in the county 30 days, and in the election precinct 10 days. All candidates for elective offices and for the office of United States Senator are nominated at a primary election. A new primary election law was enacted by the Legislature of 1915. Women may vote at elections held solely for school purposes, and may hold office in the State, except as otherwise provided in the constitution.

**Local and Municipal Government.**—New counties must have an area of not less than 24 congressional townships. Cities may surrender their charters and organize under a general law.

**Miscellaneous Constitutional and Statutory Provisions.**—A railroad doing business in the State must have and maintain an office at a public place for the transaction of business, and may not consolidate its stock, property, or franchise with another railroad owning a parallel or competing line. Bank deposits are protected by a bank guaranty law enacted by the Legislature of 1915. Married women have the right of action against liquor dealers, for damages from the sale to their husbands of intoxicating liquors. A portion of a convict's earnings must be devoted to the support of his dependent family. There is an employers' liability law.

**Finances.** At the time of admission as a State, the public debt amounted to \$710,200, but in addition South Dakota was obliged to pay North Dakota in settlement of accounts over \$150,000. In 1895 the debt was \$1,502,800. The income in the beginning came mainly (almost 85 per cent) from a State tax. Later the sale and lease of public lands developed into an important source of income, which by a special provision of the constitution must go into the permanent school fund, while the interest on deferred payments must be devoted to current school expenses. On July 1, 1913, the cash on hand was \$925,135. The total receipts for the year were \$4,337,928 and the disbursements \$4,444,939, leaving a balance on hand, June 30, 1914, of \$818,123. On July 1, 1913, the State debt amounted to \$370,000, being entirely revenue warrants.

**Militia.** The males of militia age, 18 to 44 years, in 1910 numbered 140,635. The organized militia on July 1, 1915, included 741 enlisted men and 62 officers, and was composed of a regiment and three separate companies of infantry, a detachment of sanitary troops, mounted scouts, machine gun platoon, and supply company.

**Population.** The population by periods since its admission into the Union was: 1890, 348,600; 1900, 401,570; 1910, 583,888; and 1915, 680,046; 1920, 636,547. The density per square mile in 1910 was 7.6. The State ranked thirty-sixth in population among the States in that year. In 1910, of the total population, 563,771 were white, 19,137 Indian, and 817 negro. Native-born whites numbered 463,143 and foreign-born whites, 100,628. Of the foreign born, 21,543 came from Germany, 20,918 from Norway, 13,189 from Russia, and 9998 from Sweden. The rural population in 1910 numbered 507,215.

There were 317,112 males and 266,776 females. The males of voting age numbered 178,189 in 1910. The three cities with populations of over 8000 in 1910, with their populations in that year and as estimated for 1915, are: Sioux Falls, 14,094 and 16,111; Aberdeen, 10,753 and 14,510; and Lead, 8392 and 9542.

**Education.** The excellence of the educational conditions is shown by the fact that in 1910 the total number of illiterates of 10 years of age and over numbered only 12,750. Of this number 4896 were foreign-born whites. The total school population in the same year was 183,969 and of these 122,642 attended school. The school population, according to statistics furnished by the State Superintendent of Education on May 1, 1915, was 175,092. The total enrollment in classes below high schools in 1914 was 139,068, of which 87,206 were in the rural districts. The total number of teachers was 7161, of whom 5813 were female. The average monthly salary for females in the rural districts was \$51.08 and in independent districts \$63.41; for males, rural, \$56.55; independent, \$108.35. The enrollment in high schools was 10,085, of which 1680 were in rural districts. The total expenditure was \$5,413,063. Considerable progress has been made in consolidation of rural schools, and the length of school terms has also been increased. State normal schools are at Spearfish, Springfield, Aberdeen, and Madison. The South Dakota Training School is at Plankinton. Other training and normal schools are the Kindergarten Training School at Sioux Falls, Lutheran Normal School at Sioux Falls. The universities and colleges are Augustana College at Canton, Columbus College at Chamberlain, Dakota Wesleyan University at Mitchell, Eureka Lutheran College at Eureka, Freeman College at Freeman, Huron College at Huron, Redfield College at Redfield, Sioux Falls College at Sioux Falls, Yankton College at Yankton, the State School of Mines at Rapid City, and the University of South Dakota at Vermilion. The last two are State institutions. The schools for the instruction of the Indians are the Pierre Indian Industrial School at Pierre, Riggs Institute at Flandreau, and the United States Industrial School and Academy at Rapid City. Special schools are the School for the Blind at Gary, School for the Deaf at Sioux Falls, and State College of Agriculture and Mechanic Arts at Brookings.

**Charities and Corrections.** The institutions under the control of the State Board of Charities and Corrections include the Penitentiary and the State School for Deaf Mutes at Sioux Falls, the State Training School at Plankinton, the State Hospital for the Insane at Yankton, the State School for the Blind at Gary, the State School for the Feeble-Minded at Redfield, and a State Tuberculosis Sanitarium at Custer.

**Religion.** According to the religious census of 1908, the Roman Catholics are the leading denomination, and these are closely followed by the Lutherans. Together they are equal to about two-thirds of the total communicants reported.

**History.** The State was formed on the division of Dakota Territory and was admitted to the Union November 3, 1889. (For early history, see *NORTH DAKOTA*.) The convention which met July 4 adopted the "Sioux Falls Constitution," framed in 1885, with a few changes. A prohibitory amendment was adopted

at the first election in October, 1889, but, on account of the "original package decision" of the United States Supreme Court, did not go into effect. The Sioux Indians by treaty ceded large tracts of land, which were opened for settlement in February, 1890. Other reservations were opened in 1892 and 1895. In the elections of 1908 the Republicans carried the State, Robert S. Vessey being elected Governor. For President, Taft received 67,352 votes and Bryan 40,223. In 1910 Governor Vessey was reelected. The progressive Republican element gained control in 1907, and in 1912 elected Frank M. Byrne Governor. For President, Roosevelt received 58,811 votes and Wilson 48,942. Taft electors did not appear on the ballot. In 1914 Governor Byrne was reelected. The Democrats elected their candidate for United States Senator, E. S. Johnson, defeating Senator Coe I. Crawford, a candidate for reelection. The Legislature of 1915 passed a measure abolishing the death penalty.

Finley, *Certain Climatic Features of the Two Dakotas* (Washington, 1893); Rydberg, "Flora of the Black Hills," in *Contributions to United States National Herbarium*, vol. iii (ib., 1896); Armstrong, *Early Empire Builders of the Great West* (St. Paul, 1901); Todd, "Hydrographic History of South Dakota," in *Geological Society of America, Bulletin*, vol. xiii (Rochester, 1902); *South Dakota Historical Collections*, published by the State Historical Society (5 vols., Pierre, 1902-10); Doane Robinson, *A Brief History of South Dakota* (New York, 1905); J. A. Ross, *Civil Government of the United States and South Dakota* (Mitchell, 1913); *Bulletins of State Geological Survey* (Vermilion).

**SOUTH DAKOTA, UNIVERSITY OF.** A co-educational institution for higher education founded in 1882 at Vermilion, S. Dak. It is supported almost entirely by appropriations of the State Legislature, but has an endowment of about 86,000 acres of land, which yielded in 1914-15 about \$10,000. The total income of the university in that year was \$146,000. A tuition fee of six dollars per semester is charged. The university confers the bachelor degree in law, arts, science, mechanical, civil, and electrical engineering, and chemistry. A degree is also given for full courses in education and music. The estimated value of the property under control of the university in 1915 was \$500,000, and the grounds, buildings, and equipment were valued at \$500,000. It carries on the State Geological Survey. The total enrollment in the regular courses in 1915 was 515, and there were 200 in the summer school. The faculty had 60 members. In the library were 27,000 bound volumes. The president in 1916 was Robert L. Slagla, M.A.

**SOUTH DAKOTA STATE COLLEGE OF AGRICULTURE AND MECHANIC ARTS.**

A State institution at Brookings, S. Dak., established by the Legislature and opened for instruction on Sept. 24, 1884. The college receives appropriations from the Legislature and from the Federal government. The college farm includes 460 acres, about 60 of which are used by the Agricultural Experimental Station as an experimental farm. The courses of study leading to degrees are pharmacy, agriculture, home economics, mechanical, electrical, and civil engineering, and general science. There are also special courses in several important and practical lines of work. The degrees given are bachelor of science and master of science. The total enrollment in all departments in the university in 1914-15 was 1097; of these, 387 were women and 710 were men. The faculty numbered 73. The library contains about 20,000 volumes. The president in 1916 was Elwood C. Perisho.

**SOUTH DITHMARSCHEN.** See DITHMARSCHEN.

**SOUTHDOWN.** An English breed of sheep, bred for their superior mutton. See SHEEP.

**SOUTH DOWNS.** A ridge of hills in England. See under DOWNS.

**SOUTH'END'-ON-SEA'.** A municipal borough and seaside resort in Essex, Eng., at the mouth of the Thames, 42 miles east of London (Map: England, G 5). It is a popular holiday and residential resort of Londoners. The town owns fine municipal buildings, promenade piers, a concert pavilion, electric street railways, pleasure grounds, and a cemetery, and maintains technical schools, a sanatorium, and an isolation hospital. Southend was bombarded by the Germans in 1915. See WAR IN EUROPE. Pop., 1901, 28,850; 1911, 62,713.

**SOUTHERLAND,** süth'ér-land, WILLIAM HENRY HUDSON (1852- ). An American naval officer. He was born in New York City, and graduated from the United States Naval Academy in 1872. Before his appointment to Annapolis he had served as a naval apprentice. During the Spanish-American War he commanded the *Eagle* on the Cuban coast. He was a member of the Board of Inspection and Survey in 1906-07, and of the Naval Examining and Retiring Board in 1910. Promoted to rear admiral in the latter year he commanded the second division of the Pacific fleet in 1911-12, and was commander in chief of that fleet in 1912-13. In 1912 he had charge of an expeditionary landing force in Nicaragua, and in 1913-14 was a member of the General Board. In the latter year Southerland was retired by operation of law.

**SOUTHERN ARMY WORM.** See GRASS WORM.

**SOUTHERN BAPTISTS.** The name commonly applied to that part of the regular Baptist denomination found in the southern half of the United States. It includes considerably more than half the total number of communicants in the denomination. There were in 1914 2,592,217 communicants, 14,701 clergymen, and 24,360 churches. The various activities of the body are under the supervision of the Southern Baptist Convention, organized May 8, 1845. It includes mission boards, Sunday-school boards, and young peoples' societies. The total number of missionaries under the control of the Convention in 1914 was 1387.

**SOUTHERN BAPTIST THEOLOGICAL SEMINARY.** A theological seminary founded by the Baptist denomination in 1859 at Louisville, Ky. Both men and women receive instruction in the seminary. The men are nearly all ministerial students, while the women are prepared for missionary work of various kinds. The women students do not matriculate in the seminary, nor do they graduate as do the men. Most of the women matriculate at the W. M. U. Training School, for which the seminary does a large part of the teaching. The seminary in 1915 purchased a new site containing 44 acres in the suburbs of Louisville. The endowment of the seminary in 1915 amounted to \$1,160,000, the grounds, buildings, and other property were valued at about \$500,000, and the annual income was between \$50,000 and \$60,000. The library contains about 23,000 volumes. The president in 1916 was E. Y. Mullins, D.D., LL.D.

**SOUTHERN CALIFORNIA, UNIVERSITY OF.** A coeducational institution for higher education founded in 1879 at Los Angeles. It is under the control of the Southern California Conference of the Methodist Episcopal church. The university includes the colleges of liberal arts, physicians and surgeons, dentistry, law, theology, pharmacy, music, oratory, fine arts, a Marine Biological Station, and the university high school. The College of Liberal Arts includes both graduate and undergraduate departments. In the undergraduate departments the courses lead to degrees of A.B. and B.S. In the graduate departments the degree M.A. is given. The campus is about 3½ miles southwest of the business section of Los Angeles. The total enrollment in all departments of the university in the autumn of 1915 was 2773, with a faculty of 281. The university holds a summer session, in which there were enrolled in 1914-15 247 students. The value of the grounds and buildings is about \$600,000. The library contains about 26,000 volumes. The president in 1916 was G. F. Bovard, LL.D., D.D.

**SOUTHERN CROSS.** See CRUX.

**SOUTHERN CROSS, ORDER OF THE.** The highest Brazilian order, founded by Dom Pedro I in 1822, in commemoration of his accession to the throne. The order has four classes, and until 1899 the members received pensions. The decoration is a white enameled cross of five arms, with a wreath of coffee and tobacco leaves. The effigy of Dom Pedro on the medallion is surrounded by the inscription *Petrus I, Brasiliæ Imperator*. On the reverse is a cross composed of 19 stars, with the words *Bene Merentium Præmium*. The decoration is suspended from a crown and is worn on a blue ribbon.

**SOUTHERN DVINA.** See DUNA.

**SOUTHERNE,** süth'érn, THOMAS (1660-1746). An English playwright. He was born in Ireland and was educated at Trinity College, Dublin. Entered at the Middle Temple in London, he abandoned law to write for the stage, his first play being *The Persian Prince or the Loyal Brother* (1682). His two best known pieces are the tragedies of *The Fatal Marriage* (1694), which was afterward revised by Garrick, and *Oroonoko, or the Royal Slave* (1696), founded on a novel of the time and remarkable as including one of the earliest English condemnations of the slave trade. Consult *Plays written by Thomas Southerne*, with an account of the life and writings of the author.

**SOUTHERN MINNESOTA, UNIVERSITY OF.**

A coeducational nonsectarian institution for higher education founded in Austin, Minn., in 1896. There were, in 1914-15, in all departments, 1034 students and the faculty numbered 34. The value of the grounds and buildings was \$250,000, and the income from all sources \$98,000. There were in the library 11,000 volumes. The president in 1916 was William W. Meiners, Ph.D., LL.D.

**SOUTHERN RHODESIA.** See RHODESIA, SOUTHERN.

**SOUTHEY**, south'ī or sūth'ī, CAROLINE ANNE (1786-1854). An English poet, daughter of Capt. Charles Bowles, born at Lymington, Hampshire. After the death of her mother (1816) and the loss of her property, she turned to literature. She sent the manuscript of a narrative poem, *Ellen Fitzarthur* (published 1820), to Robert Southey, who approved of it. A correspondence followed which led to marriage (1839). In the meantime Miss Bowles wrote: *Tales of the Factories* (1823), in verse; *Solitary Hours* (1826), in verse and prose; *Chapters on Churchyards* (1829), a group of tales which gained for her wide attention; and *The Birthday* (1836), a poem recalling Cowper. She also collaborated with Southey on a poem entitled *Robin Hood* (never completed). Soon after her marriage, Southey's mind completely broke down, and she passed three miserable years. After his death (1843), she lived in retirement. Consult the interesting *Correspondence of Robert Southey with Caroline Bowles*, edited by Edward Dowden (Dublin, 1881).

**SOUTHEY**, ROBERT (1774-1843). An English poet and miscellaneous writer, born Aug. 12, 1774, at Bristol. Southey passed his boyhood with an aunt at Bath, reading Spenser, Sidney, Shakespeare, and other writers, and essayed a drama. In 1788 he was sent to Westminster School, from which he was expelled four years later, on account of an essay against flogging. Aided by an uncle living at Lisbon, he entered Balliol College, Oxford (1792), where he remained for only two years. He met Coleridge in 1794; and in conjunction with another friend, Robert Lovell, they formed a socialistic scheme, which they called "pantisocracy." They were to take wives and emigrate to the banks of the Susquehanna. The three married sisters, but the scheme went no further. After secretly marrying Edith Fricker, at Bristol in 1795, Southey left to visit his uncle at Lisbon. On returning (1797) he studied law at Gray's Inn, but soon abandoned it. He settled with his wife first at Westbury, between Bath and Salisbury, and then at Burton, in Hampshire; later he joined Coleridge at Keswick in the Lake district (1803). Here at Greta Hall he passed the rest of his life amid his books. Besides the income from his pen, which became large, he received, between 1796 and 1806, an annuity of £160 from a school friend named Wynn. Its place was soon filled by a government pension of the same amount, to which was added, in 1835, another pension of £300. In 1813, then as strongly Conservative as he had once been Republican, he was appointed poet laureate. In this capacity he wrote *The Vision of Judgment* (1821), an apotheosis of George III in hexameter verse. The incident is made memorable by Byron's brilliant parody under the same title. Southey's wife died—her mind had failed years before—in 1837, and two years later he married Caroline Anne Bowles. His own mind

was giving way and soon became a blank. He died at Keswick, March 21, 1843, and was buried in the Crosthwaite churchyard. A recumbent statue was placed in the church. Southey early formed the plan of a series of narrative poems on the mythologies of the world. Under the inspiration of this idea, subsequently modified, he wrote a number of poems of an epic cast, comprising *Joan of Arc* (1796); *Thalaba, the Destroyer* (1801), an Oriental tale; *Madoc* (1805); *The Curse of Kehama* (1810), his chef-d'œuvre, founded on Hindu legend; and *Roderick, the Last of the Goths* (1814). Though they contain many noble passages, they are in the main only rhetorical. His prose is well represented by *Letters from England by Don Manuel Alvarez Espriella* (1807), a view of England from the assumed standpoint of a Spanish gentleman; *The Doctor* (1834-37), a wonderful commonplace book; the lives of Wesley (1820), of Nelson (1813), an incomparable brief biography, and of Cowper (with an edition of Cowper, 1833-37); and his delightful letters. Of his other miscellaneous work may be cited *History of Brazil* (1810-19), part of a contemplated history of Portugal; *History of the Peninsular War* (1823-32); *Colloquies on Society* (1829), unnecessarily ridiculed by Macaulay; *Naval History* (1833-40); and a revolutionary drama, *Wat Tyler* (written in 1794, and surreptitiously published in 1817). In literary industry he was one of the most notable figures of his time; and he was the master of a lucid, masculine, sinewy, and melodious prose style, which gives his works a value even when, as in some cases, they have been superseded in regard to substance.

**Bibliography.** C. C. Southey, *The Life and Correspondence of Robert Southey* (London, 1849-50), containing the fragment of an autobiography; *Selections from Southey's Letters*, edited by Warton (ib., 1856); *Correspondence with Caroline Bowles*, edited by Edward Dowden (Dublin, 1881); poems with memoir by S. R. Thompson, in the "Canterbury Poets Series" (London, 1888); *Southey: Story of His Life Written in his Letters*, edited by John Dennis (New York, 1894); Edward Dowden, *Southey*, in "English Men of Letters Series" (London, 1879; new ed., ib., 1895); also S. Saintsbury, "Southey," in *Cambridge History of English Literature*, vol. ii (ib., 1914), containing an exhaustive bibliography.

**SOUTH FORELAND.** See FORELAND, NORTH AND SOUTH.

**SOUTH GEORGIA**, jōr'jā. An island in the south Atlantic Ocean belonging to Great Britain, and situated in lat. 54° 30' S., long. 37° W., 800 miles east by south of the Falkland Islands, to which it administratively belongs (Map: World, Western Hemisphere, P 17). Area, about 1000 square miles. The island consists of mountains of Archean formation from 6000 to 8000 feet high. Several permanent glaciers exist in the deep gorges on the mountain slopes. The island is uninhabited, except by a transient group of whalers. It was discovered in 1675 by Laroche.

**SOUTH HADLEY.** A town in Hampshire Co., Mass., 3 miles northeast of Holyoke, on the Connecticut River (Map: Massachusetts,

B 3). It is the seat of Mount Holyoke College (q.v.), and has two libraries. There are manufactures of writing paper, brick, cotton goods, and lumber products. Pop., 1900, 4526; 1910, 4894.

**SOUTH HAVEN.** A city in Van Buren Co., Mich., 40 miles west of Kalamazoo, on Lake Michigan and on the Michigan Central and the Kalamazoo, Lake Shore, and Chicago railroads (Map: Michigan, C 6). It has a good harbor, from which plies a regular line of lake boats. Pianos, pipe organs, and fruit-baskets are manufactured, and fruit is canned. Considerable shipments of fruit are made. The city is a popular summer resort, having a fine beach, lake and river drives, and a golf course. There is also a Carnegie library. Pop., 1900, 4009; 1910, 3577.

**SOUTH HOLLAND.** A province of the Netherlands (Map: Netherlands, C 3). Area, 1166 square miles. Pop., 1909, 1,390,044; in 1913, according to communal lists, 1,502,105. The capital and largest city is Rotterdam. The Hague also is in this province.

**SOUTHINGTON,** sūth'ing-ton. A town, containing a borough of the same name, in Hartford Co., Conn., 18 miles south of Hartford, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, D 3). It is engaged principally in manufacturing drop forgings, general and carriage hardware, carriage bolts, tools, and wood screws. Pop. (town), 1900, 5890; 1910, 6516. Southington became a separate parish in 1724. It was incorporated as a town in 1779.

**SOUTH KENSINGTON, NATIONAL ART SCHOOLS OF.** The schools of South Kensington (London) were founded in 1852 for the application of art to industry when the nucleus of an art industrial museum was also formed. (See **SOUTH KENSINGTON MUSEUM**.) The central school for the systematic training of art teachers and students in all departments of design was afterwards established at South Kensington. Aid is furnished in the teaching of art in the elementary schools, in night classes for artisans, and in regular schools of art. The same body controls the provincial schools connected with South Kensington, which have grown extensively in number since their first establishment. Many national, local, and free scholarships are also open to British subjects.

**SOUTH KENSINGTON MUSEUM.** Officially known since 1899 as the **VICTORIA AND ALBERT MUSEUM**. An important museum of decorative and applied art under the control of the national Board of Education, located in London. It was opened in 1857 at South Kensington (London) in the temporary structure which now houses the Bethnal Green Museum, with funds derived from the International Exhibition of 1851. The present extensive buildings were begun in 1899 and opened in 1909. South Kensington's collections of applied and decorative art, derived largely from private gifts and legacies, are among the finest in the world. They are arranged in eight general departments, among the most important of which are ceramics, including glass and enamels; a representative collection of mediæval ivories and enamels; and a very comprehensive collection of mediæval and modern furniture. The museum contains also a collection of paintings, including Raphael's world-famous cartoons for the tapestries of the Sistine Chapel, an historical collection of British water colors, and many

modern British and French paintings. Besides these collections it possesses an Art Library of about 120,000 volumes and 200,000 photographs; an important art school, known as the Royal College of Art; and the collections of the former India Museum. The museum has issued a series of important catalogues of its collections, many of them of high critical and scholastic value.

**SOUTH KINGSTOWN,** king's-ton. A town, including West Kingston, the county seat, and several other villages, in Washington Co., R. I., 23 miles south of Providence, on the New York, New Haven, and Hartford, and the Narragansett Pier railroads. The Rhode Island College of Agriculture and Mechanic Arts is in the village of Kingston, also a public library. Other noteworthy features include the Hazard Memorial Library at Peacedale, the museum at West Kingston, and the Robert Beverly Hale Memorial Library at Matunuck. South Kingstown is a rich farming district and also has fishing interests. The leading manufactured products are woollens and worsteds. The first power loom in the United States was established at Peacedale in 1814. Pop., 1900, 4972; 1910, 5176.

**SOUTH McALESTER.** See **McALESTER**.

**SOUTH MILWAUKEE.** A city in Milwaukee Co., Wis., 10 miles by rail south of Milwaukee, on the Chicago and Northwestern Railroad. It has a Carnegie library and a fine high-school building. There is a large manufactory of steam shovels and dredges. Malleable iron castings, glue, baskets, veneers, mineral wool, and electrical appliances are also manufactured. Pop., 1900, 3392; 1910, 6092.

**SOUTH MOUNTAIN, BATTLE OF.** A battle fought Sept. 14, 1862, during the Civil War, at Turner's Gap, in the South Mountain Range near Sharpsburg, Md., between a small Confederate force under D. H. Hill, reinforced late in the afternoon by Longstreet's division and the right wing of the Federal army under Burnside. On the same day a battle was also fought at Crampton's Gap, 8 miles further south, in the same range, between Franklin and McLaws, the latter being outnumbered. Both of these hotly contested actions form part of the operations leading to the battle of Antietam (q.v.), and in both the Union forces were successful, winning the passes. At Turner's Gap were killed Reno on the Union, Garland on the Confederate side.

**SOUTH NORWALK.** Formerly a city in the town of Norwalk, Fairfield Co., Conn., consolidated in 1913 with Norwalk, the new city now having a government coextensive with the town (Map: Connecticut, B 5). It is situated at the mouth of the Norwalk River, on rising ground overlooking Long Island Sound. There are two libraries—the Public, and the Roth and Goldschmidt. There is a good harbor, and a large coastwise trade is carried on. The city is the centre of a large oyster trade. Its manufactures include air compressors, lace, corsets, underwear, shoes, hats, locks, and various iron products. Pop., 1900, 6591; 1910, 8968.

**SOUTH OMAHA,** ōmā-hā. Formerly a city in Douglas Co., Neb., incorporated in the city of Omaha (q.v.) in 1915. Here are large meat-packing and slaughter houses, and various other industrial establishments. South Omaha was settled in 1882, and grew rapidly after the establishment of the Union Stock Yards in 1884. The population just before its incorporation was about 27,000.

**SOUTH ORANGE.** A village in Essex Co., N. J., 4 miles west of Newark; on the Delaware, Lackawanna, and Western Railroad (Map: New Jersey, D 2). The main portion is picturesquely situated on a gentle eminence facing Orange Mountain. It is a residential suburb of Newark and New York. Seton Hall College (q.v.), a Roman Catholic institution, was opened here in 1856. The village has a public library and a town hall. Pop., 1900, 4608; 1910, 6014. South Orange was settled about 1870. Consult Whittemore, *Founders and Builders of the Oranges* (Newark, 1896).

**SOUTH ORKNEYS.** A group of sub-Antarctic islands, having an area of about 800 square miles, situated between 60 and 61 degrees S. latitude, and 43 to 47 degrees W. longitude (Map: World, Western Hemisphere, Q 16). Discovered by George Powell in 1821, they were originally named and charted as the Powell Group. On Laurie Island, second in size to Coronation Island, the Scottish National Antarctic Expedition maintained (1902-04) a magnetic and meteorological station, which has since been permanently occupied by the government of Argentina. Consult R. N. Rudmose-Brown and others, *Voyage of the Scotia* (London, 1906), and E. S. Balch, *Antarctica* (Philadelphia, 1902).

**SOUTH PASADENA.** A city in Los Angeles Co., Cal., nine miles northeast of Los Angeles, on the Atchison, Topeka, and Santa Fe Coast Line, the Salt Lake Route, and the Pacific Electric and Southern Pacific railroads. It has large ostrich farms and is engaged in fruit growing. Pop., 1900, 1001; 1910, 4649.

**SOUTHPORT.** A municipal borough and watering place in Lancashire, England, at the mouth of the Ribble Estuary, 15 miles southwest of Preston (Map: England, C 3). It is a handsome town, with fine public buildings and institutions. Owing to extreme recession of the sea at low tide there are artificial lakes and marine parks for bathing and model-yacht sailing. Southport owns the gas and electric-lighting works, markets, and cemeteries, and maintains a free library, art gallery, and technical schools. Pop., 1911, 51,650. Consult Stephenson, *Southport* (Southport, 1898).

**SOUTH PORTLAND.** A city in Cumberland Co., Me., on Fore River, opposite Portland, with which it is connected by ferry and four bridges (Map: Maine, B 5). It is the seat of the State School for Boys. Noteworthy are the government fortifications, the town hall, Masonic Building, and the Soldiers' Monument and grounds. The city has ironworks, acid works, ship, railway, and machine shops, etc. South Portland was a part of Cape Elizabeth until 1895. Pop., 1900, 6287; 1910, 7471.

**SOUTH RIVER.** A borough in Middlesex Co., N. J., 25 miles by rail from New York City, on the South River, and on the Raritan River Railroad (Map: New Jersey, D 3). The manufacture of bricks, clay products, and other fireproofing materials is the chief industry. Pop., 1900, 2792; 1910, 4772.

**SOUTH SAINT PAUL.** A city in Dakota Co., Minn., 5 miles from St. Paul, on the Mississippi River, and on the Chicago Great Western, the Chicago, Rock Island and Pacific, and several other railroads which are connected with the city by the St. Paul Bridge and Terminal Railway (Map: Minnesota, D 6). It is important as a live-stock market, and has large

meat-packing establishments, a foundry, car shops, and tanneries. Pop., 1900, 2322; 1910, 4510.

**SOUTH SEA.** A name formerly applied to the Pacific Ocean and the China Sea (q.v.).

**SOUTH SEA CHESTNUT.** See INOCARPUS.

**SOUTH SEA COMPANY, THE.** An English commercial company incorporated 1711, a financial scheme organized by the Lord Treasurer Harley for the purpose of extinguishing the national debt, then amounting to £10,000,000. The company assumed the debt on condition of receiving from the government an annual payment of £600,000 for a certain number of years and a monopoly of trade to the South Seas. On the strength of purely prospective profits the value of the stock increased enormously. In the spring of 1720 the company proposed to assume the entire national debt, at that time over thirty millions, on being guaranteed five per cent per annum for seven and a half years. At the end of this time the debt might be redeemed, if the government chose, and the interest reduced to four per cent. The directors used every means to increase the value of the stocks, until in August, 1720, the shares were quoted at 1000, when the chairman and some of the principal directors sold out. This flagrant conduct and the failure of Law's Mississippi Scheme in France opened the eyes of the public, and late in 1720 the crash came. Thousands of innocent stockholders were ruined. Parliamentary investigation revealed a scandalous complicity by some of the cabinet. About one-third of the original capital was saved for the stockholders. Consult William Coxe, *Memoirs of Sir Robert Walpole* (London, 1802), and Charles Mackay, *Memoirs of Extraordinary Popular Delusions* (ib., 1852).

**SOUTH SEA TEA.** See YAPON.

**SOUTH SHETLAND ISLANDS.** An Antarctic archipelago lying about 600 miles south of Cape Horn, between 61° and 63° 20' south latitude, and 54° and 63° west longitude, and separated from (Palmer) Graham's Land and Louis Philippe Land by the Bransfield Strait (Map: World, Western Hemisphere, Q 15). The islands are twelve in number, the chief of which are George Livingston, Smith, Deception, Elephant, and Clarence. The total area is about 880 square miles. Discovered by William Smith (1819), extended by Bransfield, explored and charted by George Powell (1821-22), the South Shetland group became at once the centre of the fishing activities of American sealers (see PALMER, N. B.). Overexploited, the fishery soon ceased, but in late years has been renewed with such success as to involve millions of dollars annually. The islands are now a British possession by proclamation of 1908. Consult Balch, *Antarctica* (Philadelphia, 1902). See POLAR RESEARCH, *American Quadrant*.

**SOUTH SHIELDS.** A seaport of England. See SHIELDS, SOUTH AND NORTH.

**SOUTH STOCKTON.** See THORNABY ON TEES.

**SOUTH UIST.** See UIST.

**SOUTH VICTORIA LAND, or VICTORIA LAND.** The eastern portion of the Victoria quadrant of the Antarctic land extending between the 160th and 170th meridian E. from about lat. 70° to beyond lat. 83° S. (Map: Antarctic Regions, F 6). It is a mountainous country, falling in steep snow-crowned cliffs to the sea, and rising to the height of 15,000 feet. It also con-

tains the volcanoes of Erebus and Terror. Near the north end is the Magnetic South Pole. Victoria Land was discovered by Ross in 1841, explored and mapped by Borchgrevink in 1899, and was the base used by Nordenskjöld (1902-04), by Scott (1902-04), by Shackleton (1909), and by Scott (1912).

**SOUTHWARK**, sūth'ērċ. A Parliamentary borough in London (q.v.), on the southern side of the Thames.

**SOUTH'WELL**. A cathedral city of the Newark Parliamentary division of Nottinghamshire, England, 27 miles by rail southwest of Lincoln (Map: England, F 3). The magnificent mediæval cathedral or minster of St. Mary, founded on the site of a church said to have been erected by the first Archbishop of York in 630, still retains its three towers; it became the cathedral of a new diocese in 1884. The building is cruciform, the towers, nave, and transept are twelfth-century Norman, and the choir is a beautiful example of the English Gothic. It was renovated in 1882. Pop., 1901, 3160; 1911, 3452; but the rural district of which it is the centre contains 19,573 inhabitants.

**SOUTHWELL**, ROBERT (c.1561-95). An English poet and martyr, son of Richard Southwell, of Horsham Saint Faith's, in Norfolk. Having studied at Douai and at Paris, he went to Rome, and was enrolled amongst the children destined for the Order of the Jesuits (1578), and ordained priest (1584). He was immediately sent to England as a missionary, where he became chaplain to the Countess of Arundel (1589). As a native-born subject ordained to the Roman Catholic priesthood, he was guilty of treason. He was not molested, however, till 1592, when he was arrested. After three years' imprisonment, with frequent tortures, he was tried, condemned, and executed (Feb. 21, 1595). During his residence in England Southwell wrote and circulated, usually in manuscript, several Catholic tracts, and a considerable body of choice verse (published after his death). His most ambitious poem is the long popular *Saint Peter's Complaint* (1595) in 132 six-line stanzas; his best is perhaps the brief *Burning Babe*, highly praised by Ben Jonson. Consult his *Poetical Works*, ed. by Turnbull (London, 1856); *Complete Poems*, ed. by Grosart ("Fuller's Worthies Library," ib., 1872); and *A Four-fold Meditation* (not in Grosart), ed. with bibliography by Edmonds (ib., 1895).

**SOUTHWEST AFRICA**, GERMAN. See GERMAN SOUTHWEST AFRICA.

**SOUTHWESTERN COLLEGE**. A coeducational institution for higher education founded at Winfield, Kans., in 1885, under the control of the Methodist Episcopal church. It includes a college of Liberal Arts, Academy, Business School, and department of Music and Oratory. The total enrollment in all departments in 1915 was 388, and the faculty numbered 30. The college had an endowment in that year of \$130,000, the grounds and buildings were valued at \$166,000, and the annual income was about \$43,000. In the library were 6000 volumes. During 1915-16 a campaign to raise \$300,000 additional endowment was carried on. The president in 1916 was F. E. Mossman, A.M., D.D.

**SOUTHWESTERN UNIVERSITY**. A coeducational institution for higher education founded in 1873 by the consolidation of the chartered rights of Ruterville College, founded

in 1840, McKenzie College, chartered in 1848, Wesleyan College, founded in 1844, and Soule University, chartered in 1856. The university was established largely through the efforts of Rev. Francis Asbury Mood, who was its first regent. It was under the patronage and control of the Methodist Episcopal Church, South. The grounds of the university comprise altogether about 50 acres within the corporate limits of Georgetown, Texas. These grounds are in two separate tracts, on which are situated the buildings of the university and its fitting school. The degrees conferred are Bachelor of Arts, Bachelor of Science, Bachelor of Science and Education, Bachelor of Music, Master of Arts, and Master of Science. The total enrollment in the autumn of 1915 was 1022; of this, 486 were in the college department, 122 in the Fine Arts Department, 89 in the Fitting School, and the remainder in the Summer Schools. The faculty numbered 48. The university has an endowment of about \$292,000, and an annual income of about \$120,000. The college grounds and buildings are valued at \$476,536. The library contains about 30,000 volumes. The president in 1916 was Charles McTyeire Bishop, A.M., D.D.

**SOUTH'WICK**. A town in Durham, England, 1 mile northwest of Sunderland. It has shipbuilding industries, glass works, and potteries. Pop., 1901, 12,640; 1911, 13,784.

**SOUTH'WORTH**, MRS. EMMA DOROTHY ELIZA [NEVITTE] (1819-99). An American novelist, born at Washington, D. C. Her first novel was *Retribution* (1849), and she became eventually the author of nearly 60 popular novels. They dealt principally with Southern life and were highly emotional. A uniform edition of her works was brought out in 1872 at Philadelphia.

**SOUVESTRE**, sōō'ves'tr', EMILE (1806-54). A French novelist and dramatist, born at Morlaix. He was early engaged in library work, in contributing to reviews, and as editor, at Brest, of *Le Finistère*. Soon after he settled in Paris in 1835 his first romances dealing with his native Brittany became popular. These include *Les derniers Bretons* (1835-37) and *Le foyer Breton* (1844), which perhaps represent him at his best. More noted is the sentimentally cheerful *Philosophe sous les toits* (1851). Lectures delivered by Souvestre at the Ecole d'Administration appeared as *Causeries historiques et littéraires* (1854).

**SOUZA**, MARTIN AFFONZO. See SOUSA, M. A.

**SOVEREIGN**. An English gold coin of the value of a pound sterling, the standard weight of which is 123.374 grains troy. The sovereign is worth approximately in United States money \$4.8665.

**SOVEREIGNTY** (OF. *sovrainté*, Fr. *souveraineté*, from ML. *superanus*, principal, supreme, Lat. *super*, above, over). Several uses of the term "sovereignty" must be distinguished. Of these the principal are internal sovereignty and external sovereignty. Internal sovereignty touches the relation between a state and its citizens or subjects; external sovereignty relates to the position of a state among other states.

**Internal Sovereignty**. Under the head of internal sovereignty distinction is made between "legal" sovereignty and "political" sovereignty. Political sovereignty is the ultimate controlling power resident in any political society. Legal sovereignty is the organized power which at any given time must be regarded as legally supreme. Political sovereignty arises out of the

nature of the state as an organization for the purposes of social control. A supreme power enabling the state to preserve a form of public order, protect the community, and otherwise promote the general welfare is necessary to organized society. Political sovereignty, then, is that power in the state the will of which is ultimately obeyed. At any given time this supreme will may or may not be accurately expressed by the existing legal or governmental authority.

Legal sovereignty refers to the supreme power of the state as embodied in some legal or governmental organ or agency. Thus the King in Parliament is termed a sovereign body in England; a Constituent Convention is so called in France; or a king in some cases is called the sovereign. This legal sovereign may not, although it generally does, represent the actual sovereignty in the state, but it is none the less supreme from the legal or governmental point of view. For example, the political sovereignty may actually belong to the mass of the people while the legal sovereignty may be vested in an aristocracy or a monarch; and, on the other hand, the actual power may be vested in a few while the government is democratic in form. Again, the legal sovereign, e.g., the Parliament in Great Britain, may pass a law opposed by the majority of the people, but the enactment is none the less law and legally enforceable until repealed, or until the government is overthrown by a revolution.

The origin of sovereignty has been explained in various ways by different schools of political philosophy. It has been asserted that the ruling authority holds by divine appointment or sanction; that the right to rule is a property right descending as other property in regular line of succession; that the sovereignty is created by a voluntary contract either between ruler and ruled or between independent individuals, as in the social contract (q.v.); that sovereignty is the prerogative of superior force and belongs to the strongest claimant. In modern times it is generally believed that sovereignty is a product of political necessity arising out of the essential nature of political association, and the tenure of the particular holders of the political sovereignty is a result of historical evolution. This process has thrown the supreme power in most civilized states into the hands of the mass of the people.

**Characteristics of Sovereignty.** In the narrower sense, sovereignty is generally regarded as absolute. Legally speaking, all governments, whether monarchical, aristocratic, or democratic in form, are absolute. There are physical and moral limitations upon it, but, so far as the legal organization is concerned, there is no other organization or association within the limits of the state which can resist in any legal way the commands of the sovereign. In the broader sense of the term, political sovereignty is not absolute, since the ruling element in the state, however powerful, is never strong enough to be absolute in all things. It is also pointed out by some authorities that there may be and actually are legal limitations on the sovereign power. Thus in the United States there is no legal way of depriving the states of their equal suffrage in the Senate without their consent (Const., Art. v), and in Germany the special rights of the states are likewise protected (Art. lxxvii). It has also been strongly urged that

the self-limitation of a state through its own constitution gives rise to inviolable rights against the supreme power, and that therefore, although limited only by its own act, the sovereignty of a state should be regarded as legally limited, and hence not absolute in character.

Furthermore, sovereignty in the narrower sense of the term is indivisible. There cannot be two sovereign powers acting on the same territory in an organized state. The king cannot be half sovereign and the people half sovereign, nor in a federal system can the various members of the union be partly sovereign and the central authority also partly sovereign. What seems like the division of sovereignty in a "federal state" is, on closer analysis, found to be either the actual sovereignty of the political society as a whole, as in the United States, or the complete sovereignty of a number of independent states, associated for certain common purposes, as in the Confederate States.

The location of sovereignty has been a vexed question, especially in connection with the rise of modern constitutionalism. The sovereignty of the king and that of people have been stoutly and ingeniously defended by the partisans of court and commonalty. In general the theory of popular sovereignty has triumphed, although in Germany the doctrine of state sovereignty has been accepted as a compromise. There the state, including both king and people, is declared to be the repository of supreme power by most publicists. The location of sovereignty has also been a subject of discussion as well as actual warfare in Germany and the United States, and in both instances decision has been against the individual states. See **STATE RIGHTS**.

**External Sovereignty.** States possessing certain powers, such as that of negotiating treaties, declaring war, and regulating their internal administration, are called sovereign powers and are the parties to international law, entitled to its rights and privileges and liable to its duties and responsibilities. In international law sovereignty is not regarded as absolute, since no state is wholly independent of the other members of the family of nations. Some states frequently receive commands from and are practically in subjection to other nations, but are nevertheless treated as sovereign powers for the purposes of international law. Such are Morocco and Egypt. Moreover, in international law, sovereignty is generally looked upon as divisible in nature. Certain states are termed half sovereign or semisovereign. A state may yield up its right to negotiate with other powers, or the right to make war, or may surrender the control of a large part of its internal administration, and yet remain in the eyes of international law at least a semisovereign state. In fact, the territorial expansion of the Great Powers has given rise to a variety of complicated relations between strong and weak states, such as the protectorate, suzerainty, and the "sphere of influence," which make exceedingly difficult the logical application of the conventional idea of sovereignty, and, indeed, can be explained only by reference to the category of international law.

Consult: C. E. Merriam, *History of the Theory of Sovereignty since Rousseau* (New York, 1900); Bryce, "Nature of Sovereignty," in *Studies in History and Jurisprudence*, vol. ii (Oxford, 1901); E. Pujol, *Essai critique sur*

*l'idée de la délégation de la souveraineté* (Tou-louse, 1911), containing a bibliography; A. V. Dicey, *Introduction to the Study of the Law of the Constitution* (8th ed., London, 1915).

**SOVEREIGNTY**, POPULAR OR SQUATTER. See POPULAR SOVEREIGNTY.

**SOW BREAD.** See CYCLAMEN.

**SOW BUG.** A small carnivorous crustacean of the family Oniscidae, the species of which live under logs in the woods and in similar places. It is an isopod. See CRUSTACEA; ISOPODA; and compare GRIBBLE.

SOW BUG.

**SOWER**, sour (or SAUR), CHRISTOPHER (1693-1758). An early American printer and publisher, born at Laasphe, near Marburg, Germany. After receiving a university education, and studying medicine at Halle, he emigrated to Pennsylvania in 1724, and in 1731 settled at Germantown. There in 1738 he set up a printing press and began the publication of an almanac in German, which was continued by his descendants for sixty years. In 1739 he issued the first number of *Der Hoch-Deutsch Pennsylvanische Geschichte-Schreiber*, a quarterly magazine, the first of the sort published in Pennsylvania. In 1743 he published a quarto edition of Luther's translation of the Bible in German—except Eliot's Indian Bible, the first published in America. He continued to publish both English and German works, and established a type foundry, the first in America, a paper mill, and an ink factory. He is credited with the invention of cast-iron stoves.

**SOWERBY** (sou'ër-bi) BRIDGE. A manufacturing town in the West Riding of Yorkshire, England, 3 miles southwest of Halifax. Its chief buildings are Christ Church, dating from 1526 and rebuilt in 1819, the town hall, and municipal offices. The town owns the gas works, slaughterhouses, and baths. Woolens are manufactured. Pop., 1901, 11,500; 1911, 11,350.

**SOW THISTLE** (AS. *sugu*, *istel*, *sugu*, sow + *istel*, thistle), *Sonchus*. A genus of about 30 species of Old World plants of the family Compositæ. Several species have been introduced in the United States. The common sow thistle (*Sonchus oleraceus*) is a somewhat branching annual weed 2 to 3 feet tall, with small yellow flowers, common in richly cultivated soils. The tops and leaves are used in northern Europe as greens. The field sow thistle (*Sonchus arvensis*) is a perennial with large yellow flowers. The spiny-leaved sow thistle (*Sonchus asper*) has also been introduced into the United States from Europe. The Alpine blue sow thistle (*Lactuca alpina*) is a native of the mountainous parts of Europe.

**SOXHLET**, zòks'lét, FRANZ KNIGHT VON (1848- ). A German agricultural chemist, born at Brünn, Austria, and educated at Leipzig. In 1879 he was appointed professor of agricultural chemistry at the Polytechnic Institute in Munich and superintendent of the principal Bavarian agricultural experiment station, working on the chemistry of milk and its action. He devised a method of extracting fats by means of ether. His investigations, embracing the difference between human and bovine milk, sterilization of milk, the determination of percentages of fat contained therein, the varieties of sugars, and the formation of fats from carbohydrates, are valuable.

**SOY BEAN** (Jap. *si-yan*, Chin. *shi-yu*, soy), *Glycine hispida*. An upright, bushy, annual leguminous plant 2½ to 4 feet tall, a native of Asia, where it has long been cultivated, especially in China and Japan, whence it has been introduced into Europe and America. The name "soy" is from the Japanese *shoyu*, a food prepared from the seeds. The varieties in cultivation vary principally in the color, shape, and size of the seed and the length of the growing period. Besides its use as forage this crop is also frequently grown as a soil improver on soils deficient in nitrogen. It thrives best under conditions favorable to corn culture and on soils of medium texture well supplied with potash, phosphoric acid, and lime, although it also gives good returns on light poor soils. If planted for hay or fodder the seed is sown broadcast or closely in drills in the spring when the soil is thoroughly warmed; if for the beans, in drills about 3 feet apart and cultivated like corn. When used for hay, ensilage, or green fodder the crop is cut when the plants are in bloom; when harvested for seed, before the pods become ripe enough to burst and scatter the seeds. From eight to ten tons of green forage are obtained from an acre. From 25 to 40 bushels of seed per acre is considered a satisfactory yield, but sometimes from 75 to 100 bushels are obtained. Insect enemies and plant diseases do not seem to be troublesome.

Soy-bean hay cut in season and well cured has a high feeding value, but since the stems become woody and the leaves fall off, the crop is put into the silo either alone or mixed with corn ensilage. The seed, being a concentrated feed, is usually ground and mixed with other fodder. Fed alone or with other materials the meal is quite thoroughly digested; experiments with sheep showed that 91 per cent of the protein and 84 per cent of the total organic matter was assimilated. Similar values of the seed were 87 and 85 per cent. The seed is also an important source of oil and the seed cake, a by-product in making oil, is a valuable feeding stuff. Feeding the seed or seed cake to cows is said to produce injurious effects at times.

Though the soy bean is eaten more extensively in China and Japan than in any other countries, so far as known it is never eaten there as a vegetable, but in the complex food products, natto, tofu, miso, yuba, and shoyu, commonly made in Japan, and similar products in China. Tofu or bean cheese, a food product prepared from soy beans in Japan, is made from the thoroughly soaked and crushed beans by boiling with water, filtering, and curdling the filtrate, which has somewhat the appearance of milk, with the mother liquor obtained in making salt from sea water. The precipitate is separated by filtering and formed into cakes, which are eaten either fresh or frozen. The composition of these foods is given in the table on the following page.

Most of these soy-bean products, popular from ancient times, are fermented. The cell walls and other carbohydrate materials are broken down, the cell contents rendered more readily digestible, and peculiar and pleasant flavors developed.

The statement is frequently made that the Orientals live almost exclusively upon rice, eating little meat. It is not, however, generally known that deficiency of protein is made up by the consumption of large quantities of these

soy-bean products, which take the place in the Japanese dietary of meat and other costly nitrogenous foods. They are eaten in some form by rich and poor at almost every meal. The beans are sometimes used for breadmaking, and

PERCENTAGE OF COMPOSITION OF FOOD PRODUCTS FROM SOY BEANS

FOOD PRODUCT	Water	Protein	Fat	Nitrogen free extract	Fibre	Ash
Fresh tofu . .	89.00	5.00	3.40	2.10		0.50
Frozen tofu . .	18.70	48.50	28.50	2.60		1.70

Red miso . . .	50.40	10.08		18.77	8.25	12.50
Shoyu (soy sauce)	63.29	8.31	5.10		..	19.45

when roasted as a substitute for coffee. Consult United States Department of Agriculture, *Farmers' Bulletin*, Nos. 58, 372, 509 (Washington, 1897-1914), and C. V. Piper, *Forage Crops and their Culture* (New York, 1914).

**SOYER**, swä'yä', ALEXIS BENOÎT (1809-58). A French cook and writer on cookery, born at Meaux-en-Brie. After the Revolution of 1830 he went to England, where he became chief cook to the Duke of Cambridge. In 1837 he became chef at the Reform Club. In 1847 on a government appointment he proceeded to Ireland, where a famine prevailed, and there erected and conducted a large number of kitchens serving food at half the regular price. In 1855 he went to the Crimea, where, with Florence Nightingale, he directed reforms in the dietaries of the military hospitals. This he continued after the war, on his return to England, with the result that a radical dietary reform both in hospital and in barrack rations was effected. He wrote extensively on cookery. Consult Volant and Warren, *Memoirs of Alexis Soyer* (London, 1858).

**SOYESHIMA**, sô-yesh'i-mä, TANÉOMI. A Japanese statesman and scholar, born at Saga, in the Province of Hizen, in Kiushu, and educated in the local school for samurai. In 1866 at Nagasaki he came under the influence of Guido F. Verbeck (q.v.), an American missionary, by whom he was taught, particularly in the New Testament and the Constitution of the United States. Giving his special attention to the study of law, he was in 1868 made a commissioner by the new government for framing laws and later an Imperial counselor. In 1871 the Mikado sent him to Russian Siberia to settle the boundary question concerning the island of Sakhalin, and in the following year he was an ambassador to the Emperor of China regarding Luchu. As Minister of Foreign Affairs he was instrumental in releasing the Chinese coolies from a Peruvian vessel at Yokohama and thus ending the coolie traffic. (See MACAO.) On his return to Japan he resigned his office because of differences on the Korean War question, but in private life continued to be influential in agitation for constitutional government, and later was invited to reënter the cabinet. He revisited China in 1876, was welcomed and lauded by the mandarins for his scholarship, and became a trusted private adviser of the Emperor, especially in his library.

**SO'YOTS**. A people residing on the headwaters of the Yenesei River in Asia. They are regarded as the original stock from which diverged the Samoyeds (q.v.) and the Finns (q.v.).

**SO'ZINS**. See IMMUNITY.

**SOZ'OMEN** (Gk. Σωζομένης, *Sōzomenos*), HERMIAS SALAMINIUS (c.400-443). A church historian. He came of a wealthy family of Palestine and spent at least a part of his life as a lawyer at Constantinople. He wrote a history of the Church, covering the period from 323 to 439. The latter portion, dealing with the years from 423, is lost. He follows the church historian Socrates (q.v.) but has some independent material, especially upon monastic matters. The work was edited by Hussey (Oxford, 1860), and there in an English translation by Hartranft in the *Nicene and Post-Nicene Fathers*, 2d series, vol. ii (New York, 1891).

**SPA**, spä. A famous watering place in the Province of Liège, Belgium, 20 miles southeast of the city of Liège (Map: Belgium, D 4). It is attractively situated in a hilly region. The waters of the Pouhon spring are largely exported. It is in an inclosure erected to commemorate the visit of Peter the Great in 1717. The *Etablissement des Bains*, a handsome modern structure, is in the Place Royale adjacent to the Casino. There are noted manufactures of woodenware, which is stained brown by being steeped in the mineral waters. Pop., 1900, 8192; 1910, 8357. Spa's greatest popularity was in the eighteenth century, when it was the favorite resort of the European nobility. It declined after the French Revolution, but is regaining its former prestige. About 15,000 people visit the place annually. "Spa" as applied to mineral springs originated in the name of this town.

**SPACE** (OF, Fr. *espace*, from Lat. *spatium*, space). The nature of space is a problem that has been discussed almost from the beginning of metaphysical speculation. The naïve unreflective view is that space is a kind of vessel or medium, having independent existence, and that objects are contained in it. If these objects were to be annihilated, space would continue to exist; just as, in the creationist view, there is a tendency to suppose that space existed before creation and was filled with objects by the creative act. Now if the term real is applied exclusively to concrete objects having definite sensible characters, pure space, i.e., a vacuum, is unreal; there is nothing in it. This seems to be the view taken of space by many Greek philosophers, e.g., Parmenides and Plato, who spoke of it as that-which-is-not, while some, e.g., Leucippus, also said that both that-which-is-not and that-which-is actually are. An intelligible meaning can be given to the position of Leucippus by supposing that he used the term "being" in two senses, definite being with sensible qualities and being without any sensible qualities. In the former sense space is not, and is non-being; and yet this non-being is, in the sense that the absence of sensible objects in space would, according to this naïve conception, not imply the non-existence of space. Some Greek philosophers, however, went further than this; Parmenides denied the existence of empty space altogether; and Plato denied the ultimate reality of space. The fundamental realities of his system were "ideas," which were not created, and hence did not need a preëxistent

space for their occupancy; while the world of sensible reality in space is of subordinate metaphysical value. Aristotle regarded space not as an independently existing entity, and yet not as unreal; but as "the first unmoved limit" of bodies. This is an anticipation of the modern empirical view, to be treated later in this article. Until modern times no thoroughgoing development of these different positions was undertaken.

Descartes considered space (= extension) as the essential characterizing feature of material substances, and as contrasting with thought, the attribute of spiritual substances. Spinoza followed Descartes in making space the fundamental differentia of matter, although he acknowledged only one substance; thus making extension one of the infinite number of attributes of substance, of which only two, viz., extension and thought, are known to us. Leibnitz denied any fundamental character to space; space is merely phenomenal; it is a confused perception of what intrinsically is not spatial but logical. The only realities are monads (q.v.), which are distinct from each other by their logical differences; these logical differences appear in confused thinking as spatial separations. To the perceived mutual spatial externalities of material bodies there correspond real logical differences between monads; hence matter in space is a "well founded phenomenon," "a regulated and exact phenomenon, which does not deceive him who is careful to observe the abstract rules of reason." Newton had meanwhile given definite expression to the old view of Leucippus: "Absolute space, in its own nature, without relation to anything external, remains always similar and immovable." "For the primary places of things to be moved is absurd. These therefore are absolute places; and transitions only out of these are absolute motions. But, because the parts of space cannot be seen, or distinguished from one another by our senses, therefore in their stead we use sensible measures . . . but in philosophical disquisitions, we must abstract from the senses." All these views have their difficulties, which led Kant to propound his now famous theory that space is an a priori form of perception. Real things (Dinge an sich) are not in space; but we cannot know such things; our knowledge is concerned only with phenomena, which are sensational in character; sensations as they are produced in the mind are arranged by the mind in forms supplied by the mind; among these forms is space. Space is thus merely subjective; only what is experienced is extended and it is so extended because the perceiving mind extends it, or supplies the form of extension to it. The same holds good of time. The form of space, subjective in origin, is not, according to the more consistent passages of Kant's writings, a ready-made mental framework into which sensations are placed; it is rather a principle of arrangement, which is applied according to need; hence space is neither infinite nor finite; but indefinitely extensible.

Recent empiricism declines to accept the Newtonian doctrine of absolute and absolutely independent space and also Kant's doctrine that space is an a priori form; extensity is regarded rather as a fundamental character of experienced objects, neither existing apart from such objects nor supplied by a mind to such objects. This **extensity** is not mathematical space, but by

abstraction from it mathematical space is derived. Real space, i.e., the extensity of objects of experience, is not homogeneous and does not submit to geometrical laws, but geometrical laws hold good of an ideal space, obtained by the ignoring of the heterogeneities of experienced space. This view agrees in part with the Kantian view that mathematical space is a creation of the mind, but it declines to accept the a priori character of such space. Homogeneous space is an empirical abstraction. Neo-realism tends to revert to the Newtonian conception, but with thoroughgoing modifications. Into the details of none of these theories is it possible to go. A very interesting speculation on the nature and origin of space is given by Bergson in his *Creative Evolution*; space is an order, but not the original order of reality. Time is the only reality, i.e., concrete time in the sense of experiential change; when this order is arrested or reversed, space arises. But Bergson does not explain why time should undergo arrest or reversal.

**SPACE PERCEPTION.** See **VISION**.

**SPACH**, späc, LUDWIG ADOLF (1800-79). An Alsatian historian, born and educated at Strassburg. In early life he was a tutor and traveled extensively. He was librarian of the Department of Bas-Rhin, Alsace, and head of the prefect's cabinet (1840), and in 1872 became honorary professor at Strassburg. His writings include *Moderne Kulturzustände im Elsass* (1873-74); *Dramatische Bilder aus Strassburgs Vergangenheit* (1876); *Zur Geschichte der modernen französischen Litteratur*, *Essays* (1877). Spach, under the pseudonym Louis Lavater, also wrote the novels *Henri Farel* (1834), *Le nouveau Candide* (1835), and *Roger de Manesse* (1849). Consult F. X. Kraus, *Ludwig Spach* (Strassburg, 1880).

**SPADEFISH.** See **PADDLEFISH**.

**SPADEFoot.** A toad of the family Pelobatidæ, prominently characterized by the inner bone of the ankle (tarsus) being covered with

a hard, sharp-edged horny sheath, which forms an effective tool for digging. Three species belong to western Europe and the Mediterranean region, of which the best known is *Pelobates fuscus*, which makes deep holes in the sand, hiding during the day, hunting at night. The numerous eggs are laid in strings in water, and the tadpoles are very large, shrinking greatly when they change into young toads.

FOOT OF A SPADEFOOT.

Undersurface of a left foot, showing the spade, a.

American representatives of the family are several species of the genus *Scaphiophus*, one of which (*Scaphiophus solitarius*, or *holbrookii*), common from New Jersey southward in lowlands, is renowned for the loud noise it makes when calling in the spring. Other species are found in Mexico. Consult Hans Gadow, "Amphibia and Reptiles," in *Cambridge Natural History*, vol. viii (London, 1901), and M. C. Dickerson, *The Frog Book* (new ed., New York, 1914).

**SPAGNA**, spä'nyä, Lo, properly GIOVANNI DI PIETRO (active 1500-28). An Umbrian painter, born in Spain. He was a pupil of Perugino and Pinturicchio and imitated them and his fellow pupil Raphael in a conscientious and often pleasing manner. He lacked, however, invention, feeling for space, and knowledge of the management of drapery. His work has frequently been confused with that of the three masters mentioned, the most notable example being the famous "Sposalizio" at Caen, long attributed to Perugino. His other paintings include his masterpiece, the "Coronation of the Virgin" (1511; at Todi), "Nativity" (Vatican), "Madonna" (Louvre), the "Nine Muses" (Capitol, Rome), and frescoes and altarpieces at Assisi and in and near Spoleto, where most of his life was passed.

**SPAGNOLETTO**, spä'nyô-lët'tô, Lo. See RIBERA, JUSEPE DE.

**SPAHIS**, spä'héz (Fr. *spahi*, from Hind., Pers. *sipāhi*, soldier, horseman, from Pers. *sipāh*, *supāh*, army). Native Algerian cavalry, originally formed from the Turkish spahis serving in the country when it was conquered by the French.

**SPAHR**, spär, CHARLES BARZILLAI (1860-1904). An American author and journalist, born at Columbus, Ohio. He was educated at Amherst, at Leipzig, and at Columbia. He was an associate editor of the *Outlook* from 1894 to 1904, when he became editor and part owner of *Current Literature*. His publications include *Essay on the Present Distribution of Wealth in the United States* (1896), in the Library of Economics and Politics, and *America's Working People* (1900). Consult Lyman Abbott, *One Who Loved his Fellowmen* (New York, 1905).

**SPAIN** (Sp. *España*, from Lat. *Hispania*). A kingdom occupying about six-sevenths of the area of the Iberian Peninsula. Lying between lat. 36° and 44° N. and long. 9° 15' W. and 3° 20' E., it is bounded by France, the Atlantic (in the north the Bay of Biscay), Portugal, and

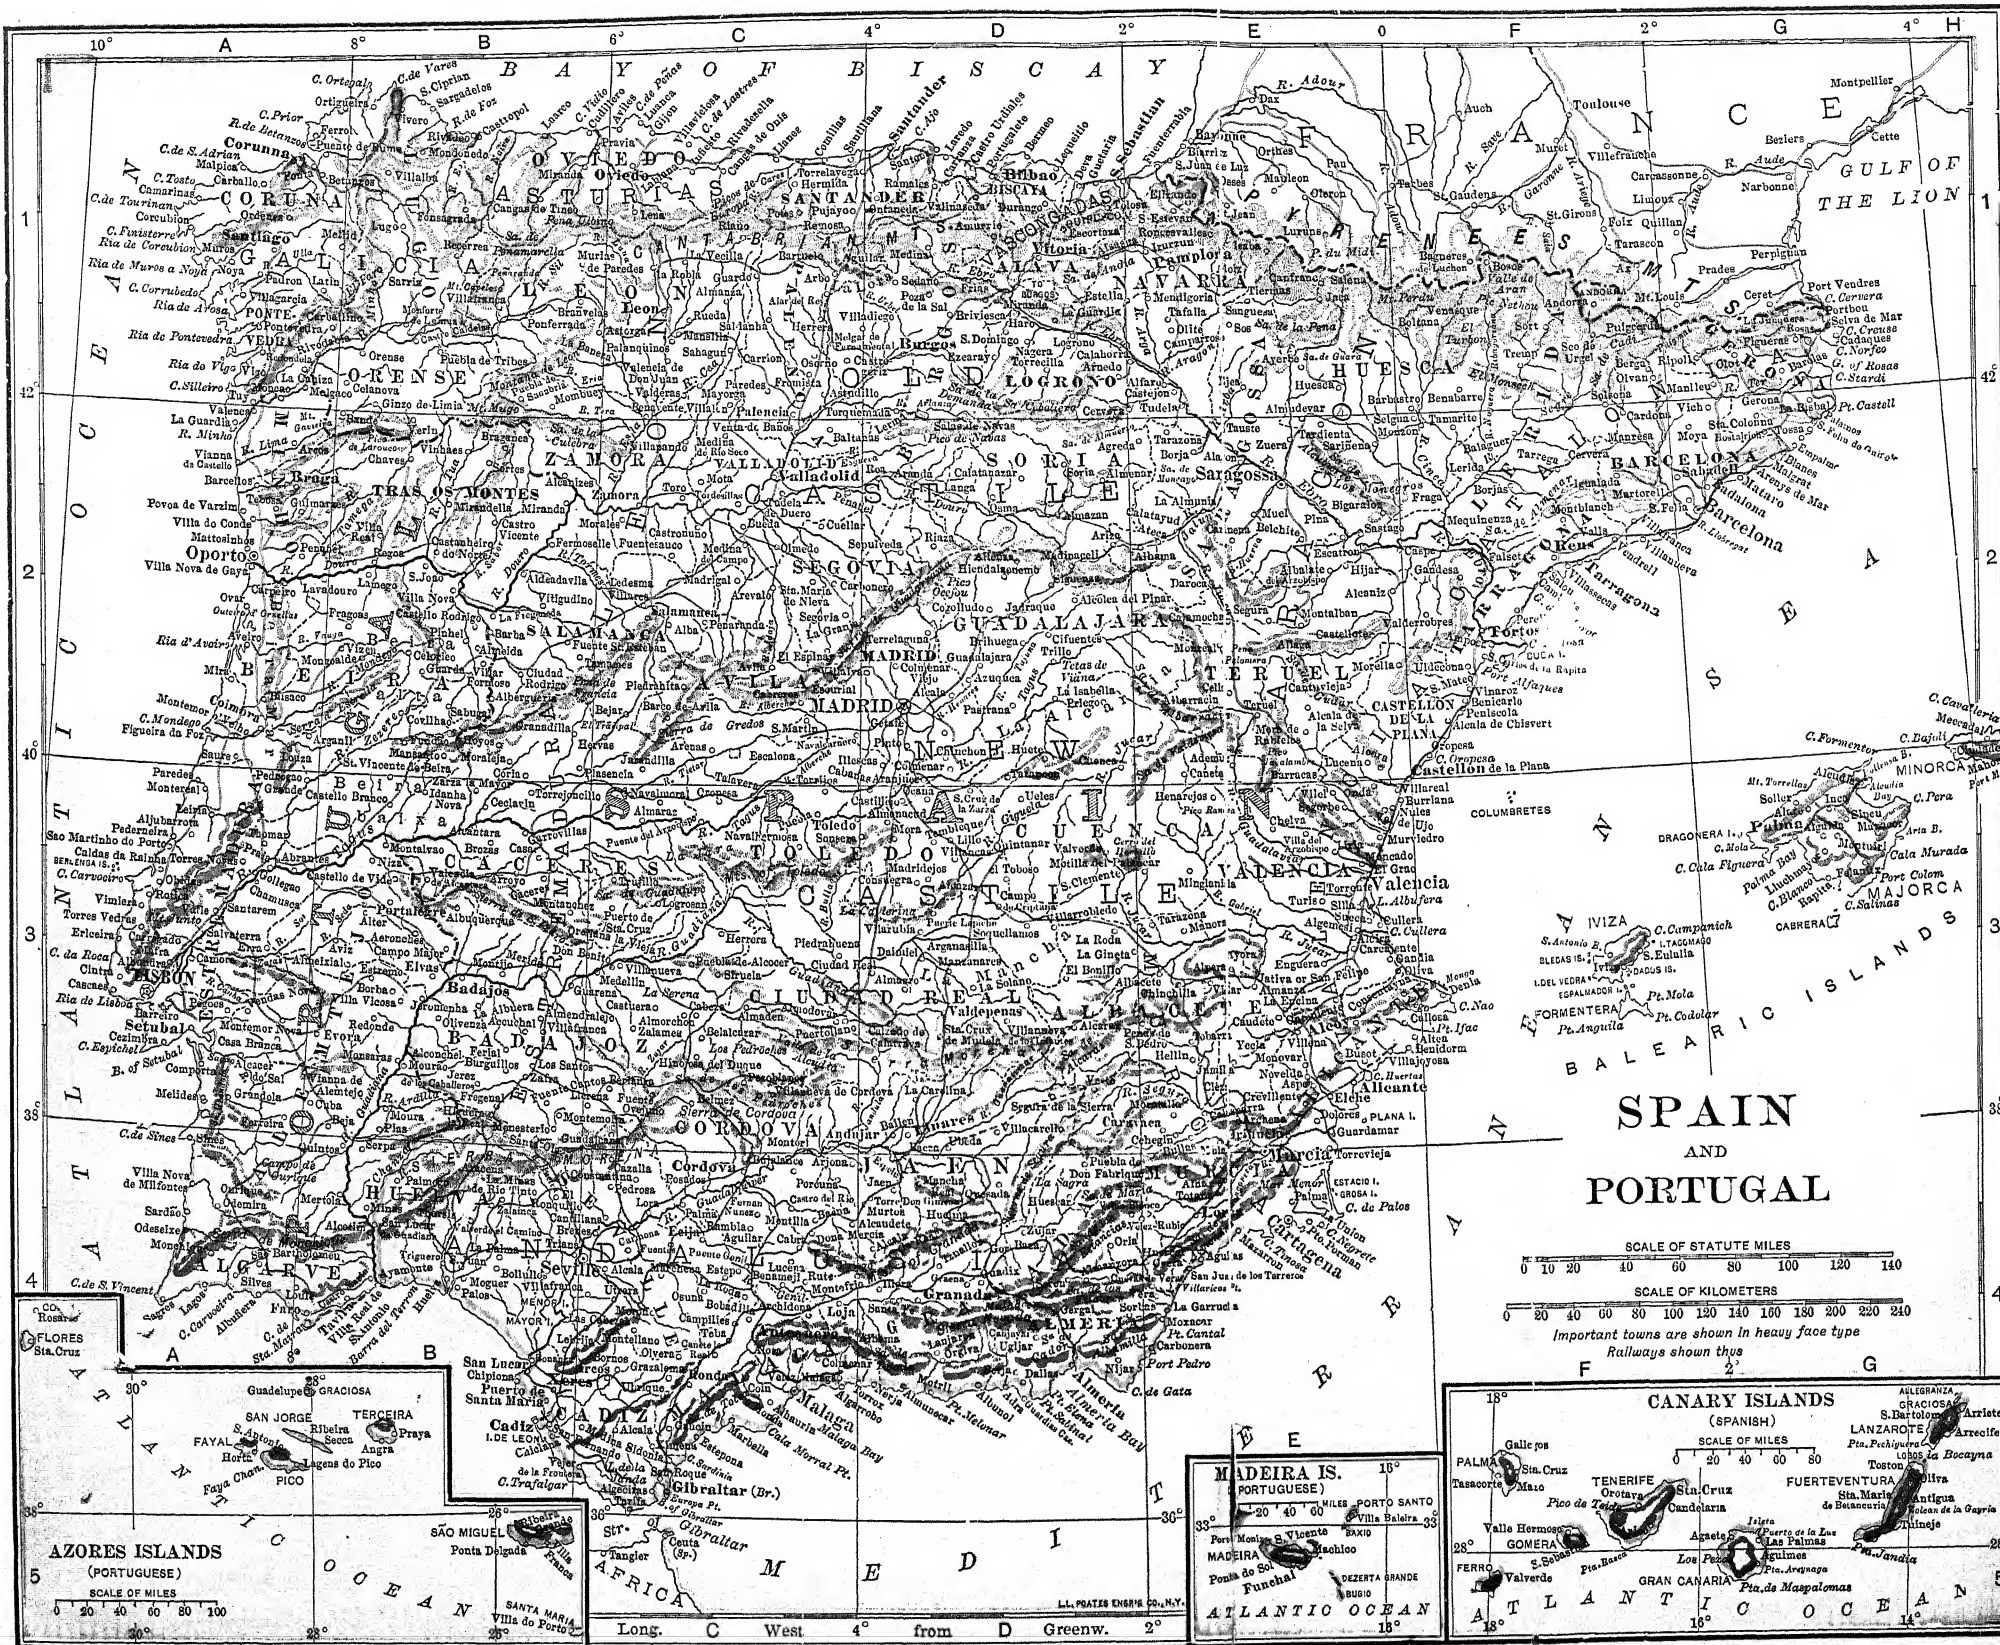

the Mediterranean. At the extreme south the narrow Strait of Gibraltar separates it from Morocco. Its continental area is 190,050 square miles. Including the Canary and Balearic islands and the small possessions on the north and west coast of Africa, its total area is 194,783 square miles. Natural features, the gorges of the Miño (Minho in Portuguese), the Guadiana River, and the cañons of the Duero (Douro) and Tagus (Tajo in Spanish), constitute a little less than one-half the boundary between Spain and Portugal.

**Topography.** The predominating natural feature of Spain is the great Iberian table-land (the meseta) which occupies three-quarters of the peninsula, nowhere reaching the sea—a compact, lofty, and mainly treeless plateau sloping as a whole to the west. The surface of the table-land rises from 1000 to 3000 feet above the sea, and its highest part is the Iberian Border Range, which separates the plateau of Castile from the Ebro basin and attains elevations of 3500 to 5000 feet. This lofty plateau is crossed by many mountain ridges called sierras, the most important of which are the Castilian Mountains in the centre of the Kingdom (Sierra de Guadarrama and Sierra de Gredos), which divide the extensive high plains of Old Castile from those of New Castile. The northern limits of the table-land are the Cantabrian Mountains, the western continuation of the Pyrenees, and the southern limits are the Sierra Morena, which is nothing more than the steep edge of the plateau separating Castile from Andalusia. The highest mountains of the table-land are those of the central region, such as the Plaza Almanzor (8730 feet) in the Sierra de Gredos and the Pico de Peñalara (7890 feet) in the Sierra de Guadarrama, but these summits rise scarcely 5000 feet above the general level of the plateau. Some of the depressions between the mountain ranges are narrow valleys drained by many rapid rivers, and communication across the sierras is difficult.

The long unbroken chain of the Pyrenees forms a mighty barrier between France and Spain, and as yet they are crossed by railroads only at their ends. The highest peak of the Pyrenees (which is situated on the Spanish side of the boundary) is the Pico de Aneto (Pic d'Anethou), whose summit is about 11,160 feet above the sea. The Sierra Nevada, in the extreme south, close to the coast, attains an elevation of 11,664 feet in Mulhacén, exceeded in Europe only by peaks in the Alps and the Caucasus.

The alternation of mountain and river valley in Spain is very conspicuous—first the Cantabrian Mountains and the Duero River in the north, then in succession the Guadarrama Mountains and the Tagus, the Toledo Mountains and the Guadiana, the Sierra Morena and the Guadalquivir, with the Nevada Mountains, in the south. Although the sea surrounds seven-eighths of its periphery, it has all the features of a continental mass, with restricted access to the ocean, as the coast is bordered by mountains, and there are almost no well-marked inlets on the coast and few navigable rivers. Barcelona has the only really first-class harbor. Spain contains two great low plains—one the plain of Aragon in the northeast, through which flows the Ebro, which drains most of northeastern Spain and extends between the Pyrenees and the Iberian Mountains, walled in from the Mediter-

reanean by the Catalan Mountains; the other the Andalusian plain in the southwest, traversed by the Guadalquivir River and extending between the Sierra Morena and the Sierra Nevada. These plains, like the narrow and comparatively short coastal plains, are among the most fertile regions of Europe.

**Hydrography.** All the long rivers, excepting the Ebro, empty into the Atlantic, as the main water parting is nearer the Mediterranean than the ocean. Most of the rivers are for the greater part of the year very deficient in water and not navigable, and therefore of small value for shipping. They lie too far below the general level to be of use even for irrigation. The Miño, Duero, Guadiana, and Tagus are not navigable in Spain, though they are useful for commerce to some extent in Portugal. Of the 800 miles of waterways in Spain only 300 miles are available the year round. The Guadalquivir, which flows through a part of the Andalusian plain, is the deepest river in Spain; vessels of 1100 tons ascend it as far as Seville, and small boats reach Cordova. Its volume is fairly constant, being maintained by the snow of the high mountains of Andalusia. The Miño and Duero flow across the plateau of Old Castile; the Tagus, the longest of the rivers, courses through New Castile. These rivers with the Guadiana flow in deep rocky valleys. The only navigable river on the Mediterranean side is the Ebro, which allows small craft to ascend as high as Rogoño and seagoing vessels to Tortosa. In its lower course it is entered by the Amposta Canal. There are no important lakes, the small lake of Albufera, near Valencia, being the largest.

**Climate and Soil.** The climate of Spain, like the physical features, is somewhat unfavorable to density of population. The country has almost a continental climate, notwithstanding the length of its coast line. The range of temperature between summer and winter is large, and the diurnal variations are great and rapid. The summers of the table-land are so hot that nearly all the rivers become dry, and the earth so parched and unproductive that whole villages are sometimes compelled to migrate. On the other hand the height of the table-land causes the winter temperature to be low. At Madrid, centrally located, there is often skating in winter, though in summer the temperature may rise to 107° F., making its climate the most extreme in western Europe. On the southern coast, by contrast, the mean temperature in January is 55° F., and frost and snow are extremely rare. The mean temperature at Malaga (south coast) is in summer 77° F. and in winter 57° F., at Barcelona (northeast), on the Mediterranean, the summer and winter means are respectively 77° F. and 50° F., and at Madrid (central), 75° F. and 44.6° F. The total rainfall of the year in by far the greater part of Spain is less than 20 inches, a higher rainfall being for the most part confined to the north and west coast. The evil of deficient precipitation is increased by the fact that the largest rainfall is in the winter months after the growing season. Irrigation is, therefore, the basis of agriculture. The soils need only moisture to make them very fertile. The hot south wind of Andalusia, known as the solano, and the cold north wind, called the gallego, are peculiar to Spain.

**Flora.** The vegetation is that of central

Europe. With such climatic conditions it is natural that both plants and animals should be limited. Herbs and shrubs predominate on the plateau, but a variety of plants is found in ascending to the mountain summits. Woods are met with only on the slopes of the mountains, especially in the north, where a heavy rainfall prevails, where chestnut trees and various oaks occupy the lower zone and conifers extend to the tree limit. The elm is found in many valleys and is planted in some cities. The poplar is one of the cultivated trees, and the beech forms large forests on some of the mountain slopes. The vine flourishes on stony soil, and the olive tree is important. The cork tree, from which the bark may be stripped every 10 years, is found in Granada and southwest of the Pyrenees and also in various other districts. Esparto, or alfa, and rushes, largely used for baskets and mats, are grown on the coast and in the interior; sugar cane is cultivated in Andalusia and Valencia; European and Mediterranean fruits and nuts, such as apples, pears, oranges, lemons, almonds, chestnuts, and figs, grow in abundance; the southern provinces also raise maize and rice; and Spain is the chief saffron-producing country in the world.

**Fauna.** The forests still harbor wolves, lynxes, wild cats, foxes, and even wild goats. The bear is now rare. Deer, hares, and other game abound, and wild boars of great size and strength are hunted in the oak forests.

**Geology and Mineral Resources.** The table-land is a very ancient and much altered block of the earth's crust, chiefly composed of Archean and Paleozoic rocks, for the most part of Cambrian, Silurian, and Devonian formation. On the north and south margins of the table-land two younger land masses were upheaved into lofty bordering ranges, the Pyrenean-Cantabrian on the north and the Andalusian on the south. The Pyrenees are an example of a young folded mountain system built up of parallel belts usually in a northwest and southeast direction. The crust folds of the Andalusian system have a low outer zone of folded Mesozoic and Tertiary strata and a lofty inner girdle, in which the Archean and Paleozoic rocks rise high above the Mediterranean. Spain, till the discovery of America, was the richest metal-producing country in the world. It is the most metalliferous land of Europe, not excepting the Ural mining district. The development of mining has been impeded by insufficient fuel and defective means of communication, but the chief reason for the inferior condition of the mining industries is found in the lack of enterprise and skill among the Spaniards. Foreign capital and energy have brought about most of the development in recent years, and the greater part of the ore is exported to foreign countries in its raw state. The rich iron ore and the copper ore go to England and Germany, and Spanish gold and silver ores are melted at Freiberg in Saxony. The great iron fields of Spain yielded in 1911 over 8,700,000 metric tons, which was exported mostly to Great Britain, chiefly through the port of Bilbao. The mines along the Bay of Biscay are nearly exhausted, but iron of excellent quality is found in considerable quantities in Andalusia, the Sierra Morena, and León. A further source of oxide of iron ore was discovered 85 miles from Malaga, and the product is now exported.

Nearly every province contains coal, the re-

sources of the country being estimated at 13,000,000,000 tons. Coal is worked chiefly in Asturias, León, and Lérída, but the amount mined is comparatively small, and there have necessarily been large imports with the increasing demands of the railroads and manufacturing industries. The quicksilver mines of Almadén are very rich, being second only to those of the United States in quantity produced. Spain produces more lead than any other country of Europe, most of the mineral being obtained from the mines of the Alpujarras (q.v.) and those of Linares in Jaén. Copper is found in inexhaustible quantities on the Río Tinto in south Spain, where mines have been worked by British and German capital since 1873. The ore is also mined in Murcia, Oviedo, Jaén, and Zamora. Salt is chiefly obtained by evaporation of sea water at Cadiz, Valencia, and the Balearic Islands, though Catalonia and New Castile abound in rock salt. Among the other important minerals found are sulphur, soda, saltpetre, alum, graphite, and potter's clay. Mineral springs are numerous, the best known being the thermal sulphur springs of Mombuy in Catalonia. In 1912 there were in Spain about 2500 productive mines employing 128,700 men, 2606 women, and 18,506 boys and girls. The output of raw minerals in the same year was valued at 255,643,000 pesetas. The quantities and values of the more important minerals produced in 1912 (the peseta being valued at about 18 cents) were as follows.

CRUDE MINERALS	Metric tons	1,000 pesetas
Iron.....	9,139,007	56,979
Coal.....	3,625,666	59,979
Copper.....	3,364,000	53 116
Lead.....	190,162	44,236
Quicksilver.....	21,889	3,562
Zinc.....	175,311	7,671
Salt.....	23,292	439,867

#### Agriculture, Live Stock, and Fisheries.

Over half the people live by farming, which supplies about two-thirds of the exports. Farm methods and implements, however, are primitive, and the special disadvantages are that much of the land is owned in large holdings, the taxes are high, and communications poor. About 90 per cent of the area is classed as productive; 35 per cent of this area is devoted to general agriculture and gardening, 2.5 to vineyards, 2.9 to olive growing, 25 to natural grasses, and 22 to fruit. Sheep and goat raising form an important industry, the plains of the comparatively dry table-land supplying a sufficient growth to sustain large flocks in summer, while in winter they are driven to the lower districts. Although about 280,000 of the holdings are in large estates, the subdivision of the soil has been rapidly advancing, and the number of small holdings is very great. Irrigation, as stated above, is necessary during the rainless months. Artificial watering in a wide belt along the Mediterranean coast transformed a great area into a fertile region. All available fertilizers, including street sweepings, are used, with the result that no land in the world is more productive than this section. Southern fruits, vegetables, sugar cane, maize, and other crops requiring abundant moisture are produced. About 9 per cent of the country is artificially

irrigated. In the last two decades the government has attempted to enlarge the agricultural area by the construction of reservoirs and irrigation canals. The plans adopted for the irrigation system cannot fully be carried out for many years. Lands now irrigated in the valleys of the Ebro and Tagus yield many times as much fruit as the dry lands.

In Valencia, which is the most profusely watered and the best cultivated region, three or four crops are harvested annually, and the level parts of Catalonia, Murcia, and Andalusia are also very fertile. The dry lands of the interior are chiefly untilled, though, where subterranean waters are near the surface, wheat and other cereals are grown. The northern provinces export small quantities of cereals, though the wheat crop does not usually meet the home demand. Rice is grown on the swampy lands bordering the Gulf of Valencia; rye is the chief breadstuff grown in the part of Spain fronting on the Atlantic; and barley is grown for cattle food.

The areas in acres devoted to the cereal crops in the year 1914 were as follows: wheat, 9,676,879; barley, 3,402,553; rye, 1,886,206; oats, 1,303,314; maize, 1,136,736; rice, 96,824.

The cultivation of the vine receives much attention, and wine at times forms as much as a third of the total exports. The wine crop of 1913 was 432,617,000 gallons, being exceeded only by France and Italy. Most of the wines are poorly made. In the south are produced the famous wines of Malaga, Alicante, and Jerez (sherry), highly valued both for medicinal and table purposes. Valencia, Malaga, and Alicante also export great quantities of raisins and grapes. The grape production of 1913 was 2,952,258 tons. The most profitable crop of the huertas is fruits. Oranges and lemons thrive best along the Gulf of Valencia and in the Balearic Islands, and quantities of the peel of the bigarade or bitter orange are sent to Holland to be used in the manufacture of the liqueur curaçao. Olives and olive oil are large products, though somewhat less important than oranges in the export trade. The olive crop of 1913 was 1,486,874 tons, and the olive oil produced 265,422 tons. Spain is one of the principal producers of olive oil, and most of the product is consumed at home. The industry is chiefly developed in the southern provinces, Seville supplying the greater part of the olives for table use, while the oil comes from Cordova. Esparto, used for the manufacture of twines and a coarse cloth, grows in the southeast and is sent in large quantities to England. Tobacco is cultivated, but much is also imported; the tobacco industry, which is a government monopoly, is an important source of revenue. Hemp and flax are grown chiefly in the northern provinces.

Sheep raising is an important industry, but of less importance than formerly, the number grown having been reduced from about 20,000,000 to 14,500,000 in 1913, while the famous fine-wool merinos have been largely replaced by coarse-wool breeds. Goats are reared for their milk, flesh, and skins, the total number being, in 1913, 3,394,000. The best horses, originally of Arab stock, are raised in Andalusia and Asturias, but horse breeding is much neglected in favor of the mule, the Kingdom containing only about 540,000 horses. On the other hand there were, in 1913, 975,000 mules and 849,000 asses, which are bred with great care

in most parts of Spain. The number of cattle amounts to 2,878,000 head. They are most numerous on the pastures of the northwest, where the rain from the Atlantic is abundant. The wild cattle specially raised for bullfighting are obtained from the Sierra Guadarrama and the Sierra Morena. Hogs, about 2,750,000 in number, are reared chiefly in the mountainous parts of the Kingdom, especially in the north and in Estremadura. Silkworm culture is only one-tenth as large as it was in the middle of the last century and is chiefly confined to the regions around the Gulf of Valencia. The yield of cocoons amounts to about 2,000,000 pounds annually. Most of the raw silk is sold to France, and large quantities of silk goods are imported. The sea fisheries are important, but the home industry does not begin to supply the demand, and much fish is imported from Norway. The total number of boats engaged in the industry is about 15,500; fishermen, 89,000. The chief catches are sardines, tunny, and cod.

**Manufactures.** Active efforts have been made to improve the manufacturing industries, which do not supply the home requirements, but the lack of fuel and raw materials renders this difficult. Catalonia has always been the home of the greater part of Spanish manufactures. Next in order come those districts of Galicia, Asturias, and Vizcaya in which water power abounds, and also a few towns in the interior, such as Madrid, Seville, and Toledo. Barcelona in Catalonia is the leading manufacturing town and the chief seat of the textile, metal, paper, and leather industries and lace making. The silk industry of Valencia, Murcia, and Andalusia and the woolen industry of Barcelona, Alicante, and Burgos also fail to supply the local consumption. The tobacco industry brings to the Treasury a large revenue and is

are over 60 mills for expressing olive oil. The pickling of green olives is an important branch of industry; in addition to the large home consumption, some 6000 to 7500 tons are annually exported. There are about 600 factories engaged in sardine canning and fish preserving, employing 32,000 workmen.

**Commerce.** The trade consists chiefly in the export of raw produce and the import of the large part of the manufactures consumed. Minerals, fruits, and wine form the larger part of the exports. The imports are chiefly confined to cotton, coal, foodstuffs, textiles, lumber, and machinery. The domestic trade is seriously hampered by natural and artificial obstacles. Spain's commerce with foreign lands is chiefly maritime, and England and France are the most important factors. Imports and exports, exclusive of gold and silver bars, were, in 1900, \$124,127,370 and \$104,634,021 respectively and, in 1914, \$203,871,000 and \$172,611,000 respectively. The principal exports were, in 1914, metals and their manufacture, \$22,937,000; cotton manufactures, \$7,737,000; timber and manufactures thereof, \$12,792,000; alimentary substances, including grain, sugar, and wine, \$78,892,000. The principal imports were cotton and its manufactures, \$25,017,000; alimentary substances, \$50,124,000; timber and its manufactures, \$10,809,000. The trade is chiefly with Great Britain, France, Germany, the United States, and Cuba. The imports into the United States from Spain in 1896, the year before the war with that country, were \$4,131,184 and, in 1914, \$24,658,557; the exports to Spain, in 1896, \$11,492,428 and, in 1914, \$30,587,539.

The following table shows the distribution of the more important foreign trade in two years (value of peseta, 1900, 14.28 cents; in 1913, 19.3 cents).

COUNTRY	Imports from		Exports to	
	1900	1913	1900	1913
	<i>Pesetas</i>	<i>Pesetas</i>	<i>Pesetas</i>	<i>Pesetas</i>
France .....	137,386,661	204,268,000	187,750,220	327,744,000
Great Britain .....	246,107,975	244,669,000	247,801,514	231,571,000
United States .....	105,834,020	167,486,000	17,415,050	72,195,000

carried on in the royal factories of Madrid, Valencia, Seville, and other towns. Paper making is steadily growing in importance. Iron ore is abundant in the north, and there is a large exportation, that to Great Britain being about \$18,000,000 annually. The imports of manufactures of metals are about \$20,000,000 annually, and those of machinery about \$40,000,000. Gold and silver wares are produced in large quantities in Madrid, Toledo, Seville, and Barcelona, and Gijón, Seville, and Madrid are noted for their glass and porcelain. In the manufacture of cotton goods 2,600,000 spindles and 68,000 looms were employed in 1910, the latest census year; the woolen manufactures used 660,000 spindles and 8800 looms; about 150 paper mills make printing, packing, writing, and cigarette paper; 50 mills produce beet and 20 cane sugar. The production of the sugar beet is growing. More than 30 factories make glass; about 50,000 tons of cork are manufactured every year; and there

Raw cotton, petroleum, staves, coal, and lumber are the chief imports from the United States. The United States sales of raw cotton to the mills in the Barcelona manufacturing district averaged 43,000 bales in the years 1912 and 1913. Wine, fruits, and cork wood are the chief exports from Spain to the United States.

**Transportation and Communications.** Much of the domestic trade is carried by coasting vessels, as Spain possesses more than 100 harbors large and small on its two seas. The home merchant marine is inferior and most of the shipping is under the British and French flags. The merchant marine in 1914 comprised 628 steamers of 844,322 tons net and 236 sailing vessels of 32,000 tons net; vessel entrances, in 1914, 18,774 vessels, with a tonnage of 21,596,000 tons. There is excellent communication with the chief Atlantic and Mediterranean ports of Europe and with the Philippine Islands and Cuba, and regular steamer service between New

York and Barcelona and the north and south coast ports of Spain. The most important Spanish ports are Barcelona, Cadiz, Malaga, Bilbao, Santander, Alicante, and Valencia. The railroad system connects all the chief towns with one another and unites Spain with France by two routes around the ends of the Pyrenees. Madrid is the centre of the Spanish broad-gauge railroad system. In 1914 the length of the railroads open for traffic was 9310 miles.

**Banking.** The chief financial institution is the Bank of Spain. Its note issue up to 1,200,000,000 pesetas is guaranteed by a metallic reserve of one-third the amount of the issue, half of which must be in gold. If the note issue exceeds this amount it must, up to 1,500,000,000 pesetas, be guaranteed by metallic reserves of at least 40 per cent in gold and 60 per cent of the remainder in silver. For issues exceeding 1,500,000,000 and up to 2,000,000,000 pesetas 50 per cent must be guaranteed in gold and 70 per cent of the remainder in silver. At the end of 1914 the notes in circulation amounted to 1,985,847,000 pesetas; capital and reserve, 172,000,000; deposits and accounts current, 640,605,000; property, 13,560,000; portfolio, 1,106,940,000; cash in hand, 1,300,313,000.

**Finance.** The revenue in 1914 amounted to 1,343,000,000 pesetas and the expenditure to 1,430,000,000. Revenue is raised by direct taxes on land, trade, mines, government salaries, etc.; indirect taxes are derived from imports, articles of consumption, tolls, and bridge and ferry dues; other sources of revenue are the tobacco monopoly, the lottery, mint, and receipts from the sales and rentals of national property. The detailed estimates of revenue and expenditure for 1915 were as follows.

REVENUE	
	Pesetas
Direct taxes on land, trade, mines, government salaries, registration, etc. . . . .	490,108,000
Indirect taxes, customs, excise, etc. . . . .	421,300,000
Tobacco monopoly, lottery, mint, and minor sundries. . . . .	313,370,000
National property. . . . .	23,987,000
From the public treasury. . . . .	31,770,000
Total. . . . .	1,280,536,000

EXPENDITURE	
	Pesetas
Civil list. . . . .	8,828,000
Cortes. . . . .	2,486,000
Public debt. . . . .	422,520,000
Pensions. . . . .	79,585,000
Presidents of Council. . . . .	927,000
Ministry of Foreign Affairs. . . . .	6,614,000
Justice. . . . .	19,864,000
Worship. . . . .	41,689,000
War. . . . .	164,640,000
Marine. . . . .	68,783,000
Interior. . . . .	94,152,000
Instruction, etc. . . . .	74,356,000
Public Works, etc. . . . .	184,321,000
Finance. . . . .	18,584,000
Tax-collecting. . . . .	150,990,000
Colonial. . . . .	125,700,000
Total. . . . .	1,465,044,000

In 1915 the outstanding debt amounted to 9,410,885,000 pesetas, mostly bearing interest at 4 and 5 per cent. Details of the principal items of the outstanding debt on Jan. 1, 1915, are as follows.

	Pesetas
External 3 and 4 per cent. . . . .	1,028,070,000
Perpetual internal 4 per cent. . . . .	6,559,043,000
Redeemable internal 5 per cent. . . . .	1,559,220,000

**Government.** The present constitution of Spain was proclaimed June 30, 1876. It de-

clares the government to be a constitutional monarchy with the executive power vested in the King. The sovereign is declared to be inviolable and irresponsible. He is aided by ministers who countersign all his official acts and who thereby assume the responsibility for them. Since the abolition of the Colonial Department in 1899 the ministry has been organized as follows: President of the Council; Minister of Foreign Affairs; Minister of Justice and Worship; Minister of Finance; Minister of the Interior; Minister of War; Minister of Marine; Minister of Agriculture, Commerce, and Public Works; Minister of Education. The ministers have seats in the national legislature and are permitted to take part in the debates.

The legislative power is vested in the King and a Cortes composed of a Senate and a Chamber of Deputies, the two Houses having substantial equality of powers in legislation. The Senate is composed of three classes of Senators: first, those entitled to seats in their own right (*senadores de derecho propio*); secondly, life Senators nominated by the crown from certain designated classes; and thirdly, 180 Senators elected by communal and municipal delegates and by the provincial estates, the church, the universities, learned societies, etc., and by the largest taxpayers. The first two groups must not exceed 180 members. Senators by right include the adult sons of the King and those of the immediate heir to the throne; Spanish *grandees* who have an annual income of at least \$12,000; captain generals of the army, admirals of the navy, the patriarch of the Indies and the archbishops, and the presidents of the councils of state, of war, of the navy, of the Supreme Court, and of the tribunal of accounts. One-half the elective Senators retire every five years, and all retire whenever the King dissolves the Senate. The Chamber of Deputies is composed of 404 members chosen for a term of five years by popular election. Eighty-eight Deputies are elected by general ticket in 26 districts, provision being made for minority representation. The members are apportioned on the basis of one to every 50,000 of the inhabitants. They must be 25 years of age. By a law of 1890 all male Spaniards 25 years of age who are in the full enjoyment of their civil rights and who have been citizens of a municipality for at least two years are qualified voters. The Deputies receive no compensation for their services and are disqualified from holding office while serving in the Parliament. Annual sessions of the Parliament are held; it is summoned by the King and may be prorogued or dissolved by him, subject to the limitation that the new Cortes must be summoned within three months after the dissolution of the old. Both Senators and Deputies are responsible only to their respective Chambers for any words spoken in debate or votes cast. They are also privileged from arrest except in case of flagrant crime. The seat of government is Madrid.

For purposes of local government Spain is divided into provinces and communes, each with its own elected assembly. The Ayuntamiento or elected assembly of the commune consists of from 5 to 39 Regidores and is presided over by an Alcalde chosen from the body of the Ayuntamiento, except in some of the large towns, where he is appointed by the King. The term of the members of the Ayuntamiento is four years, one-half the membership being renewed

biennially. The provincial Diputación meets once a year and is represented between sessions by a permanent committee. These two local assemblies have entire control of the local government in their respective jurisdictions and are free from interference of the central government except when they exceed their powers to the detriment of the general interest.

The judiciary consists of a Supreme Court of Cassation, which sits at Madrid, a number of district courts or *audiencias* immediately under the jurisdiction of the Supreme Court, *tribunales de partidos* below the *audiencias*, justices of the peace, and municipal courts. The *audiencias* serve as courts of appeal in civil matters and as courts of first and last resort for crimes and certain misdemeanors. The *tribunales de partidos* have jurisdiction in first instance of civil causes and in first and last resort of misdemeanors. They also have appellate jurisdiction in cases decided by the inferior courts. The *partido* is divided into circumscriptions, usually two, in each of which is a *jefe de instrucción*, with civil and criminal jurisdiction in cases assigned to them by the higher courts. The circumscriptions are subdivided into *comunidades*, in each of which is a municipal judge with jurisdiction of petty offenses.

**Colonies.** The colonial possessions of Spain are confined to Africa and are represented in the following table.

POSSESSIONS	Area sq. miles	Popula- tion
Río de Oro . . . . .	73,400	12,000
Spanish Guinea . . . . .	12,000	200,000
Fernando Po, Annobon, Corisco, Elobey Chico, Elobey Grande..	814	23,844
Total.. . . . .	86,214	235,844

Río de Oro, stretching along the Sahara coast, is administered by the Governor of the Canary Islands. Spanish Guinea is on the Gulf of Guinea, between French Congo and German Kamerun. The national expenditure on account of the colonies far exceeds the revenues derived from them. About \$400,000 has to be provided by the Spanish government to supply the deficiency. For an account of the colonies, see the respective headings.

**Weights, Measures, and Money.** Spain maintains the double gold and silver standard. The unit of coinage is the peseta, nominally worth 19.3 cents or 1 franc, but actually varying in value between 15 and 18 cents. The value of the money coined in Spain from 1868 to 1913 was, approximately: gold, 925,000,000 pesetas; silver, 1,335,000,000 pesetas. Metric weights and measures were introduced in 1859, but in addition to these the old Spanish weights and measures are still largely used.

**Army.** Service, theoretically, is compulsory with a total liability of 18 years. At the beginning of the European War in 1914 the government undertook measures to secure universal application of the principle. Periods of service are as follows: recruit class, one year; standing or active army, three years with the colors, five years with the reserve; second reserve, six years; third or territorial reserve, three years.

The field army in peace amounts to about 130,000 officers and men; in war this establish-

ment, with the addition of constabulary and military police, is expanded to about 300,000. Recruits are drawn for the divisions from territorial districts, of which there are 8, the total number of divisions being 14. The division is composed of 2 infantry brigades of 2 regiments of 3 battalions, a regiment of cavalry, a regiment of field artillery of 6 batteries of 4 guns each. There are in addition 6 regiments of engineers, 1 of telegraphy, 1 of railways, 3 independent brigades of light infantry each of 6 battalions, 4 regiments (16 batteries) of mountain artillery, 1 regiment (6 batteries) of horse artillery, 1 cavalry division of 2 brigades, 3 independent cavalry brigades.

For the second reserve there is provided a skeleton organization for 7 divisions, which mobilized in war should add between 90,000 and 100,000 men to the field army. For the third or territorial reserve no organization has yet been provided.

The constabulary (*Guardia Civil*) and the military police (*Carabineros*) provide an additional force of about 35,000 men, of whom 2,500 are mounted. Colonial forces are maintained, on the coast of Morocco, at Melilla, Ceuta, and Larash, Africa. In the Balearic Islands there are 4 regiments of infantry, 1 battalion of chasseurs, 2 artillery companies, 2 engineer companies, 2 squadrons of cavalry. In the Canary Islands there are 4 regiments of infantry, 4 battalions of chasseurs, 2 artillery companies, 2 squadrons, 2 companies of engineers. Including constabulary and military police, the peace strength of Spain's army is about 13,500 officers and 152,000 men; war strength, including second reserve, about 400,000 combatants. The infantry is armed with the Mauser rifle, calibre .275 inch, the cavalry with the Mauser carbine, the field artillery with the Schneider-Canet 2.95-inch quick fire.

**Navy.** See NAVIES.

**Population.** The population of Spain proper by the census of 1910 was 19,950,817, with a density of 100.5 inhabitants to the square mile (est.) 1920, 20,783,844. Emigration from Spain is chiefly to Brazil, Uruguay, and Argentina. The cities with a population of over 90,000 are: Madrid, the capital, 599,887 (est.) 1919, 608,793; Barcelona, 582,240 (est.) 1919, 582,240; Valencia, 233,348; Seville, 158,827; Malaga, 136,365; Murcia, 125,957; Cartagena, 102,719; Saragossa, 111,704. The table on page 338 gives the area and population of each of the 49 provinces.

**Religion.** The national church is the Roman Catholic, and in few countries has it so powerful an influence. The whole population adheres to that faith excepting about 30,000 Protestants, Jews, and others. The constitution requires the nation to support the clergy and religious buildings and institutions, the state expending for these purposes annually about 41,000,000 pesetas. Only restricted liberty of worship is permitted to Protestants. (See below, *History*.) The religious orders are numerous and influential, and many of them have schools and teach industries of all kinds. The total number of religious communities is 3115, with 51,000 members, over 40,000 being women and nearly 11,000 men; number of monks 12,801, of nuns 43,287.

**Education.** Until recently the Spanish educational system has not been as a whole what it should be; it lacked in the number and quality of its schools of primary and grammar grades and also to a certain extent of the

secondary grades. In 1901 the statistics showed 66 per cent of the population unable to read or write. But the authorities are awake to the situation, and for some years past several very important reforms have been brought about and others initiated. They have begun at the bottom, with measures concerning the primary in-

ning with the course for 1915-16, three courses of three months each, also at Madrid and for foreigners. The government also supports special schools for engineering, agriculture, fine arts, and music. The budget for 1914 was 62,-584,378 pesetas.

**Ethnology.** The perspective of Spanish ethnology extends back to the Paleolithic period. (See EUROPE, PEOPLES OF.) In historic times all the great divisions of the Caucasian race have mingled their blood in Spain in greater or less proportion—Hamite, Semite, Teuton, Celt, and Mediterranean. The fundamental type bears the name of Celtiberian and is a result of a mixture of the earliest long-headed Mediterraneans and the later-coming brachycephalic Celts, producing a cranial index of 76-79. Keane and Ripley call attention to the uniformity of this index in Spain and in Britain, associated with tall stature and blondness in the latter, with dark color and low stature in the former. Spain has been invaded in historic times by Phœnicians, Carthaginians, Romans, Visigoths, Vandals, Arabs, and Moors. It is generally believed that these conquerors modified the original type but little, simply because many of them were already short of stature, dark in skin, hair, and eyes, as well as dolichocephalic.

**History.** Spain, the Iberia of the Greeks and the Hispania (q.v.) of the Romans, is supposed to have been inhabited originally by a distinct race called Iberians, upon whom, however, a host of Celts appear to have descended from the Pyrenees. (For the Iberians, see ITALY, *Ethnology*.) In the earliest times of which we have any record these two races had already coalesced and formed the mixed nation of the Celtiberians, who were massed chiefly in the centre of the peninsula, in the western districts, and on the north coasts. (See CELTIBERI.) In the Pyrenees and along the east coast were to be found pure Iberian tribes, while unmixed Celtic tribes occupied the northwest. On the south and east coasts were Phœnician, Carthaginian, Rhodian, and other colonies. In the second half of the third century B.C. a large territory was brought under subjection to Carthage by Hamilcar Barca (q.v.), who, according to Roman tradition, founded the city of Barcelona (228 B.C.). After the death of Hamilcar (q.v.) the power of Carthage in Spain was strengthened by Hasdrubal (died 220 B.C.), son-in-law of Hamilcar, who founded Cartago Nova (the modern Cartagena, q.v.) and concluded a treaty with the Romans whereby it was stipulated that he should not advance his standards north of the Iberus (Ebro). Hannibal (q.v.), son of Hamilcar, after the death of Hasdrubal attacked and destroyed Saguntum (q.v.) in 219 B.C. and thus brought on the Second Punic War. (See CARTHAGE; HANNIBAL; ROME.) After the Romans had driven the Carthaginians from the peninsula (206 B.C.) the country was made into two Roman provinces (197 B.C.), Hispania Citerior, including the eastern and northern districts, and Hispania Ulterior, including the southern and western districts. The conquest of the native tribes proved an arduous task for the Romans. (See LUSITANIA; NUMANTIA.) It was not till 19 B.C. that the Cantabri and the Astures in the extreme north of the country laid down their arms to Augustus. Under Augustus the peninsula was divided into the three provinces of Hispania Tarraconensis, Bætica, and Lusitania. (See

struction; more schools (so as to make possible the fulfillment of the compulsory-attendance law), more and better teachers, and higher salaries. Some years ago the entire primary-school problem was placed in the hands of a recognized expert, and his position was made nonpolitical. The effect of this is being felt in the secondary schools because a better grade of pupils is being sent up. Commercial and technical schools have also been established. Since 1902 there has been regular governmental inspection, unaccompanied by clerical interference. The secondary schools, of which there must be one in every province, prepare for the 10 universities, which are also showing renewed life. The largest university is that of Madrid, with 5675 students. Recently there was established a Junta para Ampliación de Estudios é Investigaciones Científicas, which has in hand, through its several committees, all the various research work, carried on by the different faculties, and which has established a Summer Session for Foreigners (since 1912) at Madrid and, begin-

HISPANIA.) From the time of the establishment of the complete supremacy of the Romans till the death of Constantine the condition of Spain was eminently prosperous. Its fertile fields formed for a considerable time the granary of Rome, and from its metal-veined sierras an immense amount of treasure in gold and silver flowed into the Roman coffers.

In 409 A.D. hordes of barbarians, Alans, Vandals, and Suevi crossed the Pyrenees and swept over and desolated the peninsula. In 412 the Visigoths invaded the country, and their King, Athaulf, who acknowledged a nominal dependence on the Roman Emperor, established the Gothic monarchy in Catalonia. (See GOTHs.) The best known of the kings were Wallia (415-419), who greatly extended the Gothic monarchy, making himself master of a great part of Aquitania (where a century later the Visigoths were overcome by Clovis); Euric (466-485), who, besides increasing his territory, introduced and enforced a body of laws and did much for the advancement of civilization in Spain; Leovigild (567-586), who effected the subjugation of the Suevi; Wamba (672-680), who built a fleet for the protection of the coasts; and Roderic (q.v.), who was killed in July, 711, in battle with the Arabs (Saracens). This battle gave the Arabs almost undisputed mastery of nearly the whole of Spain, as well as (later) of Septimania (Languedoc) in France. The remnant of the Goths betook themselves to the highlands of Asturias, Burgos, and Biscay, where they maintained their independence.

The Arabs held Spain for the first few years of their rule as a dependency of the Province of North Africa, but after the downfall of Musa (q.v.) the country was governed (717) by emirs appointed by the Caliph of Damascus. These emirs were intent upon the extension of their conquests into Gaul, to the neglect of the rising power of the Goths in Asturias. Their northward progress was arrested in the battle of Poitiers by Charles Martel (q.v.) in 732. The walis, or local governors of districts and province, frequently rebelled against the emir and drew swords against each other. Within a period of 40 years no fewer than 20 emirs had been called to the direction of affairs, but a revolution at Damascus, which unseated the Omniads and placed the Abbasides in possession of the caliphate, put an end to this state of misrule in Spain. The last of the emirs, Yusuf, was in favor of the Abbasides, but the walis and alcaides, being chiefly of the Omniad faction, invited one of this family, Abd er Rahman, who was in concealment among the Zeneta Arabs in Barbary, to become an independent caliph in Spain. (See OMMIADS.) Thus was founded (758) the Emirate of Cordova. By 778 the Franks had wrested from the Arabs all their possessions north of the Pyrenees and north-eastern Spain to the Ebro. The latter acquisition, subsequently denominated the Spanish March, was for a time alternately in the hands of the Moslems and dependent upon France.

During the early period of Arab-Moorish domination the small independent Kingdom of Asturias, founded by Pelayo (q.v.), grew in power and extent. Alfonso the Catholic, son-in-law of Pelayo, conquered nearly all of Galicia and recaptured León, together with Salamanca and other cities. Alfonso the Great (866-910) by his victories greatly extended the Asturian dominions, which soon after his reign figure as

the Kingdom of León. In the course of the ninth century Navarre struggled into existence as a separate state. The Kingdom of León was for a long time distracted by bitter and bloody strife among the members of the royal line and with its neighbor, Navarre, would have fallen an easy prey to the powerful Omniads had not the latter directed their chief attention to the subjugation of Morocco. During this relaxation of the constant warfare between Moors and Christians another independent state, Castile, an offshoot from León, came into existence, at first under the rule of the famous Count Fernán González. About 1028 it was erected into a kingdom. Castile, from its central position and consequently greater facilities for expansion, soon became the most powerful of the Spanish states. A considerable part of Aragon was wrested from the Moors by Sancho the Great of Navarre (1000-35), and at his death this part of his dominions passed as a separate kingdom to his son Ramiro, who added to it the districts of Sobrarbe and Ribagorza and a considerable extent of country which he conquered from the Moors. By 1131 the territory of the counts of Barcelona (Catalonia) was united with Aragon. The last Christian kingdom to be founded in the Iberian Peninsula was Portugal (q.v.).

The Omniads ruled Mohammedan Spain for about 275 years. The greatest of this dynasty was Abd er Rahman III, who ruled from 912 to 961 and who in 929 assumed the title of Caliph. His capital, Cordova (q.v.), was the greatest city in Europe except Constantinople and was unrivaled in the splendor of its edifices. The civilization of Spain during the Moorish supremacy was far in advance of that of the rest of Europe. At the great Mohammedan universities medicine and mathematics were cultivated, and Aristotle was studied there long before he was well known to Christian Europe. An extensive literature was developed, the caliphs themselves often being poets and authors of note. Commerce and agriculture were fostered, and the stranger marveled at the splendid system of irrigation, which made the country like a garden. The Moorish fleets controlled the Mediterranean and carried on an extensive trade. For the art which was developed in Spain by the Moors, see MOHAMMEDAN ART.

The Omniad dynasty came to an end in 1031, and a number of independent Moorish kingdoms were formed—Cordova, Seville, Toledo, Lisbon, Saragossa, Tortosa, Valencia, Murcia, Badajoz, and others of less note. The kings of Castile and Aragon did not fail to benefit by this disruption of the Mohammedan realm, for by well-directed and unremitting attacks they subdued some states and rendered others tributary. A few years more might perhaps have destroyed the Moorish domination in Spain had not the rulers, hard pressed by Alfonso VI of León and Castile, who in 1084 conquered the Kingdom of Toledo (New Castile), applied for aid to the ruler of the sect of the Almoravides (q.v.) in Morocco. The Almoravides crossed over to Spain, but after defeating the Christians they turned their arms against the Spanish Moors, and by the beginning of the twelfth century the Almoravide sovereign was acknowledged the ruler of Mohammedan Spain. The power of the Almoravides was extinguished by the Almohades (q.v.), a fanatical sect who passed over from Morocco just before the middle of the twelfth

century and conquered the territories of the Mohammedans. In a great battle fought on the plains of Tolosa (*las navas de Tolosa*) in 1212 the kings of Castile, Navarre, and Aragon broke the Almohade power in Spain. Soon nothing was left out of the wreck of the Almohade realm but the Kingdom of Granada, which was forced to acknowledge the overlordship of Castile. This last Moorish kingdom rose to great splendor.

Prominent among the late Castilian monarchs were Ferdinand III, who extended the dominions of Castile far into Andalusia, conquering Cordova in 1236 and Seville in 1248; Alfonso X the Wise, famous as a legislator, writer, and patron of learning; Alfonso XI; Peter the Cruel; and Isabella, whose marriage with Ferdinand the Catholic (1469) brought about the union of Castile and Aragon in 1479. Among the sovereigns who raised Aragon to the position of an important power and extended its dominion beyond the bounds of the Iberian Peninsula were James I (1213-76), who conquered Valencia and the Balearic Islands; Pedro III (1276-85), who obtained Sicily (1282); James II (1291-1327), who resigned his rights in Sicily to his brother Frederic, founder of the Aragon line of kings of Sicily; Alfonso V (1416-58), who conquered Naples; and Ferdinand II, the Catholic (1479-1516), who became the ruler of the whole of Spain. The mediæval history of Castile and Aragon is marked by a vigorous development of constitutionalism as embodied in the assertion of their power by the estates of the realm. (See *CORTES*.) In both kingdoms the cities enjoyed great political freedom, of which they were gradually deprived after the consolidation of Spain into a single monarchy.

The union of Castile, León, and Aragon enabled the Christians in Spain, both sovereigns and people, to undertake several plans that would otherwise have been impossible in such turbulent times. The balance of power in Castile had shifted from sovereign to nobles, from nobles to the middle class as represented in the Cortes, and back to the nobles. The highways were infested with bandits, many of whom were great nobles. The sovereigns reestablished the Holy Brotherhood, which made short work of the bandits by razing their castles and driving them into exile. In 1480 Isabella held the great Cortes of Toledo, one of the most important in the history of Spain. The laws were recodified, the system of judicial procedure was reformed, and five councils were established to handle foreign relations, petitions to the sovereigns, Aragonese questions, police, and finance. The Inquisition was reestablished in Castile and reorganized in Aragon in an effort to complete the unification in religious and political affairs and finish the reconquest of the peninsula. In the Cortes of Toledo a set of very oppressive laws was adopted against Jews. In 1481 the Inquisition was formally established in Seville, and from the beginning it was aimed particularly at those of Jewish or Moorish descent. In this same year the war on the Kingdom of Granada, the last Moorish foothold in Spain, was begun. Political unification of the peninsula was attained in 1492, with the fall of Granada. Ferdinand thereupon felt free to insist that Aragonese interests in France and Italy should receive attention. In order to get money to accomplish this the Jews were expelled and their property confiscated. The money thus

obtained enabled Ferdinand to recoup his losses in Italy and avenge himself upon the French. Under the "Great Captain" Gonsalvo de Córdoba the French were easily expelled from Naples, and Spanish infantry gained the reputation (enjoyed for 140 years) of being the finest infantry in Europe. Although the Moors had been promised religious and civil liberty, the Church authorities were not pleased and soon began a system of enforced conversion and petty persecution that became intolerable (See *XIMÉNEZ DE CISNEROS*.) In 1512 Ferdinand was able to conquer that part of Navarre that lay south of the Pyrenees, thereby completing the unification of Spain. The discovery of the New World by Columbus (1492) and its exploration and conquest by his followers opened up new vistas of wealth and power for the Spanish people at the time when their rulers were about to entangle them in the obligations and wars of the Empire and of all Europe. Isabella had died in 1504, and Ferdinand had at once renounced his title as King of Castile and León in favor of their daughter and her consort the Archduke of Austria, Philip the Beautiful. (With the marriage of Ferdinand and Isabella there went no actual and immediate union of the kingdoms. Each continued to be sole ruler in his or her own realms, with only courtesy title in the realms of the other.) Ferdinand announced that Juana wished him to act as Regent. Philip would consent to no such arrangement, but none the less craftily agreed with his father-in-law in proclaiming Juana's madness, so that in the end he was recognized as King of Castile and León and authorized to reign in her stead. He promptly put a stop to the terrible work of the Inquisition in Granada and in Cordova by suspending Deza and Lucero from their functions. In 1506 he suddenly died, possibly from poisoning. If Juana was not mad before, she became so after the death of Philip, and Ferdinand hurried back from Naples to assume the regency for his grandson Charles, son of Juana and Philip. In 1516 Ferdinand died, and the crowns of all the Spains at last became united in the person of Juana. But Charles I, who was now 16 years of age, rejected the regency of Cardinal Cisneros and ordered the Cardinal to proclaim him King, despite the fact that his mother was still alive. In 1519 he was elected to the throne of the Holy Roman Empire as Charles V. The Spains and Naples he inherited from his mother Juana; the Netherlands he inherited from his father Philip I (the Beautiful); he acquired the Duchy of Milan (embracing most of Lombardy) and in the New World came into possession of Mexico and Peru, whose gold and silver mines poured forth a ceaseless stream of treasure. Charles V was the most powerful Christian monarch of his time. His reign was taken up with endless wars with the French and attempts to suppress Protestantism throughout Europe and make war upon the Turks. (See *CHARLES V, HOLY ROMAN EMPEROR*.) For two years (1541-43) Charles was in Spain and devoted a part of each day to instructing Philip in the system of government, whose principles he was to continue, and Charles was so impressed with Philip's aptitude in the matters of statesmanship that when in 1543 he was obliged to return to Germany he decided to leave in Philip's hands the regency of Spain during his absence. Upon his departure Charles left for Philip's guidance two

letters that are of the utmost importance as giving the key to all of Philip's subsequent political action. The one dealt with politics and religion, domestic and foreign, and with the statesmen whom Philip must use. The other contained still more secret instructions concerning his social conduct and his private life. Philip was to play off the rival factions against each other and thus concentrate all real power in his own hands. Philip was eminently successful as Regent and fulfilled the Emperor's fondest hopes. From 1554 to 1558, as husband of Mary Tudor (see MARY I), Philip was King of England. Upon Philip's marriage to Mary Tudor, Charles conferred upon him the kingdoms of Naples and Sicily and confirmed to him the Duchy of Milan. In 1555 Charles handed the Netherlands over to Philip, and in 1556 the crown of Spain, which he had hitherto administered only as Regent, was formally transferred to him. The outstanding facts of the reign of Philip II (q.v.) (1556-98) are as follows: in pursuit of the policy he had inherited from his father he developed the Inquisition. His attempt to root out Protestantism in the Netherlands, to introduce there the Spanish system of taxation, and to rule that country as a province of Spain, without regard for his oath to defend the rights of the several states, brought on an uprising that ultimately caused Spain the loss of the Netherlands. The years 1568-70 saw the rebellion and expulsion of the Moriscos from the Kingdom of Granada. His wars against the Turks culminated in the brilliant victory of Lepanto (1571), which placed the Spanish naval power on a pinnacle of glory from which wars with England were destined to dethrone it, with the destruction of the Armada (1588). (See ARMADA; DRAKE.) Meanwhile in 1571 Legazpi conquered the Philippines, and in 1580 Philip conquered Portugal in defense of his unsound hereditary claims. The last period of Philip II's reign saw the war with Henry IV of France (q.v.), the treachery of Antonio Pérez (q.v.), the revolt of the Aragonese (1591), and the sack of Cadiz by the English (1596) as punishment for Philip's aid of the rebellion of Tyrone in Ireland. Philip's fiscal system could hardly have been worse in principle, and his concentration of all power in his own hands reduced all the councils and representative bodies, including the Cortes of the various kingdoms, to mere figureheads. The alcavala was a 10 per cent tax on the price of every article that changed hands by sale; the *sisas* or *millones* were a heavy tax on six of the leading necessities of life—wine, vinegar, oil, meat, soap, and tallow candles; and the great number of other taxes were made the more burdensome by being farmed out years ahead at ruinous rates of interest. In the succeeding reigns the alcavala was gradually forced up to 14 per cent and the *millones* were not only advanced to an eighth of the value of the six articles previously mentioned, but were extended to many other prime necessities. Under Philip III (q.v.) (1598-1621) the financial schemes of Lerma (q.v.) practically ruined the country. Furthermore the work of the Inquisition, politically and otherwise, looking towards the unification of faith, by successive edicts (the first great ban against the Moriscos was published in 1609) brought it to pass that by 1614 the country was entirely purged of infidels and also of its most expert and thrifty subjects.

Under Philip IV (q.v.) (1621-65) internal and external affairs went from bad to worse. By the middle of the seventeenth century at least 17 formerly prosperous industries had been driven out of Spain, especially those related to metal working, cordage, and shipbuilding, and the really national industries, silk weaving, fine fabrics, linens, and gloves, were reduced to a mere shadow. To combat the natural rise in prices Olivares issued an edict diminishing by half the value of copper money. Previous to this he had attempted to administer Portugal as a province of Castile and impose upon it the 5 per cent Castilian tax on all property, movable and immovable. This caused a rebellion whereby Portugal in 1640 was lost to Spain. In a subsequent war with France the Spanish infantry, which had for more than a century been reputed the finest in Europe, received the deathblow at the battle of Rocroi (1643). The Thirty Years' War (q.v.) left all Europe exhausted; the Treaty of Münster (1648) brought it to a close, securing from Spain the recognition of the independence of the Netherlands. With the reign of Charles II (q.v.) (1665-1700) the male line of the Hapsburgs in Spain became extinct. Under the previous reign the Inquisition had been less aggressive, but as in this reign no one was really in authority, the Inquisitors saw a chance, and took it, of reasserting their awful political influence, and in 1680 the greatest auto-da-fé ever held took place at Madrid. Under Charles II the disintegration of the Spanish Empire went on apace; the Treaty of Nimeguen (1678) gave Franche-Comté to France, and by the Treaty of Ratisbon (1684) Spain ceded Luxemburg to France, which again restored it to Spain by the Treaty of Ryswick (1697). It was finally ceded to Austria by the Treaty of Rastadt (1714). Upon the death of Charles II the conflicting claims to the throne of Spain produced the War of the Spanish Succession (see SUCCESSION WARS), in which England and Holland were allied with Austria, Prussia, the German Empire, and Savoy against Louis XIV to prevent the aggrandizement of France by the acquisition of Spain as an appanage of the house of Bourbon. When the rival Austrian claimant became Emperor and head of the Austrian dominions as Charles VI in 1711, a similar objection existed to his obtaining the throne of Spain, and the allies conceded the succession to Philip of Anjou, who had been proclaimed King of Spain as Philip V in 1700 and was confirmed by the Peace of Utrecht in 1713. This was the beginning of the Bourbon dynasty in Spain. Spain emerged from the War of Succession stripped of the Belgian Netherlands, Naples, Sicily, Sardinia, and her Lombard territories. She had to cede Gibraltar to the English, who had captured it in 1704.

A few years later Spain, whose policy was at this time directed by Alberoni, made an effort to recover some of her lost possessions, but her aggressions were promptly met by the Quadruple Alliance of 1718 between Great Britain, France, Austria, and Holland, and the schemes of the able Prime Minister came to naught. In the War of the Polish Succession, however, Don Carlos, son of Philip V, wrested the Two Sicilies from Austria and established the Bourbon dynasty there.

Philip was succeeded by his son, Ferdinand VI (q.v.) (1746-59), in whose reign numerous re-

forms were introduced in the administration. Ferdinand was succeeded by his half brother Charles III (q.v.) (1759-88), who, on ascending the Spanish throne, relinquished the Two Sicilies to his son, Ferdinand IV. Charles brought into Spain from his Italian domains a new spirit and initiated reforms in the internal administration, foreign policy, and economics of the state. As a result of the Seven Years' War, in which Spain joined France, Florida was ceded to Great Britain and Louisiana acquired from France (1763). In 1767 the Jesuits were expelled from the Spanish dominions. In 1779 Spain became the ally of France in the war against England, and in 1783 she recovered Florida, which in 1819 was ceded to the United States. Charles IV (q.v.) (1799-1808) was incapable of continuing his father's vigorous policy. He was under the control of the notorious Godoy (q.v.), the Queen's favorite, who played into the hands of Napoleon for his own profit. In March, 1808, the King abdicated in favor of his son Ferdinand, and the latter was compelled to renounce his claims to the crown in favor of his father, who then handed his right over to Napoleon. The latter then conferred the Spanish crown upon his brother Joseph Bonaparte. Deserted by their rulers, the Spanish people organized resistance, declared for Ferdinand VII, and refused to recognize the Bonapartes. A supreme junta of leading Spaniards was established at Seville, and subordinate juntas were formed in each of the provinces.

It was the obstinate resistance of Spain and the efficient work of the supporting English armies in the Peninsular War that first checked Napoleon and showed Europe that he was not invincible. (See PENINSULAR WAR.) Meanwhile the Spanish colonies in America revolted, and after a fierce warfare of 16 years the Spanish dominion on the American mainland was completely extinguished (1826). After the expulsion of the French King, Ferdinand VII returned to Spain and entered Madrid, May 14, 1814. The liberal constitution of 1812 enacted by the Cortes was at once abrogated, the religious orders were restored to their earlier predominance, the Cortes were abolished, and the Inquisition was reestablished. A popular reaction aided the King and his ministers in this course. A Liberal revolution in 1820 restored the constitution of 1812 and instituted a Cortes which was notable for its extreme liberalism. The Inquisition was abolished, and the privileges and exemptions of the Church were invaded. The clergy and the peasants opposed the revolution, but it was received with favor by the army and the educated classes. In 1822 the Holy Alliance (q.v.) took note of the Spanish situation, and France was commissioned to suppress the Liberal movement. A French army of nearly 100,000 men invaded the peninsula, and the Spanish forces were entirely unable to meet the attack. On May 24, 1823, the French entered Madrid, established a regency, drove the Cortes from Seville to Cadiz and out of the country, and restored Ferdinand, who had been declared of unsound mind by the Cortes. The King at once revoked all of the liberal measures except the abolition of the Inquisition. Repression and wholesale punishment followed. The French army remained in occupation until 1827. Bermúdez, the Prime Minister, adopted finally a moderate policy, but this satisfied

neither Absolutists nor Liberals. The Clerical party, guided by the Apostolic Junta, rallied around Ferdinand's brother, Don Carlos, as the representative of extreme absolutism and clericalism, and a number of insurrections were started by the Junta in his interest. In 1831 Ferdinand, having no male heir, decreed the revival, on behalf of his daughter Isabella, of the old law admitting female succession. Ferdinand died in 1833, and Queen Maria Christina became Regent for her daughter Isabella II. The Carlists proclaimed their candidate as Charles V, and there was an immediate division of parties in the Kingdom into Carlists and Cristinos. The Queen Regent was compelled to turn to the Liberals for support. A royal charter, in lieu of a constitution, was promulgated in 1834, but it did not give real popular government, and the ministry and the chambers were both under the control of the crown. Civil war broke out, and the Carlists were at first successful. An alliance was concluded by the Regent with England, France, and Portugal for the purpose of maintaining the crowns of Spain and Portugal against the pretenders Carlos and Miguel (qq.v.). The death of Zumalacárregui (q.v.), the only Carlist leader of ability, and the accession to the command of the government forces of General Espartero (q.v.) turned the tide. Maroto, the Carlist commander, concluded the Convention of Vergara with the government in 1839 and returned to his allegiance with his army. By this treaty Navarra and the Basque Provinces, which had been the strongholds of Carlism, were confirmed in their ancient privileges. Espartero defeated the remnants of the Carlists in Catalonia, and Don Carlos went into exile, handing over his pretensions to his son.

In the meanwhile the struggle for a Liberal constitution was being waged in the Kingdom, and a revolutionary movement at the palace of La Granja in 1836 forced Maria Christina to swear to the constitution of 1812. In 1840 Espartero, the Liberal leader, was made the head of the ministry on his own terms. Maria Christina resigned the regency Oct. 12, 1840, and the Cortes made Espartero Regent and guardian of Isabella and her sister. The Regent's firm government made enemies, and in 1843 a revolutionary movement, headed by Narváez and Prim (qq.v.), drove him from power. In November, 1843, Isabella was declared of age and assumed the crown, with Narváez, the leader of the Moderates (Moderados), as Prime Minister. Maria Christina was recalled and the constitution modified on reactionary lines. Narváez exercised practically dictatorial powers until 1851. Parties gradually readjusted themselves, the old Absolutists, with whom the Moderates tended to assimilate, grouping themselves about Queen Isabella and her mother, and the Liberal elements joining the Progressists. In March, 1851, a concordat was arranged with the Pope by which all ecclesiastical affairs were to be canonically regulated, and all religions but Catholicism were forbidden in the Kingdom, the Church in return yielding its secular jurisdiction and recognizing the sale of Church lands. A cabinet of personal supporters was made up by the Queen mother. They attempted in 1852 a modification of the constitution in the direction of absolutism. This led in 1854 to a new outbreak. A coalition of the more liberal Moderates under Narváez and Progressists

under O'Donnell (q.v.) was formed and was joined by Espartero, now again recognized as one of the Progressist leaders. María Christina left the country, and a government was formed with Espartero as President of the Council and O'Donnell as Minister of War. The latter was now at the head of a new party, the Liberal Union, which favored a liberal constitutional monarchy. In the coalition government the Progressists were at first the dominant factor, but before the new constitution of 1855 was promulgated they lost control. There were republican risings in the northeast and Carlist risings in the northwest, and the suspension of popular liberties by the government, while engaged in the suppression of these revolts, gave an opportunity to O'Donnell and his party. Their control was short-lived, and in 1856 Queen Isabella appointed a Moderate ministry under Narváez, which adopted a reactionary policy. In 1858 the Queen recalled O'Donnell, and he held office for five years. A war with Morocco (1859-60) had no result except to test the efficiency of the Spanish army. Spain joined France in the ill-advised Mexican expedition, but Prim, in command of the Spanish forces, signed a convention with Juárez and refused to support the French. Napoleon III was indignant with his ally, and in Spain there was bitter discussion of Prim's course. The Progressists made it a handle for a partisan attack on the government, and the Moderates also took a hostile attitude. The O'Donnell government, which had added vastly to the national debt, went down in 1863.

With the passing of the Liberal Union there was a gradual return to absolutism. The Miraflores government, which succeeded that of O'Donnell, attempted to govern constitutionally, but the Absolutist pressure in court circles was too strong, and this ministry gave way to successors more pliable. The government really fell into the hands of the *camarilla*, a group of personal favorites who had influence with the Queen. The Liberal groups were forced more and more into a hostile and revolutionary attitude. Castelar (q.v.), then a professor in the University of Madrid, raised his eloquent voice against the extravagance of the crown and was supported by the university. The government attempted to suppress such agitation. The Cortes was dissolved in 1866, and Marshal Serrano (q.v.), President of the Senate, was sent into exile. Narváez, who had represented all shades of political opinion at different times, was now called to the head of affairs and maintained a strong government, which was really a military dictatorship, until his death in 1868. An open revolt headed by Prim failed, but a little later Prim, Serrano, and Admiral Topete (q.v.) began a better organized and better supported revolutionary movement. The fleet at Cadiz under Topete declared for national sovereignty. Serrano marched towards the capital, defeated the government forces at Alcolea on Sept. 28, 1868, and on October 3 entered Madrid, already in a state of insurrection. Isabella in the meanwhile escaped into France, and the revolution was accomplished.

A provisional government was established by the revolutionists under the presidency of Serrano. A liberal monarchical constitution was put through by a combination of Republicans under Castelar and Progressists under Prim and was promulgated June 6, 1869. Serrano

was made Regent, with Prim as Prime Minister. Carlists, Republicans, and Constitutional Monarchists all aspired to profit by the upheaval in the government. Several foreign princes were invited to take the crown—among them Prince Leopold of Hohenzollern, whose candidacy (July, 1870) gave rise to irritation between France and Germany and in a measure provoked the Franco-German War. At last in December, 1870, Amadeus, Duke of Aosta, son of King Victor Emmanuel, accepted the crown (see AMADEUS I), but before his arrival in Madrid Prim, the king maker, was assassinated. King Amadeus thus lost a strong support, and he abdicated Feb. 11, 1873, after a brief and uncomfortable reign, distracted at the end by a great rising in favor of the young Don Carlos (Charles VII) and disturbed by an insurrection in Cuba, which had broken out in 1868. A republic was then declared. Figueras was the first President of the Ministry, with Castelar as Minister of Foreign Affairs. A constituent Cortes was summoned in June and prepared a constitution making Spain a federal republic. Several ministries attempted vainly to cope with the situation, which, in addition to the Carlist insurrection in the north, was complicated by the risings of the *Intransigentes* (see INTRANSIGENTS) and *Internationals* in the cities of Andalusia, Murcia, and Valencia. On September 7 Castelar was made President of the Executive with dictatorial powers, and the Cortes adjourned until January, 1874. The wise and positive course of Castelar in enforcing order and recognizing conservative interests displeased the extremists, and when the Cortes reassembled a vote of lack of confidence was passed. Castelar resigned, and Serrano became nominally President of the Executive, but in reality a military dictator. He carried on with vigor the war against the Carlists, but he had hardly secured recognition for his government from the European Powers when Gen. Martínez Campos (q.v.) proclaimed Alfonso XII, son of Isabella, King (December, 1874). The army declared for Alfonso. The Serrano government, of which Sagasta (q.v.) was then Prime Minister, gave way, and Cánovas del Castillo (q.v.) headed a provisional government. Alfonso, then 17 years of age, assumed the government on Jan. 14, 1875, guided by Cánovas del Castillo. The Carlist revolt was completely suppressed in 1876. Don Carlos went into permanent exile, and Navarra and the Basque Provinces were deprived of their ancient privileges and *fueros* (q.v.). A constitution of a decidedly illiberal character was adopted in 1876, and its provisions were enforced with severe literalness by the ministry of Cánovas del Castillo. By 1878 order had been reestablished throughout most of Cuba. Martínez Campos, who was sent to the island to put down the insurrection, came back in 1879 an advocate of a reform policy towards Cuba and attempted to form a ministry on that issue, but failed and went into the opposition. Much of his programme, including abolition of slavery in the Antilles, was carried out by Cánovas del Castillo. In 1881 a more liberal régime was inaugurated under Sagasta.

The government under the restored monarchy was nominally in the hands of a ministry responsible to the majority in the Cortes, but personal factions and rivalries disintegrated parties to such an extent that this was not so in practice. There were two leading parties—

Conservatives, and Liberals or Constitution-  
 alists, both upholding the constitutional mon-  
 archy. The remnant of the Carlists could do  
 little but agitate. The Republicans lacked a  
 leader, since Castelar had given up the repub-  
 lican programme as impracticable. Cánovas del  
 Castillo returned to power in 1884, after having  
 been out of office for three years. On Nov. 25,  
 1885, Alfonso XII died, and his widow, Chris-  
 tina, who was pregnant, became Regent of the  
 Kingdom, the premiership being intrusted to  
 Sagasta. On May 17, 1886, Christina gave birth  
 to a son, who became King as Alfonso XIII.  
 Sagasta governed with vigor, energetically re-  
 pressing military uprisings, and brought about  
 the enactment of a measure providing for uni-  
 versal suffrage. A Conservative ministry under  
 Cánovas del Castillo was in office from July,  
 1890, to December, 1892. The succeeding Liberal  
 ministry under Sagasta was unpopular because  
 of its attempt to apply needed economies and its  
 severe measures to repress anarchism, which  
 had become rampant in Catalonia. In 1895,  
 when a new revolt broke out in Cuba, the Con-  
 servatives returned to power under Cánovas del  
 Castillo. The army officers were dissatisfied  
 with the growth of the civil power and restive  
 under the criticism of an increasingly inde-  
 pendent press. Premier Cánovas del Castillo  
 was assassinated in 1897, and Sagasta took his  
 place at the helm, in time to face the problems  
 of a war which was already imminent. The  
 Cuban revolt produced complications which led  
 in 1898 to a conflict with the United States.  
 (See CUBA; SPANISH-AMERICAN WAR; UNITED  
 STATES.) This unequal struggle was brought  
 to a close by a treaty of peace negotiated at  
 Paris, Dec. 10, 1898, by which Spain relin-  
 quished her sovereignty in Cuba, Porto Rico,  
 and the Philippine Islands. Later the Caro-  
 line, Pelew, and Ladrone Islands were sold to  
 Germany.

The military party under Weyler (q.v.) made  
 the peace treaty an issue and forced Sagasta  
 out of office. A Conservative ministry headed  
 by Silvela came in, but resigned in Octo-  
 ber, 1900, and a reconstruction was effected  
 under General Azcárraga on distinctly military  
 lines. Anticlerical disturbances in 1901 pointed  
 to a growing spirit of liberalism and independ-  
 ence. A new government was organized under  
 Sagasta, March 6, 1901, and adopted a stern  
 attitude towards the religious orders. King  
 Alfonso XIII came of age May 17, 1902, and  
 the regency was terminated. For several months  
 Sagasta retained office with great reluctance,  
 and on Dec. 6, 1902, the ministry retired, and  
 an entirely new cabinet was constituted by Sil-  
 vela. During the ensuing years there was a  
 rapid alternation of ministries, as many as four  
 cabinet changes occurring in 1905. Closer rela-  
 tions were established with France in 1904, the  
 two nations agreeing on a common policy in  
 Morocco. In 1906 a vigorous anticlerical cam-  
 paign was begun by the government, aiming at  
 the establishment of civil marriage and the  
 regulation of religious associations. On May  
 31, 1906, King Alfonso XIII married Princess  
 Ena of Battenberg, a granddaughter of Queen  
 Victoria. On May 10, 1907, an heir to the  
 throne was born and christened Alfonso. Under  
 the stress of the anarchistic activities and the  
 assassinations of the Portuguese King and  
 Crown Prince the Terrorist Bill was voted in  
 1908, and Spain joined France in the handling

of the Moroccan question. The year 1909 saw  
 renewed anarchistic activities and an attempt  
 at revolution in Barcelona, which led to the  
 trial and execution of Ferrer. The speech from  
 the throne (1910) announced that measures  
 were to be adopted for putting the relations of  
 Spain and the Vatican upon a more modern  
 basis, for limiting the number of religious  
 orders, and for obliging those orders that in-  
 dulged in business to pay the regular taxes. A  
 previous royal order granted to non-Catholic  
 bodies the right to display the signs of their  
 religion on their buildings and make public an-  
 nouncement of their services. These reforms,  
 proposed in a much more gentle way than had  
 been the similar reforms in France, were placed  
 under the leadership of Canalejas, who secured  
 the passage of the Padlock Law in 1910, and  
 introduced his Associations Bill in 1911. This  
 campaign he continued until his assassination  
 in 1912, when his successor, Count Romanones,  
 undertook it, although he pressed it with less  
 vigor. It has not yet been passed, nor has  
 the Decentralization Bill been passed, although  
 introduced by Canalejas in 1912 and earnestly  
 supported by Romanones and by his successor,  
 Dato, who in 1913 secured the passage of a  
 provisional decree giving effect to its vital prin-  
 ciple. In the Great War which began in 1914  
 Spain announced a policy of strict neutrality.

**SPALATIN**, spä'la-tën', GEORG BURCKHARDT (1484-1545). A German reformer and friend of Luther. He was born at Spalt, near Nuremberg, and took his name Spalatin from his birthplace. He studied law and theology at Erfurt and Wittenberg. In 1508 he was ordained priest. He became one of the trusted advisers of the Elector Frederick the Wise of Saxony and was influential in winning his sympathy for the Lutheran movement. He continued to enjoy court favor after the death of Frederick and was made canon of Altenburg in 1525. He wrote biographies of the electors Frederick the Wise (ed. by Neudecker and Preller, Weimar, 1851) and John the Constant, *Christliche Religionshündel or Religionssachen* (extracts from which were published as *Annales Reformationis* by Cyprian, Leipzig, 1818), and a history of popes and emperors of the Reformation period. Consult Seelheim, *Georg Spalatin als sächsischer Historiograph* (Halle, 1876), and G. Berbig, *Spalatin und seine Verhältnis zu Martin Luther* (ib., 1906).

**SPALATO**, spä'la-tō. A seaport of Dalmatia, on a peninsula in the Adriatic Sea, 74 miles southeast of Zara (Map: Austria, E 5). High mountains are north and east, and Fort Grippi on the east. The harbor, protected by a long mole, is safe. In the remarkable palace of Diocletian, to which the town owes its name, the Emperor lived after abdicating. The remains are interesting—the loggia, with its red columns, and a ruined rotunda being noteworthy. The old town, with its narrow streets, is mostly inclosed within the palatial ruins. The new town, with wide thoroughfares, lies to the west. The cathedral is an octagonal structure of Roman origin. Spalato has a naval school, an episcopal seminary, a Serbo-Croatian national Realschule and Gymnasium, and a public garden. Spalato exports olive oil, fruit, and especially wine. There are manufactures of wool and silk. Pop., 1900, 27,198; 1910, 31,451, mostly Serbo-Croatians.

**SPALDING**, spä'l'ding, ALBERT (1888- ). An American violinist, born in Chicago. He

began his studies with Jean Buitrago at New York, continuing with Chiti in Florence. After further study under Lefort in Paris he made his debut in the French capital in 1906, where he met with a flattering reception. His tours of France, Germany, and England securely established his European reputation. It proved more difficult to arouse enthusiasm in the United States, where he appeared in 1909, but after a few seasons his countrymen acknowledged him among the violinists of the first rank. As a composer he attracted attention with a *Prelude and Fugue* for piano, a set of variations on *My Old Kentucky Home*, a *Concerto quasi fantasia* for violin and orchestra.

**SPALDING, ALBERT GOODWILL** (1850-1915). An American merchant, born at Byron, Ill. In 1871 he joined the Boston Club of baseball players and pitched for them until 1875. After 1876 he was a member of the Chicago Club, serving successively as manager, secretary, and president of the club until 1891. In 1876 he established and became president of A. G. Spalding & Bros., dealers in sporting goods, and later organized also a manufacturing branch of the firm, known as the Spalding Manufacturing Company, of which he also became president. These enterprises were very successful. After 1900 Spalding lived at Point Loma, Cal., as a member of Mrs. Katherine Tingley's (q.v.) Raja Yoga Theosophical colony. In 1910, at the primaries, he won the Democratic nomination for United States Senator, but was not elected. He wrote *America's National Game* (1911).

**SPALDING, JOHN FRANKLIN** (1828-1902). An American Protestant Episcopal bishop. He was born at Belgrade, Me., and was educated at Bowdoin College and at the General Theological Seminary, New York. In 1873 he was consecrated Missionary Bishop of Colorado, with jurisdiction in Wyoming. His principal publications are: *The Threefold Ministry of the Church of Christ* (1864; 2d ed., 1887); *The Church and its Apostolic Ministry* (1887); *The Best Mode of Working a Parish* (1888); *Jesus Christ the Proof of Christianity* (1891).

**SPALDING, JOHN LANCASTER** (1840-1916). An American Roman Catholic archbishop. He was born at Lebanon, Ky., was educated at Mount St. Mary's College and at the University of Louvain, Belgium, was ordained priest in 1863, was appointed secretary and chancellor of the diocese of Louisville in 1869, and was consecrated Bishop of Peoria in 1877, resigning in 1908 on account of ailing health. In 1909 he was made titular Archbishop of Seythopolis. He took a prominent part in various social and educational movements and in 1902 was a member of the President's commission to investigate the coal strike. Among his writings are a *Life* of his uncle, Archbishop M. J. Spalding (q.v.) (1873); *Education and the Higher Life* (1890); *Things of the Mind* (1894); *Means and Ends of Education* (1895); *Thoughts and Theories of Life and Education* (1897); *Opportunity and Other Essays and Addresses* (1900); *Socialism and Labor* (1902); *Religion, Agnosticism, and Education* (1902); *Religion and Art and Other Essays* (1905).

**SPALDING, MARTIN JOHN** (1810-72). An American Roman Catholic archbishop. He was born near Lebanon; was educated at St. Joseph's, Bardstown, Ky., and in Rome, where he was ordained priest in 1834; and became Coadjutor

Bishop of Louisville in 1848 and Bishop in 1850. In 1864 he succeeded Dr. Kenrick as Archbishop of Baltimore. He published: *Early Catholic Missions in Kentucky* (1846); *Lectures on the General Evidences of Christianity* (1847; 4th ed., 1866); *Life of Right Rev. B. J. Flaget* (1852), his predecessor at Louisville; *History of the Protestant Reformation* (1860). Consult his *Life* by his nephew, John L. Spalding (q.v.) (Baltimore, 1873).

**SPALDING, WILLIAM** (1809-59). A British author. He was born in Aberdeen, where he was educated at Marischal College. In 1833 he became an advocate. A deep and minute student of the Elizabethan drama, he published a notable "Letter on Shakespeare's Authorship of 'The Two Noble Kinsmen'" (1833; reprinted by New Shakespeare Society, 1876) and other important contributions, which appeared mostly in the *Edinburgh Review*. In 1840 he became professor of rhetoric and belles-lettres in Edinburgh University and in 1845 professor of logic, rhetoric, and metaphysics at St. Andrews. He was the author of *Italy and the Italian Islands* (3 vols., 1841), the fruit of his travels and studies, and of a useful, compendious *History of English Literature* (1853). Consult the *Life*, by J. H. Burton, prefixed to the "Letter" in the New Shakespeare Society edition above mentioned.

**SPALLANZANI**, späl'län-tsä'nè, LAZZARO (1729-99). An Italian biologist, born at Scandiano and educated at Modena and Bologna. In 1754 he became professor at Reggio, in 1761 at Modena, and in 1768 professor of natural history at Pavia. He was distinguished in experimental physiology, where he disproved the doctrine of spontaneous generation of life and demonstrated the physiology of digestion and the true nature of the spermatid fluid and spermatozoa. His works are *Opuscoli di fisica animale e vegetabile* (1780) and *Expériences pour servir à l'histoire de la génération des animaux et des plantes* (1786).

**SPALLART, FRANZ XAVER VON NEUMANN**. See NEUMANN-SPALLART, F. X. VON.

**SPANDAU**, spän'dou. A town in the Province of Brandenburg, Prussia, situated at the confluence of the Havel and the Spree, 9 miles west-northwest of Berlin, of which it is now a suburb (Map: Germany, E 2). Through extensive improvements in its fortifications and the construction of numerous detached forts Spandau has been made a stronghold of the first rank for the protection of Berlin. In the citadel, which is also used as a government prison, is the Julius tower, in which was kept the Imperial military reserve fund of \$30,000,000 in gold, of which the basis was the French indemnity of 1871. Spandau has an infantry rifle-practice school, an artillery construction bureau, and a Gymnasium. The state ammunition, rifle, and artillery works are located here. The city owns the gas works. Its manufactures include porcelain, woollens, and military tents. The town is the shipping centre for a large trade between Berlin and Hamburg. There are fisheries and important horse and lumber markets. Spandau received municipal privileges in 1232 and was strongly fortified in the fourteenth century. Pop., 1900, 65,014; 1910, 84,855.

**SPAN'DREL**. The flat wall space comprised between two adjoining half arches or between a half arch and any adjacent vertical member, such as a pier, column, or pilaster, and limited

above by a horizontal line or band or entablature near to or touching the crowns of the arches. This space is approximately triangular and offers an admirable field for decoration. It may be adorned with figures in relief, as in Roman triumphal arches, or with medallions, as in the Ospedale degli Innocenti at Florence and many other Renaissance buildings; with surface enrichments in color or with incised or relief carving. In certain types of steel arched bridges the spandrels are formed by series of columns or other supports for the upper chord of the truss or the roadway. The term is also applied in the engineering of steel-skeleton buildings to the rectangular space between two columns from the head of a window to the sill of the window next above it.

**SPANGENBERG**, späng'en-bërk, AUGUSTUS GÖRTLIEB (1704-92). A bishop of the Moravian church. He was born at Klettenberg, Prussia, and educated at Jena, and while there, in 1728, came under the influence of Zinzendorf (q.v.). In 1732-33 he was a member of the theological faculty of the University of Halle. He then allied himself formally with the United Brethren and was sent to the West Indies and North America as a missionary, receiving in 1735 a grant of land near Savannah, Ga., and establishing a colony there. The Moravians made him Bishop in 1744, and for nearly 20 years he exercised his jurisdiction principally in America. In 1760 he was called to the supreme council of the sect, four years later was appointed supreme inspector in Upper Alsatia, and in 1789 was made president of the general directory. He died at Berthelsdorf, Saxony. His principal work is *Idea Fidei Fratrum, oder kurzer Begriff der christlichen Lehre in den evangelischen Brüdergemeinden* (1782), translated into English by Benjamin La Trobe (1784). Consult lives by K. F. Ledderhose (Heidelberg, 1846; Eng. trans., London, 1855), G. C. Knapp (ed. by Otto Frick, Halle, 1884), and G. Reichel (Tübingen, 1906).

**SPANGLED COQUETTE**. See HUMMING BIRD.

**SPANIARD ROD**. See OSIER.

**SPANIEL** (abbrev. of OF. *chien espagnol* (Fr. *épagneul*), Spanish dog, from Sp. *Español*, Spanish, from *España*, Spain). A short-legged, long-haired variety of the domestic dog. Two groups may be made: (1) hunting spaniels, (2) fancy or toy spaniels. The first contains the field spaniel, clumber, cocker, Norfolk, Sussex, and English and Irish water dogs; the second the King Charles, Prince Charles, Ruby, Blenheim, and Japanese spaniels. They are exceedingly close hunters on a ground scent; though for rapidity of action and range they have been supplanted by the pointer and setter, they are unsurpassable in rough, tangled country. They neither point nor set, but (except the clumber) give tongue when they scent the game. The difficulty is to keep their eagerness in control. They not only find game, but retrieve it, especially from water. The chief characteristics of all varieties are length of body and shortness of legs (in modern dogs greatly exaggerated), a great abundance of beautiful silky coat, and a placid disposition.

**Field Spaniel and Cocker**. Although of different origin, these may well be considered together. Both in form are long and low, with shapely, gracefully carried heads and straight strong front legs. The coat is straight, dense,

and silky, heavily fringing the ears, the back of the legs, and the toes. The color most preferred is solid black. The cocker spaniel will usually weigh from 18 to 24 pounds, the field spaniel twice this.

**The Clumber**. This is a large dog weighing up to 65 pounds, with a predominance of white in color. It takes its name from the seat of the Duke of Newcastle, who introduced the breed into England from the kennels of the Duc de Noailles of France early in the eighteenth century. Unlike other spaniels these hunt in silence. They are handsome, grave-looking dogs, with massive heads and a furrow between the eyes. The nostrils are large, open, flesh-colored; the eyes large and deeply set, showing a haw. The coat is not long, except the profuse featherings, properly lemon and white with few markings. The tail is usually docked. The Sussex spaniel is a variety of clumber which must be a rich golden liver color. It is faster in the field and, although not mute, is less noisy than others. The Norfolk is another variety of this type which arose in the English county of that name as a pheasant dog. In the days of hawking this spaniel was the falconer's special assistant. See Plate of Dogs.

**Irish Water Spaniel**. This dog is of very ancient lineage and great value as a retriever. Its general appearance is that of a large spaniel, with a topknot of hair over the eyes. The tail tapers like that of a pointer; the face is long and the hair on it free from curling, though that on the body is closely curled, and the small, dark amber eyes are set flush, without eyebrows. The color is a rich dark liver and the weight from 50 to 60 pounds.

**Toy Spaniels**. The best known of the small pet or fancy spaniels is the King Charles—a black and tan, maintained pure-blooded for many generations with jealous care by the dukes of Norfolk. In early times they were broken to hunt. Now they are only pets. They are in the main simply miniature spaniels, weighing from 7 to 10 pounds, with eyes large, wide apart, and level, and ears long, drooping, and silky. The Blenheim resembles the King Charles, but its ears are shorter and it differs in color, being a pure pearly white, with bright chestnut or ruby-red markings, evenly distributed in large patches. Both the ears and cheeks are red, with a blaze of white between them, in the centre of which is one small red spot. The breed is named from the estate of the first Duke of Marlborough, by whose family it was bred. They were in those days trained for the hunt as well as highly prized in the house. The Prince Charles, Charles I spaniel, or tricolor, resembles the Blenheim, except that where the Blenheim is red he is black, and he has no blaze. The ruby is a King Charles spaniel, red, with a black nose. The Japanese spaniel is pure white, parti-colored with black or red or lemon, and very small. It may weigh 8 to 12 pounds or only 1 pound, as do some of the sleeve dogs, so called in Japan because they may be carried in the coat sleeve. The Japanese spaniels have a compact body, large, highly arched head, with dark eyes set high and wide apart. The nose is short and puglike, the legs are slender, and the tail is well feathered and carried in a tight curl over the back. They are alert and affectionate. A similar dog is highly esteemed in China, especially when solid fawn or silver in color.

Consult M. H. Spicer, *Toy Dogs* (New York, 1903): also references under Dog.

### SPANISH-AMERICAN LITERATURE.

**The Colonial Period.** Spanish-American literature owes almost nothing to the few fragments of Nahua and Inca literature that survived the destruction of hieroglyphs by the Spanish conquerors. The early literature centres largely around the city of Mexico. (See MEXICAN LITERATURE.) As subsidiary literary centres Bogotá, Quito, Lima, and Guatemala became noted during the later colonial era.

The subject matter of intellectual colonial effort consists largely of the preparation of grammars and dictionaries of native languages (Menéndez y Pelayo, in *La ciencia española*, gives a list of 50 of the principal ones) and of catechisms and sermons in both Spanish and the native vernacular. This work is merely of philological interest. Another branch of literary activity was the writing of the history of the conquest and early settlement of America. During the later colonial period works on natural and political science began to appear. The remaining literary effort produced a few works of merit (so recognized by the mother country), of importance in the further literary development of America. These writers (largely ecclesiastics, though occasionally some conquistador handled the pen equally well with the sword) described the conflicts of the Spaniards with the natives, as did the Chilean epic poet Pedro de Oña (born 1560-70), in his *Arauco domado*, and the Peruvian poet Pedro de Peralta y Barnuevo, in his *Lima fundada*; or they depicted the beauties of natural scenery and the happenings of agricultural life, as did the Guatemalan Rafael Landívar (1731-93), in his bucolic Latin poem, *Rusticatio Mexicana*; or they collected the materials for history and wrote excellent accounts of the pacification and settlement of America, as did Juan de Velasco of Ecuador, in his *Historia del reino de Quito*, and the Jesuits Ovalle and Rosas in Chile. Fr. Juan de Barrenechea y Albis, of the latter country, in his *Restauración de la imperial* (1693), made a solitary attempt at novel writing. There appeared also some worthy attempts at devotional writing, both in prose and verse, such as the *Sentimientos espirituales* of the Colombian Sor Francisca Josefa de la Concepción (died at Tunja, 1742) and *La Cristiada* of Diego de Ojeda (who lived in Lima early in the seventeenth century). Juan de Castellanos (sixteenth century) of New Granada, in his *Elegías de varones ilustres de Indias*, not only celebrated in hendecasyllabic verse the deeds of the early explorers of America and of his native viceroyalty, but also achieved the doubtful distinction of writing the longest poem in the language. The crowning glory of New Granada, however, lies in the intellectual movement which, under the leadership of José Celestino Mutis (1732-1808), the "illustrious patriarch of botanists of the New World," and the many-sided José de Caldas (1741-1816), became memorable in the Spanish-American scientific literature of the latter half of the eighteenth century. During this same period the Ecuadorian Antonio de Alcedo (died 1812) produced his *Diccionario geográfico-histórico de las Indias occidentales* (1786-89), a translation of which, by G. A. Thompson, with numerous additions, was published in London (1812-15).

**The Period of Independence.** The revolu-

tionary days of the early nineteenth century, which, in Spanish America, substituted the radical philosophy and sentiment of the progressive French for the unswerving loyalty and religious mysticism of the conservative Spaniard, did not wholly release American writers from dependence upon peninsular schools of thought. Through translation and imitation one may trace the influence of Byron, of Hugo, of Heine, and other great leaders of the Romantic school of literature; but in most cases these and other writers are introduced to Spanish America indirectly, and above all through the writings of the Spanish Romanticist Zorilla, who has exerted a most profound influence upon American authors. The one great bond that unites the separate republics and keeps them in touch with the thought of the mother country is the "sonorous Castilian language," which its best writers have preserved in all its grammatical and rhetorical purity of diction, but to which they have given a buoyancy and flexibility lacking in the original and a greater freedom of thought.

During the early decades of the nineteenth century themes suggested by the revolutionary conflict, in which many writers took part, naturally formed the greater portion of the literary output. The period which followed is marked by literature of a more contemplative tone. Within recent years there has arisen the new school of creolism, whose devotees show in the faithful portrayal of native customs, generally of a rustic character, many elements of rugged strength. During the century there has also occurred a shifting of literary centres in South America. Lima, Quito, and Bogotá have been relegated to a secondary rank, while Buenos Aires, early brought under the direct influence of the French Romantic school, and Caracas, influenced as profoundly by Zorilla and his followers, and Santiago, at present the centre of the most inspiring literary productions of the South American continent, far outstrip their rivals.

The chief literary figure of Latin America is that of Andrés Bello (q.v.), whose mastery of Castilian is illustrated in his many-sided career and whose reputation as a poet rests chiefly upon his georgic *La agricultura en la zona tórrida*. José Antonio Maitín (1792-c.1859), another native of Venezuela, was one of the first of the ardent followers of Zorilla. Rafael María Baralt (1810-60), in his *Historia antigua y moderna de Venezuela*, in style and method compares favorably with the best of modern Spanish historians and also ranks high as a linguist and poet. Among others who have shed lustre on the literary reputation of Venezuela are the members of the gifted Calcaño family, Julio and José Antonio; the Romantic poet José Heriberto García de Quevedo (1819-71); the lyricist Jacinto Gutiérrez Coll (1836- ), made famous by his *A mi ángel guardián and Sueño de amor*; Francisco de Sales Pérez (1836- ), whose *La vida del campo* is a faithful portrayal of the customs of his native llanos; and the present-day Díaz Rodríguez, whose artistic romance, *Sangre patricia*, recalls the Italian D'Annunzio. Colombia was the home of the lyric poet José Eusebio Caro, whose *Lara* (published in 1834) marked an important literary period in the history of his native land. His associate, Julio Arboleda (died 1862), essayed in *Gonzalo de Oyón* a notable attempt at epic writing, but achieved a greater success in his brilliant ro-

mance *Casimiro el Montañés*. The realistic poet José Joaquín Ortiz is favorably known because of his masterpiece, *Los colonos*. The most noted Spanish-American novel, *María*, is the work of the Colombian Jorge Isaacs, while the *Historia de la revolución de Nueva Granada* (1827) of José Manuel Restrepo is but one of the many historical works that have brought honor to the northern Republic. Her southern neighbor, Ecuador, boasts of the statesman poet José Joaquín de Olmedo (1782-1847), whose *Canto de Junín* is the most stirring of revolutionary poems, but whose work has been rivaled by the more recent verse of Juan León Mera, famous also as a critic and for his novel *Cumandá*, and Julio Zaldumbide, a poet of the Contemplative school. Mention should also be made of the lyric poet Numa Pompilio Llona (born 1832), who wrote *Odisea del alma* and *Cantos americanos* and whose *Noche de dolor en las montañas* is one of the best poems of recent Spanish-American literature; and also the poet and orator Gabriel García Moreno and the elegant prose writer Juan Montalvo. Lima in Peru was the home of the political satirist Felipe Pardo de Aliaga, famous also for his dramas *Frutos de la educación* and *Una huérfana en Chorillos*. From the middle of the century Peruvian writers have largely followed the Spanish school of Romantic literature, and one of the most inspiring of this class of writers is Fernando Velarde, whose collected poems, *Flores del desierto*, appeared in 1848. José Arnaldo Márquez (1825-81) is regarded as the leading lyric poet of modern Peru. In fiction *El Padre Orani* of Narciso Aréstegui occupies a prominent place, and the dramatists M. N. Corpancho (born 1830), C. A. Salaberry, and M. A. Segura take a high rank. But the most important author in modern Peruvian literature is beyond question Ricardo Palma (born 1833) (q.v.). As under the political régime of viceroyalty days, Bolivia has continued to be in a literary sense the appendage alternately of Peru and of Argentina, but the lyric poetry of Ricardo J. Bustamante (1821-84) and the *Ensayo sobre la historia de Bolivia* of Manuel José Cortés (1811-65) have received favorable notice, as has also the *Últimos días coloniales en el Alto-Perú* (1896), written by Gabriel René-Moreno (born c.1835).

Chile, long the most backward of the South American republics, was greatly aroused by the long residence of Bello and by the coming of many exiled Argentines. Of the succeeding generation the publicist and poet Arteaga Alemparte (1835-80) achieved a poetic triumph in his hymn *Al amor*. Isaías Gamboa, in his *Poemas* (1902); the rare and strange Antonio Bórquez Solar, in his *Campo lírico* (1900); and Carlos Walker Martínez, in *Poesías* (1894) and *Romances americanos* (1899), exhibit an elevation of thought and a beauty of versification unequalled elsewhere in Spanish-America and hardly surpassed in Europe. Chilean writers of history and political science, among whom are reckoned Vicuña MacKenna, Barros, Arana, and the Amunáteguis, likewise enjoy an international reputation, while *Alberto el jugador*, a novel by Rosario Orrego de Uribe, *Contra la marea*, by Alberto del Solar, and the work of Salvador Sanfuentes, Eusebio Lillo, and Guillermo Blest Gana attest the worth of her writers of fiction, some of whom wrote dramas also.

With the dawn of independence the classic translations and imitations of Valera, Quintana, and Cienfuegos inaugurated the literary history of Argentina, a history which includes that of her neighbor, Uruguay. In Argentina Estéban Echeverría, one of the first American lyricists, known for his *La cautiva*, introduced romanticism directly from the French and liberated the thought of his own countrymen. His fellow citizen José Rivera Indarte produced the stirring poem *El festín de Baltasar*, and his pupil Juan María Gutiérrez the lyrics *Recuerdo* and *A mi caballo*. Following these came a host of litterateurs with centre at Buenos Aires or, in time of political proscription, at Montevideo, whose work in poetry and prose has greatly influenced the political thought and literature of their own and neighboring republics and has rendered famous the names of the historian and novelist Vicente Fidel López, the dramatist José Mármol (author also of the novel *Amalia*), and the poet José Hernández, whose *Martín Fierro* has been the most widely sold poem of the southern continent. The *Flores silvestres* of the dramatist Francisco Javier de Achá of Uruguay have also met with a favorable reception, and the *Libro extraño* of Francisco Sicardi is one of the best of recent novels. The *Historia argentina* (1894) of Mariano A. Pelliza is a monumental work of great merit. In the department of criticism the *revistas* of Buenos Aires have occupied a leading place, and one of their most famous contributors was Juan Bautista Alberdi, whose *Escritos completos* appeared in 1886. Bartolomé Mitre's *Historia del general Belgrano* is one of the most successful attempts at biographical history that the century has produced. Central America, in addition to a number of political writers, has contributed to the field of letters the satirist José de Batrés y Montúfar and the writers of fables García Goyena and Matías Córdoba of Guatemala.

**SPANISH-AMERICAN WAR.** A war between the United States and Spain, which occurred in 1898. After a consideration of the conditions in Cuba, which had existed in the island for a century and had resulted in violations of the laws of humanity and in systematic disregard of the rights of American citizens, the United States determined to intervene. The Cuban uprising of 1895 had been suppressed with severity by Spain. Devastation, famine, and death were the lot of the natives, and lives and property of foreigners were not safeguarded. On April 6, 1896, Secretary of State Richard Olney offered in rather vague terms the friendly offices of the United States to save Cuba from "absolute impoverishment" and to ameliorate the condition of foreigners in that country. Spain declined, and President Cleveland, in his annual message to Congress in December, 1896, spoke of "higher obligations" than those due to Spain, which would devolve upon the United States if Spain should be unable to cope with conditions. In the early part of McKinley's administration Congress appropriated \$50,000 for Cuban relief. Sagasta, the new Prime Minister of Spain, perceiving the trend of affairs, recalled the hated Captain General Weyler and sent out General Blanco in his stead. Spain promised to establish civil order in Cuba and to give it local autonomy when the American Minister to Spain, Stewart L. Woodford (q.v.), announced that his country could not view with indifference indefinite prolongation of existing conditions. In the meantime the United States government began to strengthen its naval forces. Relations became further strained when a letter written by the Spanish Minister criticizing President McKinley was stolen from the mails and published. His resignation followed the disavowal of any knowledge of the affair by the Spanish authorities. The critical point was reached when the United States battleship *Maine* was blown up on the evening of Feb. 15, 1898, in Havana harbor with a loss of 266 men. Boards of investigation were appointed by both countries. The American commission reported that the catastrophe was due to the explosion of a submarine mine. This was supported by a later investigation (1911). On March 8 Congress appropriated \$50,000,000 for national defense, and on March 11 the War Department began mobilization of the regular army. President McKinley had again tendered the good offices of the United States, before the report of the investigating committee, but, not satisfied with Spain's reply, determined to lay the whole matter before Congress. In anticipation of war American citizens left Cuba, the Cuban Junta demanded recogni-

tion before interference, and Spain declared a general truce on April 10. In his message (April 11) President McKinley described the situation, declaring intervention necessary, advising against recognition of the Cuban government, and requesting Congress to take action. Eight days later Congress declared the people of Cuba free and independent, demanded the surrender of all Spanish authority over the island, and empowered and directed the President to enforce this resolution by the army and navy. The President signed this ultimatum on April 20 and gave Spain until the 23d to make satisfactory reply. The Spanish Minister almost immediately demanded his passports, and the American Minister was handed his at Madrid. Formal declarations of war were issued by Spain and the United States on April 24 and 25 respectively.

The first naval action occurred on April 27, when Capt. W. T. Sampson (in charge of the blockading squadron, Cuban north coast) bombarded Matanzas. Spain sent a fleet to Cuban waters and had another in Philippine waters. Com. George Dewey (q.v.), who was at Hongkong, was ordered (April 25) to "proceed to the Philippine Islands; commence operations at once against Spanish fleet; capture vessels or destroy." On April 30, under cover of the darkness, he entered Manila harbor with 9 vessels, 131 guns, and 1678 men. The next morning he attacked Admiral Montojo, whose 10 more or less helpless vessels (120 guns and 1796 men) lay at anchor in Cavite Bay. After a four-hour fight he destroyed the enemy's fleet and silenced the local fortifications with a loss of only six wounded. The whereabouts of the Spanish fleet in Cuban waters, under the command of Cervera, puzzled the Americans for some time until it was discovered in Santiago Bay. The harbor was rigorously blockaded by Admiral (then Captain) Sampson (q.v.), who had superseded Com. W. S. Schley (q.v.) on June 1. A daring attempt by Lieut. R. P. Hobson (q.v.) to close the harbor channel by the sinking of the collier *Merrimac* was unsuccessful. On Sunday morning, July 3, Cervera's ships emerged. The United States fleet immediately pursued and in four hours destroyed or drove ashore the six Spanish ships. The Spanish losses were about 350 killed and 1700 officers and men captured. The Americans lost one man and had ten wounded.

President McKinley had issued a call for 125,000 volunteers on April 23, 1898, and a second call for 75,000 more on May 25. Spain had about 197,000 men in Cuba, of whom 155,000 were regulars. On June 13 Gen. W. R. Shafter, U.S.V. (q.v.), left Tampa, Fla., with 815 officers and 16,072 men, composed almost entirely of regulars. His instructions were: "Go with your force to capture garrison at Santiago and assist in capturing harbor and fleet." He landed on June 20 at Daiguiri, the Spaniards withdrawing to their intrenchments near Santiago, protected by barbed-wire entanglements. Gen. Joseph Wheeler (q.v.) dislodged the Spanish troops at Las Guasimas after a sharp engagement in which he lost 68 men, killed and wounded (Spanish loss 28). On July 1 the United States troops, with the aid of Cubans under General García, began the general assault on the Spanish positions. Two really separate actions were fought, El Caney and San Juan; San Juan Hill was captured at 1.30 p.m.; El Caney carried by storm at 4.30. On July 3 General Shafter notified the Spanish commander, Toral, that unless

he surrendered by the morning of the 4th the city would be shelled. The truce which followed was ended on the 10th and hostilities, under the form of a siege, resumed. On the 16th articles of capitulation were signed. All forces, material, and territory of the District of Santiago were to be surrendered and all Spanish soldiers to be transported to Spain. The Spanish losses are not accurately known; those of the Americans were 1156. On July 25 Gen. Nelson A. Miles, U.S.A. (q.v.), landed on the island of Porto Rico; his skillfully conducted campaign was terminated on August 13 by the news that an armistice had been concluded. On August 13 Admiral Dewey and Gen. Wesley Merritt made a combined attack on the city of Manila, which surrendered; final capitulation was concluded August 14. About 13,000 Spanish soldiers yielded to the Americans, who had lost only five killed and 43 wounded. For the subsequent organization of the Filipinos for gaining independence, see AGUINALDO; PHILIPPINE ISLANDS.

Spain sought peace through the French Ambassador late in July. On August 12 the peace protocol and preliminary arrangements were concluded. The treaty was signed on December 10 in Paris; by this Spain withdrew from Cuba and ceded Porto Rico, Guam, and the Philippines to the United States, which in return agreed to pay her \$20,000,000 and to yield temporary commercial privileges in the Philippines. The political status of the inhabitants of the new possessions was to be determined by the new government. During the war a high death rate in camps brought out charges of maladministration against the War Department. See ALGER, RUSSELL A.; CUBA; PHILIPPINE ISLANDS; PORTO RICO; UNITED STATES.

**Bibliography.** Official reports, especially those of General Miles for 1898 (Washington, 1898); J. R. Spears, *Our Navy in the War with Spain* (New York, 1898); H. C. Lodge, *The War with Spain* (ib., 1899); John Bigelow, *Reminiscences of the Santiago Campaign* (ib., 1899); C. D. Sigsbee, *Story of the Maine* (ib., 1899); R. P. Hobson, *Sinking of the Merrimac* (ib., 1899); George Kennan, *Campaigning in Cuba* (ib., 1899); Joseph Wheeler, *Santiago Campaign, 1898* (Philadelphia, 1899); Theodore Roosevelt, *The Rough Riders* (New York, 1899; new ed., 1905); A. T. Mahan, *Lessons of the War with Spain* (Boston, 1899); R. H. Titherington, *History of the Spanish-American War of 1898* (New York, 1900); H. H. Sargent, *Campaign in Santiago de Cuba* (3 vols., Chicago, 1907); F. E. Chadwick, *Relations of the United States and Spain* (2 vols., New York, 1911).

**SPANISH-AMERICAN WAR, NAVAL AND MILITARY ORDER OF THE.** A patriotic and hereditary society organized in New York City on Feb. 2, 1899. It admits to membership any man of good repute who served on the active list or performed active duty as a commissioned officer, regular, or volunteer in the United States army, navy, or marine corps during the war with Spain or in the subsequent insurrection in the Philippines, or who participated in the war or insurrection, prior to April 1, 1901, as a naval or military cadet or as an officer in the revenue-cutter service on any vessel assigned to duty under the control of the Navy Department.

**SPANISH BARBER, THE.** A comedy by George Colman, the elder, produced in 1777, based on Beaumarchais' famous comedy *Le Barbier de Séville*.

**SPANISH BAYONET.** See YUCCA.

**SPANISH FEVER.** See TEXAS FEVER.

**SPANISH FLY.** See BLISTER BEETLE.

**SPANISH FOWL.** The black Spanish fowls constitute one of the oldest varieties of domestic poultry and are renowned for fine laying qualities. The white face is a distinguishing feature and should be long, smooth, free from wrinkles, rising over the eyes in arched form, extending towards the back of the head and the base of the beak, covering the cheeks and joining wattles and ear lobes. The plumage is rich, glossy black; any gray is considered a defect. Shanks and toes are blue or dark leaden. The comb is single, bright red; wattles, bright red, except the inside of the upper part, which is white; ear lobes, pure white.

**SPANISH FRIAR, THE.** A drama by Dryden, produced in 1681, in part a satire on Roman Catholic priests. Two plots, one serious, the other comic, are combined in the story, connected by Dominick, the friar, a fat, amusing rascal.

**SPANISH GYPSY, THE.** 1. A romantic comedy by Middleton, assisted by Rowley, printed in 1653. Two stories are combined, one from Cervantes' *Fuerra de la Sangre* and the gypsy tale from his *La Gitanilla*. 2. A long dramatic poem by George Eliot (1868). A Spanish grandee is about to marry a beautiful girl, who discovers that she is the daughter of the gypsy chief Zarco. The call of race and duty finds itself in conflict with her love, and the outcome is a renunciation of her personal happiness.

**SPANISH LANGUAGE.** A Romanic language, i.e., Modern Latin, as spoken in Spain and carried by Spanish colonists to the Canaries, the Antilles, the Philippines, Mexico, portions of the United States, Central America, the greater part of South America, and a few places on the coast of Africa, and by the Jews into Turkey and other regions in which they settled after their expulsion from Spain in 1492. In the Iberian Peninsula the boundaries of the Spanish-speaking domain do not coincide exactly with those of the political division called Spain, since within the latter are contained in the northwest Galicia (whose inhabitants speak Gallegan, a language which, while closely akin to Portuguese, is recognized by many linguists as an entirely independent member of the Romanic family and has had an interesting literary renaissance since about 1875), the Basque Provinces (q.v.) in the north, and along the east coast the Principality of Cataluña and the Kingdom of Valencia (wherein Catalan (q.v.) is spoken). The inhabitants of the Balearic Islands speak a Catalan dialect. Probably not far from 55,000,000 persons at present use Spanish as their native tongue, the majority being in the New World. Five principal dialects are distinguishable in the language as spoken in the mother country: Asturian, Leonese, Aragonese, Andalusian, and Castilian. Castilian has become the standard literary speech.

Castilian has the five simple vowels, *a, e, i, o, u*, a variety of diphthongs, and a few triphthongs produced by the union of a strong vowel (*a, e, o*) with two weak vowels (*i, u*). The diphthongs *ie* and *ue* are especially common as representatives of a Latin short *e* or *o*. Qualitative distinctions in vowels (open and close *e* and *o*) exist, but are not so marked as in certain other Romance languages. The consonant sounds are *p*; a bilabial spirant written both *b* and *v* (the usual sound of these letters); a bilabial stop

written both *b* and *v* (the value of these characters where they follow an *m* of the same word or an *n* at the end of the preceding word, as in *también* and *en vida*; the sound is that of the usual English *b*, pronounced with less emission of breath, for the sound of the English *v* does not exist in Spanish); *f*; *v* (written *u* in hiatus); *m*; *t*, a voiceless lingua-dental explosive (articulated farther forward in the mouth than the corresponding English sound and with less emission of breath); a voiceless spirant that is interdental or nearly so (written *c* before *e* or *i*, and *z* at the end of a word, or before a consonant, or before any vowel, though rarely now before *e* or *i*, e.g., *celo*, zeal, *zapato*, shoe; the value is about that of *th* in the English *breath*); a voiced spirant, interdental or nearly so (written *d*, which has this sound especially between vowels, as in *lado*, side; or when preceded by a vowel and followed by *r*, as in *padre*, father; or at the end of a word, as in *abad*, abbot; the value is about that of *th* in the English *breath*); *l*; a palatalized *l* (written *ll* and pronounced nearly like the *h* of *fili*al); *n*; a palatalized *n* (written *ñ* and pronounced like the *ni* of *pinion*); a simple tongue-trilled *r* (never slurred); a reinforced form of the same sound (written *rr* between vowels and *r* at the beginning of a word or after *s*, *l*, or *n* within a word, e.g., *perro*, dog, *reo*, criminal, *israelita*, Israelite, *honra*, honor); a voiceless *s* (with the value of the English *ss*); *y* (written both *i* in hiatus and *y*); *k* (written *c* before *a*, *o*, and *u*, or before a consonant and in the final position, and *qu* before *e* and *i*, e.g., *carro*, car, *querer*, to like, *quién*, who); *g* (the so-called hard sound of English *g* in *game*, *get*; written *g* before *a*, *o*, *u*, and *gu* before *e*, *i*, e.g., *gato*, cat, *guerra*, war); a velar or guttural spirant (with approximately the value of *ch* in Scotch *loch* and German *nach*; written *j* in all positions and *g* frequently before *e*, *i*, e.g., *jamás*, never, *gente*, people; some observers find also a voiced form of this spirant, but it is usually voiceless); a velar *n* (with the value of English *ng* in *sing*; written *n* before a guttural or palatal, as in *banco*). It is the general rule that the Spanish written characters represent actual sounds, but *u* is frequently used before *e* or *i* as a sign that a preceding palatal consonant has the hard or stop value, as in *que* or *guerra*; *j* is silent in the singular noun *reloj*; and in a few words like *usted* a final *d* may not be pronounced. The simple *h* is generally not pronounced, though before the diphthong *ue* it may have a slight aspiration. In the conjunction *y* (= and) the sound is that of the vowel *i*. An aversion to the doubling of consonants is a distinguishing feature of Spanish spelling; *c* and *n* alone may be doubled, as in *acción*, action, *innoble*, ignoble, and these combinations must be pronounced as double sounds wherever they occur; *ll* and *rr* are properly not doubled consonants, and they figure as individual signs in the alphabet. Among the combinations of consonants may be mentioned *ch*, which stands in the Spanish alphabet as a single letter or character, with a value like *ch* in the English word *church*, e.g., *chico*, little. According to the Academy the written *x* is a double consonant equivalent to *ks*, but before a consonant there is a rather widespread tendency to pronounce it like a simple *s*. In older Spanish *x* was a much more common character than now and had the value of English *sh*. By a decree of the Spanish Academy issued in 1815, *x* with the value of *sh*

has been displaced in favor of *j*, pronounced as described above. The matter of accentuation is governed by strict rules of the Academy. Words ending in a consonant not *n* or *s* regularly stress the last syllable, e.g., *verdad*, truth. Words ending in *n* or *s* or in a vowel regularly stress the syllable before the last, e.g., *aman*, they love, *hijos*, sons. Words infringing these rules and all words stressed on a syllable not the last or second last must bear a written acute accent on the stressed syllable, as *nación*, nation, *cortés*, courteous, *médico*, physician. If a diphthong or a triphthong occur in the stressed syllable, the stress will fall upon its strong element (*a*, *c*, or *o*), and where the diphthong consists of two weak elements (*i*, *u*) the second of the two will have the stress.

In its chief grammatical usages Spanish accords with French, Portuguese, Italian, and the other Romanic languages. A decided peculiarity is the use of the preposition *á* (to) before the direct object of a verb when that object represents a definite person, e.g., *veo á mi amigo*, I see my friend. An idiomatic usage that lends great flexibility to the sentence structure is that of the infinitive in dependent conditional clauses, and others, with a subject pronoun in the nominative case. Like Portuguese, Spanish has two verbs "to have" (*tener* and *haber*, the latter used to-day only as an auxiliary in conjugation) and two verbs "to be" (*estar* and *ser*), and in each case the functions of the verbs are distinct. With *estar* and the gerund of a principal verb there may be formed a very useful periphrastic conjugation corresponding to the English progressive form, thus, *Juan está estudiando*, John is studying. Instead of the four conjugations of Latin there are but three in Spanish; furthermore, regular verbs of the Spanish second conjugation and the Spanish third conjugation differ in only four forms, viz., the present infinitive, the first and second persons plural of the present indicative, and the second plural of the imperative. There are certain radical-changing verbs which, though perfectly regular as to their endings, change their root vowels *e* and *o* under the accent to the diphthongs *ie* and *ue* respectively, or, going a stage farther, to the simple vowels *i* and *u*. The subjunctive mood persists with much more vigor than in most modern languages; besides the usual present and imperfect tenses it has a second imperfect form (called also the conditional subjunctive), which is properly a descendant of the Latin pluperfect indicative and upon occasion may still be used as an indicative pluperfect or aorist in Spanish, and also a descendant of the Latin future perfect indicative, the so-called future, or hypothetical subjunctive. Spanish has also a real second person plural present imperative form in addition to its second person singular. For all other affirmative imperative purposes, and for all negative imperative purposes, the corresponding forms of the present subjunctive must be used. Auxiliaries are used to form the compound tenses, as in the sister Romanic tongues, but, contrary to the custom in French and Italian, it is "to have" (*haber*) and not "to be" that forms the perfect tenses of reflexive verbs; thus *se ha lisonjeado*, he has flattered himself. Spanish outdoes by far most of the other Romanic languages in its idiomatic use of reflexive verbs with special meanings. As in the other Romanic languages the Spanish future and conditional indicative are really compounds formed by add-

ing to the entire infinitive (used as a stem) the present and imperfect indicative endings, respectively, of *haber*. The neuter gender survives in the case of the singular of the definite article *lo*, of the demonstrative words *esto*, *eso*, *aquello*, and of the objective pronoun of the third person *lo*. These neuter forms occur only in indefinite and general constructions, and when the neuter article, always accompanied by an adjective (or an adverb), forms abstract expressions, thus, *lo bueno*, the good = goodness.

Latin, of course, forms the basis of the Spanish vocabulary, but there is an admixture of words from other sources. There are doubtful traces of words from pre-Romanic languages, such as Iberian and Celtic and the speech of the Punic invaders and colonists. Despite trading relations, few permanent acquisitions seem to have been made from Greek until after the Roman conquest. The Visigothic invasion brought very few Germanic words, but that of the Arabs brought in a host of Oriental words, many of which are easily detected by the prefixed Arabic article *al*. In the eleventh century many lexical elements came from beyond the Pyrenees with the entrance of French soldiers, ecclesiastics, and colonists, and an infusion of Italian elements was occasioned by Aragonese domination in Italy and by the great vogue of Italian poetry in the Spanish Peninsula during the fifteenth and sixteenth centuries. Colonial relations have led to the introduction of a few terms from Indian and other sources, and learned influences have constantly increased the stock of borrowings from Latin, Greek, and French.

Traces of written Spanish are found in Latin deeds and grants as early as the eighth century, but the first really important Spanish document is one of the eleventh century, containing a series of glosses, and literature in Spanish does not begin until the twelfth century, in so far as the extant documents are concerned.

**Bibliography.** The second decade of the eighteenth century saw the founding of the Spanish Academy, and the results of its activity were a *Diccionario de la lengua castellana* (6 vols., Madrid, 1726-39), an *Ortografía* (ib., 1742; 24th ed., ib., 1913), and a *Gramática* (ib., 1771; frequently revised and kept up to date). An abridged edition of the *Diccionario* was produced in 1780 and has been repeatedly revised (14th ed., ib., 1914). **SPANISH LAW.** The most widely extended branch of the civil law (q.v.). Even if Portuguese law, which is an offshoot of mediæval Spanish law, be left out of the reckoning, Spanish law prevails to-day over a wider area and governs a larger population than any other system except the English. Spanish law, in its Castilian form, was introduced into all the Spanish colonies. In Mexico, in Central America, and in all of the South American states, except Brazil (which is governed by Portuguese law), the law of Castile still forms the historical basis of the legal order. Modern Spanish law, as codified in the later decades of the nineteenth century, obtains in Cuba, in Porto Rico, and in the Philippines.

**History.** 1. *Pre-Roman and Roman Periods.* In mediæval Spanish law, some legal historians find traces of Iberian, Celtic, and Phœnician customs, but for all practical purposes the history of Spanish law begins with the conquest and civilization of the peninsula by the Romans. Until the fifth century of the Christian era the rule of the Roman law was as complete in Spain as in any other province of the Roman Empire. The laws of Malaga and Salpensa, preserved in inscriptions dating from 82 or 83 A.D., are among the most valuable sources of our knowledge of Roman municipal law.

2. *Visigothic Period.*—A new and important element was introduced in the fifth century by the Germanic conquest of the peninsula. In the Visigothic Kingdom, which existed until 711, the conquered Roman population retained for nearly two centuries their own law in matters that concerned themselves only. A special compilation of Roman law, the so-called Breviary of Alaric (q.v.), was drawn up for their use 506 A.D. From the name of the royal official who attested the copies of this compilation it is generally described in Spanish legal literature as the Breviary of Anianus. The Visigothic conquerors, however, lived by their own customs and laws, and to these, in case of conflict, the Roman law gave way. Their law also was put in written form. The so-called *Lex Antiqua Visigothorum* (palimpsest in the Bibliothèque Nationale, Paris) is ascribed by some authorities to King Euric (466-c.485 A.D.), by others to King Leovigild or to King Recared, a century later. The written law of the Visigoths was developed from reign to reign, with an increasing infusion of

Roman law, civil and ecclesiastical. The assemblies which approved these laws were practically Church councils; they consisted wholly or chiefly of prelates. About the middle of the seventh century the Breviary of Alaric was deprived of legal authority, and the Romanized *Lex Visigothorum* became the general law of the peninsula. The form in which this code has come down to us is practically that which it received in the reign of King Reccesuinth (649-672). In the eighth and following centuries the Visigothic code was frequently described as the *Liber Iudicum*, or *Forum Iudicum*, or (in the vernacular) *Fuero Juzgo*. To the Visigothic period belongs a Spanish collection of council decrees and papal decretals, the so-called *Hispana*, which was much used in western Europe and became one of the most important sources of the canon law (q.v.).

3. *Mediæval Period*.—The Moorish conquest and occupation of the peninsula (711-1492 A.D.) left few permanent traces upon Spanish law. The Christians who lived under Mohammedan rule retained not only their religion, but, in matters concerning themselves alone, their laws also. This was the case even with the so-called *Mozarabs*, who accepted the speech of the conquerors, as is shown by the existence of an Arabic translation of the *Hispana* and by Arabic notes on the Visigothic code. As the peninsula was gradually reconquered by the Christian states of northern Spain the Moors who remained enjoyed similar privileges, but the general expulsion of the *Moriscos* (1609-14 A.D.) left Catholic Christianity and Gothic-Roman law in complete dominion. In Christian Spain, however, as in other parts of Europe, the development of the law during the Middle Ages was particularistic. The Visigothic code remained, in theory, applicable, but its rules were superseded by local, provincial, and class customs and laws (*fueros*, q.v.). The Spanish cities obtained charters of self-government (*cartas pueblas*) and developed independent city laws earlier than in the cities in the rest of Europe. The earliest town law that has come down to us is that of León (1020). At the close of the fourteenth century there was scarcely a town of any consequence that had not its own *fuero*. In the open country the tenants and serfs of the crown, of the Church, and of the nobles lived by different manorial customs. The earliest *fueros* of provinces or kingdoms represented the legal customs of the nobles; one of the most interesting of these is the *Fuero Viejo* of Castile (1212). In the thirteenth century attempts were first made to combine the general rules of provincial and town law in general *fueros* of the various kingdoms, issued by the kings with the approval of the estates. Such were the *Fuero Real* (1255) and the *Ordenamiento de Alcalá* (1348) in Castile; the *Fuero de Huesca* (1247) and the *Observancias* (1437) in Aragon; and the *Fueros Generales* of Navarre (1237) and of Valencia (1239). The revival of the study of the law books of Justinian in the twelfth and following centuries resulted in Spain, as elsewhere, in more or less reception of Roman Imperial law. (See CIVIL LAW.) In Catalonia, Valencia, and Navarre the law books of Justinian, as interpreted by the Italian commentators and taught in the Italian and Spanish universities, were received as subsidiary common law. In Aragon and Castile they were not so received in bulk, but in Aragon the new jurisprudence influenced legislation, and in Castile it produced an essentially Roman code, the celebrated *Siete Partidas*.

In its first form (so-called *Spéculo* or *Setenario*) this code dates from 1260, but it did not obtain legal force until 1348. It was to be applied only when the general laws of Castile and the special *fueros* still in force furnished no rule, but in practice, through the influence exercised upon the courts by the doctrines of the universities, the *Partidas* to some extent supplanted the purely Spanish sources.

4. *Modern Period*.—The union of Castile and Aragon (1479), the conquest of Granada (1492), and the annexation of Navarre (1512) established the modern Kingdom of Spain. In the new Spain, however, the provinces that had been separate kingdoms retained a considerable degree of autonomy. Each of them kept its separate parliament (*Cortes*), and in each of them the law was developed by provincial legislation. In each of them compilations of the laws were made from time to time. In Castile the most important legislative products were the *Ordenanzas Reales* (1485), the *Leyes de Toro* (1505), the *Nueva Recopilación* (1567), and the *Novísima Recopilación* (1805-07). After the parliaments had ceased to play an important part some of the new laws promulgated by the kings were made applicable to all Spain. One penal code was adopted in 1822, another in 1848, another, which is still in force, in 1870. The existing code of criminal procedure dates from 1882. A code of civil procedure was promulgated in 1855 and revised in 1881. In 1885 a commercial code was adopted. The attempts to unify the civil law encountered obstinate resistance because of the attachment of the provinces to their ancient *fueros*. The law of real property was transformed, early in the century, by the abolition of feudal tenures and of entails, and an important law requiring the registration of conveyances, mortgages, etc., was adopted in 1861 (revised in 1871). Civil marriage was introduced in 1870. In 1888 a general civil code was adopted (revised in 1889), but this code has not given Spain a common law; for, except as regards the law of marriage, it does not derogate from the laws previously in force in Navarre, Aragon, Catalonia, and the Balearic Isles, i.e., it has in these provinces only subsidiary force. In Catalonia the Roman law, civil and canon, is still subsidiary law. In the rest of the peninsula, however, the Code of 1888-89 has replaced the older laws.

*Spanish Colonies*. From the early part of the sixteenth century many laws were issued concerning the colonies. The earliest compilation of these laws was made in Mexico in 1563 by Vasco de Puga. In 1570 was published in Spain a collection of orders in council affecting the colonies, and a fuller collection was made early in the seventeenth century. In 1680 a code of colonial laws was published—*Recopilación de las Leyes de las Indias*. (This was repeatedly revised, the last edition dating from 1841.) This code dealt chiefly with administrative matters, to some extent with crimes and penalties, hardly at all with private law. In matters not covered by special colonial legislation the laws of Castile had been applied from the beginning, and this practice was expressly sanctioned in the *Laws of the Indies*, II, i, 2 and II, xv, 66. In the early part of the nineteenth century (1810-26) all the Spanish colonies of Central and South America achieved their independence. These republics have adopted codes of their own. The earliest Spanish American civil code was that of Bolivia

(1831). The most important is that of Chile, which has served as a model for several other Central and South American codes. All these codes, like the Spanish Code of 1888-89, show the influence of the Code Napoléon. (See CODE.) In Cuba, Porto Rico, and the Philippines the Spanish codes of the nineteenth century are still in force.

**Bibliography.** Systematic works on the older Spanish law: Juan Sala, *Compendio del derecho real de España* (ed. by J. F. Suárez, 2d ed., Madrid, 1833), with subsequent editions; Gómez de la Serna and Montalbán, *Elementos del derecho civil y penal de España, precedidos de una reseña histórica* (14th ed., 3 vols., ib., 1886). Antequera, *Historia de legislación española* (3d ed., ib., 1890); G. E. M. Chapado, *Historia general del derecho español* (Valladolid, 1900). The Spanish codes and the more important Spanish laws in force in the United States insular dependencies are published by the United States War Department.

**SPANISH LITERATURE** (called also Castilian literature, since the dialect of Castile is the dominant and literary speech of Spain). Literature in the Spanish tongue began only when the process of reconquest restored to the Christian Spaniards a considerable portion of their ancestral domain. This first literature was epic, reflecting the warlike spirit of an heroic age. Very little of the Old Spanish epic poetry has been preserved to us in anything like its original form. The only considerable remains are some poems on the Cid (of which one, the *Poema del Cid*, dating from 1140, is the oldest extant monument of Spanish literature), some fragments of a poem or of poems on the Infantes of Lara, and a learned poem on Fernán González. But allusions and records in the Chronicles and elsewhere lead us to believe that there once existed many epics now lost. According to the recent investigations of Menéndez Pidal, we

must abandon the theory of Gaston Paris, that the Spanish epic is derived from the French, and accept in its stead a development parallel to that of the French. It was quite natural that the French tales dealing with Charlemagne's wars against the Spanish Arabs should impress the Spaniards, and it was equally natural that the Spanish *juglares* should seek to make native heroism play some part in the conflicts with the Moors. This they did by inventing the figure of Bernardo del Carpio to supplant the French hero Roland. The traditions concerning Bernardo are preserved for us only in the *romanceros* and in the prose accounts of the Chronicles, especially the *Crónica general* of Alfonso the Wise; but the Chronicles drew upon the poems of the *juglares* for the matter that they contain.

We come to a thoroughly domestic tradition in the story of Fernán González, Count of Castile (932-970), with whom began the actual though not the nominal independence of that region. An extended poetic account of his active life we owe to a monk of the monastery of San Pedro de Arlanza. This work was written in 1250 or shortly thereafter, but we now possess it only in a manuscript of the late fifteenth century, which is incomplete, and in a few short manuscript fragments. The *Crónica general*, however, affords us the substance of what must have been the second part of the poem. A purely Spanish tradition is found again in the tragic story of the seven Infantes of Lara (or Salas), done to death through the perfidy of their uncle and aunt and later avenged by their Moorish half brother, Mudarra. Here, also, the legend is preserved in various reworkings of the *Crónica general*, which has, in this case, absorbed many verses of the Old Spanish poems on the subject without wholly obliterating their assonance and metre. Careful and dextrous studies by Menéndez Pidal have reconstructed for us about 300 lines of the primitive epic, *Gesta de los Infantes de Lara*, which has a strange and naïve beauty and energy. By similar studies Puyol y Alonso has unearthed from the *Crónica del Cid* a *Cantar de gesta de Don Sancho II de Castilla*, whose primitive form may well belong to the eleventh century. By good fortune we still possess two of the Old Spanish poems dealing with the story of the doughtiest of all the native heroes, the Cid (q.v.), an historical personage of the eleventh century. The *Poema del Cid* has survived in but a single and incomplete manuscript of the fourteenth century, and besides its versification is in an exceedingly irregular state. There are three main divisions (or *cantares*): the first begins with Rodrigo's exile from Castile and ends with the capture of the Count of Barcelona (vs. 1-1086); the second carries the account (vs. 1087-2277) through the conquest of Valencia and the marriage of his two daughters to the historical Infantes of Carrión (who were long considered as fictitious characters); while in the third (*La afrenta de corpes*) the necessity of punishing the Infantes for their abuse and desertion of their spouses brings the Cid to the court of Castile and affords an opportunity for completely reconciling him and his liege lord. The poem ends with a second marriage of the Cid's daughters, who, now wedding the princes of Barcelona and Navarra, make the Cid an ancestor of the later royal house of Spain. Other works of importance in this anonymous age are the *Disputa del alma y el cuerpo*, *La vida de Santa María Egipcíaca*, *Libro de los tres reyes dorient*, *Libro*

de Apollonio, and *Razon de amor con los denuestos del agua y vino*, all of the early thirteenth century. An imaginative account of the Cid's youth is found in the poem termed the *Crónica rimada* (which might better be called the *Cantar de Rodrigo*), a document of the fourteenth century which has survived only in a fifteenth-century reworking. It relates particularly Rodrigo's slaying of the Count of Gormaz and the marriage of the youthful slayer to the Count's daughter, Ximena.

Much greater than the bulk of the heroic poetry preserved is that of Old Spanish religious, didactic, and narrative verse. Of this the oldest monument that has come down to us is the liturgical drama *El auto de los reyes magos*. Some scholars claim that it appeared as early as 1120, and in any case it seems certain that it belongs not very late in the twelfth century and that consequently it is probably the oldest drama that has survived in any modern literature. The greater part of this early verse, however, is in the form of monorhymed quatrains called *cuderna vía* and often mistaken for Alexandrines. There is no knowledge of the existence of this learned poetry before the thirteenth century, but in the first half of that period it is found fully developed in the works of the cleric Gonzalo de Berceo, who is the first Spanish poet that we know by name. He flourished in the first half of the thirteenth century. Most of his productions deal with religious subjects. There is now attributed to him furthermore a long poem dealing with profane matter, the *Libro de Alexandre*, which relates in some 2500 stanzas the life of Alexander the Great. The assignment to Berceo is, however, far from proven.

Spanish prose, at first clumsy and labored, earliest appeared in the *Diez mandamientos* (early thirteenth century) and in law codes (*Fuero Juzgo*, 1241, and *Siete Partidas*, 1256-63) and official documents. The first use of Spanish prose for chronicle purposes is seen in the two *Anales Toledanos* put together before 1250. Alfonso X the Wise (?1220-84) wrote, or had written under his direction, many works dealing with the science of the time. Great value attaches to the so-called *Crónica general*. As early as 1251 he had caused to be made the translation of the celebrated Arabic book *Kalila et Digna*. Thanks to this many-sided interest and encouragement from the King, moralizing works and collections of sententious sayings drawn from Arabic sources or written in imitation of them became rife both in Alfonso's time and in the ensuing period. One of the Arabic moral anthologies thus introduced into Spanish was the very popular *Bocados de oro*, which lived on in the poetical aphorisms of Sem Tob and Santillana.

Sancho IV (1284-95), the successor of Alfonso X, inherited his father's love for letters, and by his direction there were prepared translations from Latin, French, and Provençal, e.g., *Li livres du Tresor* of Brunetto Latini. The interesting translation, the *Gran conquista de ultramar*, dealing with the Crusades and preserving the substance of French literary monuments now lost, was long attributed to this reign. It now seems probable that it was begun at a later period. According to the researches of Foulché-Delbosq and Groussac it seems likely that we shall have to deny to Sancho IV the credit of having written the *Castigos e documentos*, which is an adaptation of a fourteenth-cen-

tury Castilian translation of Egidio Colonna's *De Regimine Principum* (written c.1284). The translations that were made, however, show a broadening interest in foreign literature, further exemplified in an early fourteenth-century version of the prose *Tristan*. To the extreme end of the reign of Sancho IV we must probably credit the beginning of the first independent example of Spanish prose fiction, the *Caballero Cifar*, which gives us our first sketch of the knight-errant and of the *picaro*, the chivalresque and picaresque types in which Spain was to excel. If indeed the original version of the celebrated *Amadis de Gaula* were Spanish (and the oldest version and the oldest references to it, that we know, are Spanish), it too must probably be assigned to the end of this reign.

Literature was not especially favored by Sancho's immediate successor, but a monarch of intellectual force appeared again in Alfonso XI (1312-50). The most important of the works which were prepared under his direction was a series of chronicles that should close the gap between his own time and the period with which the *Crónica general* of Alfonso X ended, a work which formed the basis of the *Poema de Alfonso XI*. Don Juan Manuel (1282-1348), a nephew of Alfonso X, played a more direct part in the development of letters at this time, being, like his uncle, one of the greatest prose writers in early Spanish literature. The great prose that had been developed for didactic and historical uses he turned to the service of creative didactic literature. The most interesting and important of his many treatises is the famous framework of tales called the *Conde Lucanor* or *Libro de Patronio*. The contents of the 51 tales comprise historical or pseudohistorical elements relating to Spain, matters of personal experience, Arabic traditions, besides elements drawn from Phædrus, the *Kalila et Digna*, the Barlaam story, and above all the general European stock of stories; and all are told in an original and unpretentious style.

The poetry of this reign includes a modest and successful imitation of the *ciuderna vía*—*Poema de Yucuf* or *Poema de José*. (See JOSE, POEMA DE.) Poetry also gives us the most important literary personage of the reign, Juan Ruiz (q.v.), who in the *Cantares* recounts his erotic adventures, interspersing here and there fables, accounts of his disputes with Love and of a lesson given him by Venus, wife of Love, etc.

With the middle of the fourteenth century an artificial form of the lyric continuing the tradition of the troubadour poetry of Galicia and called court poetry—because it was mainly cultivated by versifiers attached to the royal court—began to take the place of importance formerly occupied by epic, religious, and didactic verse. There was a transition period of some duration, however, so that the greatest development of the Provençalized lyric did not come until the reign of John II (1405-54), and then there flourished by its side a humanistic literature bearing the impress of the Renaissance movement and an allegorical poetry that derived from the works of Dante and other Italian poets. Representative works of many of this brilliant galaxy are to be found in the *Cancionero de Buena*. The literary movement of the court of John II was continued outside of Spain by the poets who, in the suite of Alfonso V of Aragon (1385-1458), flocked to Naples. As time went on the Provençal Galician court poetry passed out of vogue, and the lyric

measures of Italy became predominant everywhere throughout Spain. Spanish prose, already given considerable flexibility by Alfonso the Wise and Juan Manuel, becomes in the second half of the fourteenth century the medium of translation from the classics of antiquity and, even more than the verse of this time, teems with Latinisms. Much more attractive than the verse already mentioned is the epic ballad (*romance*), which was much cultivated from the beginning of the fifteenth century, and of which Spain has a richer literature than any other country except the British Isles. Here and there, too, may be found examples of a charming popular lyric.

Pedro López de Ayala (q.v.) (1332-1407), who held important offices at the courts of King Pedro the Cruel and of Henry of Trastámara, was one of the last writers of his time to make any large use of the *cuaderna vía*. This form prevails in his satirical and didactic *Rimado de palacio*, in which he assails the social, political, and other abuses of his time. In the second part of the poem he inserts, here and there, complaints, laments, and songs to the Virgin, which are lyric in their nature and are composed in various measures. During the reign of Pedro the Cruel the Rabbi Santo of Carrión (written also Santob and Sem Tob) prepared his *Proverbios morales*. This collection constitutes one of the most important Hebrew contributions to Spanish literature, and it introduces a genre which is later to be attempted by such writers as Santillana and Pérez de Guzmán. Seriousness of purpose, lacking in the court poetry, is present in the Dantesque allegory and vision introduced into Spain, soon after 1400, by Imperial, a native of Seville, but of Genoese origin.

The moralizing tendency is also visible in the *Doctrina* of Pedro de Veragua and especially in the noted *Danza de la muerte* (Dance of Death), which seems to be a work of the middle of the fifteenth century and is much more dramatic than the corresponding French work, the *Danse Macabre*. The highest point reached by culture in the reign of John II (q.v.) (1405-54) is seen in the literary works of Santillana, Fernán Pérez de Guzmán, Mena, and Rodríguez de la Cámara, or del Padrón. To Fernán Pérez we owe the *Claros varones de España* (a panegyric in verse), versified *Proverbios*, and allegorical and lyrical poems, besides historical works in prose, and especially his great *Generaciones y Semblanzas*. Rodríguez has left us ballads and a little verse in the conventional court manner, besides a prose tale, *El siervo libre de amor*. Íñigo López de Mendoza, Marquis of Santillana (q.v.) (1398-1458), is probably the most impressive literary figure of the fifteenth century. He was one of the first in Spain to imitate Horace, he imported the sonnet from Italy, and he furthered the influence of Dante by copying the latter's allegorical methods in his *Comedieta de Ponza*, his *Coronación de Mossén Jordi*, and his *Infierno de los enamorados*. In certain other poems he displays a didactic and a satirical bent, as in his *Proverbios*, his *Diálogo de Bias contra fortuna*, and his *Doctrinal de privados*. The most interesting and certainly the most entertaining element of his poetical work is that represented by his pastoral love songs, such as the *serranillas*. In prose he himself prepared a *Carta al Condestable de Portugal*, a work of extreme interest and value, in which he appears as the first true historian of Spanish literature. The influence of Dante, as well as that of Lucan, is obvious in the allegori-

cal *Laberinto de fortuna* (also called the *Trecientas*, from the original number of its stanzas) of Juan de Mena (q.v.) (1411-56), and to him are due likewise a poetical eulogy of Santillana, entitled *La coronación*, and the moralizing *Coplas de los siete pecados mortales*.

During the reign of Henry IV (1454-74) there appeared no slight amount of political satire, among the chief instances being the *Coplas de Mingo Revulgo*. Of ballads (*romances*), as has already been said, Spain was exceedingly productive; in broadsheets or in collections (*romanceros*) there were published during the final years of the fifteenth century and during the sixteenth century a very large number dealing with subjects drawn from the real or legendary history of Spain and of France, etc., as well as with subjects chivalrous and erotic. Among the poets of this period Antón de Montoro (?1404-80) occupies a special place by reason of his origin and position (he was a converted Jew and a tailor) and his witty indecency and irony. Oddly enough one of his admirers was a knight of Madrid, Juan Alvarez Gato (?1430-96), who was himself a graceful versifier of the utmost circumspection. His love songs show a nobility of sentiment rare in his day. Pero Guillén de Segovia (1413-?74) is at present known only by his dignified *Salmos penitenciales*, since his other poems (of which there are scarcely 30) are only now being collected and edited. The greatest poets of the reign of Henry IV, however, are Gómez Manrique (?1415-?90) and Jorge Manrique (?1440-79). The former not only is a graceful lyric poet, but occupies an important position in the development of the early drama, since two of his pieces must be counted as among our earliest specimens of the religious drama, and two others take a similar position for the secular drama; the latter is remembered for his noble *Coplas* on the death of his father, which will assure him of renown as long as Castilian literature endures. They have been exquisitely done into English verse by Longfellow.

In Spanish prose of the fifteenth century the humanistic work already begun in Italy was zealously carried on. There was much translation of the classics of antiquity and of the modern Latin writings of Boccaccio and others. Ecclesiastical Latin authors also received some share of attention, and works were introduced from the French, Catalan, and Italian, those of Boccaccio being particularly popular for translation purposes. The influence of all these translations—and especially those from Plutarch, Livy, and Valerius Maximus—manifested itself in the development given to the writing of history. López de Ayala had already continued the official chronicle of the realm (*Crónicas de los reyes de Castilla*); Alvar García de Santa María (died 1460) and Diego de Valera (?1412-87) worked upon the *Crónica del rey Juan II*, and the latter worked on the *Crónica de España* (1482) and the *Memorial de Hazañas*; Diego Enríquez del Castillo (fl. 1467) wrote the *Crónica de Enrique IV*; and Hernando del Pulgar (?1436-?93) and Andrés Bernaldez (fl. 1488-1513) prepared accounts of the reign of Ferdinand and Isabella. There also appeared a multitude of chronicles dealing with the lives of individual personages. No little interest attaches to the *Crónica Sarrazina* (c.1443) of Pedro de Corral, which gives the whole legendary history of Roderick the Goth. We should remember too that Alonso de Palencia (1423-92), by writing

his *Crónica de Enrique IV* in Latin, deprived himself of the position in Spanish prose to which his talents made him eligible.

In French stories of a pseudohistorical nature the Spaniards had very early begun to take a serious interest, and these stories, particularly those treating the *matière de Bretagne*, were to play an important part in connection with the development of prose fiction in Spain. The court poetry of the reign of John II (first half of the fifteenth century) is full of references to Arthur and his knights of the Round Table, to Merlin, and to the Quest of the Holy Grail. Charlemagne and Roland are still named along with the heroes of the Round Table, but they obviously have no longer the same living interest.

With the *Caballero Cifar*, of the last half of the thirteenth century, we saw the first independent work of fiction in Spain, and this was followed, probably only a little later, by one of the most famous of all modern romances, the *Amadis de Gaula*. (See *AMADIS OF GAUL*.) This important work, which is probably *not* Spanish in its original form (see *VASCO DE LOBEIRA*), may lay claim to no small amount of originality; it accepts the elements at the basis of the French courtly romance, but it develops them in its own way, for, though retaining the traditional service of woman and quest of adventure, it stresses the virtuous qualities of the hero no less than his courtliness, something that the French romances had not done. In the form in which we possess it the *Amadis* is due to Garci Ordóñez de Montalvo (q.v.), who completed his redaction of it between 1492 and 1504 and published in 1508 the earliest version that we have. It consists of four books. The *Amadis* was the forerunner of many similar romances which enjoyed enormous vogue in the sixteenth century. For many years these chivalresque novels were thought to be wild exaggerations. As we become more familiar with the *Passo honroso de Suero de Quiñones* (which is the detailed account of an entire tourney, written by Pero Rodríguez de Lena, who was an eyewitness of the event, which occurred in 1434) we begin to realize that in most cases the chivalresque novels are only pale reflexes of what actually was the usual happening, and that in few respects do they go beyond the reality.

In imitation of Boccaccio's *Fiammetta*, which had been translated about the middle of the fifteenth century, the tale was now attempted in Spain; noteworthy instances are Rodríguez del Padrón's *Siervo libre de amor* and *El cárcel de amor* of Diego de San Pedro. Novelistic and didactic in its manner is the *Trabajos de Hércules* of Enrique de Villena (1384-1434). One of the most original and entertaining works of the whole period appeared in 1438; this is a satire on womankind by Alfonso Martínez de Toledo, chaplain to John II and archpriest of Talavera (?1398-?1470), entitled *De los vicios de las malas mujeres*, but also called the *Corbacho*. For the other side of the picture one should read the *Libro de las claras e virtuosas mugeres* (1446) of Alvaro de Luna (q.v.) (?1385-1453). Of decided interest for the study of folklore are the Hebrew-Spanish and the *aljama* documents, in which the Jews and the Moors, writing in Spanish, but using respectively their Hebrew and Arabic characters, created a rather considerable literature of their own. Many of the documents in question belong to the fifteenth century, and especially the most im-

portant of them all, the previously mentioned *Poema de José*, which gives a Mohammedan version of the story of Joseph.

The sixteenth century ushers in the classic age of Spanish letters, that period which extends into the second half of the seventeenth century and is generally known as the golden age. The influence of Italy and the Renaissance, which had been so strong during the preceding century, persists, but, contrary to what happened in other European lands, it does not tend to bring about any dissolution of continuity as between the old and the new. The ancient Church remains unaffected, and the humanistic paganism of the Renaissance gets no foothold in Spain. In lyric verse Italian forms prevail, but the subject matter is only partially affected by influences from without. A realistic movement, marked by a strict application of keen powers of observation, guides the development of the novel, which is perfected by Cervantes in the reign of Philip II. The ballad continues to be a favorite form, and it contributes to the rise of the drama. The drama, giving fullest expression to the national and religious ideals of the Spaniard, constitutes the greatest glory of the golden age.

Already in the fifteenth century Santillana had imitated the structure of the Italian sonnet, but in this innovation he had had no followers; it remained for the Catalan Boscán (q.v.) (c.1490-1542) to establish Italian verse methods in Castilian. A better poet than Boscán is his friend and companion in the work of innovation, Garci Laso de la Vega (q.v.) (1503-36). Petrarch is the chief model of the lyric poet, but so far as content is concerned, the love lyric of Petrarch did not differ very materially from that already cultivated by the Spaniard; the real innovation was a formal one. Moreover the older Castilian measures were not cast aside; even those who favored most warmly the use of the imported forms continued to employ the domestic forms. A third leading representative of the movement was Diego Hurtado de Mendoza (1503-75); elements of refinement still lacking in the art of the three poets mentioned were added by writers such as Fernando de Acuña (c.1500-c.1580), Gutierre de Cetina (?1518-57), and the Portuguese Gregorio Silvestre (1520-69). In the second half of the sixteenth century the followers of Garci Laso formed two main groups, the school of Seville and the coterie at Salamanca; minor groups were those at Granada and in Valencia and Aragon. The head of the school at Seville was Fernando de Herrera (?1534-97), who is noted both for the purity of his style and the richness of his diction, best exhibited, perhaps, in his hymns on the battle of Lepanto and on the tragic fate of the Portuguese King, Dom Sebastian. The most important member of the Salmantine group was the charming poet Luís de León (?1528-91), whose religious and mystic strains have never ceased to please. Allied to him in spirit are the other mystic poets San Juan de la Cruz (1542-91) and Malón de Chaide (?1530-96). The religious lyric may be seen at its best in the *Romancero espiritual* of Valdivielso (died 1638) and in the *Rimas sacras* of Lope de Vega; its vogue began to decrease when that of the conceptism of Ledesma and his fellows began to grow. An oversteering of the importance of the formal side of things and an undue straining of the means necessary to the attainment of perfection of style led, in the early years of the seventeenth century, to the adoption

of the kind of lyric mannerism which is known in Spain as *culteranismo*, and which is paralleled by the Marinism of Italy, by the euphuism of England, and by the précieux of France. Luís de Góngora (1561-1627) was the founder of this artificial style, which is therefore often called Gongorism. Its characteristics of bombast, obscurity, and general extravagance are fully exhibited in the so-called *Soledades* of Góngora. Even contemporaries of so high an order of talent as Lope de Vega and Francisco Gómez de Quevedo (1580-1645), who at first opposed the Gongoristic movement, later adopted many of its methods. As a poet Quevedo was most successful in his satires, which are full of the spirit of Juvenal. The lyric poets of the seventeenth century were legion: Mira de Amescua (q.v.) (?1578-1644), Estéban Manuel de Villegas (1589-1669), Salvador Jacinto Polo de Medina (fl. 1636), Francisco de Borja, Príncipe de Esquilache (1581-1658), and the dramatist Calderón were but a few of them. With the facilities now provided by the printing press it became possible to make extensive collections of the ballads (*romances*), which, previous to the end of the fifteenth century, seem to have survived only through oral tradition.

There appeared during the *siglo de oro* more than 200 poems belonging to the category of the artificial epic. Of these the most important deal with subjects appertaining to the national history; many treat religious matters, and many others are of the class of the chivalrous epic. They are mainly written in octaves, only occasionally in blank verse (*versos sueltos*). Chief among the epics of an historical character is the *Araucana* of Alonso de Ercilla y Zúñiga (q.v.) (1533-94), written by a soldier who here gives the results of his experience in the wars of the Spaniards with the Araucanian Indians. The historical value is still of a high degree in the *Elegías de varones ilustres de las Indias* (first part printed 1589) of Juan de Castellanos (q.v.) (1522-?1607) and the *Argentina* of Barco Centenera. The imagination plays a larger part than the historical fact in the *Austríada* of Juan Rufo (1547-c.1600). In the period of greatest dramatic productivity the historical epic gradually wanes in importance; the *Nápoles recuperada* of Francisco de Borja (1651) is one of the last. A place apart is occupied by the *Amantes de Teruel* (1616) of Juan Yagüe de Salas, which the author pretended to be an historical account of the tragic fate of the famous lovers. The Vergilian epic was made known to many by the *Enéida* of Hernández de Velasco (1557); after the appearance of Boscán's *Fábula de Leandro y Hero* mythological episodes from classic antiquity were made the theme of poems by Hurtado de Mendoza, Lope de Vega, Montemayor, Góngora, etc. The Italian epic of the *Cinquecento* was transplanted to Spain and was made the subject, not only of verse translations, but also of amplifications and continuations, some of these latter dealing with Spanish history or legend. A religious epic deserving of note is Azevedo's *Creación del mundo* (1615), being remarkable in that, imitating the *Semaine* of Du Bartas, it shows a resumption of literary relations with France. The mock heroic of Greece and Italy finds an echo in Juan de la Cueva's *Batalla de ranas y ratones*, Villaviciosa's *Mosquea* (1615), and Lope de Vega's *Gato-maquina*.

The tendency to fill Spanish prose with Latin-

isms, so strong in the preceding period, now yields to a feeling which finds a native dignity in the mother tongue. Juan de Valdés, in his *Diálogo de la lengua* (c.1535), initiated the scientific study of the grammatical and stylistic peculiarities of Castilian. Comparative perfection of form is attained in Mariana's (q.v.) (?1535-1624) *Historia de España* (1601, etc.), the first thoroughly good account of Castilian history based on the study of documents. In his *Agudeza y arte de ingenio* Baltasar Gracián (1601-58) gave the law book of that system of literary mannerisms termed conceptism; he also got the attention of contemporaries and posterity by his aphoristic and sententious sayings of various kinds. Religious literature of a mystic and ascetic nature must occupy an important place in the annals of the time; it is best represented by the writings of Luís de León (q.v.) (?1528-91), San Juan de la Cruz (St. John of the Cross) (1542-91), Malón de Chaide (?1530-?1596), Luís de Granada (?1504-88), and Santa Teresa de Jesús (St. Theresa) (1505-82).

Preceding the period of activity of Cervantes we have the continuation of the chivalric novel, the pastoral novel, the narrative form as exhibited in the *Celestina*, and the earliest of the picaresque novels. Of the posterity of the *Amadis*, the unsurpassable type of the romance of chivalry, are a number of continuations dealing with the adventures of Florisando, Lisuarte of Greece, Perión of Wales, Amadis of Greece, and similar heroes. Hardly less a favorite than the *Amadis* was an imitation of it entitled *Palmerín de Oliva* (1511), which in its turn was made the subject of other continuations and imitations. The books of chivalry prepared the way for the pastoral romance, introduced into Spanish by Jorge de Montemayor (q.v.) (?1520-61), who founded his *Diana* on the *Arcadia* of the Italian Sannazaro. For contemporaries a good deal of the interest in the *Diana* and its kindred depended upon the personal allusions conveyed by the characters and in the dialogue. The *Tragicomedia de Calisto y Melibea* (later termed the *Celestina*) was published at Burgos in 1499 (the first edition we know, although probably not the first edition) and appeared in an amplified form at Salamanca in 1502. Although it is called a tragicomedy, it cannot in its present form have ever been capable of scenic representation, and it is certainly more a novel than a play. On account of its spirited action and of the development which the *Celestina* gave to the handling of dialogue and the delineation of character, it exerted an influence upon both later dramatists and novelists. It soon provoked continuations and imitations, and a connection may even be traced out between it and the *Dorotea* of Lope de Vega. The realistic tendencies evinced in the *Celestina* are equally pronounced in the first of the picaresque novels, the anonymous *Lazarillo de Tormes* (1554), long ascribed to Diego Hurtado de Mendoza, although that ascription is to-day doubted. In this novel we follow the career of a rogue (*pícaro*), who, beginning as the guide (*lazarillo*) of a blind beggar, deceives him and, passing into the service of other personages representing various ranks of life, shows himself no less ready to beguile them. There is no attempt at palliation of the truth; it is a picture of the bald and iniquitous fact that is presented to us in the *Lazarillo* and its successors. Two other highly successful

books in this genre were the *Guzmán de Alfarache* (1590) of Mateo Alemán (1547-?1614) and Quevedo's *Vida del Buscón*, often called *El Gran Tacaño* (1626).

Realistic fiction of the *siglo de oro* culminates in the magnificent *Don Quijote* of Miguel Cervantes de Saavedra (q.v.) (1547-1616), a novel in which the matter-of-fact philosophy of Sancho Panza stands in sharp contrast with the grotesque idealism of his master. It is not improbable that Cervantes wrote the book in order to destroy the vogue of the chivalrous romances, although it may be urged that their popularity was already on the wane and that at the most he simply gave them the *coup de grâce*. *Don Quijote* (usually *Don Quixote* in English) has become one of the world's imperishable books. The first part of it was published in 1605; the second part was hurriedly prepared for the press in 1615, in order to baffle the designs of a certain Avellaneda, who had published a spurious sequel to the novel in 1614. Cervantes had much less success in another novel, the *Persiles y Sigismunda* (published posthumously), but that he could handle the shorter tale with skill is proved by his *Novelas ejemplares*. Among those who cultivated the tale after the time of Cervantes were Lope de Vega, Tirso de Molina (in his *Cigarrales de Toledo*, 1624), Montalbán (*Para todos*, 1632), María de Zayas, Solórzano, Salas Barbadillo, and Luís Vélez de Guevara (with his famous *Diablo cojuelo*, 1641, the source of I. Le Sage's *Diable boiteux*). Quevedo (q.v.) (1580-1645) was the foremost of the prose satirists of the age; in his witty and sarcastic *Sueños*, *cartas del caballero de la tenaza*, etc., he cries out against abuses with which bitter personal experience had made him acquainted.

As a literary form the drama had been practically unrepresented since the end of the twelfth century, but now, at the end of the fifteenth century, it was to revive and receive an unsurpassed development. Except for the three or four halting efforts made by Santillana, Gómez Manrique, and others, Juan del Encina (c.1468-1534) begins the new order. Encina spent some years in Italy; hence an Italian influence on his work is not improbable. The comic elements in some of the pieces may show an influence of the French farce. Disciples of Encina were Lucas Fernández, who employs the terms *farsa* and *comedia*, the Portuguese Gil Vicente, and Torres Naharro (q.v.) (died ?1531), whose art shows considerable progress over that of the master. In his plays we meet for the first time with a division into acts. The pieces of the foregoing authors were intended for the refined audiences of the court; those of Diego Sánchez (c.1530-47) seem to have been meant for performance amid more popular surroundings. Italian influence is unmistakable in the *comedias* of Lope de Rueda, an actor (?1510-65), famed for his short and witty *pasos* or *entremeses*. The Latin tragedy is obviously imitated in the first really important Spanish tragedy, the *Numancia* of Cervantes. Avendaño in 1533 first adopts the division into three acts instead of five. Juan de la Cueva (q.v.) (c.1550-c.1609), the first Spanish dramatist to deal with incidents taken from the national history, adopted a division into four acts.

But by common consent there is awarded to Lope de Vega (q.v.) (1562-1635) and to his younger compeer, Pedro Calderón de la Barca (q.v.) (1600-81), supremacy among the many

gifted dramatic authors. Inventive beyond conception and amazingly prolific in production, Lope is known to have composed over 1500 plays, irrespective of a number of *autos* (one-act plays of a religious and allegorical nature), *loas* (preludes), and *entremeses* (interludes); of these pieces about 500 are still extant. The number of enduring masterpieces among his plays is remarkably large, especially in the case of his historical dramas, such as *El mejor alcalde el rey* and *Los Tello de Meneses*; and we even still find hardly less interesting and powerful than they such a play as the *Estrella de Sevilla* and not a few of his *comedias de capa y espada*, or plays dealing with everyday life. Lope's disciples included Mira de Amescua (q.v.) (c.1578-1644), Luís Vélez de Guevara (q.v.) (1579-1644), Montalbán, and Ruiz de Alarcón (q.v.) (died 1639). Alarcón wrote the comedy *La verdad sospechosa*, the model of Corneille's *Menteur*. In talent Lope was most nearly approached by the cleric Gabriel Téllez (q.v.) (1571-1648; known also by the pseudonym Tirso de Molina). Nor should we omit the product of the Valencian school, so called, and especially Guillén de Castro (1569-1631) with his *Mocedades del Cid*, which served Corneille as basis for his *Le Cid*.

After Lope's death Calderón reigned on the stage. Though less inventive, Calderón paid more attention to details of form, simplifying somewhat the multitudinous metrical forms in use in the drama. In philosophic insight he was inferior to Lope, yet in *La vida es sueño* (Life is a Dream) he cannot really be deemed unsuccessful in his endeavor to give dramatic reality to one of the most transcendental of ideas. He first gave great importance on the boards to the *pundonor* (the point of honor) as an actuating impulse of the Spaniard's life, and he gave its greatest development to the stock figure of the *gracioso*, or clown. He devoted no little attention to the type of religious play called the *auto sacramental*. Of his followers two were men of distinguished talents: Francisco de Rojas Zorrilla (1607-c.1660), who produced the excellent play, *Del rey abajo ninguno*, and Agustín Moreto (c.1618-69), to whom we owe *El desdén con el desdén*.

Swift and deep was the decline in Spanish letters that followed the *siglo de oro*, and it went hand in hand with a decay in things national and political, which the advent of the French Bourbon house to the throne could do little to check. By the opening years of the eighteenth century Gongorism had thoroughly vitiated lyric verse, the novel had become unimportant, and the stage was controlled by dull or absurdly fantastic imitators of the older national drama. Not a single Spanish writer of the first order made his appearance during the first three decades of the eighteenth century, and during that period the only event of importance was the establishment in 1714 of the Spanish Academy (La Real Academia Española), whose dictionary, which appeared in six large volumes in 1726-39, was so fine a piece of work that, despite its obvious defects, there was no dictionary in any language of Europe to compare with it. With the fourth decade came a new movement, the chief object of which was to chasten popular taste by the introduction of foreign æsthetic canons, particularly those of France. The impulse to the new movement was given by Ignacio de Luzán (q.v.) (1702-54), a man of great talent and greater culture, who set forth in his *Poética*

(1737) the principles that ought to govern poetic production. Luzán preached that the various literary genres should not be intermingled and that the Spanish drama should be subjected to the French system of unities. The doctrines which he thus laid down were taken up and applied by his disciples Nasarre (1689-1751), Montiano (1699-1764), the author of two tragedies (*Virginia* and *Ataulfo*), and by Luís Josef Velázquez (1722-72), in his *Orígenes de la poesía castellana* (1754), which can more profitably be consulted in the enlarged translation (1769) by Johann Andreas Dieze. In his *Teatro crítico* (1726-39) and in his *Cartas eruditas y curiosas* (1742-60) Benito Feijóo y Montenegro (q.v.) (1676-1764) first made known to a large part of the Spanish nation many of the scientific developments and discoveries of the age. José Francisco de Isla (1703-81), in his amusing though rather long-winded novel, *Historia del famoso predicador, Fray Gerundio de Campazas* (1758), ridiculed unmercifully the extravagance, ignorance, and pedantry that characterized most of the pulpit eloquence of his time. Isla is also famous for his attempt to appropriate to Spanish literature the *Gil Blas* of Lesage, his own translation appearing posthumously (1783).

A party headed by Vicente García de la Huerta (q.v.) (1734-87) strove, but ineffectually, to curb the growing tendency to imitate French models. On the other hand the followers of Luzán formed (c.1771) a strong school, known as the Salamanca school. The foremost member of this new school was Juan Meléndez Valdés (q.v.) (1754-1817). His little volume of lyrics shows more true poetic sentiment than anything that had preceded them since the days of the masters of the sixteenth and seventeenth centuries. Of considerable merit were José Iglesias (q.v.) (1748-91), best known for his *let-rillas*; Cienfuegos (q.v.) (1764-1809), whose lyrics come nearest to those of Meléndez in the expression of genuine feeling; and Diego González (1733-94). It was in the drama that the imported French classicism was to have its real triumph. To be sure, one writer of more than average ability, Ramón de la Cruz (q.v.) (1731-94), still kept alive the traditions of the Spanish stage of the golden age in his humorous little plays called *sainetes*, but he stood alone. It was only natural that men of taste, like Nicolás Fernández Moratín (q.v.) (Moratín the Elder, 1737-80) and the dramatist statesman Jovellanos (q.v.) (1744-1811), should, in their love for moderation and order, seek to elevate the fallen stage by adopting for their own compositions the rigid principles of the French theatre. But neither of these became a favorite with the masses, and it remained for Leandro Fernández de Moratín (q.v.) (1760-1828), the son of Nicolás, to compose dramas governed by the French rules, that could captivate Spanish audiences. Moratín the Younger brings us over the threshold of the nineteenth century; still he belongs properly to the eighteenth century. An enthusiastic admirer of Molière, he both imitated and translated plays of that great dramatist. By means of a happy blending of the spirit of romantic intrigue with the cold precision of French rules he made his masterpiece, the *Sí de las niñas* (1806), obtain at once the popularity that it has never since lost, and that constitutes it the first masterpiece produced for the Spanish stage since the days of Lope and Calderón.

Spanish literature of the nineteenth century

begins with the patriotic poets, Manuel José Quintana (q.v.) (1772-1857) and Juan Nicasio Gallego (q.v.) (1777-1853), whose lyrics voice the sentiments of a party sprung up to combat the French invader. Quintana was the Tyrtæus of the struggle against the Napoleonic arms, and he attained his greatest success in the heroic ode (*Al armamento de las provincias contra los Franceses* and *A España después de la revolución de Marzo*, 1808). His friend Gallego is also seen at his best in the burning patriotic lyric (e.g., *El dos de Mayo*), and although the bulk of his verse is slight, he was a good literary artist. The classic influence still dominated Quintana and Gallego and is no less clearly marked in the members of a poetical coterie which rivaled the Salamancan school and may conveniently be termed the Sevillian school. The members of this school, of whom the chief were Manuel María de Arjona (1771-1820), José María Blanco (1775-1841, known in the history of English literature as Blanco White), Alberto Lista (q.v.) (1775-1848), and Félix José Reynoso (1772-1841), sought to reform the prevailing bad taste by setting up the authority of a respectable classic tradition. What little influence they had was favorable to the restoration of a proper æsthetic sense in Spanish literary aims, and they also helped to improve the purely formal side of Spanish verse by developing rhyme and metre.

In the thirties of the nineteenth century the Romantic movement began to appear in the Spanish Peninsula, somewhat belated, indeed, but none the less sweeping in its effects. Two elements contributed to the establishment of romanticism in Spain: (1) the influence of foreign literatures, and (2) the influence of the older national literature, and in particular of the drama of Lope and Calderón and of the *romances*. The Romantic writers whom political considerations did not force to abandon their native region founded, about 1830, a club called the Parnasillo, which, as the Cénacle had done in France, was to herald the new ideas.

In the lyrics of Manuel de Cabanyes (1808-33; *Preludios de mi lira*, 1833), which are chiefly inspired by Luís de León, there is a bare suggestion that if he had lived he would probably have become a Romantic; and a transition stage is distinctly visible in the writings of Martínez de la Rosa (q.v.) (1787 or 89-1862), in the main a man of classic tastes, yet who in two plays, the *Aben-Humeya* (1830) and the *Conjuración de Venecia* (1834), entered into the domain of romanticism. Mariano José de Larra (q.v.) (1809-37), best known as Figaro, showed similar Romantic tendencies in his novel *El doncel de Don Enrique el Doliente* and in his play *Macías*. The triumph of romanticism was insured by the performance in 1835 of the drama *Don Alvaro* of Angel de Saavedra, third Duke of Rivas (q.v.) (1791-1865), one of the writers whom Ferdinand's tyranny had compelled to seek a refuge in England and France. The Romantic principles to which he gave effect in this work governed also the composition of his lyric *El faro de Malta* and of his epic poem *El Moro expósito*, in the latter of which he revived the Old Spanish legend of the Infantes de Lara. In the person of José de Espronceda (q.v.) (1808-42), the author of the magnificent though fragmentary poem *El diablo mundo* and of the *Estudiante de Salamanca*, there are represented both the Romantic element of revolt against social and literary conventions, which in England is strongly marked

in the person of Byron, and that element of Bohemianism which characterizes so many of the French romanticists. Lyric supremacy is disputed with Espronceda by José Zorrilla (q.v.) (1817-93), who is, however, more justly celebrated for his treatment of legendary material from the Spanish Middle Ages than for his purely lyric endeavors. In the drama *Don Juan Tenorio* (which, despite its subject, is annually produced in practically every theatre in Spain for a period of about two weeks at All Hallows) he gives a modern version of the story at the bottom of Tirso de Molina's *Burlador de Sevilla*. The Cuban poetess Gertrudis Gómez de Avellaneda (q.v.) (1814-73), who spent most of her life in Spain and there became famous, had affiliations with the Romantic school. Her lyrics owe no small amount of their inspiration to Chateaubriand, Lamartine, and Hugo; her novels reflect the methods of Dumas the Elder and George Sand. Sentimentalism appears in two well-known dramas, the *Trovador* of Antonio García-Gutiérrez (q.v.) (1813-84), on which Verdi's opera is founded, and the *Amantes de Teruel* of Juan Eugenio Hartzenbusch (q.v.) (1806-80), a play which gave new life to an old Spanish story of true love that did not run smoothly.

The passing of the Romantic movement becomes evident after the beginning of the fifth decade of the century. The fertile playwright Manuel Bretón de los Herreros (q.v.) (1796-1873) had temporary connections with it, but he gained his repute mainly as a writer of lively dramas of manners, although in his masterpiece, the comedy entitled *Escuela del matrimonio* (1852), he paved the way for the coming psychological drama of López de Ayala and Tamayo y Baus. Adelardo López de Ayala (q.v.) (1828 or 29-79) gives us, in his meretriciously sociological play *El tanto por ciento* (1861), a detailed analysis of the modern greed for wealth that has stifled the nobler instincts of man and made him capable of the basest treachery, and in his *Consuelo* (1878) he makes another powerful attack upon the positivism and the lack of idealism in our modern life. The psychological development is also obvious in the work of Manuel Tamayo y Baus (1829-98). In *Lo positivo* (1862) he treats the positivism of the modern world with no less severity than does López de Ayala, and in his chief play, *Un drama nuevo* (1867), which is one of the great plays of the world's literature and a perfect example of the play within a play, he portrays the slowly growing and finally all-pervading power of marital jealousy. Tamayo's successor in popular esteem is the versatile José Echegaray (q.v.) (1832- ), the author of *El gran galeoto* and *O locura, ó santidad*, who in 1904 divided a Nobel prize with Mistral.

The particular glory of the second half of the nineteenth century in Spain has been the rise and growth of a new novelistic literature. To the development of this a considerable impetus was given by the essay on manners, which had already been handled with skill by Larra in the first half of the century and was now taken up by Estébanez Calderón (q.v.) (1799-1867) and by Ramón de Mesonero Romanos (q.v.) (1803-82), who has left us excellent descriptions of life in older Madrid. These essayists on manners prepared the way for the tale of manners and the novel of manners (*novela de costumbres*). The former was cultivated, though with no bril-

liancy, by Antonio de Trueba (q.v.) (?1819-89); the latter was written, in a way to attract attention and applause, by Cecilia Böhl von Faber de Arrom (1796-1877), familiar still by her nom de plume of Fernán Caballero (q.v.). A thoroughly delightful figure appeared in the person of the short-lived story-teller and poet Gustavo Adolfo Bécquer (q.v.) (1836-70). All his work is permeated by the highly subjective qualities that are more common in northern Europe. His tales are all of a legendary cast and are everywhere actuated by the instinct of mystery.

Pedro Antonio de Alarcón (q.v.) (1833-91) is most felicitous in the composition of the short tale of manners or adventure of the type; he is less successful in the more ambitious novel, although the less lengthy among the novels, particularly the *Sombrero de tres picos* and the *Capitán Veneno*, continue to delight and amuse their readers. An incomparably greater artist was Juan Valera y Alcalá Galiano (q.v.) (1824-1905), whom a protracted career in the diplomatic service of his country had made one of the most cosmopolitan and cultured of moderns, with a style which for clarity, precision, and beauty has no equal. In his novels Valera differs from the majority of his contemporaries in that he consciously tends towards idealism, whereas they seek rather to render the living fact. The novel of manners has been raised to a higher level than ever before by José María de Pereda (q.v.) (1833-1906), who in his chief works has portrayed life on the mountains and at the seaside in a way hardly to be excelled for detail and charm of description. The *Don Gonzalo González de la Gonzalera* and the *Sotileza* show Pereda in the fullness of his power; where he leaves the scenes of rustic life and ventures into the city and the fashionable whirl, as in the *Pedro Sánchez*, he is still a master novelist, but he treads on uncertain ground. The work of Benito Pérez Galdós (q.v.) (1845- ) from first to last has been marked by tendencies frankly revolutionary. One of the most admirable and important divisions of his labors has been the composition of the collection of novels forming the *Episodios nacionales*, but it is by his psychological novels that Galdós has attracted most attention abroad. At least two other novelists of the first rank must be mentioned here, Armando Palacio Valdés (q.v.) (1853- ) and the remarkable woman Emilia Pardo Bazán (q.v.) (1851- ). Both have had tendencies towards a naturalism not unlike that which has so profoundly affected the French novel of the second half of the nineteenth century.

In the recent period we meet with only two poets of importance, Ramón de Campoamor y Campoosorio (q.v.) (1817-1901), who will continue to be pleasantly remembered for his philosophical and humorous *Doloras* and a few descriptive poems, and Núñez de Arce (q.v.) (1834-1903), the virile author of the *Gritos del combate*. The latter has had disciples both at home and in Spanish America, but none of them have displayed superior talent. Criticism has flourished, principally through efforts of Marcelino Menéndez y Pelayo (q.v.) (1856-1912), who in his *Historia de las ideas estéticas en España* (1884-91) has raised a noble monument to the glory of his country and whose two principal pupils, Ramón Menéndez Pidal (q.v.) (1869- ) and Adolfo Bonilla y San Martín (q.v.) (1875- ), continue his work in the fields of

philology and philosophy respectively. Other moderns of note are Luís Coloma (1851-1915), Vicente Blasco Ibáñez (q.v.) (1867- ), Jacinto Octavio Picón (1851- ), Ramón del Valle-Inclán (1870- ), José Martínez Ruiz (1876- ), Ricardo León (1877- ), Joaquín Dicenta (1860- ), Jacinto Benavente (1866- ), the brothers Álvarez Quintero (1871- and 1873- respectively), Vicente Medina (1866- ), Salvador Rueda (1857- ), Juan Menéndez Pidal (q.v.) (1861-1915), Rafael Altamira y Crevea (q.v.) (1861- ), and Miguel de Unamuno (1864- ).

**Bibliography.** Collections of texts: *Biblioteca de autores españoles, desde la formación del lenguaje hasta nuestros días* (71 vols., Madrid, 1846-80); *Bibliotheca Hispánica* (ib., 1900 et seq.), in course of publication, 19 vols., issued in 1915; *Clásicos castellanos* (ib., 1910 et seq.), in course of publication, 30 vols., issued in 1915; *Colección de autores españoles* (48 vols., Leipzig, 1863-87); *Colección de escritores castellanos* (Madrid, 1880 et seq.), in course of publication, 160 vols., issued in 1915; *Colección de libros españoles raros ó curiosos* (24 vols., ib., 1871-96); *Colección de libros picarescos* (6 vols., ib., 1899-1902); *Colección de los mejores autores españoles* (60 vols., Paris, 1837-72); *Colección de poetas españoles* (ed. by Ramón Fernández, pseudonym of Pedro Estala, 20 vols., Madrid, 1789-1820); *Colección selecta de antiguas novelas españolas* (12 vols., ib., 1906-09); *Libros de antaño* (15 vols., ib., 1872-98); *Nueva biblioteca de autores españoles* (ed. by Marcelino Menéndez y Pelayo, ib., 1905 et seq.), in course of publication; also texts published by the following societies: Sociedad de Bibliófilos Andaluces (44 vols., Seville, 1868-1907); Sociedad de Bibliófilos Españoles (43 vols., Madrid, 1866 et seq.), in course of publication; Sociedad de Bibliófilos, Madrileños (10 vols., ib., 1909 et seq.), in course of publication. **SPANISH MACKEREL**, or SIERRA. Any of several mackerels of southern waters, especially *Scomberomorus maculatus*, a slender, compressed, fusiform fish, bluish green above, a beautiful satiny white below, with yellowish spots on the back and sides, weighing usually from two to four pounds, although sometimes much larger—a fine food fish. They are natives of tropical seas, but range along the Atlantic coast from Brazil to Cape Cod. A California species of high quality for the table is the Monterey Spanish mackerel (*Scomberomorus concolor*), the male steel blue, without spots on its sides, while the female has dusky cloudings and two series of dark spots along the sides. The Spanish mackerel of England is a typical mackerel, known in the United States as chub mackerel (q.v.). Cf. MACKEREL, and see Plate of MACKERELS.

**SPANISH MOSS.** See BROMELIA.

**SPANISH MUSIC.** Spanish music has always been imitative. At first the Netherlands influence predominated. This was followed by a prevalence of Roman style, especially that of Palestrina. The sixteenth century may be regarded as the time when music in Spain was at its height, for then it boasted Morales, whose compositions are still sung at Rome, and Vittoria, the master who most closely resembles Palestrina. With the appearance of Italian opera, Spanish composers not only imitated the Italians, but actually wrote Italian operas. With Wagner's innovations Spain was again ready to adopt the new tendencies. At this juncture the name of Pedrell (q.v.) deserves special mention. The rise of the Spanish drama in the seventeenth century exerted a beneficial influence upon lighter music. The earlier musical dramas of the Florentine school had no overture. Instead, a *madrigal* was sung before the curtain rose. The Spaniards adopted this for purely dramatic representations, so that before long even serious tragedies were preceded by such curtain raisers. These were called *cuatros de empezar*, and were always performed by the women of the company to a harp accompaniment. At first the *cuatros* were choruses for four voices; but with the rise of the monodic style polyphonic writing was abandoned and an action was introduced. When the curtain raisers had been developed so far, they were called *tonadillas*. This custom of beginning all dramatic representations with a *tonadilla* was adopted by the Italians, who called the

tonadilla *intermezzo*, and soon developed this latter into the *opera buffa*. (See *INTERMEZZO*.) Then the Spaniards again imitated the Italians; and the result was the development of the *tonadilla* into the *zarzuela* (q.v.). This form has always been popular in Spain, and about 1850 Hernando gave it a new impetus. Among composers who devoted their talents to this form, four deserve mention: Oudrid, Gaztambide, Barbieri, and Arrieta.

For originality and characteristic traits we must turn to Spanish folk music. Here we notice that the real folk songs are greatly used as accompaniments to dances. The limitations of the national instrument, the guitar, influenced the melodies and rhythms, rendering the latter more attractive than the former. Of the old folk songs composed in the time of the troubadours a great number have been preserved in literary collections called *cancioneros*, but the music has been lost. The music of the folk songs of the fifteenth and sixteenth centuries, however, has been transcribed from the actual performances of blind singers, who even now wander from town to town. The melodies of Andalusia, which are superior to those of the northern provinces, show undoubted traces of Moorish influences, as noted by the elaborate embellishments of the notes, peculiar intervals foreign to European scales, and a strange combination of distinct rhythms in the parts. For melody and rhythm it is only necessary to mention Bizet (*Carmen*), Massenet (*Le Cid*, *La Navarraise*), Weber (*Oberon*), and Moszkowski (*Bohémien*). The best known Spanish dance forms are the bolero, cachucha, fandango, jota, malagueña, rondeña, and seguidilla, which are accompanied by the guitar and castanets. Consult: M. Soriano-Fuertes, *Música española hasta el año 1850* (Madrid, 1857); Juan F. Riaño, *Critical and Biographical Notes on Early Spanish Music* (London, 1887); A. Soubies, *Histoire de la musique, Espagne* (Paris, 1900). See MUSIC, HISTORY OF, XXXIX.

**SPANISH NEEDLES.** See BUR-MARIGOLD.

**SPANISH PLUM.** See HOG PLUM.

**SPANISH POLITICAL PARTIES.** See POLITICAL PARTIES, Spain; SPAIN.

**SPANISH REFORMED CHURCH.** Spain has always been episcopal in its church government. It was one of the last countries in western Europe to submit to the control of the papacy, and it has preserved old liturgies which prove that it was independent of Rome. From the eleventh century down there is little or no evidence of independence from Rome. The religious wars down through the seventeenth century practically exterminated all non-Roman forms of belief. When the modern Spanish Reformers took up their work, they used at the beginning translations of the English Book of Common Prayer, but they soon realized that if they were to make progress they must have a liturgy of their own. For recognition, they appealed to the Lambeth Conference of 1878, which asked the bishop of the Mexican Reformed church to visit the Spanish Reformers and report. It was decided that the Spanish Reformed church should be organized on a synodical independent basis, with a liturgy built on the teaching of the pre-Roman church and preserving the prayers loved by the early Christian ancestors of the members. As a doctrinal basis the Reformers hold by the great creeds and have adopted the Thirty-nine Articles with the necessary local changes. The govern-

ment of the church is in the hands of a synod consisting of the clergy and lay representatives, who meet at fixed intervals. Until the church shall have three bishops, a temporary arrangement has been made by the synod, whereby the church shall have a council of bishops consisting of its own bishop (or bishops) and three bishops of the Irish church. The first bishop of the Spanish Reformed church is Juan B. Cabrera é Ibars (q.v.). Consult J. B. Cabrera, *La iglesia en España desde la edad apostólica hasta la invasión de los sarracenos* (Madrid, 1910).

**SPANISH SUCCESSION, WAR OF THE.** See SUCCESSION WARS.

**SPANISH TOPAZ.** See CAIRNGORM.

**SPANISH TOWN.** A town in Jamaica, British West Indies, on the Cobre River, about 10 miles west of Kingston (Map: Jamaica, C 2). Founded by Diego Columbus in 1525, it was the capital of Jamaica until 1871. Pop., over 5000.

**SPANISH WAR VETERANS, UNITED.**

A society formed in 1904 by the union of the Spanish War Veterans, the Spanish-American War Veterans, the Society of the Service Men of the Spanish War, and the Society of the Hispano-American War. Its purpose is to promote the best interests and general welfare of those and the dependents of those who took part in either the Spanish-American War, the Philippine War, or the Chinese Expedition.

**SPANKER.** A fore-and-aft quadrilateral sail set on the mizzenmast of ships and barks (qq.v.). It was formerly called the driver.

**SPANWORM.** See MEASURING WORM.

**SPAR** (AS. *spær*, Ger. *Spar*, gypsum). A term which is used by miners to denote any bright crystalline mineral, and which has been adopted by mineralogists in the names of a number of minerals, as calcareous spar, fluor spar, etc., in which, however, it has no proper generic significance.

**SPAR, ADAMANTINE.** See CORUNDUM.

**SPARGO**, spär'gō, JOHN (1876- ). An American Socialist reformer and writer, born at Stithians, Cornwall, England. He took extension courses at Oxford and Cambridge universities. An outspoken Socialist at 18, he opposed the Boer War and emigrated to the United States in 1901, settling in New York. Thereafter he was one of the foremost advocates of Socialism and participated in many philanthropic and charitable movements, especially that to improve the condition of poor children. He was one of the founders of the Prospect House Social Settlement and one of the workers in the Rand School of Social Science. His time was largely occupied in writing, and he came to be recognized as an authority on Marxian Socialism. He published, among other writings: *The Bitter Cry of the Children* (1906); *Socialism, a Study and Interpretation of Socialist Principles* (1906; rev. ed., 1909); *Capitalist and Laborer* (1907); *The Common Sense of the Milk Question* (1908); *The Common Sense of Socialism* (1908); *Karl Marx, his Life and Work* (1909); *Sidelights on Contemporary Socialism* (1910); *Applied Socialism* (1912); *Syndicalism, Industrial Unionism, and Socialism* (1913); *Marxian Socialism and Religion* (1915).

**SPARIDÆ** (Neo-Lat. nom. pl., from Lat. *sparus*, from Gk. *σπάρος*, gilthead, sort of fish). An important family of spiny-rayed fishes, to which belong the porgies, sheephead, scup, etc. (qq.v.). The body is elongate, with the dorsal

side more or less elevated. The scales are rather large. There is a single dorsal fin, the anterior portion being spinous. The family contains about 100 species. They are shore fishes, carnivorous in habit, most common in tropical seas.

**SPARKS.** A city in Washoe Co., Nev., 1½ miles east of Reno, on the Truckee River and on the Southern Pacific Railroad (Map: Nevada, B 3). It is the seat of Nevada State University, and contains a Carnegie library and the State Asylum for Mental Diseases. There are here large railroad repair shops and some mines. Pop., 1910, 2500.

**SPARKS, JARED** (1789-1866). An American historian, editor, and educator, born at Willington, Conn. He graduated at Harvard College in 1815. Here, after teaching school, he was (1817-19) tutor in mathematics and natural philosophy. During this time he studied theology and (1817-18) edited the *North American Review*. From 1819 to 1823 he was pastor of a Unitarian church in Baltimore; in 1821-23 he edited there the *Unitarian Miscellany and Christian Monitor* (monthly); and from 1824 to 1831 again edited the *North American Review*, of which he was chief proprietor. In 1830 he founded and was the first editor of the *American Almanac and Repository of Useful Knowledge*, published annually until 1861. In 1839 he became professor of history at Harvard, of which institution he was president from 1849 to 1853. During this time he reformed administrative methods, insisted upon the recognition by the Massachusetts Legislature of Harvard's chartered rights, and vigorously opposed the elective system. He is best known, however, as a biographer, and as an editor and collector of documents relating to American history. In this field he was a highly useful pioneer. As an editor he was, with some justice, but extravagantly, criticized for taking liberties with his materials, such as failing to reproduce quoted sources fully and accurately. Perhaps his best-known work is his edition of the *Writings of George Washington* (12 vols., 1834-38), the first volume of which is an excellent biography of Washington, frequently published separately. This edition met with much criticism, involving Sparks particularly in a controversy with Lord Mahon, and it has since been superseded in many respects by that of W. C. Ford. Sparks also edited: *The Library of American Biography* (first series, 10 vols., 1834-38; second series, 15 vols., 1844-47); *The Diplomatic Correspondence of the American Revolution* (12 vols., 1829-30), since superseded in most respects by Wharton's *Revolutionary Diplomatic Correspondence of the United States* (6 vols., 1889); *The Works of Benjamin Franklin with a Life of the Author* (10 vols., 1836-40), since superseded by Bigelow's *Complete Works of Benjamin Franklin* (10 vols., 1887-89); and *Correspondence of the American Revolution; Letters of Eminent Men to George Washington* (4 vols., 1853). He also published a *Life of Gouverneur Morris, with Selections from his Correspondence and Miscellaneous Papers* (3 vols., 1832). He left voluminous manuscript journals, and a mass of valuable documentary material relating chiefly to the diplomatic history of the American Revolution, which was collected by him during several trips to Europe, and which he bequeathed to the Harvard Library. Consult H. B. Adams, *Life and Writings of Jared Sparks* (2 vols., Boston, 1893).

**SPARROW** (AS. *spearwa*, Goth. *sparwa*, OIIG. *sparwe*, sparrow; connected with OPruss. *sperglas*, sparrow). A small bird of the finch family (Fringillidae), generally with dull plumage and slight powers of song, feeding on or near the ground, and nesting in bushes or on the ground. Originally the name belonged specifically to the common European sparrow (see HOUSE SPARROW), but now has been inaccurately extended to include certain warblers, weaver birds, etc. Of American sparrows probably the most familiar is the common chipping sparrow (see CHIPPY), or hairbird, a small grayish bird. The field sparrow (*Spizella pusilla*) is a similar species, which occurs throughout the eastern United States in summer, distinguished by its brighter rufous color and flesh-colored bill. A third species, the tree sparrow (*Spizella monticola*), occurs in the United States only in winter, breeding in Labrador and the Hudson Bay region. It is considerably larger than the chippy and has a conspicuous black spot on the grayish-white breast. Next to the chippy the best-known American sparrow is probably the song sparrow (*Melospiza melodia*, or *cinerea*), which in some one of its varieties ranges throughout practically the whole of North America. It is between 6 and 7 inches in length, the upper surface brown, the under surface dull white, but more or less streaked with black or rufous brown, the streaks on the centre of the breast tending to form one large characteristic blotch. This is an early spring songster in the Northern States, and its refrain is remarkably clear and sweet. Its nest is composed of grasses and rootlets, lined with fine grasses and long hairs, and is frequently placed on the ground. The eggs are variable in color and form, the ground shade ranging from nearly white to deep blue thickly marked with reddish brown. Two broods are often raised in a season. Two other species of *Melospiza* range through eastern North America, the swamp sparrow (*Melospiza georgiana*) and Lincoln's sparrow (*Melospiza lincolni*). They resemble the song sparrow in appearance, but are more shy and retiring in their habits. Some 20 or 30 other birds are called sparrows in the United States, among which the vesper sparrow (*Poocetes gramineus*), the savanna or grasshopper sparrows (genus *Ammodramus*), or more correctly *Passerculus* (which also includes the sharp-tailed and seaside sparrows), the crowned sparrows of the genus *Zonotrichia*, the wood sparrows or summer finches of the genus *Peucaea*, and the large fox sparrow (q.v.) are especially worthy of mention, while the sage sparrows (*Amphispiza*) and the lark sparrows (*Chondestes grammacus*) are characteristic Western forms. A familiar species of the West is the black-throated dickcissel (*Spiza americana*), a fine singer. The vesper sparrow is often called grass finch or bay-winged bunting, but its more common name has reference to its fondness for singing late in the afternoon. It feeds and nests only on the ground. The outer tail feathers of each side are white and are exposed by the bird when flying. *Ammodramus*, or *Passerculus*, includes upward of a dozen species, widely distributed, but popularly little known, on account of their retiring habits. They are shy, elusive little birds of fresh and salt marshes. The crown sparrows are large, handsome birds, of which the common white-throated Peabody bird (*Zonotrichia albicollis*) is best known. The conspicuous black and white (sometimes golden-

yellow) head markings make the crown sparrows conspicuous. The wood sparrows are a group of southwestern and Mexican species of medium or small size, with short rounded wings; one species, known as Bachman's finch or the pine-woods sparrow (*Peuceea aestivalis*), occurring in the South Atlantic States, especially Florida, is noted as a superior songster; a variety of this species, the oak-woods or Bachman's sparrow, is found in the Mississippi valley as far north as Illinois. The lark sparrow is notable for the fact that, unlike other sparrows, the sexes are very unlike in color; while the female is streaked grayish brown, the male is black with a large white patch on the wings. This is a prairie species abundant on the central plains, ranging eastward to Illinois, and occasionally, as a straggler, to the Atlantic coast.

Our native sparrows, in contrast to the introduced English sparrow, a pest, are of very great importance to the agriculturist. The great bulk of their food consists of seeds, fruits, and insects. Native sparrows destroy very little grain, hardly any cultivated fruit, but do consume vast numbers of weed seeds. It has been estimated that the tree sparrows in the State of Iowa eat 875 tons of weed seeds in a winter, and many other species of sparrows have been proven to do fully as much in the work of elimination of the future crop of weeds. Insects also make up from 25 to 35 per cent of their diet, so that sparrows are of great importance in our farming areas. Consult: *United States Biological Survey, Bulletin No. 15* (Washington, 1901); Ridgway, *Birds of North and Middle America*, part 1 (ib., 1901), and authorities there cited; Forbush, *Useful Birds and their Protection* (Massachusetts Board of Agriculture, 1913). See Plate of FAMILIAR SPARROWS and Colored Plate of EGGS of SONG BIRDS.

**SPARROW HAWK.** Any of several distinct species of small hawks, whose prey consists chiefly of sparrows and other small birds, insects, and mice. In America the name is universally given to *Falco sparverius*, a handsome little falcon less than a foot long. It is very courageous and very active, and lives largely on mice and insects. It is rufous above, barred with black; most of the head is slaty blue, and underneath it is buffy. It breeds from Florida to Hudson Bay, winters from New Jersey southward, and is everywhere one of the commonest species of hawk. It nests in a hole in a tree and lays from three to seven creamy or reddish eggs, finely marked with darker tints.

The Old World sparrow hawk (*Accipiter nisus*) is very similar, and has often been trained for the purposes of falconry, to take land rails, partridges, and similar game. See FALCON; FALCONRY; and Plate of EAGLES AND HAWKS.

**SPARTA** (Lat., from Gk. Σπάρτη, Doric Σπάρτα), also LACEDÆMON. The capital of Laconia, most famous city of the Peloponnesus (q.v.) (Map: Greece, Ancient, C 3). It occupied low hills on the right bank of the Eurotas (q.v.), and the plain between the hills and the river. Its appearance even in its palmiest days was unequal to its renown (cf. Thucydides, i, 10), for it was little better than a group of five villages, with plain and even mean private houses, though there were a few notable public buildings, such as the shrine of Athena or the Bronze House, whose walls seem to have been lined with bronze, probably decorated with reliefs. The passes which lead into the valley of the Eurotas

are so easily defensible, and the distance from the sea is so great, that Sparta continued without walls down to the end of the fourth century B.C., and, indeed, was not regularly fortified till the time of the tyrant Nabis (195 B.C.). The five villages, Cynosura, Limnæ, Mesoa, Pitane, and Dyme, were united in the worship of Artemis Orthia and Athena, and had a common agora, or market place, on which stood the public buildings—the senate house and the offices of the ephors (see EPHORI) and other magistrates. Famous public places were the *Choros*, where the youths danced in honor of Apollo; the *Dromos*, or race course, for gymnastic exercises, and where were also temples of the Dioscuri (see CASTOR AND POLLUX) and other gods; and the *Platanistas*, a broad level space, shaded by plane trees, and reached by two bridges where the Spartan youth, divided into two bands, met in strenuous personal conflict. Probably the so-called Acropolis, which was crowded with temples, was situated on the hill to the northwest, on whose southern side the theatre can still be traced. Near by excavations conducted by the American School at Athens in 1892 brought to light the foundations of a circular building which had contained a colossal statue and may have been identical with a structure mentioned by Pausanias (q.v.) as containing statues of Zeus and Aphrodite, said to be a foundation of Epimenides of Crete.

After the Dorian conquest of Laconia (see DORIANS) the supreme power always remained in the hands of the pure-blooded Dorian families of Sparta. The former population and the lesser Dorian towns became Peræci (q.v.) or Helots (q.v.). The situation of the Spartans, amid a subject population largely in excess of their own numbers, practically forced upon them a strict military discipline. This formed the basis of their whole system; Sparta was little else than a permanent camp. At the birth of a child the elders decided whether it was strong enough to be reared. A weakling was exposed on Mount Taygetus. After their seventh year boys entered upon severe training, designed to develop physical strength and courage, as well as uncomplaining endurance of hardship and cunning such as might serve the soldier. Music and the dance were added, and perhaps the elements of letters. Girls, too, passed through a training in gymnastics and the dance, that they might be fit consorts and bearers of strong children. Sentiment played but little part in the Spartan system, and the only function of marriage was the perpetuation of the state. At 20 the young Spartan was liable to active service, was admitted to the public meals, and allowed to marry, but, still obliged to live with his companions, he could obtain only stolen interviews with his bride. At 30 he became a full citizen. Discipline, however, was not relaxed. He must still eat regularly at his *Phiditia*, or mess, and contribute regularly to its support from the produce of his farm, which was cultivated by Helots. The government was a development from the old Homeric form of the king and council of elders. In Sparta there was a double kingship. The two lines claimed descent from the twin sons of Aristodemus, Eurysthenes and Procles, but they were named Agidæ and Euryptidæ, from the second generation, Agis and Eurypon. These two kings were the religious representatives of the state, on whose behalf they offered stated sacrifices, and also exercised

limited legal functions. Their chief duty was, however, the command of the army, over which in early times they exercised unlimited power, though in the fifth century B.C. they were subject to the ephors and the assembly. (See *ECCLĒSTĀ*.) In the field their power was absolute. Associated with the kings was a council (the *Gerousia*) of 28 elders, men over 60 years of age, chosen for life from certain noble families by acclamation in the popular assembly. They discussed and prepared the matters to be submitted to the assembly, and also sat as a court of criminal jurisdiction in crimes against the state, especially where the kings were involved. Once a month the assembly of the citizens (*Apella*) met at the call of the kings, though in the fifth century B.C. the ephors presided. This body seems ordinarily merely to have voted on the business presented to it. Speeches were in general delivered only by the officials; there was certainly no general discussion. Into this government were introduced at an early date the ephors, who, during the period of Spartan greatness, were the real rulers. (See *EPHORI*.) They exercised a general oversight over the community and maintained the established order. Elected for one year, they had the power to call any magistrate to account and even to suspend him from office. They presided over the *Gerousia* (q.v.) and could impeach any citizen before that court. Their short term of office and accountability to their successors were almost the sole limits to their power. Under the iron discipline of this constitution, which was attributed to the mythical *Lycurgus* (q.v.), the Spartan state gradually extended its power until it had gained complete control over *Laconia* and *Messenia* (q.v.) and the recognized leadership of a somewhat loosely joined confederacy, which included most of the *Peloponnesus* outside of *Argos*. At the time of the Persian wars Sparta was the leading state in Greece, but the constitution was not adapted for military operations requiring prolonged absence from home, and with the transfer of the war to Asia the Spartans soon withdrew from the scene. (Leading events other than domestic in the history of Sparta have been given under *GREECE, Ancient History*.) The creation of the fleet which decided the *Peloponnesian War* put a severe strain upon the ancient customs, and long absences in foreign lands, often with free opportunity for luxury, rendered men unwilling to submit to stern discipline on their return. The hegemony of Greece, which had fallen to Sparta on the overthrow of Athens, was used solely as a means of aggrandizement and profit, and in a short time led to renewed wars. In 371 B.C. the defeat at *Leuctra* (q.v.; see also *EPAMINONDAS*) at the hands of the Thebans broke forever the power of Sparta, and the disintegration, which had begun with naval empire and the accumulation of gold and silver, forbidden by the ancient laws, went rapidly forward. The attempt of *Agis IV* (c.244-240 B.C.) to reform the state was defeated and *Agis* put to death, but *Cleomenes III* (c.235-219 B.C.) carried through a series of sweeping changes, which increased largely the number of citizens and reestablished the *Lycurgan order*. After his death Sparta was ruled by the tyrants *Machanidas* and *Nabis*, was then forced into the *Achæan League* (see *ACHÆA*), and finally with the rest of Greece passed under the rule of Rome. Treated with favor by the Romans, the city prospered; the

old laws of *Lycurgus* were once more placed in force, and the old training practiced, at least nominally, though the forms of government seem to have been much altered. In the thirteenth century the *Acropolis* was fortified by a wall, which may still be traced. The Frankish lords of the *Peloponnesus* built a strong fortress at *Mistra* (1248-49) on a spur of *Taygetus*, west of Sparta, and its superior security led to the abandonment of the ancient city. After the Greek Revolution a new town of Sparta was laid out, in 1834, under King Otto, as the capital of the *Nomarchy of Laconia*. In 1906 excavations were begun on the site of Sparta by the British School at Athens; for these see *Annual of the British School*, xii ff.

**SPARTA.** A city in Randolph Co., Ill., 54 miles southeast of St. Louis, Mo., on the Mobile and Ohio and the Illinois Southern railroads (Map: Illinois, E 9). It contains railroad repair shops, coal mines, plow works, also flour and planing mills, etc. Pop., 1900, 2941; 1910, 3081.

**SPARTA.** A city and the county seat of Monroe Co., Wis., 26 miles east by north of La Crosse, on the La Crosse River and on the Chicago, Milwaukee, and St. Paul and the Chicago and Northwestern railroads (Map: Wisconsin, C 5). It has an attractive situation and artesian mineral wells, and is a fine health resort. There are in Sparta a Carnegie library, the State Public School for Dependent and Neglected Children, St. Mary's Hospital, and St. Mary's Convent. The city is the shipping centre for a rich farming and stock-raising region, and manufactures well-drilling machinery, iron products, monuments, and grain separators. Pop., 1900, 3555; 1910, 3973.

**SPARTACUS.** The leader in a great insurrection of Roman slaves in southern Italy (73-71 B.C.). He was a native of Thrace, originally a shepherd, but afterward a robber chief. He was taken prisoner and placed in a gladiatorial school at Capua. Seventy gladiators, including Spartacus, escaped, defeated the Roman soldiers sent to bring them back, and established themselves on Mount Vesuvius, where they received considerable accessions, chiefly runaway slaves. Spartacus was chosen leader, and proclaimed freedom to all slaves. Thousands rushed to his standards. He defeated Claudius Pulcher, Cossinius, legate of P. Varinius Glaber, the praetor, and finally Varinius himself in several engagements. All southern Italy now fell into

his hands; the country was devastated, the cities either pillaged or garrisoned. After the defeat and death of his lieutenants, two Celts, Crixus and Oenomaus, who had separated from him (72 B.C.), Spartacus marched northward through Picenum towards the Po, overthrew first one consular army under Cn. Cornelius Lentulus and then another under Gellius Poplicola, and at the head of a large force meditated a march upon Rome. He was forced, however, by his followers to retreat south, and took up his winter headquarters at Thurii. In 71 the proconsul, C. Cassius Longinus, and the proprætor, Cn. Manlius, were defeated; in Picenum, Mummius, a legate of Crassus, was routed; at last, however, Crassus succeeded in forcing Spartacus into the narrow peninsula of Rhegium. Crassus now built lines of circumvallation to force him to surrender; but one stormy winter night Spartacus broke through and resumed the offensive. Near Petelia, Spartacus again defeated his adversaries; but, seeing clearly that he could not hold out much longer, he made a dash for Brundisium, hoping to seize the shipping in the harbors and get safely across the Adriatic to his native shore, but was baffled by the presence of Lucullus (q.v.). There was nothing left for Spartacus but to die gallantly as he had lived. Drawing up his army in battle array, and solemnly slaying his war horse, he began his last fight in a spirit of heroic desperation, and after performing prodigies of valor he fell unrecognized among the heaps of his slain foes. After his death the slave insurrection was at an end.

**SPARTANBURG.** A city and the county seat of Spartanburg Co., S. C., 93 miles northwest of Columbia, on the Carolina, Clinchfield, and Ohio and South Carolina, the Charleston and Western Carolina, on the Southern and the Piedmont and Northern railroads (Map: South Carolina, B 1). It has the Kennedy Public Library, and is the seat of Converse College, a nonsectarian institution for women, opened in 1890, Wofford College (Methodist Episcopal, South), opened in 1854, a textile school, and the State Deaf, Dumb, and Blind Institute. Spartanburg is the centre of a large cotton manufacturing district, containing some 38 mills with more than 806,000 spindles. There are also ironworks, lumber mills, and manufactories of brooms and roller bearings. The city has adopted the commission form of government. Pop., 1900, 11,395; 1910, 17,517; 1915, 20,745; 1920, 22,638.

**SPARTEINE**, spär'tē-in or -ën (from Neo-Lat. *Spartium*, from Lat. *spartum*, *sparton*, from Gk. σπάρον, Spanish broom, cable). A volatile, oily liquid alkaloid obtained from the tops of the broom plant (*Cytisus scoparius*), a European shrub of the order Leguminosæ. Spartheine is odorless, very bitter, soluble in alcohol, ether, and chloroform, but insoluble in water. Its sulphate, which is used in medicine, is a colorless, crystalline powder, soluble in water and in alcohol. It is a cardiac stimulant, acting at times when digitalis fails. It is also an uncertain diuretic.

**SPARTIUM**, spär'shī-üm. A genus of plants. See BROOM.

**SPARTIVENTO, CAPE.** See CAPE SPARTIVENTO.

**SPASM** (Lat. *spasmus*, from Gk. σπασμός, *spasmos*, σπάσμα, *spasma*, spasm, from σπᾶν, *span*, to draw, rend). Involuntary and sudden muscular contraction, due to central nerve disturbance, to peripheral irritation, or to reflex action

from irritation of other parts of the body. There are two kinds, tonic and clonic. Tonic spasm is a prolonged involuntary rigidity of a muscle or a group of muscles. Such spasm occurs at the beginning of an epileptic attack, during hysteria major, tetanus, angina pectoris, and meningitis. It also occurs in muscles of the calves of the legs in swimmers, attended with pain, when it is called cramp (q.v.). Clonic spasm is an involuntary contracting and relaxing of groups of muscles, causing twitching, jerking, and rolling movements and contortions. It is the common convulsion, or fit. Such a spasm occurs in epilepsy, hysteria, uræmia, chorea, hydrophobia, and in some cases is due to indigestion or intestinal worms. In asthma (q.v.) there is spasm of the muscles controlling the bronchial tubes, as also in whooping cough (q.v.), together with hyperæsthesia. Spasm occurs also in colic. Treatment consists of the use of antispasmodics: asafoetida, musk, valerian, belladonna, cannabis indica, opium, the bromides, and stramonium, and the administration by inhalation of chloroform or amyl nitrite, or by prolonged hot bathing.

**SPASMODIC COLIC.** See HORSE.

**SPASMODIC SCHOOL OF POETRY.** See POETRY, SPASMODIC SCHOOL OF.

**SPAVIN, BOG** (OF. *esparvain*, *esparvent*, Fr. *éparvin*, *spavin*; possibly from Goth. *sparwa*, OHG. *sparo*, *sparwe*, AS. *spearwa*, *sparewa*, Eng. *sparrow*; in allusion to the hopping gait of a spavined animal). A lesion of the true hock joint of the horse, consisting in distention of the capsule inclosing the joint. It usually arises suddenly from a sprain in action, from overwork, or wounds.

**SPAVIN, BONE.** An inflammation of and bony deposit on the flat bones of the lower and inner part of the hock joint of the horse. At first there is tenderness, local heat, swelling, and lameness, but as the inflammatory stage passes the lameness is less perceptible, although the horse still continues to go stiffly. If the lameness is only slight it usually disappears after a little exercise. The animal should be given rest.

**SPAWN EATER.** The spotted-tailed minnow (*Notropis hudsonius*). See MINNOW.

**SPEAKER.** The name of the presiding officer in various legislative bodies. In the English House of Commons the office seems to have existed as early as the reign of Henry III, but the title Speaker was first given to Sir T. Hungerford in the reign of Edward III (1377). The Speaker of the House of Commons presides over the deliberations of the House and enforces its rules. He puts the question and declares the determination of the House. As the representative of the House, he communicates its resolutions to others, and conveys its thanks or its censures. He issues warrants in execution of the orders of the House for the commitment of offenders, for the issue of writs, the attendance of witnesses, the bringing up prisoners in custody, etc. He cannot speak or vote on any question, but on an equality of voices he has a casting vote. The office is nonpolitical; and hence a Speaker may hold during several successive and opposing administrations. A retiring Speaker is usually rewarded with a peerage. See PARLIAMENT.

Unlike the English prototype, the Speakership of the United States House of Representatives is a political office of the highest importance. The first Speaker, chosen in 1789, was a modera-

1. SPEARFISH (*Tetrapturus albidus*). 2. WEST INDIAN SAILFISH (*Histiophorus nigricans*). 3. YOUNG OF SWORDFISH (No. 5).  
4. SAILFISH (*Histiophorus gladius*). 5. SWORDFISH (*Xiphus gladius*).

tor on the British pattern. But beginning with the right to appoint the standing committees in 1790, the powers of the Speaker have gradually expanded until, by his power to appoint committees, to refer bills to the various committees, and, as chairman of the committee on rules, to direct the course of legislation, he became the majority leader in the House and a sort of American Premier. His power, however, was much curtailed in 1910, when the House took from him the appointment of the committee on rules. (See CANNON, JOSEPH GURNEY.) The Speaker is a member of the House, chosen by the members; and he may exercise his privilege of voting on any measure. From 1874 to 1907 his salary was \$8000 a year; since 1908 it has been \$12,000. He signs all bills, resolutions, and acts of authority; certifies to the mileage, etc., of members; and appoints three of the regents of the Smithsonian Institution. He may be removed from office by an act of the House.

For the early history of the Speakership, consult Sir William Stubbs, *Constitutional History* (6th ed., Oxford, 1897), and in general, Alpheus Todd, *Parliamentary Government* (London, 1869), together with Michael Macdonagh, *The Speaker of the House* (ib., 1914). The most important work on the American office is M. P. Follett, *The Speaker of the House of Representatives* (New York, 1896). This was preceded by A. B. Hart, "The Speaker as Premier," in *Practical Essays* (ib., 1893).

**SPEAKING TRUMPET.** An instrument for concentrating the sound waves of the human voice, and enabling the sound to be conveyed to a distance; often used on shipboard. Its inventor was Sir Samuel Morland (q.v.). It is now generally superseded by the megaphone (q.v.).

**SPEARFISH.** A city in Lawrence Co., S. Dak., 17 miles northwest of Deadwood, on the Chicago, Burlington, and Quincy Railroad (Map: South Dakota, A 3). It is the seat of a State Normal School and also of a United States government fish hatchery. Fruit growing and stock raising are carried on, and there are saw, planing, and flour mills, a cyanide plant, stucco mills, and a creamery. Pop., 1900, 1166; 1910, 1130.

**SPEARFISH, or SPIKEFISH.** The great billfish, or aguja blanca (*Tetrapturus albidus*) of West Indian waters. It is dark blue above, whitish beneath, and may be 7 feet long, including the spearlike jaws, and weigh 100 pounds. It is probably identical with the Mediterranean species, and others occur in the Eastern tropics. Their habits are similar to the sailfishes and swordfishes. See Plate of SPEARFISH AND SWORDFISH.

**SPEAR GRASS.** See BLUE GRASS.

**SPEAR LILY.** See GIANT LILY.

**SPEARMINT.** See MINT.

**SPEARS, JOHN RANDOLPH** (1850—). An American author and journalist, born at Van Wert, Ohio. He was early connected with the *Buffalo Express* and with the *New York Sun*. Later, devoting himself to writing, he settled at Little Falls, N. Y. His publications include: *The Gold Diggings of Cape Horn* (1895); *The Port of Missing Ships and Other Stories of the Sea* (1896); *The History of our Navy from its Origin to the Present Day* (5 vols., 1897-99); *The Fugitive* (1899); *The American Slave Trade* (1900; new ed., 1907); *David G. Farragut* (1905); *A History of the United States Navy* (1907); *The Story of New England Whalers*

(1908); *A History of the American Navy* (1909); *The Story of the American Merchant Marine* (1910); *Master Mariners* (1911).

**SPECIAL ASSESSMENT.** A compulsory contribution levied in proportion to special benefits derived from public improvement; designed to cover, entirely or partially, the cost of that improvement. A special assessment is levied frequently on the opening or improvement of streets or highways. It differs from a tax, being levied in proportion to benefits directly derived from the uses to which the contribution is put. (See TAX.) Charges of this nature were imposed in France as early as 1672. In 1807 a general law was passed authorizing such levies, but it has rarely been invoked. In Prussia, since 1875, expenses of certain street improvements have been thus partially defrayed. In England contributions of the same nature were imposed in 1427 and in 1667. The Public Health Act of 1875 permits urban authorities, under certain contingencies, to recover the cost of improvements from property owners in proportion to frontage.

The principle first appeared in America in a law of the Province of New York of 1691. By that law all houses in the city of New York might be assessed in proportion to benefits derived from public improvements. By a law of 1787, assessments were limited to the owners of property which was to be benefited. In other States this form of raising revenue appeared about 1830. After the Civil War the principle became extended, and is now throughout the United States a recognized principle. In a typical case, when a street is graded or paved, after the improvement has been made a board of assessors is appointed, who apportion costs in proportion to benefits received. Such assessments are usually subject to legal limitation as to amount. Consult Victor Rosewater, *Special Assessments* (2d ed., New York, 1898).

**SPECIAL JURY.** In the English law, a jury consisting of men who are entitled to be called esquires, or persons of higher rank, bankers, merchants, and persons who occupy private dwelling houses, or possess certain other property qualifications. Under the "Juries Act" of 1870, either the plaintiff or the defendant in an action is entitled to demand a special jury, but he must bear the additional expense, unless the trial judge certifies at the end of the trial that the case was a proper one to be tried by a special jury. In some of the United States no provision is made for special juries; but in a few States *struck* or special juries may be ordered, in the discretion of the court, in important cases. See JURY.

**SPECIAL PROCEEDING.** Under modern codes of procedure, any civil proceeding which is not an action (q.v.). Under the New York Code of Civil Procedure the following have been held to be special proceedings: an application for admission to the bar; proceedings supplementary to execution; a proceeding to vacate an assessment; proceedings for contempt; proceedings for condemnation of land; habeas corpus and other State writs (q.v.). Consult J. N. Fiero, *Practice of Special Proceedings* (2d ed., 2 vols., New York, 1899). See ACTION.

**SPECIAL SESSIONS.** Under the English judicial system, where two or more justices of the peace sit together for the trial of some important cause, or to transact other urgent judicial business, the sitting is known as *Special*

Sessions. In New York a criminal court for the trial of misdemeanors and petty criminal cases is called the Court of Special Sessions. See COURT; PETTY SESSIONS.

**SPECIALTY.** In law, in its broadest sense, any formal, as distinguished from a simple, contract, including judgments, recognizances, statutes staple, statutes merchant, and deeds of grant; the term is more frequently used as synonymous with contract under seal. Contracts under seal were the earliest form of contract known to the law—used from the earliest time both under the common and the Roman law system. Unlike simple contracts, no consideration is required to give them validity at law; that, as in the case of all other specialties, depending on their form and the method of their execution. They must be written or printed on paper or parchment and must be sealed and delivered by the grantor or obligor. It is said that signing a deed by the obligor is not essential to the validity, although it is now the universal practice to execute the instrument by signing as well as by sealing and delivering it. The latter is effected by actual delivery of the instrument by the person executing it to the obligor (or to another for the obligor) with the intent that it should become operative as a deed or contract under seal. After sealing and delivery the instrument remains in full force even if the person executing it take it back into his possession. One executing a specialty may, however, make a qualified delivery of it called a delivery in escrow (q.v.). Formerly specialties were classified as deeds poll and indentures (see DEED), but now the most satisfactory classification of specialties (using that term as applicable only to instruments under seal) is into grants, bonds, and covenants (qq.v.). All statements contained in a specialty are absolutely conclusive against the party making them and executing the instrument, that is, he is conclusively estopped to deny them. Whenever a specialty contract is given on account of or in place of a simple contract, the simple contract is merged and extinguished. (See MERGER.) The statute of limitations provides a much longer period of limitation for specialties than other forms of obligations, usually twenty years. (See LIMITATION OF ACTIONS.) In case of the death of the obligor the holder of specialty obligations executed by the deceased had at common law much higher rights against his estate than the holder of simple contract obligations. (See ADMINISTRATION.) Although consideration is not necessary to give legal validity to a specialty, courts of equity will not grant their peculiar form of relief by way of specific performance to one who has not given consideration for the specialty obligation which he holds. (See SPECIFIC PERFORMANCE; TRUST; USES.) It was formerly held that a corporation could contract only by specialty under its corporate seal. This is no longer the rule in the United States, where it is held that a corporation may enter into contracts by its proper officers without the use of its seal, wherever a private individual might so contract. For further information consult BOND; CONTRACT; CONSIDERATION; COVENANT; DEBT; DEED; EQUITY; SEAL; ETC.; and authorities referred to under CONTRACT and SEAL.

**SPECIAL VERDICT.** A verdict in which the jury find merely the facts as proved by the evidence and do not apply the law to the facts, but leave it to the discretion of the court as

to whether in its opinion the plaintiff or defendant shall succeed. Thus where there is a substantial conflict of evidence as to only one or a few of the facts, proof of which is essential to a recovery, the court may submit that particular issue to the jury for a special finding thereon. The matter is now regulated by statute in most jurisdictions. In some States such a verdict is said to be "subject to opinion." See JURY; VERDICT.

**SPECIE PAYMENTS** (abbrev. of *ML. in specie*, in coin, Lat., in kind; *in*, in, and *specie*, abl. sing. of *species*, kind), SUSPENSION AND RESUMPTION OF. There are few states which have not passed through crises when the metallic covering of their paper money has become too scanty, and the convertibility of the paper has been suspended. Such a general suspension of specie payments is legalized either directly or tacitly by the government. The effect of suspension is to relax the restrictions upon the issue of paper money, and the general result is a redundancy of such money and its depreciation. The action generally leads to the hoarding or export of such metallic money as remains in the country, thus causing a void in the monetary circulation which the issues of paper money do not at once fill, but the extent of depreciation of paper usually depends upon the facility of issue. On the suspension of specie payments by the Bank of England in 1797, the effect of increased note issues was only gradually felt, for the bank followed a conservative policy. This was true also of the suspension by the Bank of France in 1870. On the other hand, during suspension of specie payments in the United States in 1813, the banks issued notes recklessly and the depreciation was considerable. When the banks of the United States, on December 30, 1861, again suspended specie payments and the government followed their example, large issues of legal-tender notes caused a like result.

The first step towards resumption is the gradual restriction of paper issue; for government notes redemption is accomplished by the aid of taxation, while in the case of bank notes resumption occurs through pressure of the government by taxation of excessive issues or by other means. The second step is to procure metallic money sufficient to meet demands. To effect this government credit is usually called into requisition. The resumption of specie payments restores the convertibility of credit money, but does not destroy the money. It provides for redemption in specie of such sums as may be presented, but not compulsory redemption of the whole.

At the close of the Civil War the monetary circulation of the United States was exclusively paper, government issues, State bank notes, and national bank notes. Specie payments had been suspended since 1861; a return to them seemed the first duty. Fear of a contraction of the currency made the first steps in this direction hesitating. The gradual redemption of the United States notes (in January, 1864, \$449,000,000) undertaken under the Law of April 12, 1866, had been arrested in February, 1868 (the amount standing at \$356,000,000). In the financial troubles of 1873, the Secretary of the Treasury, upon somewhat dubious authority, had increased the volume, but by Act of June 20, 1874, Congress stopped this increase when the issue had reached \$382,000,000. The task of resump-

tion was earnestly taken in hand early in 1875, when an act was passed providing for resumption on Jan. 1, 1879. In the following years the act was repeatedly attacked, but efforts to repeal it failed. This law removed the limitation which had heretofore rested upon the aggregate issue of national bank notes. It provided, moreover, that, as new notes were issued, United States notes to the extent of 80 per cent of the new bank issues should be retired and canceled. Under this provision the volume of the legal-tender notes diminished by May 31, 1878, when this provision was repealed, to \$345,000,000. The resumption act further authorized the Secretary of the Treasury, by the accumulation of surplus revenues and by the sale of bonds, to collect a supply of gold wherewith to resume. The amount to be collected and the amount to be maintained after resumption became a fact were left to his discretion. By the sale of bonds at favorable opportunities the Secretary had on hand on the day of resumption \$140,000,000 in gold. The growing strength of the Treasury produced a diminishing premium on gold, and the 1st of January, 1879, passed off without any shock. Only a small amount of paper money was actually presented for payment. Consult E. E. Sparks, *National Development, 1877-1885* (New York, 1907), and D. R. Dewey, *Financial History of the United States* (4th ed., ib., 1912). See MONEY.

**SPECIES.** See CLASSIFICATION OF ANIMALS; EVOLUTION.

**SPECIFICATION.** In the law of patents, a technical description of the invention mentioned in an application for a patent, and when used without the word "claim" it includes the claims or arguments of the inventor as to the novelty, usefulness, etc., of his invention. See PATENT, and the authorities there referred to.

In architecture and building, and in mechanical work of all kinds in which the contract system is followed, the specification is a document attached to the contract, describing in detail every part of the work to be done, the materials to be employed, the kind and quality of workmanship required, and the time within which and conditions under which the contract is to be fulfilled; and providing in general all the instructions necessary for the contractor's guidance. Separate sections deal with each trade or kind of work involved. The specification supplements and explains the drawings and is made an essential part of the contract. Even for work done by day labor a specification is often prepared providing like detailed information for the guidance of workmen and superintendent. See BUILDING.

**SPECIFIC GRAVITY** (ML. *specificus*, specific, particular, from Lat. *species*, kind). The ratio between the weights of equal volumes of any substance and of some other, chosen as a standard. For solids and liquids the standard substance is water; for gases, air, or sometimes hydrogen. Since the volume of a given weight of a substance changes with temperature, it is necessary for exact determinations that the standard selected should be at a certain fixed temperature. Thus specific gravity is not the ratio of an equal volume of a given substance to water at any temperature, but only at the standard temperature selected, as described below. Likewise for a specific-gravity determination to be of value the temperature of the substance at the time of making the measurement

should be given. For gases not only the temperature but the pressure must be mentioned. For many purposes the term density has replaced specific gravity, but the two are not synonymous. The density of a substance (at a given pressure and temperature) is the mass of that substance in a unit volume, provided it is homogeneous; otherwise it is the mass of a volume so small as to be homogeneous, divided by the volume. Thus density is an absolute term, expressing the quantity of a certain kind of matter in a given space, while specific gravity is merely relative, being in fact the ratio of the density of the substance to the density of the standard. The specific gravity of a gas or vapor is usually referred to air at the same pressure and temperature as that of the gas, but it is also frequently referred to hydrogen under like conditions. In terms of the latter it is equal to half the molecular weight of the gas. See the article MOLECULES—MOLECULAR WEIGHTS.

The specific gravity of solids and liquids is variously referred to water at 4° C., 15° C., or 62° F., and sometimes other temperatures. Specific gravities on these scales are respectively as 1.000045, 1.000913, 1.001180—the density of water at these temperatures being inversely as these numbers. The difference is not of importance except for purposes of extreme accuracy. Density in the metric system is measured in grams per cubic centimeter (kilograms per liter). If a liter of water at 4° C. weighed exactly a kilogram, as was intended, the density of water at this temperature would be one, and metric density and specific gravity referred to water at 4° C. would be identical. The density of water at this temperature is actually 0.999955, so that specific gravity referred to water at 4° is equal to density  $\times 1.000045$ . Specific gravity referred to air at 0° C. and 76 centimeters' pressure is equal to metric density divided by the density of air, i.e., 0.001293.

On the English system density is variously expressed in pounds per cubic foot, pounds per cubic inch, grains per cubic inch. To reduce specific gravity referred to water at 62° F. to density on these scales multiply by 62.3546, 0.0360848, 252.593, respectively.

**Methods of Measurement. I. Density.** Two courses may be pursued to determine the density of a substance: (1) Weigh a portion of it and measure its volume; (2) Determine its specific gravity referred to a substance of known density. For approximate purposes the former is better, particularly in the case of solids of regular shape. To attain great accuracy is difficult, since the direct determination of volume is subject to many errors. Hence the density of most substances is found by determining, by one of the methods below, its specific gravity referred to water or hydrogen, the density of each of these having been carefully investigated. The density of water is found by observing the loss in weight of a solid of regular shape when immersed in water, some of the best results being obtained with a glass cube whose exact dimensions were found by a method based on the interference of light.

**II. Specific Gravity of Solids and Liquids.** Most of the methods given below are based on Archimedes' principle—that a solid floating or immersed in a liquid loses weight equal to that of the liquid it displaces. Hence if totally immersed the loss of weight is the weight of a

volume of liquid equal to the volume of the solid. Hence:

$$\frac{\text{Weight of solid}}{\text{Loss of weight}} = \frac{\text{Specific gravity of solid}}{\text{Specific gravity of liquid}}$$

Thus if either is known the other may be found. For exact purposes the temperature of the liquid must be known, weighings in air must be corrected for the buoyancy of the latter, and the solid must be supported in the liquid so that only a single fine wire cuts the surface. Air

BRIDGE AND PAN FOR USE WITH BALANCE.

bubbles are also a serious source of error, and for this reason water when used should be freshly distilled or boiled.

**A. Hydrostatic Balance.**—A chemical balance (see BALANCE) so arranged that a vessel of liquid may be placed under one end of the beam without resting on the pan. This is done by replacing the ordinary pan by a shorter (Fig. a) or else by resting the vessel on a bridge (Fig. b) over the pan.

The solid is weighed in air, then suspended from a hook on the pan or pan support by a wire of known weight, so that it hangs totally submerged in the vessel of liquid, and again weighed.

**B. Jolly Balance.**—A large delicate spiral spring supported by a vertical rod of adjustable length and carrying at the bottom two pans, one below the other. For description see JOLLY BALANCE.

**C. Specific Gravity Bottle.**—A light glass flask with a groundstopper generally pierced with a fine hole so that it may be completely filled. The flask is weighed empty, then full of water. Knowing the density of water, the internal volume is calculated. The bottle may now be filled with a liquid of unknown density and weighed and the density calculated. Or a weighed amount of solid in small pieces may be put in the bottle, which is then

SPECIFIC GRAVITY BOTTLE OR PYCNOMETER.

A, simple form; B, with thermometer.

filled up with water and weighed. The difference between the weight of the solid plus that of the bottle entirely filled with water and the weight observed

is the weight of water displaced by the solid. This is the most accurate method for liquids and solids in small bits.

**D. Mohr's Balance.**—A balance beam divided into tenths carries suspended from one end by a platinum wire a glass cylinder, *F*, almost solid. On the other end is a counterpoise, *P*, balancing the cylinder in air. Riders, *A, B, C, D*, are provided of weight equal to the loss of weight of the cylinder in water at 15° C. and of 1-10, 1-100, 1-1000 this weight. When the cylinder hangs in a jar, *E*, filled with a liquid whose density is desired, these riders are adjusted on the beam so that balance is restored, and the position of the riders then gives directly the specific gravity referred to water at 15°. Thus with the riders as in the figure the specific gravity would be 0.8642. The glass cylinder carries a small thermometer, and the temperature

SPECIFIC GRAVITY, MOHR'S BALANCE.

should be adjusted to about 15°. The method is extremely convenient to three places of decimals. The fourth requires many corrections.

**E. Hydrometer.**—A long hollow glass cylinder or "stem" weighted at one end by a bulb containing shot or mercury so that it will float upright in a liquid. The stem is graduated and the specific gravity is given by the mark to which it sinks, read *through* the liquid. The graduations are sometimes in specific gravity or density, but often according to established arbitrary scales, those of Beaumé and Twaddell being best known. Instruments are of different styles for milk, spirits, oil, acids, etc. See HYDROMETER.

**F. Balancing Columns.**—A tube such as that shown is supported vertically in two jars containing two liquids. These are drawn up into the tubes by suction on the tube at the top, which is then closed. The heights of the liquids in the tubes above their surfaces in the tumbler are inversely as their densities. If the liquids do not mix a simple inverted U tube may be used, one liquid being poured into each arm. If tubes less than half an inch in diameter are used the liquids should be drawn up only a little; heights measured, then as far as possible, and the ratio of the *increase* in lengths of the columns taken.

**G.** The specific gravity of a solid lighter than water is found by either the hydrostatic or Jolly's balance, a weight being attached sufficient to sink it. This weight should hang under water throughout.

III. Specific Gravity of Gases. Bunsen's

**Method.** The rate of effusion of a gas, i.e., the volume escaping per second through a very small opening, is for a given opening and difference of pressure inside and out, inversely as the square root of its density.

Near the top of a long vertical glass tube is a partition consisting of a disk of platinum

HYDROMETER.

APPARATUS FOR METHOD OF  
BALANCING COLUMNS.

pierced by a hole about 0.0005 inch in diameter. Above this the tube is closed by a ground stopper. The tube is filled with gas and plunged into a deep bath containing mercury and adjusted until a glass float on the mercury stands at a fixed level. The stopper is removed and the time required for the float to rise to another fixed level as the mercury drives out the gas is measured. The experiment is then repeated in exactly the same manner with the standard gas. The ratio of the times observed is the square of the ratio of the densities, i.e., the specific gravity of the unknown gas referred to the standard gas. See MOLECULES—MOLECULAR WEIGHTS.

Consult Landolt and Börnstein, *Physikalisch-Chemische Tabellen* (Berlin, 1905), and "Smithsonian Physical Tables," in Smithsonian Institution, *Miscellaneous Collections*, vol. lxiii, no. 6 (6th rev. ed., Washington, 1914).

**SPECIFIC HEAT.** See HEAT.

**SPECIFIC LEGACY.** See LEGACY.

**SPECIFIC PERFORMANCE.** A technical legal term employed to denote the equitable doctrine and rules under which a court may compel a party who has refused to perform his part of an agreement to carry it out according to its terms. In an action at law for the breach of a contract the only relief possible is damages, but as money is not always an adequate compensation for the loss which may be suffered, the courts of equity will in certain cases decree a specific or actual performance of the terms of the contract. This lies in the discretion of the court, but precedents must be followed as a

guide. In general, to obtain a decree of specific performance the plaintiff must satisfy the court that the remedy at law is inadequate; that there was a valid, fair, and reasonable contract between the parties; that he has done nothing inequitable on his part. It is a general rule to grant specific performance of contracts for the conveyance of real estate; only in exceptional cases will relief be granted in cases of contracts to convey personal property, and then only when the article is unique in its character and practically unobtainable elsewhere, such as a rare picture not to be duplicated. In a few cases specific performance of a contract to do some act, such as build a structure, will be decreed. For example, where a railroad agreed to build an ornamental bridge over a private roadway in consideration of the right of way through a man's premises, the court decreed that the company should construct the bridge according to the contract. While it is the general rule that the courts will not compel the specific performance of an act requiring personal skill, as in the case of actors, an exception is made where the agreement to do the act for one person is accompanied by an express agreement not to act for any one else. In such cases the courts will enforce the negative agreement and thus indirectly give the desired relief. Consult Sir Edward Fry, *Treatise on the Specific Performance of Contracts* (5th ed., Toronto, 1911). See also CONTRACT and EQUITY and authorities there referred to.

**SPECK VON STERNBURG, HERMANN, BARON** (1852–1908). A German diplomatist, born at Leeds, England. After studying military and naval science and international law he entered the army and served throughout the Franco-Prussian War. From 1885 to 1890 he was the German military attaché at Washington, D. C. In the following year he entered the diplomatic service as Secretary to the Legation at Peking, China. In 1896 he was sent to Buenos Aires, and soon afterward to Belgrade, Servia. In 1898 he became First Secretary to the German Embassy at Washington and in 1900 was appointed Consul General for British India and Ceylon. From 1903 until his death he served as Ambassador to the United States. The tariff arrangements made between Germany and the United States in 1906–07 were largely the result of his efforts.

**SPECTACLED BEAR** (so called from the marking on the face). The small bear of the northern Andes. See BEAR.

**SPECTACLES**, or EYEGLASSES (Lat. *spectaculum*, show, from *spectare*, to behold, from *specere*, to see; connected with Gk. *σκέπτεσθαι*, *skeptesthai*, to look). A device for the purpose of aiding the sight when impaired by age or otherwise. (See SIGHT, DEFECTS OF.) The term "spectacles" is more definitely applied to a frame which has side pieces fitting over the ear. Eyeglasses or *pince-nez* are frames supported by a clasp fitting to the sides of the nose. Spectacles were invented during the thirteenth century. The credit is attributed by some to Alessandro di Spina, a Florentine monk; by others to Roger Bacon. The lenses are made of the best optical glass, and ground with extreme care. Lenses may be mounted as either eyeglasses or spectacles, care being taken that the centre of the lens is opposite the pupil and that the glasses are tilted at a proper angle for reading or distance as desired. When separate lenses are required for these pur-

poses the so-called bifocal glasses may be used. They are made by cementing a small strong lens upon the lower part of the other, so that when the eyes are lowered, as in reading, the line of vision passes through that portion. Lenses are now numbered, with one of a focus of one meter as a unit, known as one diopter. One with four times that strength has a focal distance of one-quarter of a meter and is known as 4 D. (diopters). Convex spherical lenses are used in hypermetropia, presbyopia, and after removal of the crystalline lens for cataract. Concave spherical lenses are employed in myopia. If astigmatism exists a cylindrical lens, either concave or convex as required, is used. As the astigmatism may be in only one meridian, or, since there may be either hyperopic or myopic astigmatism in both, or hyperopic in one and myopic in the other, it is sometimes necessary to employ cross-cylinder lenses, a combination of two cylinders with their axes at right angles to each other. Prismatic glasses are used in cases with weakness of ocular muscles, one being chosen which will make the images seen by the two eyes coincide. Combinations of cylindrical and spherical lenses and prisms are needed when errors of refraction or accommodation are combined with astigmatism and muscular weakness, which cause double vision. Colored glasses, designed to protect the eyes from light, either natural or artificial, are made in tints, viz., smoked, amber, amethyst, greenish yellow (the so-called euphus), blue, and green. Of late years a lens has been perfected which has the same refractive power in every plane, whereas the old-style lens was only absolutely perfect at its centre. Consult: C. F. Prentice, *Ophthalmic Lenses* (2d ed., Philadelphia, 1907); R. D. Pettet, *Mechanics of Fitting Glasses* (Chicago, 1913); Sir William Crookes, *The Preparation of Eye-Preserving Glass for Spectacles* (London, 1914).

**SPECTATOR, THE.** 1. A famous periodical published daily in London from March 1, 1711, to Dec. 6, 1712, to which Addison and Steele were the principal contributors. Addison wrote 274 papers, Steele 236. Addison's essays, almost perfect in form, fixed a new standard in manners, morals, and taste, whose influence lasted for years. The *Spectator* was revived in 1714, when 80 numbers were issued, of which Addison contributed 24.

2. A London weekly periodical, founded in 1828, devoted at first solely to literature and social questions; politics were, however, introduced and it became a strong advocate of the Reform Bill. The first editor was Robert S. Rintoul, who continued in office till his death in 1858. John Stuart Mill was a member of the staff. From 1861 to 1897 it was edited by Richard Holt Hutton, who wielded great influence in literature and theology, while his partner, Meredith Townsend, managed politics, which were liberal until 1886. In 1897 John St. Loe Strachey became editor and owner, and the political attitude of the paper became Liberal-Unionist.

**SPECTRAL BAT.** See BAT, and Colored Plate of MAMMALIA.

**SPECTRAL PHOTOMETRY.** See SPECTROPHOTOMETRY.

**SPECTRE** (from Lat. *spectrum*, appearance, image, apparition). A fanciful book name for one of the small lemurine animals of the Malayan region, the tarsier, on account of its gaunt form, enormous eyes, and nocturnal appearance. Many superstitious notions attach to these and

related animals (see LORIS) among the natives of the East Indies, causing them to be regarded with more dread than curiosity. Their nocturnal and irregular appearance have caused certain bats and small owls also to be called spectral.

**SPECTROGRAPH** (from Lat. *spectrum*, appearance, apparition, from *specere*, to see + Gk. *γράφειν*, *graphein*, to write). A particular form of spectroscope (q.v.) in which the apparatus to record the radiations is a photographic plate. The apparatus, then, consists of a collimator, a prism, or a grating, and a telescope in which the eyepiece is replaced by a photographic camera.

**SPECTROMETER** (from Lat. *spectrum*, appearance, image, apparition + Gk. *μέτρον*, *metron*, measure). An instrument especially designed to determine the index of refraction of transparent bodies. The ordinary type of instrument is illustrated in the cut, and, as shown, consists essentially of two arms which are movable around an axis carrying a platform on which rests a prism of the substance to be investigated. One of the arms carries a telescope, *A*, while the other supports what is known as the collimator, *B*. This consists of a tube at one end of which is a slit made by two movable parallel edges, and at its other end is a lens so placed that the slit is in its principal focus. If a source of light, for instance a sodium flame, is placed in front of the slit, a beam of parallel

SPECTROMETER.

light will proceed from the collimator lens, fall upon the prism, suffer deviation, enter the telescope and be focused by the objective on the cross hairs of the eyepiece. The angles made between the telescope and collimator may be read on a scale attached to the platform of the instrument.

To determine the index of refraction of a substance in the form of a prism, for radiations of a given wave length, it is necessary to know: first, the angle of the prism, that is, the angle made between the two plane faces of the prism; second, the angle of minimum deviation for the given radiations. Both these quantities can be measured with the spectrometer, care being taken to have the axes of the telescope and collimator perpendicular to the axis of the instrument, and the edge of the prism parallel to it. The following formula then gives the index of refraction, in which *A* represents the angle of the prism and *D* the angle of minimum deviation:

$$\text{Index of refraction } n = \frac{\sin \frac{A + D}{2}}{\sin \frac{A}{2}}$$

**SPECTROPHONE.** See PHOTOPHONE.

**SPECTROPHOTOMETRY** (from Lat. *spectrum*, appearance, apparition + Gk. *φῶς*, *phōs*,

light + *-μετρα, -metria*, measurement, from *μέτρον, metron*, measure), or SPECTRAL PHOTOMETRY; see also SPECTROSCOPY and PHOTOMETRY). The study of the relative intensities of light of various colors from the same source or from different sources. Not only, as in ordinary photometry, may the relative intensities of two sources of white light or of monochromatic light be compared, but spectrophotometers are provided with dispersing prisms so arranged that

FIG. 1. DOUBLE PRISM, BRACE'S SPECTROPHOTOMETER.

the various colors of one beam of white light may be compared with the corresponding colors of another. The general method is to bring some of the light from one source and some from the other source side by side in the same field of view, and by suitable means to alter the intensity of either beam (or of both) in a known degree until a match or photometric equality is secured; this condition of equality being determined by the vanishing of the line of separation between the two portions of the field of view, illuminated respectively by the two sources to be compared. There is also a so-called method of contrast devised by Lummer and Brodhun.

One of the most efficient forms of spectrophotometer is that devised by Professor Brace

FIG. 2. OPTICAL SYSTEM, BRACE'S SPECTROPHOTOMETER.

of the University of Nebraska. It consists essentially (Figs. 1, 2) of a double prism *P* with a narrow silvered strip *SS* on the face *AD* of the right half. *T* and *T'* are two similar collimators symmetrically situated with respect to the prism and provided with adjustable slits through which the light from the two sources enters the

optical system of the photometer. The amount of light entering the system through either collimator depends upon the width of its slits. The width of one slit, say *T*, is, after the initial adjustments of the instrument, kept fixed throughout any one series of observations, while the width of the other collimator slit (*T'*) may be altered at will to secure a match in intensity of the two beams. Light of the same wave length (i.e., of the same color) is thus brought by direct transmission from the collimator *T*, and after reflection at the silver strip from *T'*, to the same focus in the observing telescope *R*. When the eyepiece is removed and the prism viewed through a slit in the focal plane of *R*, the eye sees three fields (as in Fig. 3), the central one *ABCD* illuminated by light from the right collimator, *T'*, and the upper and lower ones, *ACF* and *BDG*, by light from the left collimator, *T*. The fields meet in the sharp edges of the silver strip. A match in

FIG. 3. FIELD VIEW OF SPECTROPHOTOMETER.

intensity is secured by altering the width of the slit *T'*, which is controlled by an accurately turned screw carrying a graduated drum so that the width of *T'* can be altered at will by a known amount and thus the total amount of light passing through this collimator can be changed as desired. The intensities of two beams will be inversely proportional to the slit widths required for a match between them and the light coming through the fixed slit *T*. (This simple relation is not quite true; the deviations from it are treated in the articles cited below.) The amount of light coming through the collimator with the fixed slit may be altered without changing the width of the slit by means of a rotating disk with certain sectors cut out mounted directly in front of the fixed slit, so as to cut off the light during a certain fraction of each revolution. This device greatly increases the range of the instrument.

By turning the telescope *R* through a small angle the various colors of the spectrum may be brought into the field of view in succession, and the relative intensities of the two sources for each color determined.

A comparison of the intensity distribution in the spectra of the electric incandescent and arc lights with that of the sun gives the following results, where in each case the intensity of the sunlight is cut down until at the *D* line it equals that of the incandescent (or arc) light for the same wave length:

WAVE LENGTH	Inc. sun	Arc sun
800 $\mu\mu$ .....	11.88	1.67
Line A.....	4.88	1.37
" B.....	2.68	1.28
" C.....	1.25	0.97
" D.....	1.00	1.00
" E.....	0.38	0.77
" F.....	0.17	0.56
" G.....	0.10	0.83
" H.....	0.05	1.21

The reflecting power of a polished plane surface or the absorbing power of a thin film or plate of an absorbing medium can be determined for

various colors by means of a spectrophotometer, by placing the mirror or the thin film in front of the adjustable slit  $T'$ , and comparing the intensity of the light after reflection or transmission with the intensity of the light coming directly to the other collimator of the photometer. For example, a polished silver surface reflects 95 per cent of the red light falling on it normally, while for the blue only 60 per cent is reflected. A mirror of solid cyanine reflects 15 per cent of the orange, 2 per cent of the green, and 6 per cent of the violet. The flicker photometer, described under PHOTOMETRY, can also be used as a spectrophotometer, and it has certain advantages over all others.

**Bibliography.** The methods of observation and of calibration and the sources of error are fully treated in the following articles: Lummer und Brodhun, in *Zeitschrift für Instrumentenkunde*, 1889 (Berlin, 1889, 1892); Murphy, in *Astro-Physical Journal* (Chicago, 1897); Brace, in *Philosophical Magazine* (London, 1899), and *Astro-Physical Journal* (Chicago, 1900, 1902); H. E. Ives, in *Transactions of the Illuminating Society of New York*, vol. iii (New York, 1908); Uppenborn-Monasch, *Lehrbuch der Photometrie* (Munich, 1912).

**SPECTROSCOPE** (from Lat. *spectrum*, appearance, image, apparition + Gk. *σκοπεῖν*, *skopein*, to view). An instrument designed to investigate the nature of the radiations emitted by various sources of light, it being understood that this term includes all waves in the ether, although only those within certain narrow limits of wave length affect the sense of sight. It is shown in the article on SPECTROSCOPY that radiations are being sent off in the ether from all natural bodies, and that these are in the form of waves of different wave length. When these waves pass through a spectroscope they are dispersed in such a way that the waves of certain wave length are brought to focus at a point different from that to which waves of a different wave length are brought. In this way the radiations from any source are analyzed and spread out in what is called a spectrum. The essential features of a spectroscope are then: first, a slit, or extremely small source of radiation; second, some means of producing dispersion; third, a lens or other means of focusing the radiations at the eyepiece of a telescope, upon a screen, or upon some suitable recording instrument. If the radiations are of such a nature as to affect a photographic plate, i.e., if they are in the ultra-violet or in the visible portion of the spectrum, methods of photography may be used in connection with the spectroscope. (See SPECTROGRAPH.) If the radiations are in the infra-red, i.e., if the wave lengths are so long that they do not affect the sense of sight, instruments must be used which are sensitive to such radiations; for instance, a thermometer, bolometer, radiomicrometer, radiometer, or other heat-registering device. It has been found that if a plate of glass covered with some phosphorescent substance, such as Balmain's paint, is exposed to light and then carried into a darkened room, it will continue to be luminous for some time; but, if exposed in a spectroscope to infra-red radiations, the phosphorescence at those points reached by the radiations is destroyed. This furnishes a method, therefore, for the study of these long waves.

As ordinarily constructed, a spectroscope has the same general appearance as a spectrometer

(q.v.). There is, however, in addition, in case prisms are used to produce dispersion, some auxiliary apparatus for the purpose of enabling the observer to record numerically the positions occupied by the waves which he is observing, in comparison with other waves. One method which is in common use is to attach to the instrument a tube containing at one end a transparent scale and at its other end a lens, the tube itself being so placed that when the scale is illuminated by a lamp the waves proceeding from it fall upon the last face of the last prism and are reflected in such a manner as to be brought to focus in the same plane as are the radiations under investigation. By this means there is produced across the spectrum a series of lines regularly spaced and numbered, and the position of any radiation can be recorded.

Various means are used to produce dispersion, but the two methods most generally adopted are (1) to interpose a prism or train of prisms between the collimator and telescope, or (2) to allow the light from the collimator to fall upon a diffraction grating. The dispersing action of a prism and of a grating has been explained before (see DIFFRACTION AND DIFFRACTION GRATINGS); but there are several important differences between the spectra obtained by these two instruments. Prismatic spectra are said to be irrational because there is no simple relation between the material and shape of the prism and the dispersion produced by it; and, further, because prisms of the same shape and size produce quite different spectra, in the sense that the relative deviations of the same waves differ widely when different prisms are used. See DISPERSION.

The spectra produced by plane gratings, on the other hand, obey a definite law, there being an extremely simple relation between the constants of the grating and the deviation of a given train of waves, which is independent of the material of the grating, and which enables one by simple means to measure the wave length of the radiations being studied. If a concave grating is used in place of a plane one, as was first done by Rowland in 1882, it is not necessary to have lenses in the spectroscope, the essential parts of the instrument then being simply a slit, a grating, and some receiving apparatus, such as a photographic plate. There is a further advantage in the use of a concave grating (which may also be obtained with a plane grating if suitably adjusted) if this instrument is used in the standard manner, in the fact that the spectra produced are of such a kind that the distances along the photographic plate are proportional to differences in wave length of the waves which are thus recorded. A spectrum of this kind is said to be normal. Consult T. T. Baker, *The Spectroscope: Its Uses in General Analytical Chemistry* (New York, 1907), and H. F. Newall, *The Spectroscope and its Work* (London, 1910).

**SPECTROSCOPY.** The science which deals with the methods of production of the spectra by various sources of light (or of waves in the ether) and with their study and interpretation. Newton, in 1672, was the first to observe that if sunlight entering a darkened room through a small opening were allowed to fall upon a prism a spectrum was produced, owing to the fact that waves characteristic of different colors suffer different deviations by the prism, and that, therefore, the components of white light were separated. (See DISPERSION.) Newton made no

observations except upon the visible portions of the spectrum; but in the year 1800 F. W. Herschel observed that the spectrum continued beyond the red, as was shown by holding a thermometer in that position; and in 1801 J. W. Ritter proved the existence of the ultra-violet light by showing that silver chloride was affected not alone by the violet portion of the spectrum, but beyond. In 1802 Wollaston made the discovery that the solar spectrum was not continuous, but was interrupted by certain dark lines, using in his experiments a slit and a prism with its edge parallel to the slit. It is remarkable that Newton did not make this same discovery in his investigation on the spectrum of the sun, because he also at times used a slit in the same manner as did Wollaston. The most important investigation, however, on the solar spectrum, one which in fact serves as the foundation of the science of spectroscopy, was that of Fraunhofer, beginning in the year 1814. Fraunhofer (q.v.) was the inventor of the diffraction grating and was the first to measure accurately the wave lengths of light waves. By using both grating and prism spectroscopes he showed that there were numerous dark lines in the solar spectrum, to the strongest of which he gave certain names in the form of letters, A, B, C, etc. He studied, further, the radiations from certain of the stars and from certain sources of light, such as flames, etc. He made the important observation that the position occupied in the solar spectrum by the dark D lines is identical with that occupied by the bright yellow line observed in the spectra of all flames. His whole work was epoch making.

Herschel was the first to investigate the absorption spectra produced by various bodies, that is, to study the effect of interposing between the source of light and the spectroscope a substance which absorbs certain radiations. The next great step was made by Kirchhoff, who showed from theoretical considerations that the emission spectrum and absorption spectrum of a substance should be the same at a definite temperature, and that as the temperature changed the intensity of the spectra would vary. In this way Kirchhoff was able to explain the dark lines in the solar spectrum as due to an absorbing layer of metallic vapors forming an atmosphere around the white-hot central portion of the sun, which was supposed to emit a continuous spectrum. In collaboration with Bunsen he then undertook a careful study of the spectra of various substances and founded the science of spectrum analysis. The explanation of the fact that absorption spectra and emission spectra are identical was first given by Stokes many years before Kirchhoff's statement, and Balfour Stewart had also arrived at the same idea. From the day of Kirchhoff up to the present time all branches of spectroscopy have been pursued most vigorously, the most important discovery being the principle of the concave grating, made by Rowland in the year 1882, which is discussed under SPECTROSCOPE and under DIFFRACTION AND DIFFRACTION GRATINGS.

There are many methods of making vapors luminous, among which it may be sufficient to name the flame, the electric arc, the electric spark. The spectra produced in these various ways have received the names of flame spectra, arc spectra, etc. The standard method of producing flame spectra is to hold a portion of the substance to be investigated or a salt of the substance in the Bunsen flame until it is vaporized,

and thus the vapor is raised to the temperature of the flame, and in general becomes luminous. Other flames than that of the Bunsen burner may be used. Extremely minute amounts of the substance may be recognized in this way, as has been shown by Kirchhoff and Bunsen. They state that one fourteen-millionth of a milligram of sodium can be recognized in the Bunsen flame, one sixty-thousandth of lithium, one fifty-thousandth of a milligram of calcium, etc. To produce arc spectra it is customary to bore out a small opening in a carbon rod, fill this with some salt of the substance to be investigated, and then use it as the positive pole in the ordinary electric arc. By this means a high temperature is produced, viz., about 4000° C., and the vapor of the substance is made luminous. To produce the spark spectrum numberless methods are in use. Among these it may be sufficient to mention two. If the electric spark produced by an induction coil or transformer is made to pass between solid electrodes made up of the substance to be studied, they will be vaporized and the vapor will be luminous. If a gas, e.g., nitrogen or hydrogen, be inclosed in a glass bulb into which enter two metal wires to serve as electrodes, and if the pressure be made sufficiently low, a spark can be made to pass through the remaining gas. Changes in the pressure, in the electrical constants of the circuit, etc., produce alterations in the spectra. The main distinction between the flame spectra and arc spectra is one of temperature, but so little is known in regard to the mechanism of a spark that no conclusions can be drawn with certainty. Beyond a doubt the spectra produced in the arc are due in the main to the high temperature of the arc, whereas the cause of the production of spectra in the spark is probably not a temperature effect at all, but something concerned with the transformation of electric energy.

The means of producing spectra are discussed under the head of SPECTROSCOPE (q.v.). Prisms or gratings are used for this purpose. The accepted method at present for measuring wave lengths in the spectrum of any substance is to photograph on the same plate with these lines the spectrum of some substance whose lines are known and then to obtain the desired quantities by a method of interpolation. The spectrum of iron is as a rule used to give the comparison lines.

It has been found as a result of careful observation that, with one or two doubtful exceptions, the spectrum of a solid or liquid is always continuous; and within recent years attempts have been made successfully to express in mathematical form the connection between the temperature of the solid and the distribution of energy in its spectrum as a function of its wave length. These laws have been deduced theoretically and verified by experiment. (See RADIATION.) It has been found further that the spectrum of a gas when rendered luminous is in all cases discontinuous, although occasionally there is a faint continuous background. This fact in regard to gaseous spectra is what would be expected from the kinetic theory. The exact origin of the spectrum is in general inside the atom; but the connection between the parts of the atom and the ether in which waves are produced is not known. The spectra of compounds when rendered luminous at a temperature not sufficient to decompose definitely the substance have been studied with care, and many interesting facts have been discovered.

It has been shown that all gases will produce under varying conditions different spectra, but the reason for this is by no means clear. There are at least three different spectra of hydrogen, many of oxygen, many of argon, etc. The influence of pressure, of temperature, and of the electrical conditions is marked; and these subjects form at present one of the most important fields of research in spectroscopy.

The spectrum of a gas is modified if the source of light is either approaching or receding from the spectroscopist, as, for instance, in the case of a star with a motion towards or away from the earth. It is owing to this fact that one is able, by a comparison of the spectra of certain stars with spectra produced here on the earth, to calculate the motion of the stars in the line of sight. See DOPPLER'S PRINCIPLE.

A careful comparison of the lines in the spectrum of any one gas or vapor, and of the spectra of different vapors, has led to the discovery of several simple mathematical laws connecting them. Thus the lines in the ordinary hydrogen spectrum have such wave lengths that they can be expressed in a mathematical formula which is known as Balmer's law. This can be expressed

as follows:  $\lambda = h \frac{m^2}{m^2 - 4}$ , where  $\lambda$  represents the wave lengths,  $m$  has in succession the values 3, 4, 5, etc., and  $h$  is a constant whose value is approximately 3647.20.

A relation similar to this of Balmer's has been shown by Kayser and Runge to apply to most of the lines in the spectra of the alkalies and the alkaline earths. Another law has been found to express most accurately the distribution of the lines in the well-known bands which are produced by carbon, nitrogen, and other substances. Laws have been found also connecting the spectra produced by different substances, in those cases where these substances are related chemically.

In the year 1896 Zeeman discovered that a source of light if placed in a magnetic field and viewed either along the lines of force or at right angles to them had its spectrum changed by the resolution of its lines into several components. This fact has a most important bearing upon theories of matter and serves to prove that the vibrations in the ether are produced by the vibrations inside the atom of minute electrical charges which have been called electrons. A recent investigation of the Zeeman effect by Runge has shown that the components of these spectrum lines produced by the magnetic field also obey certain mathematical laws.

A most important branch of spectroscopy is the study of the solar spectrum as we observe it on the earth. A few of the absorption lines are due to the fact that the waves coming from the sun pass through the atmosphere of the earth, and, therefore, suffer absorption owing to the water vapor and oxygen in it. The "rain band" is due to the presence of the former. The other lines are, as explained above, caused by the absorption in the atmosphere of the sun itself. The interior portion of the sun, which is at a high temperature, emits a continuous spectrum, but, owing to the presence in the atmosphere of the sun of metallic vapors at a temperature less than that of the interior, there is absorption, and thus the solar spectrum is a continuous one crossed by dark lines. There are radiations also coming to us from the outer portions of the sun, the so-called chromosphere and corona; but

these are not easily observed, except at times of solar eclipses. Most of the solar lines can be identified with the spectra of known substances on the earth; for instance, sodium, iron, carbon, etc., are known to be in the sun. It may be stated in general that if the earth were raised to a temperature as high as that of the sun its spectrum as seen at a distance would be practically identical with that of the sun as we see it.

A careful study has been made of the spectra of the various stars, and attempts have been made with more or less success to group the stars in certain classes according to their spectra, the idea being that some knowledge might be obtained in regard to the evolution of the stars and their present stage in this progress. Consult Schuster, "The Evolution of Solar Stars," *Astrophysical Journal*, April, 1893.

The wave lengths of a few of the important Fraunhofer lines in the solar spectrum, as measured by Professor Rowland, are as follows:

B.....	6870.186 $\times 10^{-8}$ cm.	F.....	4861.527 $\times 10^{-8}$ cm.
C.....	6563.045 "	G.....	{ 4308.081 "
D.....	5896.357 "		{ 4307.907 "
D.....	5890.186 "	H.....	3968.625 "
E.....	5270.495 "	K.....	3933.825 "
E.....	5269.723 "

**SPEC'TRUM.** See DISPERSION; LIGHT; SPECTROSCOPE; SPECTROSCOPY.

**SPECTRUM ANALYSIS.** The process of ascertaining the constituents of a substance by means of the spectrum emitted. See SPECTROSCOPE; SPECTROSCOPY.

**SPEC'ULAR IRON ORE.** See HEMATITE.

**SPEC'ULA'TION** (Lat. *speculatio*, exploration, contemplation, from *speculari*, to watch, spy out, from *specula*, watchtower, from *specere*, to see). Buying and selling of property chiefly with a view to securing a profit through changes in its price. There is a speculative element in many business transactions; but the term is usually confined to those in which the element of risk is important. Formerly speculation was largely engaged in seeking to take advantage of differences in price in distant markets. Foreign trade 100 years ago was highly speculative. Improvements in transportation and in means of communication have reduced such differences to a matter of exact calculation, and speculative business has come to be confined almost exclusively to transactions involving the time element.

In its simplest form time speculation involved the buying of property outright, and the holding of it in anticipation of a rise in price. This prac-

SPECTRA OF THE METALS OF THE ALKALIES AND ALKALINE EARTHS.

tice is as old as civilization, and until lately has usually been regarded as socially injurious. At the end of the seventeenth century the practice developed in Holland of buying and selling the products of fishing voyages before the results of the voyage were actually known. In the early part of the eighteenth century speculation in grain, coffee, etc., was active in Amsterdam, developing many of the practices of modern exchanges. In these early forms of speculation, however, what was bought and sold was the right to a particular lot of goods. With the development of warrants and the grading of goods speculation received a new impetus. It became possible for a man to sell goods he did not possess, since he could at any time secure identical goods upon the market by paying the price. It is largely to this principle that the phenomenal development of speculation in recent years is due. For the extent of speculative dealings and the practices of modern exchanges, see STOCK EXCHANGE.

**Economic Function of Speculation.** When the supply of any commodity is subject to great uncertainty, as the products of agriculture, it is manifestly to the advantage of society that it should be properly distributed through a long period. Individuals who study the conditions of demand and supply endeavoring to buy such commodities when they are abundant and cheap, in order to sell them when they are dear, serve to bring about such a distribution of consumption and render important social service. Again commodities like iron are subject to fluctuations in demand, and hence in price, thus introducing a large element of uncertainty into all the industries which make extensive use of them. The speculator, by making contracts to deliver the article at a future date at a fixed price, frees the consumer from that uncertainty. Legitimate speculation thus serves as a means of insurance against certain classes of risks.

It may be that the speculator is mistaken in his estimates of future supply and demand. In that case he exaggerates the evil which it is his function to minimize. Thus speculation may keep prices abnormally high for a period, only to render prices abnormally low for a succeeding period. Speculation may thus bring about a crisis (q.v.) with attendant industrial stagnation.

A more serious evil results from the fact that speculation is carried on not only by those who are conversant with market conditions, but by a large class of individuals who engage in it without the proper equipment of technical knowledge. Unscrupulous operators, through false reports, or through their own apparent eagerness to buy or sell, often lead unsophisticated speculators to financial ruin. Such influences tend to increase business uncertainty, and diminish considerably the net social gain from speculation.

Popular sentiment in England and America has generally been hostile to speculation, and laws have frequently been passed to prevent it. An act of Parliament was passed in 1733, "To prevent the infamous practice of stock-jobbing." The act had no effect and was repealed in 1860. In America an act was passed in 1864 to prevent speculation in gold, but its operation was so unsatisfactory that it was repealed in two weeks. In several of the States laws have been enacted aiming to prohibit speculation in one form or another. These have proved quite ineffective.

SPECULUM DIANÆ. See NEMI.

**SPEDDING, JAMES** (1808-81). An editor of Bacon's works. He was born in Cumberland, England. From the grammar school at Bury St. Edmunds he passed to Trinity College, Cambridge, where he graduated in 1831. Leaving Cambridge in 1835, he entered the Colonial Office. This position he gave up in 1841 that he might devote himself to the study of Bacon. For 30 years he continued his researches. Spedding's most delightful book is *Evenings with a Reviewer* (written in 1845, privately printed; published 1881), in which with quiet humor Macaulay's essay on Bacon is torn into shreds. His magnum opus is an edition of Bacon's entire works with an exhaustive life (14 vols., 1857-74), and on this he was in some degree aided by Leslie Ellis and D. D. Heath. The biographical and historical parts of this work, much cut, were published under the title, *Account of the Life and Times of Bacon* (2 vols., 1878). Spedding also contributed articles to J. Gairdner's *Studies in English History* (1881) and wrote several other admirable historical papers. A pamphlet, *Publishers and Authors* (1867), also came from his pen; and *Reviews and Discussions* (1879) is composed of reprints from the *Edinburgh* and *Fraser*. Consult the memoir of G. S. Venables prefixed to *Evenings with a Reviewer* (London, 1881); Edward Fitzgerald, *Letters* (ib., 1889); Baron Tennyson, *Alfred, Lord Tennyson: Memoir* (new ed., New York, 1911).

**SPEE, shpā, MAXIMILIAN, COUNT VON** (1861-1914). A German naval officer, born at Copenhagen, Denmark. Prominent in naval strategy, he was presumably author of the German plans for assembling scattered ships under his command after the outbreak of the European War in 1914. The success of these plans resulted in the surprise and defeat of Admiral Cradock's squadron at Coronel off the coast of Chile on Nov. 1, 1914. On Dec. 8, 1914, Von Spee's fleet was attacked and destroyed by the British fleet under Rear Admiral Sir Frederick Sturdee (q.v.) off the Falkland Islands. Admiral von Spee was lost with the German flagship *Scharnhorst*. See WAR IN EUROPE.

**SPEECH** (AS. *spæc*, *spēc*, *spræc*, *sprēc*, OHG. *sprāha*, Ger. *Sprache*, speech). The faculty of producing articulate sounds or words for the communication of ideas. Speech differs from voice in that the latter is rather the physiological potentiality and mechanical process. Speech is, so far as known, peculiar to man, although attempts have been made to assign it also to monkeys, while gesture language (q.v.) is probably shared by man with certain other animals. In a broader sense speech is also synonymous with language. See LANGUAGE; PHONETICS, ETC.; VOICE.

**SPEECH, DEFECTS OF.** See APHASIA; DEAF-MUTE; STAMMERING.

**SPEECH, FIGURES OF.** See FIGURES OF SPEECH.

**SPEECH, PARTS OF.** See GRAMMAR.

**SPEECH, VISIBLE.** See VISIBLE SPEECH.

**SPEED, HAROLD** (1873- ). An English figure and portrait painter. He was born in London and studied at the South Kensington and Royal Academy Schools and on a traveling scholarship abroad. His art is "typical of the academic system in its freest form." He is an admirable draftsman, possesses imagination, a sense of values and of movement, and is conscientious in composition and execution. His men sitters include John Redmond, Holman Hunt,

Elihu Vedder, and Sir Robert Baden-Powell. Good examples of his charming portraits of young women and children are Miss Johnson, Miss Craies (1908), and Curtsey O'Sullivan (1906). He also painted figure pieces, mural decorations, including a fresco in the Royal Academy refreshment room (1895), and landscapes. He is represented in the Tate Gallery, and the galleries at Liverpool, Bristol, and Melbourne. In 1913 he published *The Science and Practice of Drawing*.

**SPEED, JAMES** (1812-87). An American politician, born near Louisville in Jefferson Co., Ky. He graduated at St. Joseph's College, Bardstown, Ky., in 1828 and after studying law at Transylvania University began its practice at Louisville in 1833. In 1847 he was elected to the State Legislature, where he served one term. He was the most effective opponent of the disunion cause in Kentucky, was elected to the State Senate in 1861, and in 1861-64 was in charge of the Kentucky recruiting stations. In 1864 he was appointed Attorney-General of the United States by President Lincoln, but he resigned from the post in 1866 because of his opposition to the reconstruction policy of President Johnson. In 1856-58 and 1875-79 he held a chair in the law department of the University of Louisville.

**SPEED, JOHN** (c.1552-1629). An antiquary and cartographer, the son of a London tailor. Through the generosity of Lord Brooke he was able to give up manual labor and devote himself to study. Between 1608 and 1610 he published 54 maps of England and Wales, which were collected and described under the title of *Theatre of the Empire of Great Britaine* (1611). He next published the great work on which he had been engaged for many years: *The History of Great Britaine*, from the invasion of Julius Cæsar to King James I (1611). This is regarded as the best history up to that time written by an Englishman. He also published *Genealogies Recorded in Sacred Scripture* (c.1611), of which 33 editions appeared in the course of 30 years, some of them being attached to issues of the Bible, and *A Cloud of Witnesses Confirming the Holie Word* (1616).

**SPEEDOMETER, IN MOTOR VEHICLE.** See MOTOR VEHICLE.

**SPEEDWELL** (*Veronica*). A genus of about 200 annual and perennial herbs and shrubs of the family Scrophulariaceæ, natives of temperate and cold climates. Some species grow in ditches and marshes, some only on the driest soils. They have generally very beautiful, small, blue, white, or pink flowers, for which several species are cultivated. The bitter and astringent leaves of the common speedwell (*Veronica officinalis*), widely distributed in the Northern Hemisphere, are in some countries used medicinally and as a substitute for tea, as are those of the germander speedwell. *Veronica virginica* is called Culver's physic in North America. Brooklime (q.v.) belongs to this genus. See LEPTANDRA and Plate of BLOODROOT, ETC. in article SANGUINARIA.

**SPEER, ROBERT ELLIOTT** (1867- ). An American religious leader and authority on missions. He was born at Huntingdon, Pa., graduated at Princeton in 1889, and studied at Princeton Theological Seminary in 1890-91. In 1891 he was appointed secretary of the Presbyterian Board of Foreign Missions. He visited missions in Persia, India, China, Korea, and Japan in 1896-97, and in South America in

1909, and made later similar tours. Under his leadership the foreign missions of the Presbyterian church became remarkably successful. Besides various inspirational books, he published: *A Memorial of a True Life: Biography of H. M. Beaver* (1898); *Presbyterian Foreign Missions* (1901); *Missionary Principles and Practice* (1902); *A Memorial of Horace Tracy Pitkin* (1903); *Missions and Modern History* (2 vols., 1904); *Christianity and the Nations* (1910); *The Light of the World* (1911); *South American Problems* (1912); *Studies of Missionary Leadership* (1914); *John's Gospel* (1915).

**SPEICHER, spi'chër, EUGENE EDWARD** (1883- ). An American portrait and landscape painter, born in Buffalo. He studied there at the Albright Art School; in New York at the Art Students' League and the Henri Art School. After studying also for two years in Europe, devoting himself especially to the old masters in Paris, Holland, and Spain, he settled in New York, and soon became known as one of the most promising of the younger group of American painters. His work is characterized by vigorous and sincere presentation and a refreshing sureness of technique. Among his best portraits are those of Miss Helen Appleton (Proctor Prize, National Academy, 1911); Charles Dana Gibson, Miss Mary Stuart Snyder, "The Girl in Rose" (1913), and John Nelson Cole (1914). A charming landscape, "Morning Light" (1912), is in the Metropolitan Museum. He became an associate of the National Academy of Design (1913).

**SPEIER.** See SPEYER.

**SPEISS, spis** (Ger. *Speise*, amalgam, food, OHG. *spisa*, food, from OIt., ML. *spesa*, expense, cost, from OIt., *spendere*, from Lat. *expendere*, to expend, from *ex*, out + *pendere*, to weigh). A mixture of the compounds of copper, iron, and nickel with antimony, arsenic, and sulphur. It collects in the bottom of a crucible when ores of arsenic, antimony, cobalt, or lead, containing sulphur, are smelted with fluxes. Speiss consists usually of iron in large part, but contains often large quantities of nickel and cobalt. It is obtained in smelting the complicated lead ores occurring near Freiberg, Saxony, and also in reducing the copper ores of the Sudbury district and the silver ores of the Cobalt district, both in Ontario, Canada.

**SPEKE, spēk, HUGH** (1656-?1724). An English author and agitator, son of George Speke of White Lackington, Somerset, who as a royalist suffered heavily during the civil war. Hugh Speke was educated at Oxford, and studied at Lincoln's Inn in 1680. In 1688 he was a spy for James II, and he obtained the confidence of the Prince of Orange. Speke's appeals to George I and to Queen Anne to reward his services were successful to the small extent of £100, on receipt of which, in 1703, he left for Ireland, where he had hopes of securing employment through Harley. He wrote *Memoirs of the Most Remarkable Passages and Transactions of the Revolution* (1709), reissued with certain changes as *The Secret History of the Happy Revolution in 1688* (1715).

**SPEKE, JOHN HANNING** (1827-64). An English African explorer. He was born at Jordans, Somersetshire, entered the Indian army in 1844, served in the Punjab campaigns, and distinguished himself as a soldier, naturalist, and sportsman. While in the Indian service he made several trips into the Himalaya and even en-

tered Tibet, bringing back valuable collections. He began his brilliant though brief career as an African explorer in 1854, when he accompanied Captain Burton into Somaliland. He was also Burton's companion on the expedition of 1857-59 from Zanzibar into the interior of Africa. In 1858 they discovered Lake Tanganyika, and in the same year, while Burton was ill at Kaze, Speke reached the Victoria Nyanza. He believed that he had found one of the sources of the Nile, but Burton discredited the information he brought back and Speke could not verify his discovery until 1862, when he returned to the lake with Capt. J. A. Grant, and, proceeding northward, came to the Nile, which he found to be the outlet of the lake. Speke was killed by the accidental discharge of his gun. His books were *Journal of the Discovery of the Source of the Nile* (2 vols., 1863; new ed., 1908), and *What Led to the Discovery of the Source of the Nile* (1864). His companion, Grant, also described their journey in *Walk Across Africa* (London, 1864). See ANGANYIKA; VICTORIA NYANZA; BURTON, SIR RICHARD F.

**SPEKE'S ANTELOPE.** See NAKONG.

**SPELL.** See KNURR AND SPELL.

**SPELLING** (from *spell*, ME. *spellen*, OF. *eseler*, to spell, from OHG. *spel*, AS. *spell*, Goth. *spēl*, tale). The representation of words by combinations of alphabetic symbols. In an accurately constructed alphabet there is but one symbol for each significant speech sound. Under the conditions spelling is determined solely by the pronunciation of the word to be spelled. Such phonetically correct orthography requires no special consideration apart from the alphabet employed. (See ALPHABET; ORTHOGRAPHY; PHONETICS; SPELLING REFORM.) Except in the writing of phoneticians, however, spelling of suchrecision does not exist, though in certain languages it is approximated. In customary spelling, there is usually alphabetic inadequacy, or a lack of symbols to represent certain speech sounds redundancy, or use of two or more symbols to represent the same sound; and use of the same symbol or combination of symbols to represent two or more sounds. This divergence of customary spelling from the true alphabetic method has resulted, historically, in part, from defects in the alphabets themselves; but principally from continuous change in the sounds of the languages to which they have been applied. Since in every language pronunciation varies historically and geographically, the true phonetic character of an alphabet could be maintained only by continuous adaptation to these alterations of pronunciation.

As a matter of fact such changes in spelling have always taken place, and in modern European languages in particular (alone considered here) they have occurred abundantly, especially prior to the invention of printing; but ordinarily they have been effected under conditions unfavorable to phonetic precision, with the result that they have often tended to increase confusion instead of promoting accuracy. Ambiguities and irregularities multiplied, new associations between sounds and symbols were formed, and it became increasingly difficult to infer the pronunciation of a word from its written form. Moreover, this tendency towards phonetic corruption was intensified by a cause to which many defects of modern spelling may be attributed, i.e., the establishment of a

"standard" orthography, due principally to the introduction of printing. The beginnings of such an inflexible system existed earlier, wherever certain spellings were recognized as customary and then as "correct" from the literary point of view (regardless of phonetic value); but its chief sources were the practical need of uniformity in spelling, which was quickly felt after printing once became established. From this fixation of orthography it resulted that practically all the existing faults of the spelling were rendered permanent. Pronunciation has continued to change, often radically, but spelling has lagged behind. In certain languages notable divergence of the written from the spoken language has thus been effected, while others, like Italian or Spanish, have been more fortunate in having had a relatively rational system of spelling from the beginning, with, accordingly, less need of variation.

These facts are well illustrated by English spelling, which presents a striking case of phonetic corruption. Its early form was to a large extent phonetic—the scribes sought to indicate the actual sounds of the words they wrote, using the Roman alphabet (with modifications) and giving its letters the values assigned to them in Latin pronunciation. As the sounds gradually changed, confusion set in; certain symbols had different values in different combinations; new ones were introduced, others lost; accentual marks over the long vowels used in Anglo-Saxon disappeared, increasing the difficulty in distinguishing the long from the short vowels. But the most important irregularities were due to the influence of Norman, and later of literary (Parisian) French, under which, in the thirteenth and fourteenth centuries, English was practically respelled in accordance with Anglo-French methods. Notwithstanding this confusion, English spelling continued to remain to a great extent phonetic. After the invention of printing, the choice of spellings was too frequently determined, unfortunately, by the judgment of the printer, to the detriment of our language. Alteration in response to phonetic change was not, indeed, wholly stopped, but it was made more and more difficult, and from the sixteenth century on the power of effecting any substantial phonetic improvement of English spelling has been lost. Notwithstanding many later modifications of details (there are still over 3000 words whose orthography is unsettled), the subsequent development of the spoken language is practically unrepresented in English orthography. Although the alteration of sound has been great, we still retain what is essentially the Elizabethan spelling.

Furthermore, under the influence of the revival of learning, which brought words of classical origin into prominence, the idea was developed that (regardless of their pronunciation) such words should be made to conform in spelling as nearly as possible to Latin and Greek terms from which they were ultimately derived. This etymological theory of spelling gained strength, mainly from the difficulty found by the printer in making a selection among existing forms, which offered an opportunity for the activity of pedants; and from the sixteenth century until the present time it has kept its hold upon orthography. There was much tinkering, not only with words directly borrowed from classical tongues, but with words of Romance origin,

while native English and Scandinavian elements of the language were little interfered with. A result was the introduction of many forms erroneous from both the phonetic and philological points of view. A familiar example is the present English *debt* (from Middle English *det*, *dette*, from Old French *dette*), in which the *b* was etymologically inserted both in French (though later abandoned) and in English to make the spelling more directly suggest the original Latin *debita*, though it has never been sounded. On the other hand, this process in some cases actually corrupted pronunciation. For example, the *l* in *fault* (Middle English and Old French *faute*), inserted in the same way, to suggest the Latin *fallere*, has actually come to be pronounced, though the correct pronunciation still survived in the eighteenth century for Pope makes the word rhyme with *ought* and *taught*. Of etymological blunders, again, an instance is the *s* in *island*, inserted to indicate derivation from the Latin *insula* and connection with English *isle* (corrupted from *ile*), to neither of which it is related. One might form a long list of corruptions of this kind.

The results of the above-indicated history are briefly as follows:

1. While all of the other principal European alphabets have retained with small variations the Roman or Continental values of the letters, the English has to a very large extent abandoned them. This is especially true of the "long" vowels—at least of their common values: Thus, approximately, "long *a*" (say) = Cont. *é*; "long *e*" (mete) = Cont. *ê*; "long *i*" (isle) = Cont. diphthong *ai*; "long *o*" = Cont. *ô*; "long *u*" (duty) = Cont. diphthong *iu*. Great confusion thus exists in the vowel nomenclature, as well as an unfortunate divergence from the common usage of those languages most closely connected with English, both historically and practically.

2. The letters of the alphabet are used with a great diversity of sound values: thus, of the vowels, accented and unaccented, *a* has approximately 9 (as in name, bore, man, father, water, want, ask, village, data); *e*, 9 (be, here, there, acme, met, alert, English, sergeant, prudent); *i*, 8; *o*, 10; *u*, 9; *y*, 3—48 in all; of the consonants, *b*, 2 (counting silent ones); *c*, 6; *d*, 4; *f*, 3; *g*, 4; *h*, 3; *j*, 5; *k*, 2; *l*, 3; *m*, 3; *n*, 3; *p*, 2; *q*, 3; *r*, 2; *s*, 5; *t*, 5; *v*, 2; *w*, 2; *x*, 5; *y*, 2; *z*, 4—70, in all. To a certain extent this multiplication of values is due to inadequacy of the alphabet, with 26 symbols to represent 40 elementary sounds of cultivated English speech (44 with diphthongs), but it is far in excess of what is necessary.

3. The various English speech sounds are written with an even greater variety of symbols and combinations of symbols. These sounds, which comprise 16 vowels and 24 consonants (with 4 diphthongs), are represented in the standard phonetic alphabet, adopted by the American Philological Association, as follows (the sound being that of the corresponding letter in the word placed within parentheses): *i* (it), *e* (met), *a* (at), *æ* (ask), *o* (not), *u* (obey), *ʊ* (but), *u* (full), *i* (pique), *ē* (they), *ā* (air), *ā* (arm), *ō* (nor), *ō* (no), *ʊ* (burn), *ū* (rule), *p* (pet), *t* (tip), *ch* (chest), *c* or *k* (come), *f* (fat), *th* (thin), *s* (sown), *sh* (she), *h* (he), *b* (bet), *d* (dip), *j* (jest), *g* (gum), *v* (vat), *dh* (thee), *z* (zone), *zh* (azure), *w* (wit), *l* (lo, ell), *r* (rat, are), *y* (ye, year), *r* (rime),

*n* (no), *ng* (sing): diphthongs, *ai* (aisle, use), *au* (out, hour), *ei* (oil, boy), *iu* (feud, jew). The ways in which these sounds are represented in customary spelling are too numerous to be given, but the orthographic situation will be understood from these examples: *i* (it), accented or unaccented, is represented by *i*, *y*, *e*, *o*, *u*, *ie*, *ee*, *ui*, *ai*, *hi*, *ive*, *eo*, *ia*, *ei*, *ey*, *ea*, *eig* ('), *ehea*, *ewi*, *ois*, *uy*, *oi*, *igh*, *ay*, *ieu*, as in the following words: *fit*, *hymn*, *pretty*, *women*, *busy*, *sieve*, *breeches*, *build*, *Saint John* (sin'jun), *exhibit*, *fivepence* (fip'ens), *Theobald* (tib'ald), *carriage*, *forfeit*, *donkey*, *guinea*, *sovereign*, *James's*, *forehead*, *housewife* (hus'if), *chamois*, *plaguy*, *Jervois* (jer'vis), *Denbigh*, *Rothsay* (roth'si), *Beaulieu* (bew'li). *E* (met) = *e*, *ea*, *a*, *u*, *ai*, *ei*, *ie*, *eo*, *ue*, *ay*, *æ*, *ave*, as in *get*, *head*, *many*, *bury*, *said*, *heifer*, *friend*, *leopard*, *gues*, *says*, *fætid*, *Abergavenny* (abergen'i). *O* (no) = *o*, *o-e*, *oa*, *ow*, *ou*, *owe*, *oe*, *oo*, *ew*, *ewe*, *oug*, *oh*, *eau*, *eo*, *au*, *os*, *aut*, *ock*, as in *holy*, *vo*, *road*, *bowl*, *soul*, *roiced*, *woe*, *brooch* (bröch), *sew*, *sewed*, *though*, *oh*, *beau*, *yeoman*, *haute*, *apropos*, *hautboy*, *Cockburn*, (kō'bn). *C* (cor) = *c*, *k*, *q*, *ck*, *ch*, *cc*, *cq*, *qu*, *que*, *lk*, *gh*, *c*, *x*, *ke*, *lke*, *quh*, *ceh*, as in *call*, *kill*, *quell*, *bk*, *ache*, *account*, *acquaint*, *liquor*, *barque*, *wh*, *hough*, *viscount*, *except*, *Burke*, *Folkessne*, *Urquhart*, *Bacchanal*. *T* (tip) = *t*, *tt*, *edth*, *tw*, *bt*, *ct*, *pt*, *cht*, *pth*, *tte*, *as*, *inten*, *better*, *stopped*, *thyme*, *two*, *debt*, *indict*, *reipt*, *yacht*, *phthisis*, *caste*, *gazette*. In brief, 44 English sounds are represented by upwrd of 500 symbols and combinations.

Notwithstanding this confusion English spelling exhibits a certain amount of system and it is possible also to demonstrate in it a very considerable phonetic element. Apart from the inadequacy of the alphabet, its chief practical defects are the ambiguities in the use of *c* and *k* (cat, kill), *c* and *s* (cinder, seat), *f* and *ph* (fool, philosopher), *t* and *d* or *ed* (roped, kept), *ch* and *k* (choler, keep), and the employment of silent letters as in *feather*, *jeopardy*, *parliament*, *pedagogue*, *guard*, *ad*, *feign*, *ghost*, *though*, *thorough*, *scythe*, etc.

**SPELLING REFORM.** The modification of customary spelling in such a way as to remove, or at least lessen, the divergence of orthography from pronunciation. (See SPELLING.) Complete reform of this sort involves: (1) the elimination of superfluous letters (e.g. in English, of two of the equivalent letters *c* (hard), *k*, and *q*); (2) the enlargement of the alphabet by the addition of enough symbols (letters or digraphs) to represent all significant speech-sounds in the language (in English there are 40 elementary sounds and but 26 letters); (3) the use of each letter or symbol to represent but one sound; and (4) in English the use of the letters of the alphabet with their Roman values. Rules for partial simplification were adopted in 1883 by the American Philological Association and the British Philological Society, and in 1886 a list of amended spellings, based upon them, was adopted by the Philological Association and published in its *Transactions*. It has since been republished in the leading American dictionaries. Simplification of this sort would greatly enhance the phonetic accuracy and simplicity of English spelling. Up to the present time, however, spelling reform, even in this restricted sense, has made but little headway. The American National Education Association in 1898 adopted 12 simplified spellings: program, tho, altho, thoro, thorofare, thru, thruout, catalog, prolog, decalog, demagog, pedagog.

The Simplified Spelling Board, organized in New York in March, 1906, with Prof. Brander Matthews (q.v.) as chairman, received from Andrew Carnegie an offer of \$15,000 a year for five years in support of its work. The board issued a list of 300 words which it proposed to simplify. In this list "ed" and "sed" were replaced by "t," as in addressed, missed, clipped; "er" was used in place of "re" in centre, calibre; the "e" was dropped from such words as acknowledgement; diphthongs "æ," "œ," reduced to "e" in anæmia, æolian; final "ue" in words like catalogue, final "te" in words like cigarette, final "me" in programme, etc., were dropped, as well as "u" in ardour, humour, etc. In August, 1906, President Roosevelt ordered the public printer to adopt the spelling advocated by the board in all documents of executive departments. The order led to such protests that it was afterward withdrawn, except as to official correspondence of the White House. A number of scholars declared their approval of the board's scheme, among them editors of many well-known dictionaries. The board published in September, 1906, a list of 825 American college professors and officers who had agreed to use its simplified 300 words where practicable.

In France, where the peculiarities of orthography give spelling reform a practical importance second only to that of English-speaking countries, much interest in this subject has long existed, but little has been accomplished, owing to conservatism. Nevertheless, a government commission, of which Prof. Paul Meyer was chairman, made a report in 1905 upon a simplification scheme which aroused some discussion at the time. Since then the movement has made but little headway. The reform has also

been active in Germany, and something has been done there, particularly in the omission of silent letters (*tat* for *that*, etc.). In Spanish and Italian, spelling is so largely phonetic that the practical reasons for reform have relatively little application.

**SPEL'MAN, SIR HENRY** (c.1564-1641). An English antiquary and philologist. He was born at Congham, Norfolk, and educated at Cambridge and in law at Lincoln's Inn. He became High Sheriff of Norfolk, and was employed on various public missions by King James. He devoted himself to the relation of ancient law and custom to the English constitution. In prosecuting this work he encountered so many strange and obsolete words that he turned aside to compile a glossary of law terms the first part of which, to the end of the letter L, he published in 1626, at his own expense. The second volume appeared in 1664 edited by Sir William Dugdale. He also compiled a collection of decrees of English church councils from 1066 to 1531. He is best known in modern times by this and his curious *History and Fate of Sacrilege* (1698; new ed. with appendix by C. F. S. Warren, London, 1895). His collected works were published in 1723.

**SPELT** (from Lat. *spelta*). A species of wheat (*Triticum spelta*), characterized by grains held tightly within the chaff and not hulled in threshing. It is grown where wheat fails, on poor soils of mountainous regions in Germany, Italy, Spain, and France, and is mainly employed as a stock food. The grain commonly called spelt in the United States and

Russia is emmer (*Triticum dicoccum*), with a much shorter and more compact head, and hardier as regards cold, drought, and rust resistance. Both spelt and emmer are grown and harvested like wheat.

**SPELTER.** See ZINC; SOLDER.

**SPENCE, FRANCIS STEPHENS** (1850-1917). A Canadian journalist and temperance worker, born at Donegal, Ireland. He went to Canada in early manhood and was educated at Toronto Normal School. After serving as headmaster of several public schools in Toronto, he devoted himself in 1882 to journalistic and temperance work, his attitude being prohibitionist. He became editor successively of the *Canada Citizen*, *Vanguard*, *Ontario Good Templar*, and later managing editor of the *Pioneer*. He was prominent in temperance organization, secretary to the committee organizing the Dominion plebiscite for prohibition in 1898, and in 1886-1907 was secretary of the Ontario Branch of the Dominion Prohibition Alliance. He was elected president of the Ontario Municipal Association in 1911. He published a book in favor of prohibition, *The Facts of the Case* (1896).

**SPENCE, JOSEPH** (1699-1768). An English anecdotist, born at Kingsclere, Hampshire, and educated at Oxford. He took orders in 1724. His *Essay on Pope's Odyssey* (1726) led to an intimate friendship with Pope, and to Spence's appointment as professor of poetry at Oxford (1727). While associated with Pope he noted down the conversations of the poet and his friends. These most valuable anecdotes were published in 1820. Consult the *Anecdotes*, edited from Spence's own manuscript, by S. W. Singer (London, 1820; reprint, 1859); *Selections*, edited by Underhill, Camelot Series (ib., 1890); also Austin Dobson, in *Eighteenth Century Vignettes* (first series, New York, 1892).

**SPENCE-JONES, HENRY DONALD MAURICE** (1836- ). An English clergyman and Church historian, born in London. He was educated at Westminster School and Cambridge University; took orders in the Church of England; held various important charges; and after 1886 was Dean of Gloucester. In 1906 he became also professor of ancient history in the Royal Academy. Among his published works are: *Oloister Life in the Days of Cœur de Lion* (1892); *The Church of England: A History for the People* (4 vols., 1897-99); *The White Robe of Churches of the XI Century* (1900); *Early Christianity and Paganism* (1902); *The Early Christians in Rome* (1911); *The Secrets of a Great Cathedral* (1914).

**SPENCER.** A city and the county seat of Clay Co., Iowa, 152 miles northwest of Des Moines, on the Little Sioux River and on the Chicago, Milwaukee, and St. Paul and the Minneapolis and St. Louis railroads (Map: Iowa, B 1). It has a Carnegie library and a fine courthouse. Spencer is known for its large live-stock interests. There are two large cement-block and tile factories and a razor factory. Pop., 1900, 3095; 1910, 3005.

**SPENCER.** A town in Worcester Co., Mass., 12 miles west by south of Worcester, on the Boston and Albany Railroad (Map: Massachusetts, C 4). It has the Richard Sugden Library, Bemis Memorial, Myrick and Prouty parks, the David Prouty High School, and a handsome monument to Elias Hove (q.v.), the inventor of the sewing machine, and his two brothers. Boots and shoes, wire, woolen goods, brooms, and cast brass goods

are manufactured. Pop., 1900, 7627; 1910, 6740. Consult: Draper, *History of Spencer* (Worcester, 1860); Tower, *Historical Sketches Relating to Spencer, Massachusetts* (Spencer, 1901-02).

**SPENCER, AMBROSE** (1765-1848). An American jurist, born in Salisbury, Conn., educated at Yale and Harvard, admitted to the bar in New York, and in 1794 entered the State Assembly, the next year becoming a member of the State Senate, to which he was reelected in 1798. He was Attorney-General of the State (1802-04), and then became one of the judges of the Supreme Court, serving as Chief Justice from 1810 to 1823, when he resumed private practice. He was Mayor of Albany (1824-26) and (1829-31) a member of Congress. Later he retired to a farm near Lyons. Spencer secured the abolition in New York of the death sentence in all cases except those of murder and treason; took an important part in the State Constitutional Convention of 1821; and later opposed an amendment making the judiciary elective. In 1844 he presided over the National Whig Convention at Baltimore. Consult *Memorial of Ambrose Spencer* (Albany, 1849).

**SPENCER, CHARLES**, third EARL OF SUNDERLAND. An English statesman. See SUNDERLAND, CHARLES SPENCER, third EARL OF.

**SPENCER, CLAUDIUS BUCHANAN** (1856- ). An American Methodist Episcopal clergyman and editor, born at Fowlerville, Mich. He graduated from Northwestern University in 1881 and entered the ministry in the same year. He was editor of the *Rocky Mountain Christian Advocate* from 1892 to 1900, and then became editor of the *Central Christian Advocate*, Kansas City, Mo. He was a member of various important Methodist and other conferences and in 1908 was associate secretary of the Federal Council of the Churches of Christ in America. He was a candidate for Governor of Colorado on the Prohibition ticket in 1896. His writings include: *The Blue Flower of Methodism* (1903); *Easter Reflections* (1909); *The Layman* (1912); *That they May Be One* (1915).

**SPENCER, HERBERT** (1820-1903). A distinguished English philosopher. He was born at Derby, April 27, 1820. His father was a teacher by profession, with views in advance of his time. He believed in training the student's mind in observation and in reflection on objective facts instead of mere ideas. Herbert's health was delicate, and he was largely educated at home, with much outdoor life. A little later he was put under the charge of his uncle, a clergyman of the Church of England. He showed a fondness for nature, and for years his favorite occupation was the catching and preserving of insects and the rearing of moths and butterflies; he also studied botany, and laid the foundation for the scientific character and interest of his later work. His parents were both originally Methodists, but his father became a Quaker. The boy's mind being an independent one, and having early been brought into contact with the intellectual influences centering about John Stuart Mill and with the scientific spirit, he tended towards extreme liberalism in theological matters.

An uncle planned to send him to Cambridge, but the boy "perseveringly objected," and continued to study privately. He had no aptitude for languages, and made little progress in the classics, but showed original constructive power

in mathematics and mechanics. His father wanted him to take up teaching, but an accidental opportunity decided in favor of a more suitable vocation. In the autumn of 1837 work was offered to him under the chief engineer of the London and Birmingham Railway, with whom he spent nearly a year. For some 10 years he engaged in engineering. When the railway mania subsided, Spencer, now 26, was left without occupation. The time spent at home while he was looking for something to do was spent in miscellaneous reading. He studied Lyell's *Principles of Geology*, in which the doctrine of evolution as defended by Lamarck was attacked, but came away from the reading with a favorable impression of Lamarck's doctrine as against creationism.

While very young he had written some articles for the *Nonconformist* on "the proper sphere of government," in which he outlined the principles of noninterference which regulated his later thinking. When no more work offered as an engineer he went to London and obtained employment on the *Economist*, becoming its subeditor in 1848. This position, which he held till 1852, gave him time for his studies, and made him acquainted with that brilliant coterie which centred about George Henry Lewes, George Eliot, and John Stuart Mill. During his leisure hours he wrote his first considerable work, *Social Statics* (1851).

In the eight years after his leaving the *Economist* he pursued his studies with eagerness, and published a work on *Psychology* (1855), which he afterward revised and expanded into a part of his *Synthetic Philosophy*. Overapplication brought on a serious attack of nervous prostration, which obliged him for the rest of his life to abridge his hours of study. He became a chronic sufferer from dyspepsia and insomnia, so that all his later work had to be done under a disadvantage. Meanwhile he had conceived a system of philosophy which should embrace the general principles of all existing knowledge. In 1860 he published a prospectus of it, indicating his intention to give 20 years to its development. The first installments of the system did not meet with the reception he expected, and he feared he would have to abandon his undertaking. But the timely aid of American friends, at the head of whom was E. L. Youmans, editor of the *Popular Science Monthly*, enabled him to continue. His health, however, was so precarious that at one time he feared he would not live to complete the system. He suspended his labors on the main part of his work to write *The Data of Ethics*, which had been the chief interest of the whole system, and in which it was intended to culminate. Fortunately his life was prolonged sufficiently to enable him to complete the system, and to revise a part of it in order to bring it up to date. It consists of *First Principles* (1862); *Principles of Biology* (1864); *Principles of Psychology* (1871-72); *Principles of Sociology* (1876-80); *Principles of Ethics* (1879), all of which have appeared in subsequent editions. He also wrote three volumes of *Essays, Scientific, Political, and Speculative* (1858-63), and some fugitive articles including two essays on *Weissmannism* (1894, 1895). His *Education: Intellectual, Moral, Physical* (1861) has had an immense influence in the development of educational theory and practice. He died Dec. 8, 1903.

It was his intention in the *Synthetic Philosophy* to develop a complete and articulated conception of all cosmic phenomena, including those of mental and social principles. His qualifications for attempting so comprehensive a task were wide powers of generalization, astonishing acquaintance with the facts of the various sciences, and a veritable genius for detecting the relations and connections of phenomena that escape the specialist. No philosopher has surpassed him in exploiting such a wealth of illustration and facts to explain his meaning or to prove his thesis. It is the clearness of his thought, the force of his illustrations, and the ingenuity with which the facts and methods of the inductive sciences were made to serve his views that have given him his popularity. Among professional philosophers he did not secure a strong following. But his attempt to systematize all knowledge in terms of modern science and especially in terms of evolution must always give him a high place among the thinkers of the second half of the nineteenth century.

The *First Principles* endeavors to define the fields of "the unknowable and the knowable," and the postulates with which the study of the knowable must be pursued. The whole weakness of Spencer's system is shown in his discussion of the unknowable. The absolute, space, time, matter, force, and motion were all taken as unknowable. After telling us that all these are unknowable, he asserts that the most certain things in our conviction are the "absolute" and all the other fundamental data for the knowable. Besides, after telling us that all explanation consists in reference to the known, he says that all phenomena are explained as manifestations of the unknowable. Then, in the discussion of the knowable, space, time, matter, force, etc., appear as known. Both the strength and weakness of his system are due to this equivocal import of the term "knowledge."

The whole system is an application of the idea of evolution to the universe, and more particularly to organic life and its forms, and to political and social institutions. Spencer's conception of this process did not go beyond Darwin's in its details, but it was apparently quite as original and certainly more comprehensive, besides involving philosophic generalizations to which Darwin was averse. Spencer was accused of applying the materialistic formula to the explanation of all things, but protested that he was not a materialist, for he claimed that he could equally well have expressed his doctrine in terms of consciousness. In order to adapt the conception of evolution to all forms of phenomena, he variously expressed the process as the passage from the simple to the complex, from the homogeneous to the heterogeneous, from indefinite homogeneity to definite heterogeneity, and so on. This description of the process brought him into controversy with all those who exalt metaphysics, and gave him no credit with those who do not. In his facts and illustrations, however, Spencer gives a clearer idea of his doctrine than in his abstract formulas intended to cover every type of phenomena in the organic and inorganic kingdoms. These facts, he thinks, show a continuous order of things with historical connections and relations which suggest a common origin from some ultimate indefinite form of force which he calls matter and motion. Darwin did not pre-

tend to go beyond the extension of a few types in the organic world or to develop their genesis. He was content to demonstrate the origin of species in the organic world and left unsolved and undiscussed the general origin of things—a much larger task. Spencer sought to make intelligible the process of evolution throughout the whole field of nature, and hence the importance of his formula about “continuous redistribution of matter and motion.”

It was Spencer's antagonism to the doctrine of creationism that caused a complete misunderstanding of what evolution really undertakes to accomplish. The theory of creation was equivocal. It assigned a cause for the origin of phenomena, and it was associated with the conception of the miraculous and supernatural. Spencer denied the creational theory and adopted the gradual development of all things in its stead. But what he failed to recognize sufficiently, though he sees it at times, is the fact that evolution is the history of origin, not the explanation of it.

Conceiving evolution, however, as the history rather of events than of causes that originate change, we shall find that Spencer's services to human knowledge can hardly be overestimated. It was a stroke of genius to combine the ideas of the persistence of force, adjustment to environment, and natural selection, for the purpose of explaining the relations of all phenomena. It offered a mode of unifying the cosmos which showed identities and relations throughout the whole not before observed. The persistence of force guaranteed the fundamental identity of all reality, in spite of the differences of form which it assumed, while the varieties of composition explained the differences. The conception supplies an initial presumption of the variation of a single species to account for the varieties; this once done, the whole problem of evolution is at least historically conceived as intelligible. In the ethical world growth is in the form of the substitution of altruism for egoism or selfishness. In the political and social worlds the process is but a repetition of that in the others, except that we deal with collective as distinct from organic wholes. One law prevails throughout the whole process—the redistribution of matter and motion according to the conditions of the persistence of force. Originally Spencer reduced life to a function of matter and motion. But in the last edition of his *Biology* he admitted that life was an “unknown force,” a position which involves a complete revolution in his system as recognizing something more in the world as ultimate than matter and motion. The hypothesis of a universal ether and the modification of older views regarding the nature of electrical and magnetic phenomena, with the discovery of a number of forms of energy not suspected a generation ago, threaten to modify greatly the bases of Spencer's system. But they do not disturb the general conception which he formed of the process of evolution, since this is independent of the forces involved and is simply a process of composition and decomposition throughout the cosmos and in all specific forms of reality. It is Spencer's manner of tracing the relations and affinities between the various phenomena of existence that gives his work its interest and has so generally influenced the intelligent public. He knew little of Greek philosophy and less of the modern Kantian-Hegelian

movement. The consequence was that he began his speculations with science, eschewed the transcendentalism of German epistemology, and wrote in terms that every intelligent man can understand. The public has not cared whether his abstract formulas were exact or not. It was impressed with his power of illustration and reference to facts which it was willing to use as interpreting his formulas, and as his illustrations and analogies depicted such an interesting unity in the course of nature, it was ready to take him as a prophet of the new gospel and leave subtleties to the transcendentalists.

**SPENCER, JESSE AMES** (1816-98). An American Protestant Episcopal scholar. He was born at Hyde Park, N. Y.; graduated at Columbia College (1837), and at the General Theological Seminary; and held pastorates at various times. He served as editor and secretary of the Episcopal Sunday School Union and Church Book Society (1851-57) and as professor of Greek in the University of the City of New York (1869-81). He edited the American reprint of T. K. Arnold's series of Greek and Latin textbooks (1846-56) and other classics, including the Greek New Testament (1847). His works include: *History of the English Reformation* (1846), *Egypt and the Holy Land* (1850), *History of the United States* (1856-69), *Eschatology* (1887), *Memorabilia, 1820-86* (1890).

**SPENCER, JOHN CANFIELD** (1788-1855). An American jurist and politician, born at Hudson, N. Y. He graduated at Union College in 1806 and was admitted to the bar. In 1813 he was brigade judge-advocate-general in the northern frontier army. He was a Democratic member of the United States House of Representatives (1817-19) and wrote the report condemning the United States Bank, which was afterward used by President Jackson when the author's views had changed. In 1820-21 he was a member of the Lower House of the State Legislature, the first year as Speaker. He was in the State Senate (1824-28), and in 1827 was appointed by Governor Clinton on the com-

mittee to revise the statutes of New York. For a time he was an Antimason and was appointed by Governor Van Buren to prosecute the alleged abductors of William Morgan (q.v.), but resigned in 1830. He again sat in the Legislature in 1832, and in 1834-40 was Secretary of State for New York and Superintendent of Schools. In 1841 he became Secretary of War in the cabinet of President Tyler. He was transferred to the Treasury Department (1843), but opposed measures for annexation of Texas and resigned May 2, 1844. He edited a translation of De Tocqueville's *Democracy in America* (2 vols., 1838). Consult Proctor, *Review of John C. Spencer's Legal and Political Career* (New York, 1886).

**SPENCER, JOHN CHARLES, EARL** (1782-1845). An English statesman, best known as Lord Althorp. He was the son of the second Earl Spencer, and was born in London. He was educated at Harrow and at Trinity College, Cambridge, entered Parliament in 1804, and became Junior Lord of the Treasury in 1806. From then till 1834 he continuously represented Northamptonshire in the Whig interest, successfully advocating salutary measures relating to bankruptcy proceedings and the recovery of small debts. In 1830 he became Chancellor of the Exchequer and leader in the House of Commons under the Grey ministry, and was active in carrying the Reform Bill of 1832. He held office under the Melbourne ministry (succeeding the Grey ministry) in July, 1834, but in November of that year the death of his father raised him to the House of Lords. He died Oct. 1, 1845. He was a man with slight ability, fond of agriculture and country sports; but honesty and industry raised him to responsible positions, which he filled with credit. Consult Ernest Myers, *Lord Althorp* (London, 1890).

**SPENCER, JOHN POYNTZ, fifth EARL** (1835-1910). An English statesman. The only son of the fourth Earl, he was born at Spencer House, was educated at Harrow and at Trinity College, Cambridge, and in 1857, the year of his graduation, was elected member of Parliament. At his father's death he succeeded to the peerage. He was Lord Lieutenant of Ireland (1869-74 and again in 1882-85), President of the Council with a seat in Gladstone's cabinet (1880-83 and 1886), First Lord of the Admiralty (1892-95), and Liberal leader in the House of Lords (1902-05).

**SPENCER, JOSEPH** (1714-89). An American soldier, born in East Haddam, Conn. He became a colonel in the French and Indian War and was one of the eight brigadier generals appointed by Congress on June 22, 1775, served at Boston and New York, became a major general in August, 1776, and commanded in Rhode Island in 1777. He served in Congress in 1779.

**SPENCER, JOSEPH WILLIAM WINTHROP** (1851- ). An American geologist, born at Dundas, Ontario, Canada. He graduated at McGill University in 1874 and took his Ph.D. at Göttingen three years later. He was professor of geology in King's College, Nova Scotia, in 1880-82, and in the University of Missouri in 1882-87; and was State geologist of Georgia (1888-93). Among his published works are: *Niagara Fossils* (1884); *Glacial Erosion in Norway* (1887); *Geological Survey of South-western Georgia* (1891); *Geological Survey of*

*the Paleozoic Belt of Georgia* (1893); *The Duration of Niagara Falls and the History of the Great Lakes* (1895).

**SPENCER, PLATT ROGERS** (1800-64). The originator of the Spencerian system of penmanship. He was born at East Fishkill, N. Y. He gave many lectures upon penmanship in various parts of the country, and his work was influential in causing the establishment of business colleges. Spencer published *Spencer and Rice's System of Business and Ladies' Penmanship* (1848), later republished as *Spencerian or Semi-Angular Penmanship*.

**SPENCER, ROBERT**, second EARL OF SUNDERLAND. An English statesman. See SUNDERLAND, ROBERT SPENCER, second EARL OF.

**SPENCER, SARA ANDREWS** (1837-1909). An American woman suffragist, long president of the Spencerian Business College at Washington, D. C. She was born at Savona, Steuben Co., N. Y., and in 1864 married Henry C. Spencer, and afterward removed to Washington, D. C. In 1871, with other women, she unsuccessfully attempted to register and vote, and afterward brought suit—the Supreme Court of the United States deciding (1874) that women have not the right to vote without local legislation. She represented the National Woman's Suffrage Association at the Republican National Convention in Cincinnati, in 1876, and signed and presented the *Woman's Declaration of Rights* at the Centennial Celebration at Philadelphia. Her publications include *Problems on the Woman Question* (1871).

**SPENCER, WILLIAM ROBERT** (1769-1834). An English poet and wit, grandson of the third Duke of Marlborough. He was educated at Christ Church, Oxford. Among his friends were Pitt, Fox, Sheridan, and Sydney Smith. In 1796 Spencer published a version of Bürger's *Leonore*, which was praised by Scott; and in 1802 burlesqued German romance in *Urania*, a play performed at Drury Lane. In 1811 he collected his poems in a volume. As a poet, Byron ranked him with Moore, Campbell, and Rogers. Consult the reprint of *Spencer's Poems* with biography (London, 1835).

**SPENER, shpā'nēr, PHILIPP JAKOB** (1635-1705). A German clergyman, founder of the German Pietists. He was born at Rappoltsweiler in Upper Alsace and was educated at Strassburg, Basel, Tübingen, Geneva, and Lyons. At Geneva he was influenced by Labadie (q.v.), and his natural disposition led him towards a religion of mystical and untheological type. He preached at Strassburg, was transferred to Frankfurt, and in 1666 became first pastor there. He strove to awaken deeper faith and more active Christian life, emphasized the necessity of conversion and regeneration, and scriptural study in opposition to teaching which laid stress on orthodoxy and connection with the Church. His views were set forth in his *Pia Desideria, oder herzliches Verlangen nach gottgefälliger Besserung der wahren evangelischen Kirche* (1673). In 1670 he began meetings at his house for the cultivation of evangelical morality, the so-called *collegia pietatis*, aiming, as he said, to form within the Church (*ecclesia*) a smaller church (*ecclesiola*) with a deeper spirituality. He reorganized the method of catechizing and improved the religious instruction of children. In 1679 a preface he wrote for a new edition of the *Postille* of Arndt, in which he censured the morals of the

upper classes, brought him into difficulties; and in 1686 he accepted an invitation to become court preacher at Dresden and member of the upper consistory. Here he effected changes in the theological teaching of the University of Leipzig and in the system of religious catechizing throughout Saxony; but because of attacks from orthodox theologians, and having fallen into disgrace with the Elector Johann Georg III, in 1691 he went to Berlin as provost of the church of St. Nicholas and consistorial inspector, remaining here till his death. The Elector of Brandenburg encouraged his efforts for religious reform and intrusted theological instruction in the new University of Halle to Francke, Breithaupt, and others of his disciples. In 1695 the theological faculty of Wittenberg formally censured as heretical 264 propositions drawn from Spenser's writings. There is no collected edition of his works; the full list (180 in number) is given in his biography by Von Canstein (Halle, 1740), and his chief works have been edited by Grünberg (Gotha, 1889). Consult also W. Hossbach, *Philipp Jakob Spener und seine Zeit* (3d ed., Berlin, 1861), and P. Grünberg, *P. J. Spener* (3 vols., Göttingen, 1893-1906). See GERMAN THEOLOGY; PIETISM.

**SPENGL**, shpēng'el, JOHANN WILHELM (1852- ). A German zoölogist, born at Hamburg and educated at Berlin and Göttingen. He was privatdocent in zoölogy at Göttingen from 1879 to 1881; director of the Municipal Museum in Bremen from 1881 to 1887; and thereafter professor of zoölogy at Giessen. He was editor, from 1886, of *Zoologisches Jahrbuch* and, from 1907, of *Ergebnisse und Fortschritte der Zoologie*.

**SPENGL**, LEONHARD (1803-80). A German classical scholar, born at Munich. He became known through his edition (1826) of Varro's *De Lingua Latina* and was appointed in 1826 lector, in 1830 professor in the present Wilhelmshausgymnasium of Munich. From 1842 to 1847 he was professor at Heidelberg, but he returned to Munich. Among his publications were his edition of the *Artes Rhetorica ad Alexandrum*, which, following Petrus Victorinus, he attributed to Anaximenes of Lampsacus (1844), his edition of the *Rhetoric of Aristotle* (1867), and his text edition of the *Rhetores Græci* (3 vols., 1853). His address *Ueber das Studium der Rhetorik bei den Alten* (1842) is a valuable outline sketch of the art of eloquence in classical times. Consult J. E. Sandys, *A History of Classical Scholarship*, vol. iii (Cambridge, 1908).

**SPEN/LOVE-SPEN/LOVE**, FRANK (1866- ). An English landscape and figure painter, born in Stirling, New Brunswick. After 1886 he exhibited regularly at the Royal Academy, London. Among his best-known paintings are "Funeral in Holland in Winter" (gold medal, Paris Salon, 1901); "Too Late" (Luxembourg, Paris); "The Little White Cross," "In the Shadow of the Church" (both in the Manchester Gallery); "Vespers, Holland" (1906, Glasgow Gallery); "Grey of the Morn" (Guildhall, London); "Grey of Evening" (Hull Gallery), and "The Hill-Top" (1912), all of which show his peculiar skill in the rendering of atmosphere. He founded a successful school of modern art at Beckenham, Kent, and is also known as an author.

**SPEN'NYMOOR**. A town in Durham, Eng-

land, 4 miles northeast of Bishop Auckland. It has coal-mining and iron industries. Pop., 1901, 16,660; 1911, 17,909.

**SPEN'SER**, EDMUND (c.1552-99). An English poet, born in London. His father has been identified with John Spenser, a London clothmaker. The boy was apparently sent to the Merchant Taylors' School, London, and passed, as sizar or poor scholar, to Pembroke Hall, Cambridge. Here he read widely in Latin, Greek, Italian, and French literature, being especially fond of Petrarch and Chaucer, of Marot and Du Bellay. He formed lifelong friendships with Gabriel Harvey and Edward Kirke. After graduating M.A. in 1576, he seems to have spent two years with kinsfolk in Lancashire, where he fell in love with a young woman whom he celebrated under the name of Rosalind. In 1578 he went to London and found a place in the household of the Earl of Leicester. There he probably met Sir Philip Sidney, to whom he dedicated *The Shepheardes Calender* (1579). In 1580 he was appointed secretary to Lord Grey, the new Lord Deputy of Ireland. Thenceforth Spenser lived mostly in Ireland. There he wrote the remainder of *The Faerie Queene*, begun at Leicester House. By 1588 or 1589 he was living at Kilcolman Castle, in the County of Cork, which with its extensive lands was legally transferred to him in 1591. In the meantime he had written *Astrophel* (1586), a noble pastoral elegy on Sidney, and had received a visit from Sir Walter Raleigh (1589), made memorable by *Colin Clouts Come Home Againe*. In 1589 he accompanied Raleigh to London, was welcomed at court, and published three books of *The Faerie Queene*, a moral and historical allegory. In 1590 followed a volume of miscellanies called *Complaints* including "The Ruines of Time," "The Teares of the Muses," "Mother Hubbard's Tale," "The Tale of the Butterflie," and four other poems. Disappointed of expected court preferment, Spenser returned to Ireland, where he married (1594) a certain Elizabeth, probably Elizabeth Boyle, related to the first Earl of Cork. The courtship is described in the *Amoretti* (published in 1595), a series of sonnets; the marriage is celebrated in the *Epithalamion* (published in 1595), the richest nuptial hymn in the English language. In 1596 he brought to London for publication three more books of *The Faerie Queene*. Spenser intended to continue the work to twelve books, but never got further than two cantos on *Mutabilitie* (printed 1609). While in England he seems to have completed a prose treatise on the *Present State of Ireland* (not published till 1633); he prepared for the press the beautiful *Four Hymnes* (1596), in honor of love, beauty, heavenly love, and heavenly beauty; and wrote (1596) for a double marriage at Essex House the *Prothalamion*, one of his finest poems. Again disappointed of preferment, he returned to Ireland. In October, 1598, his castle was sacked and burned by the Irish rebels. Spenser fled to England, where he died at a London inn, Jan. 16, 1599. He was buried near Chaucer in Westminster Abbey.

*The Shepheardes Calender* marks an epoch in English poetry. Conventional in theme, it yet shows a command over rhythm greater even than Chaucer's. It sounded the note of the Elizabethan outburst. As Spenser grew older he became more weighty in substance and discovered new melodies. In *The Faerie Queene*

he invented a nine-line stanza known as "Spenserian." It is the Italian *ottava rima* with an added Alexandrine (12 syllables). The rhymes run ababbce. Spenser's imagination dwelt in a realm of beauty and the noblest ideals. His fault is an insistence on the allegory which sometimes becomes monotonous and frequently obscure. Spenser has been a favorite with the poets. The generation following him were Spenserians, and Milton owed much to him. In the Romantic revival at the end of the eighteenth century he was potent, and Keats's *Eve of Saint Agnes* and Byron's *Childe Harold* were written in the Spenserian stanza.

**Bibliography.** *Works*, edited by H. J. Todd (8 vols., London, 1805; new ed., 1877), by R. Morris, with memoir by J. W. Hales (Globe ed., ib., 1869, often reprinted), and by A. R. Grosart (Huth Library, 10 vols., ib., 1882-84), by J. P. Collier (5 vols., new ed., ib., 1891; Riverside ed., 3 vols., Boston, 1908). Consult G. L. Craik, *Spenser and his Poetry* (new ed., 3 vols., London, 1871); J. R. Lowell, *Among my Books*, second series (Boston, 1876); R. W. Church, *Spenser*, in "English Men of Letters" (New York, 1894); Sir Sidney Lee, in *Great Englishmen of the Sixteenth Century* (ib., 1904); W. H. Schofield, "Chivalry in English Literature," in *Harvard Studies in Comparative Literature*, vol. ii (Cambridge, Mass., 1912); C. G. Osgood, comp., *Concordance to the Poems of Edmund Spenser*, published by the Carnegie Institution (Washington, 1915). The Spenser Society, founded at Manchester in 1867, published a facsimile of the first edition of *The Shepheardes Calender*.

**SPENSERIAN STANZA.** See SPENSER, EDMUND; VERSIFICATION.

**SPERANSKY**, spä-rän'ské, MIKHAIL, COUNT (1772-1839). A Russian statesman. Educated at the St. Petersburg Ecclesiastical Academy, he was appointed professor of mathematics there in 1797 and State Secretary in 1801. He became Assistant Minister of Justice in 1808 and Privy Councillor in 1809. During his administration he remodeled the system of taxation and the system of national education, besides instituting many other reforms. As Governor-General of Siberia (1819-21), he displayed great energy in fighting official corruption and bettering the condition of the exiles. In 1821 he was made a member of the Imperial Council. Nicholas I intrusted him with the codification of the Russian laws, a task which he performed with singular success.

**SPERM**, IN PLANTS (Lat. *sperma*, seed), **ANTHEROZOIDS**, **SPERMATIZOIDS**. The male sexual cell, whose union with the egg is the process of fertilization, which results in the formation of an embryo. An ordinary sperm is an actively moving, naked cell, consisting essentially of a relatively large nucleus with a thin sheath of cytoplasm, forming the body, and delicate, hair-like swimming appendages (cilia). The male organ which produces sperms is uniformly called an antheridium (q.v.). See FERTILIZATION; REPRODUCTION; SEX.

**SPERMACETI**, spēr'má-sē'ti (Neo-Lat., whale's seed). A solid wax obtained principally from cavities in the head and from blubber of the sperm whale or cachelot (*Physeter macrocephalus*), inhabiting the Pacific and Indian oceans. In the living animal the "head matter" exists as a liquid, which deposits flaky white crystals of spermaceti from the yellow liquid

"sperm oil," as a result of trying out and cooling. The so-called sperm oil is really a mixture of liquid waxes.

As many as 12 barrels of the crude product are obtained from an ordinary whale.

Spermaceti is purified by chilling, pressure, and crystallization. When pure it is a white translucent solid, smooth to the touch, and without taste or odor, insoluble in water and cold alcohol, soluble in hot alcohol and ether, from which it crystallizes readily. By exposure to air and light it grows yellowish and rancid. Spermaceti burns with a bright clear flame and was formerly used in the best candles. When made of definite weight and size these candles were used as the standard of illumination, but have now been replaced by the pentane lamp.

Spermaceti is a wax and hence contains no glycerin; the ester is known as cetin or cetyl palmitate,  $C_{16}H_{33}COOC_{16}H_{33}$ . Spermaceti is still used in ointments and toilet preparations.

**SPERMARY.** See ANTHERIDIUM.

**SPERMATISTS.** A school of physiologists of the seventeenth century, who held that the whole of the material transmitted from the parents to the offspring as the foundation of the embryo was contained in the spermatozoon of the male, opposing those (the ovulists) who asserted that all the material was supplied by the mother in the egg. See PREFORMATION.

TYPES OF SPERMS.

1. *Chara*; 2-4, fern; 5, *Marsilea*; 6, club moss; 7, fern; 8, quillwort; 9, liverwort.

**SPERMATOPHYTES** (from Gk. σπέρμα, *sperma*, seed + φυτόν, *phyton*, plant), **SEED PLANTS**. The highest of the four primary divisions of the plant kingdom, distinguished from the other groups by the production of seeds.

This group, which includes practically all the conspicuous vegetation (herbs, shrubs, and trees), is by far the most useful group to man, so useful, indeed, that until the closing years of the nineteenth century elementary botanical training dealt with no other group and botanists were thought of chiefly as students of flowers. About 140,000 species of seed plants have been described, and grouped in two distinct but very unequal divisions—gymnosperms (q.v.) and angiosperms (q.v.). They are distinguished by the position of their seeds, which are naked or freely exposed in the former but inclosed in a seed case in the latter.

In all seed plants the alternation of generations (q.v.) is very much obscured by the great

reduction of the sexual plants, which are not popularly recognized, and are undiscoverable except by laboratory manipulation, the whole visible body of these plants, contrary to the popular notion, being the sexless phase or sporophyte. All the members of the group are also heterosporous. (See HETEROSPORY.) The pollen grain is a sexless microspore that in germination gives rise to a small plant consisting of only a few cells, among them two male cells, which are formed within the pollen grain or pollen tube and function as sperms. The pollen grain is transferred to the immediate neighborhood of the female plant, usually by the wind or by insects. See POLLINATION; FERTILIZATION.

The megaspore, a large sexless spore that produces the female plant, is developed within the ovule, which is, therefore, a sporangium. The fact that in this sporangium there is usually but a single megaspore, and that is not discharged,

OVULE IN OVARY CAVITY.

Showing *i*, integument; *n*, nucellus; *s*, embryo sac; and *e*, embryo.

but retained, is what makes a seed possible; for the retained megaspore germinates within its sporangium (ovule; see OVULE, and Illustration) and produces the female plant there. This megaspore within the ovule was once thought to be merely a saclike cavity, within which the embryo appeared, and hence was called the "embryo sac." In germination the megaspore produces a female plant, with several or many cells, a tissue which has long been called "endosperm," and recognized as a prominent nutritive tissue within the seed. The female plant, therefore, is entirely inclosed within the ovule, and produces an egg which is reached by a pollen tube and fertilized. This act of fertilization is followed by two conspicuous results, viz., (1) the development of the embryo, and (2) the development of a hard superficial tissue (testa) in the outer part of the ovule, which hermetically seals the female plant and embryo within, the whole complex structure constituting the seed.

In the seed condition the plant passes into a dormant condition of greater or less duration, and then, under favorable conditions, the seed is said to germinate. This simply means the renewed growth of the young plantlet, whose embryo, which had begun to develop, was checked by the hard investment of the seed. A seed, therefore, is a complex of three generations: (1) the old sexless generation (sporophyte), represented at least by the seed coats; (2) the following female sexual generation (gametophyte), represented by the endosperm; and (3) the new sexless generation (sporophyte), represented by the embryo.

**SPERMATIZOIDS.** See SPERM, IN PLANTS.

**SPERMATIZOÏN** (Neo-Lat., from Gk. σπέρμα, *sperma*, seed + ζῷον, *zōon*, animal). The male germ cell. The phenomenon of sexuality consists of the union of two cells. In the lowest forms these may be alike, but in the higher plants and animals there is a difference in size of the two uniting cells. The larger is called the female cell or egg, the smaller the spermatozoön. This difference in size is advantageous, for it means a division of labor. The large cell is passive and accumulates a large amount of food material by virtue of which the future embryo is better provided for. The spermatozoön, on the other hand, retains the capacity for locomotion; it seeks the passive egg. Consequently the spermatozoön becomes as small as possible and is provided with a large locomotive organ—the tail, flagellum, or lash. The spermatozoön is thus a highly specialized, actively locomotor cell. A typical flagellate spermatozoön consists of three parts: head, middle piece, and tail. The head contains the nucleus, made up of an extremely dense mass of chromatin; also often an apical body or acrosome, lying in a spur of the head. The middle piece is larger than the tail and usually contains the centrosome. The tail is a cytoplasmic thread, containing a central delicate thread and having a lateral membrane or fin which makes the stroke of the tail more effective.

The spermatozoa develop in a special organ of the body called testis, typically a mass of germ cells, young and old. In the young male this gland is made up of epithelial cells known as primordial germ cells; from these by cell division arise spermatogonia, still undifferentiated cells. The spermatogonia grow until they become very large, and are then called spermatocytes. Each spermatocyte divides and the daughter cells promptly divide again into spermatids, four of which thus arise from each spermatocyte. But each spermatocyte has only half the number of chromosomes that the original spermatocyte had. Each spermatid now undergoes a change of form by which it becomes a spermatozoön, and not until then is it ready to fertilize the egg. See FERTILIZATION.

**SPERMIN**, spē'r'min (from Gk. σπέρμα, *sperma*, seed + -ina). A substance found in the thyroid and thymus glands, spleen, ovaries, testes, and blood in the form of a phosphate. It is believed by Poehl to be a leukomain and to be produced by the retrogressive metamorphosis of albumens. It is a powerful stimulant to the oxidizing properties of the blood and is given for its action in this respect. It has been administered with marked benefit in ataxia, epilepsy, senile degeneration and nervous affections of the aged, and as a tonic in tuberculosis. Spermin is given hypodermically in the form

of the hydrochlorate. See ORGANOTHERAPY.

**SPERM OIL.** See WAXES.

**SPERMOPHILE** (from Gk. σπέρμα, *sperma*, seed + φιλεῖν, *philein*, to love). A ground squirrel of the genus *Spermophilus*, of which more than a dozen species occur in the United States, but only one or two in Europe. They are terrestrial, live under ground, feed chiefly on herbage and seeds, are very prolific, and are commonly called gophers (see GOPHER), thus being confused with an entirely different group of mammals. Three species at least are sufficiently abundant to damage lawns and cultivated fields. An effective means of destroying them is by soaking some absorbent in carbon bisulphide and placing it in the burrows. In size, form, color, and length and shape of tail, they show great variety, being usually some shade of brown, mottled, spotted, or striped with other shades. With the tail they will average about a foot in length. All are western, and denizens of open regions, only two species occurring as far east as Illinois. The flesh is edible. Consult Bailey, "Prairie Ground Squirrels," in Department of Agriculture, Division of Ornithology and Mammalogy, *Bulletin* 4 (Washington, 1893). Compare CHIPMUNK.

**SPERM WHALE.** See WHALE.

**SPERRY, CHARLES STILLMAN** (1847-1911). An American naval officer, born in Brooklyn, N. Y. He graduated from the United States Naval Academy in 1866 and passed through the various grades of the service to commander in 1894, captain in 1900, and rear admiral in 1906. During the Spanish-American War he was on ordnance duty at the Brooklyn Navy Yard, but in 1899 went on active duty in command of the *Yorktown* at Manila. When the Filipino Insurrection broke out he attempted to cut off Aguinaldo's retreat with a landing party, but during the land manœuvres half of the *Yorktown's* men were captured. The remainder of the crew pursued the insurgents and finally recaptured the American prisoners after a long chase. In 1903 Sperry was appointed president of the Naval War College at Newport, and in 1907 was one of the American representatives at the Second Hague Conference. During the cruise of the American battleship squadron around the world in 1908, Admiral Sperry commanded the Second Squadron until the fleet arrived in San Francisco, when he succeeded Admiral Evans (q.v.) in command of the entire fleet. He was retired in 1909.

**SPERRY, ELMER AMBROSE** (1860- ). An American electrical engineer, born at Cortland, N. Y. In 1879-80 he attended Cornell University. About this time he perfected one of the first electric arc lights in America. Sperry was a pioneer in the manufacture of electrical mining machinery, electrical street-railway cars, and electric motors. In addition he perfected the gyroscopic compass, produced apparatus for stabilizing ships and aeroplanes, and invented electrochemical apparatus for the production of caustic alkali and chlorin compounds. In 1915 Sperry was appointed a member of the United States Naval Advisory Board. See AERONAUTICS, *Monoplanes*.

**SPES** (Lat., hope). The Roman goddess of hope, represented as a youthful divinity clad in a long robe and bearing a bud in one hand. Spes personified hope for good harvests and for children, and was invoked at births, marriages, and other important times.

**SPES'SARTITE.** See GARNET.

**SPET.** See BARRACUDA.

**SPEUSIPPUS** (Lat., from Gk. Σπείσιππος) (c.400-c.330 B.C.). An Athenian philosopher, nephew and pupil of Plato, with whom he is supposed to have visited Syracuse. In 347-339 Speusippus was head of the Old Academy. He went even further than Plato in his mystical interest in the Pythagorean numbers, but in general agreed with his master, save that he denied the perfect goodness of the primordial unity, inasmuch as bad must be held to proceed from it as well as good. Consult: Fischer, *De Speusippi Atheniensis Vita* (Rastatt, 1845); E. Zeller, *Plato and the Older Academy* (Eng. trans., London, 1888); P. Lang, *De Speusippi Fragmentis* (Bonn, 1911); Ritter-Preller, *Historia Philosophiæ Græcæ* (9th ed., Gotha, 1913).

**SPEY**, spā. A river of Scotland, rising in Inverness-shire and, after a northeast course of about 110 miles, falling into the Moray Firth, 3 miles west of Port Gordon (Map: Scotland, E 2). The Spey is the second longest river in Scotland. It has salmon fisheries.

**SPEYER**, spī'ēr, or **SPEIER** (in Eng. often *Spires*). The capital of the Palatinate, Bavaria, at the confluence of the Speyerbach and the Rhine, 23 miles north of Karlsruhe (Map: Germany, C 4). The chief feature is the magnificent cathedral, a vast Romanesque edifice. It was begun in 1030 by Conrad II, the founder of the Franconian dynasty of German emperors, and in its original form was completed in the reign of his grandson, Henry IV. It was long the burial place of the German emperors. The cathedral suffered in 1689 and 1794 from the vandalism of the French invaders, who spared nothing. Restoration was completed in 1853. The interior has magnificent frescoes, statues, and reliefs by Schraudolph and other masters. Among other architectural monuments of the city is a splendid gate (thirteenth century). There is a fine museum of antiquities. Manufactures include woollens, machinery, shoes, tobacco, vinegar, and sugar. Speyer, the Roman Augusta Nemetur (later Noviomagus), was created an episcopal see in 348. It was a favorite residence of the German emperors, and became a free Imperial city in 1294. At the Diet of Speyer in 1529 the followers of Luther presented their protest, which gave them the appellation of Protestants. The city belonged to France from 1801 to 1814, when it passed to Bavaria. Pop., 1900, 20,911; 1910, 23,045.

**SPEYER, JAMES** (1861- ). An American banker, born in New York City. He was educated at Frankfort-on-the-Main, Germany, where he entered the family's banking house in 1883. He was then employed in the Paris and London branches, and later returned to New York to take charge of the branch there. Finally he became head of the firm. He was elected trustee or director in various other financial and industrial organizations. In 1902 he presented the Speyer School to Teachers College (Columbia)—he served as trustee of the university—and he was a director of Mt. Sinai Hospital. In 1894 he was a member of the Committee of Seventy that helped to overthrow Tammany Hall's control of the city.

**SPEYERS**, spī'ēr, CLARENCE LIVINGSTON (1863- ). An American chemist, born in New York City. He graduated from Columbia University in 1884 and was assistant in chemistry in the University of Missouri during 1885-

91 and associate professor at Rutgers College from 1891 to 1908. Thereafter he was research associate of the Carnegie Institution. He published numerous papers on physicochemical subjects, such as heat of solution, vapor pressures of mixed liquids, osmotic pressure, dielectric constants of solutions, and compressibilities of substances as related to their surface tensions.

**SPEZIA**, spēt'sé-ā. A city in the Province of Genoa, Italy, on the Gulf of Spezia, 56 miles by rail southeast of Genoa (Map: Italy, B 2). Its scenery and mild climate have made it a favorite winter resort. Its advantages as a naval station were pointed out by Napoleon, and in 1861 the Italian government made it the chief naval harbor of Italy. On surrounding hills there are strong fortifications. Some of the largest Italian warships have been constructed at the shipbuilding yards. The city has a technical institute, a school of navigation, and a marine hospital. Considerable trade is carried on, chiefly in olive oil, wine, fruits, and marble. There are manufactures of furniture, hemp linen, and leather. Spezia is near the site of the ancient Luna, of which some remains exist. Pop., 1881, 30,732; 1901, 65,612; 1911, 73,599.

**SPHACTERIA**, or SPIAGIA. A small island off the southwest coast of Messenia, Greece, commanding the entrance to the Bay of Navarino (Map: Greece, C 7). The island is hilly and characterized by the steep slopes of its heights.

**SPHAGNUM** (Gk. σφάγνος, *sphagnos*, a sort of moss), or Bog Moss. A genus of mosses intermediate between the liverworts and true mosses (see MUSCI) remarkable for their whitish or pale color. They often grow in considerable masses, absorbing water like sponge, but becoming friable when dry. They contribute much to the formation of peat. Gardeners employ them for covering and moistening the roots of plants because they readily absorb moisture from the air. The cells of the leaves are remarkable for their spiral structure and for large pores in their sides. See Plate of BRYOPHYTES and Colored Plate under MUSCI.

**SPHALERITE**, or ZINC BLENDE. A zinc sulphide and important ore. See BLENDE.

**SPHENE** (from Gk. σφῆν, *sphēn*, wedge; from its crystal shape). One of the light-colored (yellow or green) varieties of titanite (q.v.), sometimes cut as a semiprecious stone.

**SPHENISCI**, sŕē-nīs'sī. A group of birds, the penguins (q.v.).

**SPHENODON**. See HATTERIA.

**SPHENOID BONE** (Gk. σφῆν, *sphēn*, wedge

lated with all the other cranial bones, which it wedges firmly together. It somewhat resembles a bat with its wings extended, and hence was termed the *os vespertilionis*. It is divisible into a body, the greater and lesser wings, and various processes. The greater wings present three surfaces: a superior or cerebral surface, forming part of the floor on which the brain rests; an anterior surface, which helps to form the outer part of the orbit of the eye; and an external surface with a rough ridge, giving attachment to the external pterygoid muscle, one of the most powerful muscles of mastication. The second, third, fourth, fifth, and sixth cranial nerves emerge from the cranial cavity through foramina in this bone.

**SPHENOPALATINE GANGLION**. See MECKEL'S GANGLION.

**SPHERE** (Lat. *sphæra*, ball, globe). A solid bounded by a surface every point of which is at a given distance from a fixed point. The given distance is called the radius and the fixed point the centre of the sphere. A spherical surface may be generated by revolving a semi-circumference about its diameter. Sections of a sphere made by planes are circles. If the plane passes through the centre of the sphere, the circle is a great circle, otherwise a small circle of the sphere. If the segments into which a plane divides a sphere are unequal, the smaller is called the minor and the larger the major segment. That portion of the spherical surface which is included between two parallel planes which cut or touch the surface is called a zone. The portion of a sphere generated by the revolution of a circular sector about any diameter of its circle as an axis is called a spherical sector.

The surface of a sphere is equal to four times the area of a great circle of the sphere, that is,

SPHERICAL SECTORS, THE LEFT ONE A SPHERICAL CONE.

to  $\pi d^2$  or  $4\pi r^2$ ,  $d$  and  $r$  being respectively the diameter and the radius of the sphere. Its volume is  $\frac{1}{6}\pi d^3$  or  $\frac{4}{3}\pi r^3$ . The rectangular equation of a sphere, the origin being at the centre, is  $x^2 + y^2 + z^2 = r^2$ . (See COORDINATES.) (For the formulas for areas and volumes relating to zones, segments, and sectors, see MENSURATION.) A remarkable property of the sphere is that its surface is equal to the curved surface of the circumscribed cylinder and its volume is two-thirds of that of the cylinder, a property said to have been discovered by Archimedes (q.v.). If a sphere and a double cone are inscribed in an equilateral cylinder, the sphere and the volume between the cone and the cylinder are Cavalieri bodies. See CAVALIERI.

**SPHERICAL TRIGONOMETRY**. See TRIGONOMETRY.

**SPHEROGRAPH**. See SAILINGS.

**SPHEROID**. See ELLIPSOID.

**SPHEROIDAL STATE** (from *spheroid*, like a ball or sphere). The phenomenon observed when a drop of water placed on a highly heated surface remains in its spherical shape and moves

SPHENOID BONE AS SEEN FROM THE FRONT.

+ *ēidos*, *ēidos*, form). A bone situated at the anterior part of the base of the skull and articu-

about over the surface, evaporating gradually, instead of vaporizing instantaneously. The experiment to show this condition of a liquid is generally performed by using a metallic disk heated by a lamp or Bunsen burner, on which one or more drops of water are carefully let fall. If the disk is sufficiently heated a layer of vapor will be formed between its surface and the drop which is known as the Crookes's layer. The liquid remains suspended on this vapor and the drop takes the form of an oblate spheroid, the temperature, however, never rising above the boiling point, being in the case of water about 206° F. or 96.6° C., while the disk itself must have a temperature of at least 340° F. or 171° C. The explanation of this fact is that the latent heat carried off in the course of vaporization is sufficient to keep the temperature below the boiling point. The drop does not actually touch the disk but is supported on a cushion of vapor, which is evaporating towards the hot plate so rapidly as by its reaction to keep the water from falling. This may be seen by looking at a flame through the intervening space, or by attempting to pass an electric current from the drop of water to the metal disk, using a galvanometer to detect its passage, there being no deflection of the needle unless the two substances are in actual contact. The liquid takes a spherical shape owing to capillary action. Other liquids and bodies that are solid at ordinary temperatures also show this phenomenon. Consult: G. F. Barker, *Physics* (New York, 1893); B. Stewart, *Elementary Treatise on Heat* (6th ed., Oxford, 1895); Alfred Daniell, *Text-Book of the Principles of Physics* (new ed., New York, 1911).

**SPHINCTER MUSCLE** (Lat. *sphincter*, that which binds tight). A circular band of muscular fibres, whose function is to antagonize the expellent action of certain viscera, especially the bladder and the lower part of the intestinal canal. It is to the presence of these muscles that the higher animals owe the power of retaining for a considerable period the excrementitious matters collected in the bladder and rectum, and of discharging them at intervals, the sphincter muscles being, like those engaged in the process of respiration, mainly, but not entirely, under the control of the will.

**SPHINX** (Lat., from Gk. *σφιγγειν*, *sphingein*, to strangle). A composite monster, famous in Greek mythology, having the head of a woman, the body of a lion, the wings of a bird, and the tail of a serpent. According to the legend, she proposed a riddle to the Thebans, slaying all who were unable to guess it, and when Œdipus finally solved her riddle, she threw herself over a cliff and perished. She is said to have been the daughter of Echidna and her son Orthrus, or of Chimera and her brother Orthrus. The name "sphinx" was applied by the Greeks to a class of composite figures, familiar in Egyptian art, having the body of a lion and the head of a man or of some animal.

The most remarkable of all Egyptian sphinxes is the Great Sphinx of Ghizeh, lying about 300 feet east of the second pyramid, and made, according to Budge, to protect the neighboring tombs from evil spirits. It is sculptured out of the native rock, to which masonry has been added in certain places to complete the form. The body is roughly hewn out, but the head was originally executed with great care. The entire height of the monument, from the crown of the

head to the pavement on which the forelegs rest, is about 66 feet. In length the figure measures 172.5 feet; the forelegs are 50 feet long; and the head is 30 feet long by nearly 14 feet in breadth. The face was originally colored red, but the coloring has almost entirely disappeared. In 1816 the front of the Sphinx was cleared of sand by Caviglia, who found close to the breast a shrine, or small temple, containing an inscription of Thothmes IV and one of Rameses II. Both monarchs had cleared away the sand that had accumulated about the monument. From the inscription of Thothmes IV it is clear that the Sphinx was considered to represent Harmachis (q.v.), a special form of the sun god, and its office was to serve as a guardian of the necropolis near the pyramids. It has been supposed to be the work of King Chephren of the fourth dynasty, and some archaeologists have even assigned it to an earlier period, but the existing evidence is insufficient to fix its date with any degree of accuracy. See Plate of PYRAMIDS.

**SPHINX MOTHS.** Moths of the family Sphingidæ, described under HAWK MOTH. Prominent American examples are depicted on the Colored Plates of MOTHS and of INSECTS.

**SPHYGMOGRAPH** (from Gk. *σφυγμός*, *sphygmōs*, pulse + *γράφειν*, *graphein*, to write). An instrument invented by Vierordt and perfected by Marey, by which are ascertained and recorded the force and frequency of the pulse beat and the changes it undergoes. It consists of two parts: (1) Two levers, one of which is so delicately adjusted on the vessel the pulsation of which it is desired to examine, that on each expansion of the vessel the lever undergoes a corresponding slight elevation; this lever communicates by a perpendicular arm with a second, transmitting the impulse received from the vessel; the extremity of this second lever has a pen point, which records the movement thus indicated on a movable plate, controlled by the second part of the instrument. (2) A plate, moved by clockwork, and bearing a strip of paper on which the sphygmogram is written. The instrument may be combined with a microphone, constituting a sphygmophone. The pulsations may be seen by an appliance termed a sphygmoscope.

The sphygmograph is only one of several instrumental methods of studying the cardiac rhythm. Another is the electrocardiograph. The usefulness of this instrument depends on the fact that contracting muscles give rise to electrical changes, and the further observation that if the legs or arms are used and connected by means of lead electrodes with a galvanometer (q.v.), the electrical reaction which then occurs with the heart contractions will affect the magnet. By means of the string galvanometer, invented by Einthoven, the movements of the heart are registered as follows: a thread of platinum is placed between the poles of the magnet. In this magnetic field the thread becomes sensitive

to the slightest electric change. The right arm or left leg or right arm and left arm are immersed in a basin containing salt water and a sheet of copper, the latter connected by wires with the platinum thread lying in the magnetic field. Electrical disturbances set up by heart contractions are conveyed to the thread and cause it to execute slight movements. By a series of lenses and an arc light suitably placed the shadow of the thread is shown upon a movable photographic plate and its movements photographically recorded. Such a record is called an electrocardiogram; students of these records are able to distinguish the separate movements of the ventricles and auricles and draw definite conclusions as to the normal or pathological conditions of these portions of the heart. Consult Lewis, *Electrocardiography* (London, 1913), and Hoffman, *Die Electrographie als Untersuchungsmethode des Herzens* (Wiesbaden, 1914). See PULSIMETER.

**SPICCATO**, spē-kū'tō (It., separated). A term in music indicating a distinct and detached mode of performance—usually applied to music for bowed instruments, and implying that each note is to be played with a springing bow. The bow is allowed to fall upon the string; it rebounds, and falls again for the next tone, etc.

**SPICEBUSH**. See FEVER BUSH.

**SPICE ISLANDS**. A group of islands in the Dutch East Indies. See MOLUCCAS.

**SPICES**. See FLAVORING PLANTS.

**SPIDER** (from A.S. *spinnan*, to spin). Any member of the Araneida, an order in the class Arachnida. The arachnids are distinguished from insects by the possession of four pairs of legs; while spiders are separated from other Aracnida by the presence of spinning organs near the tip of the body. The body of a spider is divided into two portions connected by a small slender pedicel. The anterior part, the cephalothorax, is supposed to represent the combined head and thorax of insects. The posterior part is the abdomen. On the anterior part of the cephalothorax are the eyes, commonly eight in number, and frequently arranged in two transverse rows of four each. In the lower front margin of the cephalothorax are the mouth parts. These consist of a pair of jaws, sometimes called mandibles or falcæ; a pair of palpi, whose basal joints are enlarged into maxillæ; and a median unpaired lower lip. The mandibles are two-jointed; the basal joint is very large and stout, the apical one is small, clawlike, and called the fang. The palpi are filiform and six-jointed. In the female they are simple and often terminate in a claw; in the male, however, the apical joint is curiously modified into a complicated accessory sexual organ, suited to carry and apply the seminal fluid. The four pairs of legs are similar in structure but variable in length. Each consists of seven joints and ends in two or three toothed claws. The spiders that live on webs usually have three claws, the median more curved than the others; while other spiders commonly have but two. In place of the median claw is sometimes a dense fascicle of hairs. The abdomen of spiders is generally soft, tumid, and has no apparent joints. The genital organ opens near the base of the abdomen beneath. The male aperture is inconspicuous, but the female vulva or epigynum is often very prominent and sometimes quite complicated. At the apex of the abdomen are four to six short, often two-jointed, pieces, the spinnerets or spinning

organs. Each spinneret has on its surface many minute orifices, from each of which may issue a thread, and the many threads joined together make the spider's line. The substance which exudes from the spinnerets is glutinous but dries on contact with the air. Some spiders possess an accessory spinning organ, a transverse surface in front of the base of the spinnerets known as the cribellum. Correlated with this is a row of curved hairs on the hind metatarsus called the calamistrum. The spider draws the row of hairs over the cribellum and combs out a curled or tangled thread of silk.

The mouth of the spider opens into a short oesophagus, which leads to a sucking stomach which draws up the liquid food. From the posterior part of this organ arise two branches which extend upward and forward and meet over the mouth; each branch gives off on the outer side four smaller branches, one in front of each leg, and these unite below the sucking stomach. From the stomach arises the intestine, which passes into the abdomen and opens just behind the spinnerets. In the abdomen just above the intestine is a long tubular heart or pulsating vessel, with openings in front, behind, and along the sides. The nervous system is represented by a large, long ganglionic mass lying on the floor of the cephalothorax. In front is a smaller mass which gives rise to nerves to the eyes and jaws. At the base of the abdomen below there is a cavity on each side, nearly filled by a series of thin plates through which the air reaches the blood. These are the lungs. Spiders also have a pair of branching tracheæ, which open just in front of the spinnerets. The silk glands lie above the spinnerets and along the floor of the abdomen. They are of two kinds, most of them short, but two are larger and very long. Each silk gland has a separate opening or duct in the spinnerets.

The eggs are deposited (10 to 2000 in number) within silken cases or cocoons made by the mother spider for this purpose. The young spider on hatching is in general appearance much like the parent, but with larger hairs and less distinctly marked. As the young spider grows it is obliged to molt the skin. The number of molts varies from six to nine. The spider's silk is not used solely in the construction of webs but serves a variety of purposes. With many spiders the web is a loose, irregular maze of crossed threads, which are the true cobwebs. In other cases it is a flat sheet of threads with a tubular retreat at one corner. The geometric or orb webs consist of a varying number of radiating lines crossed by many parallel or spiral threads. The whole is supported by several guy lines or stouter threads. At one corner or in the near vicinity is a silken nest or retreat, where the spider remains concealed during the day or when not using the web. This retreat is connected by a line to the centre of the web. When waiting for prey the spider rests upon the centre of the web, head downward and legs extended. See ORB WEAVER.

The male spider is usually smaller than the female, with longer legs, and often is more highly colored; sometimes he has additional spines on the legs or spurs on the coxæ. In many of the minute species the male has the front of the cephalothorax greatly swollen and elevated, often molded into grotesque shapes. The courtship of spiders is frequently attended with grave peril to the male. The female, if

not in the suitable temper, may attack and devour her devoted admirer. In some cases, however, the male is larger than his mate.

As a rule spiders can see clearly only for a few inches. They have an acute sense of hearing, as well as of touch. A number of spiders are so shaped or colored as deceptively to resemble ants, an appearance heightened by their erratic movements. Others resemble the surfaces upon which they usually occur, as the bark of trees, dead leaves or twigs, and the petals of flowers. A few are able to produce sounds; some by rubbing the base of the abdomen over the base of the cephalothorax, others by rubbing the palpi against the sides of the mandibles. A considerable number, known as trap-door spiders, dig holes in the ground, line them with silk, and cover the entrance by a close-fitting door, the upper surface of which is made to resemble its surroundings. Some species make similar nests in trees. A few spiders are social and produce webs in common, or closely connected to each other. Some of the large spiders are very powerful and can kill small birds, rats, fish, and other animals. All spiders have poison glands and use them in capturing prey, but with most spiders the mandibles are so small and weak as to be incapable of piercing the human skin, and if they did so the small amount of poison injected could have no deleterious effect. With the large tarantulas it is different, although cases of death from their bites are few and doubtful. There is one group of spiders, however (genus *Latrodectus*), which appear to merit the name of poisonous spiders. The New Zealand species, locally known as katipo (q.v.), certainly appears to be dangerous. A species of *Latrodectus* occurs in the southern United States, where it is called malmignatte, but its bite (as far as known) has not proved fatal.

The classification of spiders, formerly quite simple and based on their habits and webs, has undergone a complete revolution. Thirty-five or 40 families are now known; several, however, contain but few species. The more prominent families may be grouped in two classes for convenience. Of the nonweb-building kinds are the Theraphosidæ, or tarantulas, and trap-door spiders. They have vertically moving fangs, four lung slits, and are of large size. The Dysderidæ possess but six eyes and live in dark places. The Drassidæ are flat, with prominent spinnerets, and live on the ground or under stones. The Clubionidæ are convex and occur on bushes or among dead leaves. The Sparassidæ are very flat and broad and are abundant in the tropics. The Thomisidæ, or crab spiders, are flat, broad, can walk sideways, and catch prey by the forelegs. The Lycosidæ, or wolf spiders, have the eyes in three rows, those of the lowest very small; they wander in woods and fields. The Attidæ, or jumping spiders, have eyes in three rows, those of the lowest row the largest; they jump and stalk their prey.

Among web-building forms are the Agalenidæ, which make flat sheets of web with a tubular retreat at one side; the Dictynidæ, which possess a cribellum and make irregular webs with curled threads; the Theridiidæ, which make the familiar cobweb; and the Epeiridæ, which make geometric or orb webs.

1889-93); J. H. Emerton, *The Common Spiders of the United States* (Boston, 1902); J. H. Comstock, *The Spider Book* (New York, 1912); Cecil Warburton, *Spiders*, in "Cambridge Manuals of Science and Literature Series" (Cambridge, 1912), containing a bibliography; J. H. Fabre, *Life of the Spider*, English translation by A. Teixeira de Mattos (London, 1912).

**SPIDER CANCER.** See NÆVUS.

**SPIDER CRAB.** Any crab in which the legs are of unusual length in comparison with the body. The famous giant crab of Japan (*Macrochira kempferi*) is the largest known spider crab, and has legs from four to six feet in length. On the eastern coast of the United States the name is usually given to species of *Libinia*, especially *Libinia canaliculata*, very common on muddy shores or flats. See Plate of CRABS.

**SPIDER MONKEY, or COAITA.** Any American monkey of the genus *Ateles* or *Ateles*, characterized by slenderness and agility. (See MONKEY.) They frequent in small bands the tallest forest trees, moving swiftly by astonishing leaps, sprawling out like spiders, and catching by their perfectly prehensile tails. Most are black or nearly so, with the face shaded by projecting hair, which is either light or dark in color. They are mild, intelligent, and make interesting pets. Ten species occur between southern Brazil and central Mexico, of which the Amazonian red-faced (see Plate of MONKEYS) and the Mexican one are best known. Their food is mainly fruits and insects, and their flesh is eaten.

**SPIEGEL, shp'gel, FRIEDRICH VON** (1820-1905). A German Orientalist. He was born in Kitzingen, studied at Erlangen, Leipzig, and Bonn, then (1842-47) in the libraries of Copenhagen, Paris, London, and Oxford, and from 1849 to 1890 was professor in the University of Erlangen. His early studies on Pali did much for the knowledge of southern Buddhism. The edition of the greater part of the extant Avesta, together with the Pahlavi translation (2 vols., 1851-58), was followed by a German version (3 vols., 1852-63), and supplemented by a commentary (2 vols., 1865-69). He published a number of Persian works, as well as a grammar of Old Bactrian (1867). Other of his important publications include: *Die altpersischen Keilschriften* (1862; 2d ed., 1881), *Erân* (1863), *Erânische Altertumskunde* (3 vols., 1871-78), *Vergleichende Grammatik der alterânischen Sprachen* (1882), and *Die arische Periode und ihre Zustände* (1887). Mention should also be made of the *Grammatik der Parsisprache* (1851) and of the *Einleitung in die traditionellen Schriften der Parsen* (2 vols., 1856-60). In 1908 a memorial volume, edited by J. J. Modi, was published in his honor at Bombay by his pupils and admirers. The work is prefaced by a sketch of his life by W. Eugen.

**SPIEGELEISEN.** See IRON AND STEEL, Blast Furnace.

**SPIELHAGEN, shpêl'hä-gen, FRIEDRICH** (1829-1911). A German novelist, born at Magdeburg and educated at Berlin, Bonn, and Greifswald. He taught for a while at Leipzig, and in 1859 became editor of the *Zeitung für Norddeutschland* in Hanover. Thence he moved in 1862 to Berlin, and edited (1878-84) Westermann's *Illustrierte Monatshefte*. Spielhagen's first successful work was *Problematische Naturen* (1860; 50th ed., 1907), championing extreme political liberalism, and then for a while he

dealt with social problems, arising from the irrepressible conflict between the stolid landed nobility and the intelligence of the nation. In several books (*Durch Nacht zum Licht*, 1861; *Die von Hohenstein*, 1863; *In Reih, und Glied*, 1866, schemes for the good of the laboring classes; *Hammer und Amboss*, 1869, dealing with the conflict between capital and labor) he treated the subject with an aggressive optimism that won him a popularity which he afterward maintained by sensational novels of a somewhat lower type. Of these *Sturmflut* (1877), *Ein neuer Pharao* (1889), and *Freigebohren* (1900) are sufficient exemplars. Excellent are his critical *Beiträge zur Theorie und Technik des Romans* (1883). His own ideal for the novel is to present an artistically composed picture of the times, and for this he makes constant hardly veiled allusions to persons of contemporary prominence, so that his novels lose with time something of their significance and actuality. Among his briefer works may be mentioned *Die Dorfkoette* (1868), *Ultimo* (1874), and *Quisisana* (1880). Spielhagen's popularity ran from 1860 to 1880; but his best works, *Problematische Naturen*, *In Reih, und Glied*, and *Hammer und Amboss*, though excellent in descriptions of nature and ingenious in their somewhat complex plots, still have too large an element of political or social purpose to be rated now as artistic productions of the first class. As a translator Spielhagen rendered into German Curtis's *Howadji*, Emerson's *English Traits*, a selection of American poems (1859; 2d ed., 1865), and Roscoe's *Lorenzo de' Medici*. He also translated from the French minor works of Michelet, *L'Amour*, *La femme*, *La mer*. His collected novels appeared in 22 volumes in 1895; new series, 7 vols. (Leipzig, 1902 et seq.). Consult his autobiographical *Finder und Erfinder* (Leipzig, 1890), Karples, *Friedrich Spielhagen* (ib., 1889), H. Henning, *F. Spielhagen* (ib., 1910); R. Gottschall, *Die deutsche National-litteratur des 19. Jahrhunderts*, vol. iv (Breslau, 1892).

**SPIELMANN**, spēl'man, MARION H. (1858- ). An English art critic and author. He was born in London and studied at University College, London, with a view to becoming an engineer. He wrote articles on art for the *Pall Mall Gazette* (1883-90), and was art critic of the *Daily Graphic*, art editor of *Black and White*, and from 1887 to 1904 editor of the *Magazine of Art*. Among his publications are the *History of Punch* (1895); *Millais and his Works* (1898); *The Unidentified Contributions of Thackeray to Punch* (1899); *John Ruskin* (1900); *Notes on the Wallace Collection in Hertford House* (1900); *British Sculpture and Sculptors of To-Day* (1901); *Kate Greenaway* (1905), with G. S. Layard; *British Portrait Painting* (1910); *Iconography of Andreas Vesalius* (1914).

**SPIERS**, spērz, R. PIENÉ (c.1841-1916). A British architect, educated at King's College, London, and at the Ecole des Beaux-Arts, Paris. He was architect of two board schools, London, of Lord Monkswell's house on Chelsea Embankment, of Locke Park, Barnsley, and of painters' studios in London. He was elected president of the British Architectural Association and member of various foreign architectural societies. Besides writing architectural essays and works on architectural drawing, he reedited Pugin's *Normandy* (1870), Fergusson's *History*

of *Architecture* (1893), and published: *The Orders of Architecture* (1902); *Architecture East and West* (1905); and in collaboration with W. J. Anderson, *The Architecture of Greece and Rome* (1907).

**SPIGELIA**, spi-jē'lī-ā (Neo-Lat., named in honor of Adrian van der Spiegel, a Belgian physician and professor of anatomy at Padua in the seventeenth century). A genus of plants of the family Loganiaceæ. *Spigelia marilandica*, often called worm grass and Carolina pinkroot, a native of the southern United States, occurring from New Jersey to Wisconsin, and west to Texas, is a perennial plant with a simple quadrangular stem. The root has been employed in the United States as a vermifuge, as has also *Spigelia anthelmia*, a tropical American annual with spikelike racemes of purplish flowers.

**SPIKE**. A kind of inflorescence (q.v.).

**SPIKEFISH**. See SPEARFISH.

**SPIKE/NARD** (from Lat. *spica nardi*, spike of nard), or **NARD**. A costly perfume of India highly prized by the ancients and used both in baths and at feasts. The ointment of spike-nard (John xii. 3) was probably an oil or fat impregnated with the perfume. The plant which produces it has been ascertained to be *Nardostachys jatamansi*, a native of the mountains of northern India. *Andropogon nardus* yields an oil sometimes called oil of spikenard; and in the United States *Aralia racemosa*, a tall herb with large perennial aromatic roots, is known as spikenard. False spikenard is *Smilacina racemosa*. See ARALIA.

**SPIKE RUSH**. See CYPERACEÆ.

**SPILLER VON HAUENSCHILD**, RICHARD GEORG. See HAUENSCHILD, R. G. S. VON.

**SPILLIKINS**. See JACKSTRAW.

**SPINA BIFIDA** (Lat., cleft spine). A congenital hernia of the membranes of the spinal cord through a fissure in the wall of the bony canal. A tumor is thus formed, which is nearly round, in size from that of an egg to that of an adult head, lying in the middle line of the back, fluctuating, and adhering to the adjacent vertebrae either directly or by a pedicle. The sac may contain only the spinal membranes (meningocele) or a part of the cord with the membranes (meningo-myelocele), or, lastly, the spinal cord so distended by the expansion of the central canal as to form a neural lining to the sac. The usual termination of the condition is death. As the size of the tumor increases, fatal convulsions ensue; or the skin investing the tumor may ulcerate, and infection of the cerebro-spinal fluid follow. Occasional cases are recorded in which patients have survived till middle life. Active surgical treatment usually hastens death and should be used only in urgent circumstances. Moderate support by means of a hollow truss, or a well-padded concave shield, may tend to keep the tumor from increasing; any interference beyond this is, in most cases, unadvisable.

**SPINACH**, spin'áj, -éch, or **SPIN'AGE** (from Lat. *spina*, thorn), *Spinacia*. A genus of herbs of the family Chenopodiaceæ; probably natives of Asia. Common spinach, or garden spinach (*Spinacia oleracea*), is an annual widely cultivated for its young leaves, which are used as greens. Two very distinct botanical varieties are cultivated: prickly spinach, with somewhat triangular and arrow-headed leaves and rough knobby fruit; smooth spinach, or round spinach (*Spinacia glabra* of some botanists), with

round and blunt leaves and smooth fruit. Upon poor soil and after the appearance of the stem, which reaches a height of two feet, the leaves become bitter, hence the more luxuriantly spinach grows, the better it is. It may be sown in spring in rows about one foot apart, but it is generally sown in autumn for early spring use. The smooth spinach is very generally preferred for the former purpose and the prickly kind for the latter. Several unrelated plants are also called spinach, of which the best known is New Zealand spinach (*Tetragonia expansa*), a plant of the family Aizoaceæ, a trailing, succulent annual that withstands the heat of summer and is a valuable successor to true spinach. See ANTHRACNOSE, Plate of YAM, SWEET POTATOES, ETC.

**SPINAL ANÆSTHESIA.** A method of inducing insensibility to pain first suggested by Dr. Leonard Corning, of New York, in 1885. Its earliest application in European surgical practice was by August Bier of Berlin. Corning subsequently dealt with the subject in his book on *Pain*, published in 1894. Matas employed the method in the United States in 1890; and Tuffier, of Paris, Severanu, and Racoviceanu-Príteeci, both of Bucharest, together reported 220 cases. At first cocaine was used, but later eucaïne and stovaine were substituted, being less toxic. Jonnesco, of Bucharest, advocated injections into the dorsal region of the spinal canal, using a solution of stovaine and strychnine and thus rendering possible operations upon the upper extremities, the trunk, and even the head. Up to 1910 Jonnesco had reported 1386 cases without a death, 195 of which were superior dorsal injections. Nevertheless this method is regarded as dangerous, particularly in the United States.

As generally practiced, the anæsthetic solution is injected through the fourth lumbar interspace, this being located by drawing an imaginary line across the back at a level with the superior iliac spines. The needle is introduced a little to one side of the median line until it penetrates the dura and lies free in the subarachnoid space. The patient should be in an upright sitting position. Such an injection anæsthetizes the parts below the point of penetration so that painless operations can be performed upon the lower extremities, the perineal and genital regions, and pelvis. The disadvantages of the method are that the patient is conscious during the operation; that it is apt to be followed by general weakness, lasting for a day or two, nausea, vomiting, severe headache, chills, elevation of temperature, and delirium. The procedure itself is not painless. A number of deaths have been reported, and disturbances of sensation, transient paralyses, and the like, are not uncommon, due, according to Spielmeyer, to toxic degeneration of the motor ganglion cells of the anterior horns of the spinal cord.

**SPINAL COLUMN** (Lat. *spina*, thorn, spine), or **SPINE**. The most important and characteristic part of the skeleton of the highest animal subkingdom, including mammals, birds, reptiles, amphibians, and fishes. In each of these classes it is composed of a series of bones placed one above or in front of another and called vertebrae; hence these animals having this characteristic in common are all included in the term "vertebrates." The vertebrae vary in number in different animals, and in shape they differ extremely, even in parts of the same spine,

in accordance with their special functions. In man the number of vertebrae which collectively form the spinal column is 7 in the neck (cervical vertebrae), 12 in the back (dorsal vertebrae), 5 in the loins (lumbar vertebrae), 5 ossified together, forming the sacrum, and 4 similarly united forming the termination of the column or coccyx. However long or short the neck may be, every mammal has 7 cervical vertebrae, excepting the three-toed sloth, which has 9, and the sea cow, which has 6. In other regions of the spine no such law exists. Each vertebra is attached to the two adjoining by numerous strong and somewhat elastic ligaments, and between each pair of vertebrae there is interposed a lenticular disk of fibrocartilage, which acts as a buffer. By these arrangements the spinal column is rendered highly elastic, communication of jars or shocks is prevented, and a considerable general range of movement permitted, although the motion between any two adjacent vertebrae is slight. The elasticity of the column is further increased by the component vertebrae being arranged in curves, instead of being placed perpendicularly. These curves enable the spine to bear a greater vertical weight than it could otherwise maintain; they facilitate movements of the body, especially in the act of running; and they are so disposed as to protect the cord in movements of the spine.

The vertebral canal formed by the apposition of the spinal foramina, or neural arches, and containing and protecting the spinal cord, varies in its size at different parts of the column. The intervertebral foramina through which the nerves emerge vary in shape and position in different parts, but are always of sufficient size to prevent injurious pressure on the nerves during movements of the spine; and in the dorsal region, which is the usual seat of angular curvature, the nerves are so protected by bony arches that they may escape injury, even when the bodies of several dorsal vertebrae have been destroyed by ulceration.

**SPINAL CORD.** See NERVOUS SYSTEM AND BRAIN.

**SPINAL MENINGITIS.** See MENINGITIS.

**SPINDLE.** See DRAGON FLY.

**SPINDLER**, shpind'ler, KARL (1796-1855). A German novelist, born at Breslau. He studied law at Strassburg, fled thence to escape being drafted into the military service of France, and became an actor. In 1825 he turned to literature, and became one of the group, including Hauff and Häring (Wilibald Alexis), which imitated in historical fiction the *Waverley* methods of Scott. Most of his work, which fills 101 volumes in the Stuttgart collective edition of 1854-56, while fascinating as to plot, is careless in execution. In a few cases, however, as *Der Jesuit* (1820); *Der Jude* (1827), his best work; *Der Invalide* (1831; new edition, 1913), and *Der Vogelhändler von Imst* (1842), he skillfully depicted the historical background, and merited, though he did not gain, a more than temporary success.

**SPINDLE SHELL.** A genus (*Fusus*) of gastropodous mollusks nearly allied to *Murex* (q.v.), having a spindle-shaped shell, with a very elevated spire, the first whorl often much dilated, and with a straight elongated canal. About 100 existing species have been described, and more than three times that number of fossil ones. See Illustration, page 398.

**SPINDLE TREE** (*Evonymus*, or *Buonymus*).

A genus of about 60 species of shrubs or small trees of the family Celastraceæ. The common spindle tree (*Evonymus europæus*), a European

SPINDLE SHELLS (Page 397).

a, a living species (*Fusus proboscidalis*); b, a fossil (Miocene) species (*Fusus longirostris*).

shrub with an orange-colored aril, is often planted for ornament. The hard, fine-grained wood is used for fine turnery and for skewers. It was formerly used for making musical instruments and for spindles, whence the name. Charcoal made of it is much valued for crayons. In the United States wahoo, or burning bush (*Evonymus atropurpureus*), is a small crimson-fruited tree or shrub, which occurs from New York to Nebraska and southward. Strawberry bush (*Evonymus americanus*) is a low shrub often found along wooded river banks from New York to Illinois and southward. The Japanese species, *Evonymus japonicus*, and especially its varie-

SPINDLE TREE (*Evonymus europæus*).

gated forms, are extensively planted as an ornamental shrub.

**SPINE.** See SPINAL COLUMN.

**SPINE, CURVATURE OF THE.** There are two distinct forms of curvature, lateral curvature, arising from weakness of the bones, ligaments, and muscles, and angular curvature, which results from carious disease of the vertebræ.

Lateral curvature of the spine, or scoliosis, is not simply a bending of the spine laterally. In addition there is also considerable rotation or twisting of the vertebral bodies which normally are held in their proper relation and position by

the ligaments and muscles. Muscular action is necessary for the maintenance of the erect pose; and if, through fatigue and exhaustion or through muscular weakness, from disease, such as rickets (q.v.), the muscles fail to act, a temporary deformity is brought about. If this is not remedied the ligaments become relaxed, the bones which are not yet fully developed adapt their growth to conform to the new relations, and the deformity persists. Postural habits, such as standing on one leg or sitting incorrectly at a desk, tend to distort the spine and to stretch certain ligaments, and often result in permanent deformity. Lateral curvature is more frequent among girls than among boys, for their muscles are less developed by physical exercise and their strength is often unequal to the strain put upon them in their school life. In lateral curvature the bodies of the vertebræ rotate towards the convexity and the spines towards the concavity of the curve. In the dorsal region the ribs are carried with the vertebræ in their rotation, and the chest becomes deformed and the functions of heart and lungs are seriously interfered with. In order to maintain the erect position a compensatory curve develops. In the dorsal region the tendency is to the right, while in the lumbar region it is to the left. The subjects of this affection do not usually complain of pain and often nothing wrong is noticed except awkwardness in gait or a tendency to carry one shoulder higher than the other. An examination will show the prominent spinal processes and the abnormal curve of the spine. Spinal supports and plaster jackets are not to be used. The treatment should be directed to strengthening the muscles by exercise and massage. Orthopedic appliances, braces, etc., and specially prescribed calisthenics are of the greatest value. Exercise must not be carried to excess, as this will only aggravate existing conditions.

Angular curvature of the spine, commonly known as Pott's disease, is the result of caries of the vertebræ. It occurs most frequently in children between the ages of three and twelve years, but is also met with in babes and in adults. The most common seat of disease is the dorsal vertebræ. The inflammation begins in the bodies of the vertebræ, and as they become softened or destroyed the spinal column above settles upon the healthy portion below and the spines of the diseased vertebræ are pushed backward. See ORTHOPEDICS; POTT'S DISEASE.

**SPIN'EL** (from Lat. *spina*, thorn, spine). A mineral magnesium aluminate crystallized in the isometric system. Spinel has a vitreous to dull lustre and is found in various shades of red, passing into blue, green, yellow, brown, black, and occasionally nearly white. It is prized as a gem, and the transparent red crystals are called spinel rubies; the violet and purple ones are known as almandine; the rose-red to pink, balas rubies; the black, pleonaste; the yellow or orange, rubicelle, and the pale to sapphire-blue, sapphirine. The gem varieties are found for the most part in Ceylon, Siam, and other Eastern countries, and crystals yielding small gems have occasionally been found near Franklin, N. J., and in Orange Co., N. Y.

**SPINELLO ARETINO**, spē-ně'lō ār-ă-tě'nō, properly LUCA SPINELLO (c.1333-1410). A Florentine painter of an Aretine family, a prominent representative of the late school of Giotto. His

birthplace is uncertain, but he was probably a pupil of Jacopo di Casentino and was employed in decorating numerous churches of Florence, notably the sacristy of San Miniato, in the Campo Santo of Pisa, where he painted scenes from the lives of Saints Ephesus and Potitus, and in the Palazzo Pubblico of Siena. He also executed extensive frescoes at Casentino and Arezzo. A large panel of "The Magdalen" by him is in the Metropolitan Museum, New York. Spinello's work is facile in composition and vivacious in presentation, but superficial in form and execution and often gaudy in color.

**SPIN'ET** (from Lat. *spina*, thorn, spine). A stringed musical instrument with a keyboard, smaller and weaker than the harpsichord, and,

SPINET.

like it, one of the precursors of the pianoforte. The general outline of the instrument nearly resembled that of a harp laid in a horizontal position, with the keys occupying the position of the sounding board. The oldest extant specimen is dated 1490.

**SPIN'GARN**, JOEL ELIAS (1875- ). An American literary scholar, born in New York City and educated at Columbia (A.B., 1895; Ph.D., 1899) and Harvard universities. At Columbia he rose through various positions, being professor of comparative literature in 1909-11. From his pen came: *A History of Literary Criticism in the Renaissance* (1899; It. trans., 1905); *The New Criticism* (1911); *The New Hesperides and Other Poems* (1911); *A Note on Dramatic Criticism* (1913); and a contribution to the *Cambridge History of English Literature*. He edited *Critical Essays of the Seventeenth Century* (3 vols., 1908-09), and *Temple's Essays* (1909).

**SPIN'NAKER**. A triangular racing sail carried by yachts. It hoists to the foremast or foretopmast head and is spread by a boom which is, at other times, carried up and down the foremast. The spinnaker is set only when the wind is free. See **YACHT**.

**SPIN'NER**, FRANCIS ELIAS (1802-90). An American political leader, born at German Flats, now Mohawk, N. Y. From 1845 to 1849 he was auditor of the naval office in New York City. In 1854 he was elected to Congress as a Free-Soil Democrat, but soon identified himself with the newly organized Republican party, and was twice reelected to Congress (1857-61), and was then appointed Treasurer of the United States. In 1875 he resigned on account of failing health and afterward lived in Florida. Dur-

ing his administration women were first employed as clerks in the Treasury.

**SPIN'NING** (from AS. *spinnan*, to spin). The art of drawing, twisting, and combining either animal or vegetable fibres so that they are formed into continuous threads for the further operations of weaving, knitting, or sewing. The principal textile fibres are silk, wool, flax, jute, and cotton (q.v.), and the method of spinning each of these differs slightly from the rest.

The most ancient instruments for spinning were the spindle and distaff, pictured on the earliest Egyptian monuments. The distaff was a staff upon which a bundle of the prepared material was loosely bound, and which was held in the left hand or stuck in the belt; the spindle was a smaller tapering piece to which the thread was attached. By a twirl of the hand the spindle was made to spin round and at the same time recede from the spinster, who drew out between the forefinger and thumb of the right hand a regular stream of fibres so long as the twisting of the spindle lasted. It was then drawn in, the new length of thread wound upon it, and the operation renewed. An improvement in this device was to set the spindle in a frame and make it revolve by a band passing over a wheel, driven by occasional impetus from the hand.

The Saxony wheel is said to have been invented in Nuremberg in 1530. This wheel, used only for flax spinning, contained the germ of Arkwright's invention, described later. A bobbin or pirn with a separate motion was placed on the spindle, which had a bent arm—a flyer or flight—for winding the yarn on the bobbin. The spindle and bobbin revolved at different speeds, revolutions of the spindle giving the twist, and the difference of the speed causing the winding on. The two-handed wheel had two spindles and pirns a little apart, with the distaff stuck into the frame between them, and the spinster produced a thread with each hand.

During the last half of the eighteenth century three inventions were made which completely revolutionized the art of spinning. These inventions were Hargreaves's spinning jenny, Arkwright's throstle machine or roll-drawing spinning machine, and Crompton's mule spinner. In the spinning jenny a number of large reels of fibre, formed into a thickish coil, called a roving, were set on upright fixed spindles, and the ends of the rovings were passed between two small movable bars of wood placed horizontally and under the control of the spinner, who could thus make them press more or less on the roving, and consequently increase or decrease the draw upon it from the spinning spindles, set in a row at the other end of the frame, and all capable of being set in motion simultaneously by the wheel. The spinner drew out the rovings by moving the bars back and forth and at the same time turned the crank with his right hand to rotate the spindles. The throstle machine, patented by Arkwright (q.v.) in 1769, had for its object the drawing of the rovings through a succession of pairs of rollers, each pair in advance of the others, and moving at different rates of speed. The first pair receive the sliver, compress it, and pass it on to the second pair, which revolve at a greater speed, and thus pull it out to exactly the number of times greater length that their revolutions exceed those of the other pair, and as the first roving is passed through a second, third, and sometimes fourth

machine, the finished roving is 32 times longer than the sliver. As the roving issues through the last rollers of each machine it is received on spools or reels, calculated to hold a given quantity; and these are transferred to the spinning frames, which resemble the roving frames. Here the roving takes the place of the sliver, and, as it unwinds from the spool, is drawn through successive pairs of rollers, moving as before at different rates, each succeeding pair faster than the backward ones, so that the roving gets thinner and thinner, until tenuity is carried as far as desirable. It is then carried on to a rapidly revolving spindle, which, by means of a simple arrangement, is made both to twist the thread and wind it on the spindle ready for the weaver. Arkwright's machine was too heavy to be driven by hand, hence horse power was used at first, and later water power, which gave it the name of the "water frame." Steam power was applied to it in 1790.

It was found that the process of spinning by rollers produced too great a strain upon the thread in its progress to admit of its being

kind of automatic feed and delivered in laps which are then placed on the intermediate lapper, either 3 or 4 laps being doubled on the same and the cotton after being loosened and further cleaned is delivered in laps to be placed on the finisher lapper, 3 or 4 laps from the intermediate being again doubled and delivered in a single lap ready for the card. The function of the lappers is thoroughly to loosen the lumps of cotton as taken from the bale, to remove dirt and dust and as much leaf, trash, and motes as possible. There are usually three of these—the breaker, intermediate, and finisher lapper. Fig. 1 is a section of an intermediate or finisher lapper. The cotton enters these machines in a sheet made up from the laps, *A*, delivered onto the slowly moving apron, from which it is taken by the feed rolls and delivered to the rapidly revolving beater, which forces it against the grid bars, loosening the dirt and motes which fall through the grids into the mote box. The cotton is left in a light and feathery mass, drawn in between the squeeze rolls by suction of the fan, which also draws dust and fine dirt

FIG. 1. SECTION OF INTERMEDIATE OR FINISHER LAPPER.

drawn as fine as is wanted for many purposes; this led to the invention of the mule jenny by Crompton in 1779, with its traveling frame upon which the spindles are set, which in its modern form is described below.

During the nineteenth century many important improvements were made in the details of the construction of spinning machinery, but the general principles are those worked out a hundred years ago. The greatest improvements have been changes in the construction of spindles, allowing more rapid and free revolution. In the modern factory spinning is the final process in a series of operations necessary to convert the raw fibre into thread. Each of these processes has for its object the removal of smaller and smaller impurities and the production of a finer and stronger thread. These are: (1) opening and picking; (2) carding and combing; (3) drawing; (4) roving; (5) spinning. Other intermediate operations may be introduced.

The opener or breaker, picker or lapper is a similar machine to the intermediate or finisher lappers, as shown in Fig. 1 and described below. In the breaker lapper the cotton as taken from the bale is fed to it in a hopper or by some

from the beaten mass, discharging them by the dust flue. The sheet of cotton from the squeeze rolls is taken by the calender rolls, and compressed and finally rolled into the lap *B*. The lap is about 1 inch in thickness, 40 inches to 48 inches wide, and usually from 48 to 52 yards long.

After the cotton has passed through the series of lappers the laps from the finisher lapper go to the card (Fig. 2). (See CARDING.) The cotton in the lap *A* is delivered to the feed roll of the card and is grasped by the teeth of the licker-in, or taker-in, from which it is taken in a thin sheet by the fine wire teeth of the card clothing on the cylinder *B*, and carried upward to come in contact with the teeth on the clothing of the top flats, and the fibres are combed into a degree of parallelism—the cylinder revolving rapidly, while the flats, which are in a chain, move slowly forward so that new flats are continually coming in contact with the cylinder—and much of the short and broken fibre is removed; the comb, *C*, removes the short fibres from the flats and they are rolled upon the rod, and the flats are further cleaned by the brush. The carded cotton is taken from the cylinder by the doffer

cylinder, the latter having a surface velocity somewhat less than that of the main cylinder, and is removed from the doffer by the comb, *D*, in a thin evenly carded film; this film is drawn

can by the coiler the same as from the card. This drawing process is repeated two or three times as the work may demand, always doubling and drawing, but without putting in any twist.

FIG. 2. SECTION OF REVOLVING TOP-FLAT CARD.

through the trumpet by the calender rolls, in a round strand about 1 inch thick called a sliver, which is automatically coiled in the sliver-can by the coiler.

As all the processes are arranged to double the mass of cotton and then reduce the mass in size by drawing it out to several times its

FIG. 3. DETAIL OF DRAWING PRINCIPLE.

original length until the yarn is finally produced, an examination of Fig. 3 will help the reader to understand how the drawing acts on the fibres. On the left is shown the sliver from the card, the cotton being in a more or less tangled condition, but after passing between the successive pairs of drawing rolls, 4.4', the last or right-hand pair, revolving faster than the

FIG. 4. SECTION OF DRAWING FRAME.

others, draws the fibres past each other and straightens them, bringing them into a nearly parallel position.

The card sliver goes first to the drawing frame, Fig. 4, and four to eight slivers, *A*, are combined by passing them through the drawing rolls as above described. The drawing sliver is carried through the trumpet and deposited in the

After the drawing frames the drawn sliver is placed in cans, behind the first of the roving frames, which have rolls similar to the drawing frames, but have spindles by which the stock, then called roving, is twisted and wound on bobbins. The first of the roving frames is called the slubber, and is heavier than the intermediates and fine frames, as the other roving frames are designated. The full bobbins, *A*, from the slubber are placed in the creel of the intermediate frame, as shown in Fig. 5, and two strands

FIG. 5. SECTION OF ROVING FRAME.

combined are delivered to the rolls and drawn, the new strand of roving is carried to the top of the flyer, on the spindle *B*, is passed through one arm of the flyer, which is hollow, and delivered to the bobbin, *C*, by the presser foot. The

revolving of the flyer puts the twist into the strand of roving, while the difference in speed between the flyer and the surface of the bobbin winds the roving on the latter.

The fine frame is a similar frame to the above and delivers the roving finer and more even than

FIG. 6. SECTION OF SPINNING FRAME.

any of the preceding machines and ready for the spinning frame (Fig. 6). The roving may be doubled or run singly on the spinning frame, the rolls produce the drawing effect as on the preceding machines, and the revolution of bobbin and spindle puts in the twist. The bobbin, A, is fast on the spindle, B, and draws the yarn through the traveler, a small wire loop attached to and movable on the spinning ring, which surrounds each spindle. The spindles are made to revolve by an endless cotton band, which passes around the whorl of the spindle and is driven by

from the fine frames as for frame-spun yarns, but the drawing and twisting being accomplished in a different manner. On the spinning frame the roving is drawn, twisted, and wound continuously, while on the mule it is drawn out intermittently, and then wound on bobbins or cops intermittently. The roving is placed in a creel and passed through the drawing rolls, as on the spinning frame, and carried to the spindles, which, instead of being in a stationary rail, are mounted in a carriage, which runs away from and back to the rolls alternately, traveling about 5 feet each way. As fast as the rolls deliver the roving, the carriage and spindles recede from the roll stand and the spindles revolving twist the yarn over the top of the spindles, where it is held by the fallers. In some cases the carriage travels several inches more than the delivery of the front roll and causes additional drawing. The movement out of the carriage is called stretch, and at the end of each stretch the rolls are stopped automatically, the required twist being completed, the spindles are stopped and reversed in motion, while the fallers guide the spun yarn away from the top of the spindle and wind it on the cop or bobbin, the carriage approaching the rolls again, after which the same movements are repeated continuously. The spinning frames are arranged with an average of 104 spindles to a side of about 27 feet in length, but this number varies according to the gauge, or distance between centres of spindles. The mules, not having spinning rings, admit of the spindles being nearly twice as near together, the average number per mule being 480, though some are built much larger.

In a general way the spinning of other textile fibres is the same as for cotton, the desire being to reduce the strands and to make them of uniform diameter throughout their entire length and to give them the requisite amount of twist. Woolen yarn is spun on a mule as described for spinning cotton, except that the carded roving comes to the mule in a different shape, being carded differently and without twist until spun on the mule. Worsted and some cotton yarns are produced by a combing operation which is a special drawing process to increase the parallelism of the fibres, the cotton being afterward worked on the roving frames, while worsted is spun on a frame not unlike the roving frame, the twist being put in by flyers, as the twist in the cotton roving. For the spinning of silk and other fibres, see special articles on those fibres.

the cylinder, D. The production of the spinning frame is technically frame-spun yarn, either warp or filling. This is wound on the bobbins by the moving up and down of the ring rail, which holds the spinning rings with the travelers, the pull or drag of the travelers winding the yarn on the bobbin.

Mule-spun yarn is produced by spinning the roving on a mule (Fig. 7), the roving coming

**SPINNING MITE.** See HOP INSECTS.

**SPÍNOLA**, spé'nô-lâ, AMBROSIO, MARQUÊS DE LOS BALBASES (1569-1630). A Spanish general, born in Genoa, Italy. In 1602 he led a force of 9000 veterans to the Netherlands against Maurice of Nassau. Made chief commander of the Spanish army there, he forced Ostend to surrender in 1604. He continued his operations against Maurice till the 12 years' truce of 1609, when he took command of the Spanish troops in Germany. He took the field against the Elector Palatine Frederick V and the Protestant Union in 1620, and forced the Union to disband in 1621. He captured Jülich in 1622, and Breda in 1625. Disease forced him to give up his command, but he afterward commanded the Spanish army in Italy. Consult Antonio Rodríguez Villa, *Ambrosio Spínola, primer marqués de los Balbases* (Madrid, 1905).

**SPINOZA**, spé-nô'zâ, BARUCH, or BENEDICT (1632-77). A famous Dutch-Jewish philosopher, born in Amsterdam, Nov. 24, 1632. His father, a Portuguese merchant, had fled from Catholic persecution to the Netherlands. Spinoza was carefully educated in Jewish theology and speculation. He was, however, alienated from the orthodox belief by studies of physical science and of the writings of Descartes and probably those of Giordano Bruno. His heresies resulted in threats of severe punishment from his instructors in the Talmud and the Cabala, and the relation soon became so unpleasant that Spinoza withdrew from the synagogue. The rabbis, in 1656, excommunicated him and secured his banishment from Amsterdam. However, he remained in the neighborhood of the city for five years, supporting himself, as in later years, as a lens maker. His first work, *Tractatus de Deo et Homine ejusque Felicitate*, was discovered in a Dutch translation in 1852 (the Latin original not being extant), in which the form of his developed system is foreshadowed. And the *De Intellectus Emendatione* and *Tractatus Theologico-politicus* are also probably referable to the period of his Amsterdam residence, although the latter was not published until 1670 and the former until 1677.

In 1661 Spinoza went to Rhynsburg, near Leyden, and two or three years later to Voorburg, near The Hague. Shortly after, yielding to the solicitations of friends, he removed to The Hague itself. The Elector Palatine, Charles Louis, offered him a chair at the University of Heidelberg, but Spinoza declined the position in order to be free from any restrictions upon his thinking. An offer of a pension, on the condition of his dedicating a work to Louis XIV, he rejected with scorn. His domestic accounts after his death show that he preferred to live on a few pence a day rather than be indebted to another's bounty. He died Feb. 21, 1677. His constitution was no less undermined by consumption and overwork than his sensitive mind was wrought upon by persecution and the violent severance of natural ties. But no word of complaint ever passed his lips; simplicity and heroic forbearance, with a warm, sympathizing heart, were the salient features of his character. His life, in its nobility and suffering, is perhaps the most convincing plea for the vitality of the philosophy for which it served as the human context.

Spinoza's philosophy finds its most adequate expression in his great work, *Ethica Ordine Geometrico Demonstrata* (posthumously published in 1677). The basis from which it was developed was mainly Cartesian. This treatise, on the analogy of geometrical demonstrations, consisted of a series of axioms with corollaries, propositions, and elucidations, designed to render bias or extraneous inference impossible, and there can be no doubt that Spinoza was one of the most conscientious of thinkers in his effort to eliminate the personal equation. Nevertheless, there are few philosophers in whom the personal element is more distinctive. The very fact of Spinoza's severance from his own race and religion, together with his failure to adopt Christian thought, made the individuality of his system the more inevitable; he was bound by no tradition and so followed to the fullest the instincts of his reason. He was influenced by Descartes in method and probably by Bruno in his pantheism, but his system is still his own to a degree seldom true in the history of philosophy.

This system is a thoroughgoing and complicated pantheism. The universe is identical with God, who is the substance of all things. The conception of substance (which Spinoza inherited from the Scholastics) is not that of a material reality, but of a logical subject—the self-sufficient and comprehensive basis for all reality, capable of sustaining as modes of its attributes all temporal existences. Spinoza recognized the possible existence of an infinite number of such attributes, but held that only two kinds are known to us—extension, or the world of material things, and thought. These two comprehended humanly knowable existence.

The idea of extension as the gist of physical reality, and of thought as a nonextended reality, Spinoza derived from Descartes. But Descartes had made each of these into independent substances and conceded to them the power of causal interaction in the privileged case of human mind and body—mind acting upon body and vice versa. Spinoza, as we have seen, makes both forms of reality dependent upon an ultimate substance—God—in which is their existence. Furthermore, he denies their power of causal interaction. Cause and effect in his conception are always similar; extension and thought are wholly dissimilar; therefore their causal interrelation is impossible. Causation may subsist between individual objects in the attribute extension, i.e., between physical bodies, or between individual ideas in the attribute thought, but not between ideas and things. To explain the apparent causal interactions of the latter Spinoza resorted to an elaborate theory of parallelism (q.v.). Every idea has a physical counterpart in the attribute extension; every physical object has its corresponding idea. This is not only true for the individuals in each attribute, but necessarily for their relations also. Hence parallel with every physical causal series there is an ideational causal series re-duplicating it; neither is dependent upon the other, but both depend upon the divine substance made manifest through them.

The individuality of things, whether ideas or physical objects, Spinoza explained as particular modes or affections of substance. All particular things in space are the modes of God in the attribute extension; all particular thoughts and feelings are modes of God in the

attribute thought. The modes are *natura naturata*; substance or God is *natura naturans*. The modes are ephemeral and their existence assumes temporal form; God is eternal, transcending all modal changes. Particular things, accordingly, whether of body or mind, are evanescent and finite. All existence is mortal.

Nevertheless there is an indestructible world. It is not to be found in the realm of existences, but in a realm of essences—something wholly different. The Spinozistic conception of essence is most nearly related to the Scholastic conception of realism and to Plato's conception of a world of ideas. It is an hypostatization of the universal aspect of things, i.e., of their essential nature in a logical or definitive sense, and in many respects is a striking forecast of Hegel's logic of the absolute. The most distinctive difference between Spinoza's world of existences and his world of essences or attributes is that the former exists in time, while the latter has no temporal being. But mortality can pertain only to temporal being; therefore the world of essences, being timeless, must be immortal. Furthermore, the world of essences is a world of immanent being. Every existence has a universal or essential character, though to realize this character it must transcend its own intrinsic form, i.e., free itself from whatever gives it particularity. The world of essences thus has a kind of being within the world of existences—as the immanent cause of the latter—though it does not share its temporal limitation. Now this is precisely true of the divine substance; and so it is that the world of essences represents the essential nature of God.

Immanent causation means self-causation, and that which is self-determined is free. From this reasoning Spinoza derived his doctrine of freedom to be won in the world of essences. Existence in the attribute is bondage, for each existent thing is determined by its own causal series; every particular object or idea is subject to other objects or ideas, and the form of its being is determined by them. Only in non-temporal, self-caused being, i.e., in the universal and immanent, is freedom possible; only by identification with the eternal verities, with substance or God, is immortality—and with it peace—to be obtained.

From this conception springs Spinoza's ethical doctrine, developed in the third, fourth, and fifth parts of the *Ethica*. In its practical form his teaching assumes that everything, so far as in it lies, strives to remain in its own being. The effort by which this striving is manifest is nothing but the actual essence of the thing. This effort, when it is in the mind alone, is will; when in mind and body, it is appetite. If desire is satisfied, we have pleasure; if not, we have sorrow. All affections and emotions resolve themselves into desire, joy, and sorrow, accompanied by ideas. A thing is not desired because it is good; it is good because it is desired. Knowledge of good and bad can be a cause in the moral world, counteracting passion and raising us from the world of appetite and mortality to the world of eternal truths.

Spinoza's position in the development of philosophical thought is in many respects unique. He belonged to no school and he founded none. While in a measure his work was based upon that of his predecessors, it is too strikingly individual to be conceived a mere continuation,

even of Cartesian thought. In the vigor and comprehensiveness of his conception, in synthetic daring, he must be ranked with the greatest philosophical thinkers; and though his system gave rise to no sequential development, he has had perhaps the most pervasive influence of all modern philosophers except Kant. Not only metaphysicians, but poets such as Goethe, Wordsworth, and Shelley, have gone to him for inspiration, and the essence of his thought has been in large part appropriated in the poetic pantheism of modern interpretations of nature.

**Bibliography.** Complete editions of Spinoza's works have been published by Paulus (1802-03), by Bonden (1843-46), and by Van Volten and Land (1882; new ed., 1895). English translations have been made by White of the *Ethics* and the *De intellectus Emendatione* (London, 1883); by Fullerton of selections with introduction under the title *The Philosophy of Spinoza* (2d ed., 1894); by Elwes of *The Chief Works of Spinoza* (1883), and by Wolf of *The Short Treatise* (1910). Freudenthal, *Die Lebensgeschichte Spinozas* (Leipzig, 1899); Frederick Pollock, *Spinoza: His Life and Philosophy* (New York, 1899); James Caird, *Spinoza* (new ed., London, 1901); H. H. Joachim, *A Study of the Ethics of Spinoza* (Oxford, 1901); R. A. Duff, *Spinoza's Political and Ethical Philosophy* (New York, 1903); J. Freudenthal, *Spinoza, sein Leben und seine Lehre* (Stuttgart, 1904); E. E. Powell, *Spinoza and Religion* (Chicago, 1906).

**SPINTHARISCOPE.** See RADIOACTIVITY.

**SPIRÆA** (Lat., from Gk. *σπειρα*, *speiraia*, meadowsweet). A large genus of herbs and low deciduous shrubs of the family Rosaceæ, natives of the Northern Hemisphere. Dropwort (*Spiræa filipendula*) and meadowsweet or queen of the meadow (*Spiræa ulmaria*, now called *Filipendula ulmaria*) are European species. Two other species are shown on the accompanying plate. Many species are cultivated in shrubberies for their flowers. *Spiræa tomentosa* is sometimes called hardhack. The name "goatsbeard" is applied to *Spiræa aruncus*, or *Aruncus sylvestris*, on account of its long panicles of white flowers.

**SPIRAL** (ML. *spiralis*, from Lat. *spira*, coil). A curve which during its gradual regression from a point winds repeatedly around it. A

SPIRAL OF ARCHIMEDES.

plane spiral is generated by a point moving along a line according to a fixed law, while the line revolves uniformly about a fixed point in the

SPIRÆA, ETC.

1. HARDHACK (*Spiraea tomentosa*).  
2. WILLOW-LEAVED SPIRÆA (*Spiraea salicifolia*).

3. SHADBUSH (*Amelanchier Canadensis*).  
4. SAXIFRAGE (*Saxifraga Virginensis*).

plane. A spiral which is not plane is generated by a point moving on a given surface other than a plane, about a fixed point according to a given law, e.g., the loxodrome (q.v.). A great many spirals have been studied. Of these the most common are the spiral of Archimedes, the hyperbolic, parabolic, Cotes's, logarithmic or equiangular spirals, and the lituus.

The spiral of Archimedes, probably discovered by Conon, has the equation  $r = a\theta$ . In this curve the point moves with a constant velocity

SPIRAL HYPERBOLIC.

along the radius vector, and the length of the radius is proportional to the angle described. The curve may be constructed by points as follows: Draw a circle of radius  $a$  about  $O$  as a centre; draw radii dividing the circumference into  $n$  equal parts, and lay off from  $O$  on these radii the distances  $\frac{a}{n}, \frac{2a}{n}, \frac{3a}{n}, \frac{4a}{n}$ , etc. The circle used in this construction is called the measuring circle of the spiral. If the point so moves that the radius vector varies inversely as the angle described, the curve is called a hyperbolic or reciprocal spiral. Its equation is  $r = \frac{k}{\theta}$ ,

$k$  being the circumference of the measuring circle. It follows from the equation that an infinite number of spires are necessary for the curve to reach the origin. The curve received its name from the fact that it can also be con-

PARABOLIC SPIRAL.

structed by means of an auxiliary equilateral hyperbola. If  $r$  varies directly as the square root of  $\theta$  the equation becomes  $r^2 = a\theta$ , and we have the parabolic spiral. The figure represents the curve for both positive and negative values of  $r$ .

If  $p$  denotes the perpendicular distance from

the pole to the tangent at any point  $P$  of the curve, and if  $p = \frac{br}{\sqrt{a^2 + r^2}}$ , various spirals may

be formed representing this equation. These are known as Cotes's spirals, and are of scientific interest, especially in their relation to trajectories (q.v.). If  $b = a$  the equation is that of the logarithmic or equiangular spiral. The characteristic property of this spiral is that the angle between any radius vector and the corresponding

LOGARITHMIC SPIRAL.

tangent is constant. The equation of the logarithmic spiral is  $\log r = a\theta$ . It is evident from the equation that the curve has an infinite number of spires. The evolute (see EVOLUTE AND INVOLUTE) of the logarithmic spiral is a similar logarithmic spiral.

LITUUS.

A spiral in which the square of the radius vector varies inversely as the angle described is called the lituus or trumpet, a curve described by

Cotes (1682-1716). Its equation is  $r^2 = \frac{a}{\theta}$ . The curve begins at infinity and winds round the origin, but cannot reach it by a finite number of spires. Consult: Pfaff, *Betrachtungen über die Spirale* (Munich, 1830); Brocard, *Notes de bibliographie des courbes géométriques* (Bar-le-Duc, 1897-99); also *Nouvelles Annales de Mathématiques* (Paris, 1846, 1860, 1869, 1880).

**SPIRAL PUMP.** See ARCHIMEDES' SCREW.

**SPIRE** (AS. *spir*, stalk, Ger. *Spier*, needle, pointer). A high pyramidal roof surmounting a tower. The earliest examples of the spire are the pyramidal roofs of towers in the Romanesque buildings of the eleventh century in France and in the Rhine valley. In the twelfth century, especially in France, these stone roofs were often made octagonal and began to assume the slender proportions later characterizing the Gothic spires. In England such spires became common in the thirteenth century; in Italy the square campanile (q.v.) was generally preferred to the spire. The earlier German spires were commonly of wood, covered with slate or lead. In France the point where the square tower merged into the octagonal base of the spire was marked by angle turrets and pinnacles, to which tabernacles and windows often corresponded in the alternate faces of the spire. This masking afterward was carried still farther up by galleries, flying buttresses, and pinnacles, and the outlines of the

spire were serrated at the angles with crockets. Before the close of the thirteenth century the masonry was often more or less pierced with ornamental openings, which the Germans in the fourteenth and fifteenth centuries developed into the type of openwork or traceried spires seen in the examples at Freiburg, Strassburg, Ulm, Cologne, Vienna, etc. Two of the finest French examples are those at the west front of Chartres Cathedral; the finest English spire is that of Salisbury, 406 feet high; those of Cologne are 512 feet high, while those of Vienna and Strassburg are of nearly the same height as Salisbury's.

**SPIRES.** A town of Germany. See SPEYER.

**SPIRIFER** (Neo-Lat., from Lat. *spira*, coil, spire + *ferre*, to bear). A genus of long hinged fossil brachiopods of Paleozoic age. The shells are biconvex with the greatest width on the hinge line, the hinge areas are well marked and usually large, the ventral beak prominent and overreaching that of the dorsal valve, the surface marked by strong radial folds or striations, and with a pair of calcified spirally coiled brachidia within the interior of the shell. These brachidia served as supports for the breathing organs, and are coiled in the form of cones with the apices of the cones directed towards the outer angles of the shell. The genus has many species, ranging from the Silurian system upward into the Carboniferous and distributed all over the world. Consult Schuchert, "Synopsis of American Fossil Brachiopoda, etc.," in United States Geological Survey, *Bulletin* No. 87 (Washington, 1897). See Plate of BRACHIOPODA.

**SPIRILUM.** See BACTERIA.

**SPIRIT** (Fr. *esprit*, from Lat. *spiritus*, spirit, breath, air, from *spirare*, to breathe). A term used in connection with a variety of volatile substances, and more especially with solutions of volatile substances in alcohol. Spirits of wine is ordinary (ethyl) alcohol; spirits of wood, or pyroxylic spirit, is wood alcohol, or methyl alcohol; spirit of hartshorn is aqueous ammonia. Among the spirits, i.e., alcoholic solutions, used in medicine may be mentioned aromatic spirits of ammonia, composed of ammonium carbonate, ammonia water, aromatics, and alcohol.

**SPIRIT.** See PSYCHOLOGY; SOUL.

**SPIRITS, ARDENT.** See DISTILLED LIQUORS.

**SPIRITUALISM** (from *spiritual*, Lat. *spiritalis*, relating to spirit or breath, from *spiritus*, spirit, breath, air, from *spirare*, to breathe). A term which, as most commonly used, describes the belief of those who think that communications are occasionally established between the living and the dead who survive in some other mode of existence. This conception, in so far as any general acceptance of the doctrine is concerned, is probably not more than half a century old, although sporadic instances of the belief are possibly as old as human nature.

In modern times the first definite movement in the direction of a general interest in spiritualism took place in 1848 in America, and was associated with the Fox sisters, at Hydesville, New York. The phenomena associated with these sisters were the traditional raps and knockings, the meaning of which required that the experimenter agree upon some certain number of raps as an indication of an affirmative or negative answer to questions. In more complicated matters the answers were spelled out by pointing to letters, etc. The *modus operandi* of the communications is not important, as it was only the familiar production of physical phe-

nomena supposed to be evidence of some transcendental origin. The Fox sisters (who moved to Rochester) performed their wonders for all classes of men and women and numbered among their followers many intelligent people. But opinion was divided as to the value and significance of their phenomena. The more intelligent investigators discovered fraud in them, and finally the sisters confessed to the manner in which they had consciously produced the raps and knockings. Meantime the excitement and interest in spiritualism had spread to England and the Continent. It was probably much less the actual facts in the alleged phenomena that created the widespread interest in the subject than it was two facts in the mental condition of the age wholly independent of the inciting cause. The first was the immense strides which skepticism and criticism had made in discrediting the older theology; the second was the growing faith in scientific experiment and methods.

It was about the same time that hypnotism (q.v.) began to arouse a scientific interest and to contribute to the spiritualist's cause. It had arisen about 1770 or 1780 under Mesmer and was called mesmerism (q.v.) after him. But the quackery and incautiousness associated with it, encouraged by the inertia of scientific academies, brought it into neglect, and it was not heard of more until Dr. Braid, of Manchester, England, reopened the question by showing that there were genuine phenomena in it worthy of scientific attention. This was about 1840. He changed the name of mesmerism to hypnotism and employed suggestion as the explanatory principle as against magnetic fluids of Mesmer. But the peculiar methods of producing hypnosis and the strange psychological susceptibilities exhibited by hypnotic patients were well calculated to impress the popular mind with the belief in occult forces, and in spite of the scientific treatment to which it has been exposed, it still suggests to the public the possibility of supernormal phenomena. Its facts were more easily demonstrable, and could be put to more dignified uses, than the ordinary absurdities of the séance room.

Another type of phenomena occurred about the same time to encourage the spiritualist in his general theory. It was the production of Andrew Jackson Davis, who discovered in 1844 that he could go into a trance, and that he had a strange power of performing intellectual feats in this condition, which were not natural to him in his normal state. He made a bargain with two friends to mesmerize him and to take down in notes what he said during the trance. A volume was published as a result representing the work of fifteen months. His utterances, which were very slow and deliberate, were taken down verbatim, and the volume was called *The Principles of Nature, Her Divine Revelations, and a Voice to Mankind*. The work dealt with the physical, chemical, and vital phenomena of the cosmos, on a large scale, and treated of astronomical matters in a manner to excite curiosity, especially when the prediction of a new planet was verified soon afterward by the discovery of Neptune by Leverrier and Adams. At the same time the man was practicing clairvoyance, and the book asserted the existence of spirit communication. But it was not the philosophic nature of the work that gave it its influence. It was the apparent illiteracy of the man who produced it, and its association with clairvoyance and alleged spirit communications.

Davis himself said that, up to the time of his work, he had read but one book in his life, and this was a romance called *Three Spaniards*. This claim, however, seems to be fairly well controverted, and it is probable that the man had read scientific matter in a casual way. But no amount of casual reading will easily explain in a normal way the systematic character of this work. There are indications in the man's history, and the fact that he was clairvoyant or subject to the trance state is evidence, that his was a remarkable case of secondary personality. See DOUBLE CONSCIOUSNESS.

In 1853 a work was published by Judge Edmonds and Dr. George Dexter that was second in interest only to that of Davis. Mr. Edmonds was a judge of the Supreme Court of New York State and Dr. Dexter was an eminently respectable citizen of New York City. Their attention had been called to the subject of spiritualism by the excitement about the Fox sisters, and they set about investigation for themselves, and soon developed personal phenomena of a peculiar interest. They entered upon a system of experiments in coöperation upon themselves and various mediums, with the result that they published a work which soon became classic, owing to the reputation of the authors. The phenomena recorded and described purported to represent more or less direct communications with discarnate spirits. At first they investigated with a view to ascertain whether the phenomena were genuine, in any sense of the term, and having convinced themselves that they were dealing with spiritistic influences, they published, as the bulk of their work, the alleged messages from Swedenborg and Bacon, and the respectability of the men availed to carry their work through many editions. But the subject of secondary personality was not understood in their time, and was not worked out until a generation later, when the result was to discredit the spiritistic claims of Edmonds's and Dexter's work.

The most remarkable personality, however, in this movement was William Stainton Moses. He was born in 1839 and was educated at Oxford, in England, becoming a clergyman in the Established church. In 1872 he became interested in spiritualism through his friend, Mrs. Speer, and soon developed mediumistic powers in himself. He fought against their influence on his mind for a long time, but his skepticism was finally overcome, and he became a spiritualist, and abandoned the church, and at last became the editor of the chief spiritualist paper, *Light*. No one ever questioned his sincerity and honesty. The phenomena which he records were of a type and variety which tend to excite astonishment. They included the physical and the trance phenomena, of the usual kind, such as the alleged movements of physical objects without contact, and even through other matters, and automatic writing evincing the personal identity of deceased persons and the spiritual and hortatory counsel of discarnate spirits long since deceased. His two works, *Spirit Identity* and *Spirit Teachings*, were widely read. But he resented scientific investigation because he thought it a reflection on his honesty, and hence, though there is some independent testimony to the nature of his phenomena, they depend mostly upon his own asseverations; and though there is no reason to impeach the probity of these, neither he nor his contemporaries reckoned sufficiently with the problems of abnormal psychology and secondary

personality to assure the elimination of influence in the production of the phenomena that were quite compatible with honesty and yet were inconsistent with their supernormal character.

After the excitement produced by the Fox sisters, there appeared a perfect inundation of similar and more questionable performances in the person of all sorts of traveling mediums. The popular conception of spiritualism was soon determined by the methods of this class of impostors. Their demonstrations took the form of cabinet séances, materializations, slate-writing performances, and tricks that are easily imitable by the prestidigitator. To this day the general public has no other conception of spiritualism than that which is furnished by the most absurd and most trivial legerdemain. Finally the indifference of the public after discovering the futility of such methods and the influence of the *Report* by the Seybert Commission (see below) caused the interest in such phenomena to decline. The Society for Psychical Research (see PSYCHICAL RESEARCH, SOCIETIES FOR) also had its share of the credit in this depreciation of the movement.

To this period, contemporaneous with Moses and apparently combining the phenomena described by him and the performances of the average trickster, belonged David D. Home, who created an enormous sensation throughout America and Europe. He received the attention of Sir William Crookes, and a group of experiments involving all sorts of physical miracles which still mystify students who have confidence in Crookes.

What the Society for Psychical Research has accomplished tends to show that the methods of physical science which had captivated the last generation are not adequate to cope with the problem of spiritualism. It has been shown to be a psychological problem that must comprehend the whole field of normal and abnormal psychology, including in the latter all the phenomena of automatism, sensory and motor, illusion, hallucination, secondary personality, hysteria, insanity of the functional sort, and the various hyperæsthesias. The consequence of all this has been to suggest that neither fraud nor spirits are always necessary to account for seemingly supernormal phenomena. We are being made acquainted with a vast fund of facts in connection with subliminal consciousness which are well calculated to strike the unwary as of a spiritistic significance, but which are really phenomena of irresponsible secondary personalities. These personalities, like the dream life of normal people, are apparently quite as liable to deception as are the states of consciousness of everyday life. However, the range and capacity of the powers of subliminal states have not yet been exactly determined.

About the same time that the Society for Psychical Research was founded a Mr. Seybert gave a fund to the University of Pennsylvania for the investigation of spiritualism, and the Seybert Commission was appointed for the purpose. The commission exposed many of the ordinary frauds of professional mediums, and its conclusions were adverse to the usual spiritistic claims. After publishing a *Report*, the commission was allowed to lapse.

In Germany and France the movement has had a similar history and outcome. In Germany Reichenbach was the most important investigator, and in France Cahagnet and Du Potet

are the principal men of interest. This was in the earlier period. Later we have Karl du Prel, A. N. Akakoff, a Russian, and Schrenck-Notzing, who manifested interest in the subject and wrote freely upon it.

In recent years the *Proceedings* of the Society for Psychical Research have recorded data, especially in the phenomena of coincidental apparitions and experiments with a Mrs. Piper, a Boston medium, which some of the members have thought favorably confirm the possibility of the spiritistic theory. She has been the subject of experiment for nearly 18 years. This, with two volumes of Mr. F. W. H. Myers, has had the effect of reviving an interest in the general problem. But the subject must still run the gantlet of scientific skepticism and investigation. The early history of the movement has been so infected with charlatanism, fraud, half-baked science, and various forms of radicalism in religious and social matters as to put it under abeyance by the critically intelligent part of the community.

It is not possible to determine with any accuracy the number of adherents to the spiritualistic belief. Spiritualists are certainly very numerous, and have many thriving organizations. These take the form of the ordinary church. It is claimed that they have nearly 350 churches and over 200,000 members. It is probable that the number of believers far exceeds this figure. There is nothing in the belief to suggest the necessity of organization as in the orthodox Christian Church. Their periodicals are quite numerous. *Light*, a weekly, published in London, England, is, perhaps, the best. The *Banner of Light* is published in Boston, Mass.

**SPIRITUALISTS.** See LIBERTINES.

**SPIROCHÆTA PALLIDA** (Neo-Lat., from Gk. σπείρα, *speira*, coil + χάλρη, *chaitē*, flowing hair, and Lat. *pallidus*, pale). The specific organism of syphilis, a very motile spirillum, discovered by Schaudinn (q.v.) and Hoffmann in 1905. This spirochæta is from four to 10 micromillimeters long and has a pointed,

nonretractile, spirally curved body, difficult to stain. The organism is very motile, moving in three ways: rotation on its own axis; whiplike undulation without locomotion; and forward and backward movements. It has been found in almost every tissue of the body of the syphilitic, in the blood in even the smallest capillaries, in saliva, in the brain, in cerebrospinal fluid, in the initial and secondary lesions of acquired syphilis, and in the organs of congenitally syphilitic persons, from the newborn infant to the fully developed man or woman. There exist several other varieties of spirochæta, all belonging to the genus of flagellated protozoans, such as *Spirochæta carteri*, which causes Indian relapsing fever; *Sp. duttoni*, the cause of African relapsing fever; *Sp. obermeieri*, the specific cause of relapsing fever; *Sp. pertenuis*, which causes yaws (q.v.); etc. See SYPHILIS.

**SPIROPHYTON** (Neo-Lat., from Gk. σπείρα, *speira*, coil, twist, spire + φυτόν, *phyton*, plant). A supposed fossil alga found in rocks of Devonian age. It presents a flabellate expansion with a central pit from which radiate curved ribs as from the centre of a vortex. The surfaces of the Esopus grit of Lower Devonian age in eastern New York and Pennsylvania are covered with these fossils. The genus is known also in the Carboniferous rocks, and it has been described from European localities under the name of *Taonurus*. Recent investigations have proven it to be formed by successive packings of sediment along the radial side of a curved burrow which was shifted with each packing, the aperture remaining stationary. The animal which produced these structures was probably a sedentary polychæatous annelid. See Sarle, "Preliminary Note on the Nature of *Taonurus*," in *Proceedings of the Rochester Academy of Sciences*, vol. iv (Rochester, 1906).

**SPIRULA** (Lat., dim. of *spira*, coil, spire). A genus of small decapod, dibranchiate cephalopods, comprising two or three species, and constituting the family Spirulidae, with internal skeleton in the form of a nacreous, discoidal shell, the whorls of which are not in contact with one another, and which are divided into a series of chambers by partitions pierced by a ventral tube or siphuncle. The animal has minute lateral fins, and six rows of small suckers on the arms. The three species constituting the family dwell in deep waters of tropical seas. In internal anatomy *Spirula* is a true dibranchiate, having two branchiæ and an ink bag. It has the peculiar feature that the hinder end of the body acts as a suctorial disk for fastening itself to foreign bodies.

The genus *Spirula* is not known in a fossil state, but it has ancestors, *Spirulirostra* and *Spirulirostrina*, in the Tertiary deposits of Italy. These latter have remnants of the guard at the apical portion of the shell, which feature seems to indicate the descent of *Spirula* from some form of shell-like Belemnites. See CEPHALOPODA.

**SPITALFIELDS.** An eastern district of

SPIRULA.

1, animal, showing position of shell; s, shell; m, siphon muscles; 2, shell enlarged.

London, England, in Whitechapel, adjoining Bethnal Green. It is a manufacturing district inhabited chiefly by the poorer class of population, and by silk weavers, descendants of French Huguenots. It is the seat of the Spitalfields market. Spitalfields derives its name from the Hospital of St. Mary, founded in 1197. Pop., 1901, 27,965; 1911, 28,172.

**SPITHEAD.** A roadstead off Portsmouth, England, separating the Isle of Wight from the mainland on the northeast (Map: England, E 6). It is 14 miles long by 4 miles in average breadth, and receives its name from the Spit, a sand bank stretching south from the English shore for three miles. Fortified by circular towers, and, except on the southeast, protected from all winds, it is a favorite anchorage of the British navy, styled by international lawyers the Queen's Chamber, on account of its security.

**SPITTA, FRIEDERICH ADOLF WILHELM** (1852- ). A German Protestant theologian. He was born at Wittingen, Hanover, and was educated at Göttingen and Erlangen universities. After filling several minor educational and pastoral positions he was pastor at Ober-Kassel (1881-87) and was then appointed university preacher and professor of New Testament exegesis and practical theology at Strassburg. In 1896 he became coeditor of the *Monatsschrift für Gottesdienst und Kirchliche Kunst*. His works include: *Die Apostelgeschichte, ihre Quellen und deren geschichtlicher Wert* (1891); *Zur Reform des evangelischen Kultus* (1891); *Zur Geschichte und Literatur des Urchristentums* (3 vols., 1893-1907); *Jesus und die Heidenmission* (1909); *Das Johannes-Evangelium als Quelle der Geschichte Jesu* (1910).

**SPITTA, KARL JOHANN PHILIPP** (1801-59). A German religious poet, born in Hanover. He was educated at Göttingen and from 1824 to 1828 was a tutor at Lüne, and there wrote the best of his hymns. Afterward he was vicar or pastor in several churches, and in 1859, shortly before his death, was made superintending clergyman at Burgdorf. His hymns, contained in *Psalter und Harfe* (1833; rev. with bibliographical note by his son Ludwig, 1890; Jubilee ed., 1901), and in the *Nachgelassene geistliche Lieder* (1861 and often), rank high in the German spiritual song of the century, and attained great popularity by their freshness of thought, purity of style, depth of sentiment, and finished form. Consult Munkel, *P. Spitta* (Leipzig, 1861; 2d ed., by Majer, Bremen, 1891).

**SPITTA, PHILIP** (1841-94). A German musical scholar, born at Wechold in Hanover. He studied philology at the University of Göttingen, and taught at the Gymnasium in Sondershausen (1866-74) and then at Leipzig. The appearance of the first volume of his monumental Bach biography in 1873 won for him international reputation, so that in 1875 he was called to Berlin to be professor of the history of music and secretary of the Royal Academy of Arts. In 1891 he was made Privy Councillor. He died in Berlin. His biography of Bach (2 vols., 1873-80), still the standard work, combines the results of profound scholarly research with a rare æsthetic appreciation. The influence of his method in all fields of musical investigation has been enormous, as is proved by the work of his pupils, among whom was Max Friedländer (q.v.). He contributed to the foremost musical journals, and edited a critical edition of the organ works of Buxtehude (2

vols.) and the complete works of Schütz (16 vols.). From 1885 till his death he was, with Chrysander and Adler, editor of the *Vierteljahrschrift für Musikwissenschaft*.

**SPITTING SNAKE.** See NAJA.

**SPITZBERGEN**, spits'bër-ge-n or -bër-ge-n. An Arctic archipelago lying principally between long. 10° and 28° E. and from lat. 76° 30' to 80° 30' N. (Map: Arctic Region, G 4; World, Eastern Hemisphere, B 22). The largest islands are West Spitzbergen (15,000 square miles), Northeast Land (4000 square miles), Edge (2500 square miles), Barents (1000 square miles), and Prince Charles Foreland (900 square miles). Northeast Land is covered with high inland ice, as is the greater part of West Spitzbergen, where ice-free peaks appear, the highest being Diadem, 4150 feet. Discovered by the Dutch (1596) under Barents, Heemskereck and Rijp at its extreme northwestern parts, its area was extended by Hudson, Prince Charles Foreland (1607); Poole, Edge, Edge Island (1614); Marmaduke, Smythe Island (now Northeast Land) and Barents Island (1617). (See POLAR RESEARCH.) The climate is harsh, the temperature ranging from 40° F. in July to -10° F. in February.

Through intensive hunting whales, seals, walrus, foxes, and reindeer have practically disappeared. Only 14 species of fish are found in its waters. Flowering plants somewhat exceed 100 in number. While there was a luxuriant Miocene vegetation (cypresses, oaks, etc.) only a tiny willow creeps along favored spots to-day. In recent years the archipelago has become of economic importance. The phosphate discoveries of Nathorst and Wilander (1870) proved temporarily unprofitable. The existence of coal in Spitzbergen has been known for three centuries, but the first full cargo was shipped in 1899. Recently extensive areas of valuable coal have been located and exploited by American, British, and Swedish companies. Forty thousand tons were shipped to Europe by one company in 1912. The main field of operation is on the south side of Ice Fiord, where large forces are engaged in mining, the largest number being at Advent Village, the American settlement. Three wireless stations keep Spitzbergen in touch with the outside world.

International conventions have considered without definite conclusion the important point of the sovereignty of the archipelago, which will probably be governed by a commission. Instances of lawlessness, disputes, conflicting claims, and wanton destruction of game have been of not infrequent occurrence. See POLAR RESEARCH.

**Bibliography.** Sir Martin Conway, *First Crossing of Spitzbergen* (London, 1897); *Early Voyages to Spitzbergen*, published by the Hakluyt Society (ib., 1904); Sir Martin Conway, *Noman's Land: History of Spitzbergen* (New York, 1906); Nathorst, Hulth, and De Geer, *Swedish Explorations, 1758-1908* (Stockholm, 1909); A. W. Greely, *Handbook of Polar Discoveries* (Boston, 1910); Raestad, "Le Spitzberg dans l'histoire diplomatique," in *La Géographie*, vol. xxiv (Paris, 1912); Rudmose-Brown, "Spitzbergen in 1914," in *Geographical Journal* (London, July, 1915).

**SPITZ DOG**, or POMERANIAN DOG. See SHEEP DOG.

**SPITZKA, EDWARD CHARLES** (1852-1914). An American psychiatrist, born in New York City. He was educated at New York University (M.D., 1873) and in Leipzig and Vienna. He

served as interne in the New York City Asylum for the Insane, was professor of medical jurisprudence and diseases of the nervous system in the New York Post Graduate Medical School and Hospital from 1885 to 1887, and was editor of the *American Journal of Neurology* from 1881 to 1884. In 1890 he held the presidency of the American Neurological Association. Spitzka was well known as an alienist and acted as such in the trial of Guiteau, assassin of President Garfield. His writings include *A Treatise on Insanity* (1883) and many monographs.

**SPITZWEG**, spits'vák, KARL. (1808-85). A German genre and landscape painter. Although self-taught in art, he was one of the most original figures in the art world of Munich, his native city, the most genial exponent of the humorous genre. He depicts German life of the forties with realism, humor, poetic fancy, and a delicacy learned from the old masters. In color his paintings are superior to most contemporary German work. Among the best known are "The Poor Poet" (1837), "Two Hermits" and a "Scholar in the Attic" (1832), all in the Pinakothek, Munich; "The Hypochondriac" and five others in the Schack Gallery, Munich; "Going to Church Near Dachau" (1862), in Dresden; "His Reverence" and four others in the National Gallery, Berlin. He also contributed frequently to the *Fliegende Blätter*. Consult: the monograph by Uhde-Bernays (Munich, 1913) and Richard Muther, *History of Modern Painting* (New York, 1907); and for reproductions, *Spitzweg Mappe* (Munich, 1887) and *Spitzweg Album* (ib., 1888).

**SPLAY**. The sloping or beveled opening in window recesses and other such openings. Also the corner taken off the outer angle of these.

**SPLEEN** (Lat. *splen*, spleen). The largest and most important of the so-called ductless glands. It is generally oval in form, somewhat concavo-convex, soft, brittle, highly vascular, of a dark bluish-red color, and situated in the left hypochondriac region, its interior concave surface embracing the cardiac end of the stomach and the tail of the pancreas. In the adult it is normally about 5 inches in length, 3 or 4 in breadth, an inch or an inch and a half in thickness, and weighs about 7 ounces. At birth and through most of life, its weight, proportioned to the body, is as 1 to 350; in old age it decreases in weight, the ratio being 1 to 700. The size of the spleen is increased after gastric digestion, and is large in highly fed and small in starved animals. In infectious diseases, such as in typhoid fever, and in chronic malaria, it is much enlarged, weighing occasionally from 18 to 20 pounds, and constituting what is popularly known as the ague cake.

The spleen is invested externally by the peritoneum and inside this by a fibrous capsule giving off from its inner surface numerous small fibrous bands termed *trabeculae*, which unite at numerous points with one another, and run in all directions. The parenchyma or true substance of the spleen occupies the interspaces of the above-described areolar framework—a soft pulpy mass of a dark reddish-brown color, consisting of colorless and colored elements. The colorless elements are granular matter, of nuclei about the size of the red-blood disks, and a few nucleated vesicles, and constitute one-half or two-thirds of the whole substance of the pulp in well-nourished animals, while they diminish in number and sometimes disappear in starved

animals. The colored elements consist of red-blood disks and of colored corpuscles either free or included in cells; sometimes enlarged blood disks are seen included in a cell, but more frequently the inclosed disks are altered in form and color as if undergoing retrograde metamorphosis. Besides these, numerous deep-red, or reddish-yellow, or black corpuscles and crystals, closely allied to the hamatin of the blood, are seen diffused through the pulp substance.

The venous blood of the spleen is carried away by the splenic vein, which contributes to form the great portal venous system, distributed through the liver; while arterial blood is supplied by the splenic artery, the largest branch of the celiac axis. The branches of this artery subdivide and ramify like the branches of a tree, with the *Malpighian* or *splenic corpuscles* attached to them like fruit. These splenic corpuscles, originally discovered by Malpighi, are whitish spherical bodies, which are either connected with the smaller arterial branches by short pedicles, or lie upon their sheaths. They vary in size and number, their diameter usually ranging from  $\frac{1}{80}$  to  $\frac{1}{60}$  of an inch. Each consists of a membranous capsule, homogeneous in structure, formed by a prolongation from the sheath of the artery. The blood capillaries form a delicate plexus within these corpuscles.

The office of the spleen in the human economy is not thoroughly understood, but there is considerable evidence to show that this organ may act as a storehouse of nutritive material; that it is engaged in the formation of blood corpuscles, both red and white, particularly the latter; that in it worn-out and exhausted red corpuscles undergo disintegration; that it has a special nitrogenous metabolic function; and that it acts as a reservoir in connection with the portal circulation. Besides this it is known to have an internal secretion which is believed to have a stimulating influence on the stomach and digestion generally, as well as upon the muscles of the intestines. See SECRECTIONS, INTERNAL.

**SPLEENWORT**. See ASPLENIUM, and Colored Plate of FERNS.

**SPLENIC** (splén'ík or splé'ník) **EXTRACT**. The spleen is believed to have an internal secretion which stimulates the processes of digestion in the intestinal mucosa. An extract of the substance of this organ is given, either alone or in combination with other glandular extracts, to stimulate intestinal digestion and as a general aid to oxidation. It has also been recommended in chronic malaria, tuberculosis, typhoid fever, and various blood disorders. It may be given as an ethereal extract made into an emulsion, or in a form suitable for hypodermic injection. See ORGANOETHERAPY; SPLEEN.

**SPLENIC FEVER**. See ANTHRAX.

**SPLE'NOMEG'ALY**, TROPICAL. See KALA AZAR.

**SPLICING**. See KNOTTING AND SPLICING.

**SPLINT** (Swed. *splint*, spike, forelock, flat iron peg). In surgery, a mechanical contrivance for keeping a fractured limb in proper position and for preventing any motion of the fractured ends; also employed for securing perfect immobility of the parts to which it is applied in other cases, as in diseased joints, after resection, etc. Many different kinds of splints are used, but wood and plaster of Paris are most common. Wire netting, gutta serena, papier maché, and other materials are also frequently employed, as

they can be molded to the shape of the limb. In the same way plaster of Paris can be applied to one side of a limb, carefully molded to it, and held in place by bandages. All movable splints, however, have the disadvantage that they must be readjusted from time to time, and thus the fractured limb is subjected to handling.

The plaster-of-Paris splint is desirable, therefore, in many cases. The limb is carefully protected with a light layer of nonabsorbent cotton, especial care being used to guard bony prominences and to avoid unevenness. Coarse, wide-meshed bandages well rubbed with dry plaster of Paris are immersed for a moment in water and then applied like ordinary bandages, each layer being rubbed into the one beneath so as to make a firm cohesive splint. The plaster should include the joints above and below the seat of injury. This splint may be both strengthened and lightened by the introduction of wooden or metal strips between the layers of plaster. Drying takes place rapidly and gives a firm resisting splint. In compound fractures or in operative cases a fenestrum may be left over the wound proper and opportunity given to attend to required dressings without disturbing the splint.

**SPLINT.** A bony enlargement on the horse's leg between the knee and the fetlock, usually appearing on the inside of the foreleg, frequently situated between the large and small cannon bones. It is usually caused by concussion, and is most common in young horses that have been driven rapidly along hard roads before their bones have become firm.

**SPLIT MOUTH.** See **CUTLIPS.**

**SPLÜGEN**, shply'gen. An Alpine pass between a tributary of the Hinter Rhein and Val S. Giacomo, a feeder of Lake Como, a few miles east of San Bernardino Pass and at an altitude of 6946 feet (Map: Italy, B 1). The southern or Italian descent has three great galleries built to protect the road from avalanches, and completed by the Austrian government in 1834.

**SPODUMENE** (from Gk. σποδός, *spodós*, ashes). A mineral lithium and aluminium silicate crystallized in the monoclinic system. It has a vitreous lustre and is light green, gray, yellow, or purple in color. The yellow-green to emerald-green crystalline variety found in Alexander Co., N. C., is known as hiddenite, from its discoverer, W. E. Hidden, of New York. A beautiful pink variety, recently discovered in San Diego Co., Cal., is named kunzite, from its discoverer, George F. Kunz. Both of these varieties have been cut for gems, and the latter is still very popular as a semiprecious stone. See **HIDDENITE.**

**SPOELBERCH DE LOVENJOUL**, spool'-berk de lö'ven-zhool, CHARLES, VISCOUNT DE (1836-1907). A Belgian literary collector, born at Brussels. Possessed of a large private fortune he devoted himself to collecting manuscripts, first editions, autographs, reliques, etc., of the French masters in literature, especially Balzac. By his will this collection was left to the Institute of France. The Viscount de Lovenjoul prepared a number of literary monographs, including: *Etude critique et bibliographique des œuvres d'Alfred de Musset* (1867); *Alfred de Musset et ses prétendues attaques contre Victor Hugo* (1878); *Histoire des œuvres d'H. de Balzac* (1879; 3d ed., 1888), crowned by the French Academy; *Un dernier chapitre de l'histoire des œuvres de Balzac* (1880); *Histoire des œuvres de Théophile Gautier* (1887); *Etudes balzacienes:*

*un roman d'amour* (1896); *Etudes balzacienes: autour d'Honoré de Balzac* (1897); *Une page perdue d'Honoré de Balzac* (1903).

**SPOFFORD**, AINSWORTH RAND (1825-1908). An American librarian, born at Gilmanton, N. H. He was in 1861 assistant librarian of Congress, and from 1864 to 1899 librarian in chief of the Congressional Library. He wrote much for periodicals, on literature, economics, and history, and edited with others a *Library of Choice Literature* (10 vols., 1881-88) and a *Library of Wit and Humor* (5 vols., 1884). He published annually *The American Almanack and Treasury of Facts, Statistical, Financial, and Political* (1878-91), and *A Book for All Readers* (1900), on the collection and preservation of books and the founding of libraries.

**SPOFFORD**, HARRIET (ELIZABETH) PRESCOTT (1835-1921). An American novelist, born at Calais, Me. In 1865 she married Richard S. Spofford, a lawyer of Boston. Her writings include: *Sir Rohan's Ghost* (1859); *The Amber Gods and Other Stories* (1863); *Azarian, an Episode* (1864); *New England Legends* (1871); *The Thief in the Night* (1872); *Marquis of Carabas* (1882); *Poems* (1882); *Ballads About Authors* (1888); *Scarlet Poppy and Other Stories* (1894); *A Master Spirit* (1896); *Four Days of God* (1905); *Old Washington* (1906); *The Making of a Fortune* (1911).

**SPOHR**, shpör, LOUIS (1784-1859). A German composer and violinist, born at Brunswick. He studied there under Kunisch and Maucourt and in 1802 became a pupil of the celebrated Franz Eck. In 1805 he accepted the appointment of concertmeister at Gotha and in 1812 went to Vienna as leader at the Theater an der Wien, where he remained until 1815. From 1817 to 1819 he filled a similar position at Frankfort and in 1821 received a life appointment as court conductor at Cassel. It was in connection with this last position that he won his greatest successes as a violinist, composer, and conductor; besides which he succeeded in bringing his orchestra to a pitch of perfection that earned it a world-wide reputation. In 1831 he completed his work, *The Violin School*, which has remained one of the standard works of instruction for that instrument. He was a prolific composer and wrote in all nearly 200 works. Most of his operas were little known outside of Germany, but his oratorios formerly were very popular in England and America, particularly *Die letzten Dinge* (The Last Judgment). His works include ten operas, five oratorios, nine symphonies, twelve concertos for violin, and a great quantity of chamber music. He died at Cassel. Consult: *Autobiography* (Cassel, 1860; Eng. trans., London, 1865); H. Schletterer, *Louis Spohr*, in Waldersee, *Sammlung* (Leipzig, 1881); L. Nohl, *Spohr* (ib., 1886).

**SPOILS SYSTEM.** See **CIVIL-SERVICE REFORM.**

**SPOKAN**, spō-kān'. An Indian tribe of Salishan stock formerly occupying the whole basin of Spokane River in Washington and Idaho and now chiefly gathered upon reservations in the same States. They were visited in 1806 by Lewis and Clark, who call them Liartielo. In language, customs, and alliance they were closely connected with the Sanpoil (q.v.). They number 643. See **SALISHAN STOCK.**

**SPOKANE**, spō-kān'. A city and the county seat of Spokane Co., Wash., in the extreme eastern part of the State, 339 miles by rail east of

Seattle, on the Spokane River, and on the Chicago, Milwaukee, and St. Paul, the Great Northern, the Idaho and Washington Northern, the Northern Pacific, the Oregon-Washington Railroad and Navigation Company, the Spokane and Inland Empire, the Spokane International, and the Spokane, Portland, and Seattle railroads (Map: Washington, H 3). It was formerly known as Spokane Falls. In the valley, half plain and half mountain, through which flows the Spokane River, at a point where the slopes narrow and the hills close in, is the beautiful natural park in which the city has been built. It rises from the river banks to the north and the south, to an elevation of 1900 feet above the sea. Below are the business streets, while on the slopes are the homes. The famous cataract, Spokane Fall, is in the heart of the city's business district. A fine concrete bridge, 1070 feet long, spans Latah Creek, a tributary of the Spokane River. The Monroe Street Bridge, whose arch is 281 feet in length, is also of concrete. Spokane is the seat of Gonzaga University (Roman Catholic), opened in 1887; Whitworth College, Spokane College, Spokane University, and Brunot Hall, an Episcopal school for girls. The city is amply provided with hospitals and charitable institutions, is well laid out, having 68 miles of paved streets, 1933 acres of parks, and owning its water works and sewage system. Notable structures are the Carnegie Library, the Davenport Hotel, erected at a cost of \$2,500,000, the Federal, Auditorium Theatre, and Old National Bank buildings, city hall, and courthouse. There are 23 bridges within the city limits. Fort Wright, a large United States army post, is situated on the river, just outside the city. Spokane is the mining centre of the Pacific Northwest, the tributary mines producing more than \$35,000,000 annually in gold, silver, copper, zinc, and lead. North, east, and south of the city stand large pine timber forests. The city is also the trade centre of a highly productive cereal belt. In 1915 there were \$50,926,273 invested in the city's 225 industrial establishments, employing 10,053 persons, and yielding a product valued at about \$50,000,000. Lumbering, mining, wheat raising, fruit growing, and the manufacture of foundry and machine-shop products, cars, flour, brick, brooms, furniture, pottery, marble and granite, and ornamental iron constitute the leading manufactures. Spokane adopted the commission form of government in 1910. It spent for maintenance and operation in 1913 \$1,936,000, the chief items of expenditures being: schools, \$694,000; highways, \$248,000; fire department, \$185,000; police department, \$131,000; water-supply system, \$160,000; sanitation, \$153,000. In the same year its total bonded indebtedness amounted to \$13,432,000, while the assessed valuation of its property was \$89,800,000. The growth of the city dates from 1881, when the Northern Pacific Railway was completed to this point. Pop., 1890, 19,922; 1900, 36,848; 1910, 104,402; 1915 (U. S. est.), 142,990; 1920, 104,437. Consult Edwards, *An Illustrated History of Spokane County* (1900), and Harold Bolce, in L. P. Powell, editor, *Historic Towns of the Western States* (New York, 1901).

**SPOLETO**, spò-là'tò. A city in the Province of Perugia, Italy, situated on a hill, 61 miles north-northeast of Rome (Map: Italy, D 3). It is dominated by a citadel, now a prison, in which in 1499 Lucretia Borgia was incarcerated. The town is united with the neighboring height of

Monte Luco by a Roman bridge and aqueduct. Beneath the Piazza Vittorio Emanuele are the ruins of a Roman theatre. Several of the churches occupy the sites of Roman temples. The eleventh-century cathedral has a fine Renaissance portico. The gathering of truffles, together with the preservation of meats, fruits, and vegetables, the manufacture of olive oil and silk, and the mining of lignite are the chief industries. Pop. (commune), 1881, 21,507; 1901, 24,642; 1911, 25,996 (town, 9631). The ancient Umbrian town of Spoletium was colonized by the Romans in 241 B.C. It was destroyed by the Goths, but rebuilt by Narses. In 574 it became the capital of the Lombard Duchy of Spoleto, which rose to great power in the ninth century, when two of the dukes, Guido (q.v.), and Lambert, his son, successively received the Imperial crown from the Pope. From 1220 to 1860 it was a papal possession. Consult E. H. and E. W. Blashfield in *Italian Cities* (New York, 1912).

**SPOLETO**, DUKE OF. See GUIDO.

**SPOLIA OPTIMA** (Lat., richest spoils). The name given by the Romans to the fairest honor that could be won in battle. The *spolia optima* were gained only when the actual commander in chief of the Roman army slew the commander in chief of the enemy and stripped him of his armor. They were won but thrice: by Romulus, when he killed the King of the Caeninenses; by A. Cornelius Cossus, when he slew Lar Tolumnius, King of the Veientes (426 B.C.); by Marcus Claudius Marcellus, when he killed Viridomarus, King of the Insubrians (222 B.C.). The *spolia optima* were deposited in the temple of Jupiter Feretrius. Consult the article "Spolia" in William Smith, *A Dictionary of Greek and Roman Antiquities*, vol. ii (3d ed., London, 1891).

**SPOLIATION** (Lat. *spoliare*, to plunder, spoil). The destruction of a thing by a person not an owner or interested therein, particularly the erasure of a signature on or alteration of the body of an instrument in writing. The wrongdoer is liable in damages for his act. Such an alteration or destruction of an instrument will not destroy its legal effect if the original contents can be clearly proved. Spoliation differs from alteration in that the former is committed by a stranger and the latter by a person interested in the thing destroyed or altered.

In admiralty law the hasty spoliation or destruction of ship's papers or other documents connected with the voyage by the officers of a vessel suspected of smuggling or blockade running is held to create a presumption of guilt, which, however, may be rebutted.

In ecclesiastical law the term denotes the destruction or waste of church property.

**SPON'DEE**. See VERSIFICATION.

**SPONDYLITIS** (Neo-Lat., from Lat. *spondylus*, vertebra + *-itis*). Inflammation of the spinal column or its segments (vertebrae). It occurs as a form of arthritis deformans, a slow inflammation of the bone usually terminating in ankylosis and rigidity of the spine. For this reason it has been termed "poker back." In the tuberculous form spondylitis occurs as an acute osteomyelitis with rapid destruction of the vertebrae. The affection is comparatively rare.

**SPONGE** (Lat. *spongia*, sponge). A group of animals representing a distinct branch or phylum, Porifera. The sponges are many-celled animals, with three-cell layers, without a true digestive cavity, supported usually by cal-

careous or siliceous spicules, the body mass permeated by ciliated passages or containing minute chambers lined by flagellate, collared, monad-like cells. There is no true mouth opening, but usually an irregular system of inhalant pores opening into cell-lined chambers or passages through which food is introduced in currents of sea water, the waste particles passing out by a single but more usually by many cloacal openings (oscula). Sponges are hermaphroditic, multiplying by fertilizing eggs, the germ passing through a cleavage and a gastrula stage.

Sponges are divided, according to the nature of the skeleton or supporting fibres or spicules, into two orders: (1) *Calcispongiae*, in which the spicules are calcareous, and (2) *Silispongiae*, or glass sponges, in which the spicules are siliceous, or horny and fibrous, as in the bath sponges, when spongin instead of silica forms the supporting framework. Examples of the siliceous sponges are the Venus's flower basket (*Euplectella*) and allied deep-sea forms (*Hyalonema*, *Holtenia*, etc.). To the second order also belongs the fresh-water sponge (*Spongilla*), growing in lakes or sluggish streams. These differ from other sponges in producing statoblasts or winter buds, formed by the protoplasm dividing into round bodies as large as a pin's head and enveloped by a dense membrane, thus enabling the species to survive freezing cold or droughts.

Certain sponges bore into shells, causing them to disintegrate. For example, *Cliona sulphurea*

has been found boring into various shells—the oyster, mussel, scallop; it also spreads out on all sides, enveloping and dissolving the entire shell. It has even been found to penetrate one or two inches into hard marble. *Cliona* also disintegrates coral. (Of the marketable sponges there are six species, with numerous varieties. They are available for use from being simply fibrous, hav-

A FOSSIL SPONGE.

One of the Brachiospongia  
(*Thaliasterella gracilis*).

ing no siliceous spicules. The Mediterranean sponges are the softest and best; those of the Red Sea are next in quality, while the West Indian species are coarser and less durable. The glove sponge (*Spongia tubulifera*) corresponds to *Spongia adriatica* (the Turkey cup sponge and Levant toilet sponge of the Mediterranean). *Spongia gossypina*, the wool sponge of Florida and the Bahamas, corresponds to *Spongia equina*, horse or bath sponge of the Mediterranean. This wool sponge of Florida attains under favorable circumstances a weight of one-tenth pound, in six months, and reaches a size of commercial value in a year.)

Fossil sponges are known in rocks of all ages. They appear first in the Cambrian as *Protospongia* and *Archæoscyphia*, representing the hexactinellids and lithistids. They are represented in the Ordovician by the curious *Brachiospongia*, and a number of irregular forms; in the Silurian by *Astræospongia*, *Astylospongia*; in the Devonian by *Hindia* and the *Dictyospongiæ*, which latter enjoyed such great expansion in the shallow seas of western New York during Chemung time. *Receptaculites* is a peculiar sponge that is common in the Ordovician. During the Mesozoic, sponges attained a great de-

velopment, became especially abundant during the Cretaceous period, and declined during the succeeding Tertiary. Noteworthy Cretaceous genera are *Ventriculites* and *Cœloptychium*.

Bowerbank, *Monograph of the British Spongiæ* (4 vols., London, 1864-82); Alpheus Hyatt, "Revision of North American Porifera," in *Memoirs Boston Society of Natural History*, vol. ii (Boston, 1875); Hinde, *Catalogue of Fossil Sponges of the British Museum* (London, 1883); D. W. Thompson, *Bibliography of Protozoa, Sponges, Cœlenterata, and Worms* (Cambridge, 1885); Rauff, "Palæospongiologia," in *Palæontographica*, vol. xl (Berlin, 1893); I. B. J. Sollas, "Porifera," in *Cambridge Natural History*, vol. i (New York, 1909).

**SPONGE, VEGETABLE.** See VEGETABLE SPONGE.

**SPONGING HOUSES.** In the law of England, the private houses of the bailiffs, who may detain there a debtor who has been arrested for debt for 24 hours, to admit him or his friends to arrange to settle the debt. The name is derived from the extortion often practiced on the debtor. The name is not used in the United States.

**SPONGIOZO'A** (Neo-Lat. nom. pl., from Gk. σπογγία, *spongia*, sponge + ζῷον, *zōon*, animal). One of the branches or phyla of Invertebrates, intermediate between the Protozoans and the Cœlenterata, and represented by a single class, Porifera, which comprises the sponges.

**SPONSORS** (Lat. *sponsor*, surety). The persons, also called godfathers and godmothers, who present a candidate for baptism, and in the Roman Catholic church for confirmation also, to the minister of those sacraments. In the case of infants they are representatives who make the vows the child is incapable of making, and are regarded as in some measure responsible for developing religious life in their godchildren. The spiritual bond resulting from this relation is held by Roman Catholic theologians to constitute a species of affinity, and hence an impediment of marriage, extending to the parents of the baptized, and even at one time to the sponsors themselves.

**SPONTANEOUS COMBUSTION** (Lat. *spontaneus*, willing). The ignition of substances apparently without any direct cause. The spontaneous combustion of organic materials is sometimes a cause of fires. When large quantities of soot, linen, paper, cotton or woollen stuffs, ship's cables, etc., became soaked with relatively small amounts of oils (especially drying oils) and exposed to a limited access of air, they may take fire sooner or later. The presence of moisture frequently aids spontaneous combustion, and piles of damp hay, freshly mown grass, sometimes take fire spontaneously. The phenomenon is not, however, without a clearly defined cause. Fats and oils can be shown to undergo a slow process of combustion at but slightly elevated temperatures. Combustion of a small amount of oil causes the evolution of a corresponding amount of heat; rise of temperature accelerates the combustion, producing a further degree of heat, until at a given moment the temperature may become so high as to cause the mass to burst into flame. As to the spontaneous combustion of human bodies, it is an impossibility, and all reports of such cases are due to erroneous observation, if they are not intentionally fraudulent. See PYROPHORUS.

**SPONTANEOUS GENERATION and PROTOGENESIS.** The doctrine that different forms

of life, especially the lower, have arisen by physicochemical agencies from inorganic substances. This view prevailed from ancient times until after the middle of the seventeenth century, and as late as 1842 Weeks maintained that mites (*Acarus*) were spontaneously generated in "several solutions under electrical influence." In 1859 Pouchet, in his *Hétérogénie*, revived the subject, and in 1871 Bastian maintained that bacteria and torulae were developed at the present day in certain fluids containing organic matter by laws similar to those by which crystals arise, or by what he calls archebiosis.

In 1660 Redi disproved the prevailing notion that the maggots of flies were generated in putrefying meat, by covering similar pieces of meat with fine gauze, and keeping away the blowflies. He thus demonstrated that the maggots grew from eggs, and that there was "no life without antecedent life." About 1750 Needham experimented by boiling and corking flasks of water containing infusoria, but in every case animalcules appeared after a time. This led Spallanzani (1768) to experiment carefully. He boiled infusions longer, and, instead of corking, fused his flasks. The result was that the infusions remained free from living organisms. Schulze and Schwann in 1836 made further experiments. They carefully boiled their infusions, and then supplied air; but they made it first pass through red-hot tubes, so that germs present would be burned; no infusoria appeared. Then the discovery was made by Cagniard de la Tour that fermentation, like putrefaction, is accompanied by the presence of microscopic organisms. In 1854-59 Schroeder and Dusch invented the screen of cotton wool now used for plugging the openings of tubes, which kept out the germs, and it was thus found that the cause of putrefaction and fermentation, and the origin of the living forms accompanying these processes, must be microscopic particles existing in the air. The next step was taken by Pasteur (*On the Organized Particles Existing in the Air*, 1862). On sowing these particles in suitable sterilized infusions he produced microscopic organisms. Germs like these were afterward shown by Cohn to be low plants to which he gave the name "bacterium." (See BACTERIA.) Finally Tyndall, in 1869, by passing a beam of light through the air in a box, showed that whenever dust was present the putrefaction occurred sooner or later; when it was absent it did not. The result of these experiments is that the view that spontaneous generation takes place at the present day has been entirely discarded.

**Spontaneous Generation (Protogenesis) Necessary for the Beginnings of Life.** Some

who, like Wyman, made observations disproving its occurrence at the present day, yet supposed that the first living organisms probably arose from inorganic matter, through the action of unknown physicochemical processes. In 1868 Herbert Spencer, while rejecting the doctrine of spontaneous generation, stated his belief that the formation of organic matter and the evolution of life in its lowest forms "took place at a time when the heat of the earth's surface was falling through ranges of temperature at which the higher organic compounds are unstable." He conceived that the molding of such organic matter must have begun with portions of protoplasm (q.v.), more minute, more indefinite, and more inconstant in their characters than the lowest rhizopods, or even the Protogenes of Haeckel. With this view biologists now agree.

When the earth had assumed its present shape, with incipient continents, and oceans lying in their basins, the period arrived when the conditions for the appearance of life became favorable, and at this critical moment the protoplasmic substance probably came into being. The chemical compounds giving origin to it were far more abundant, and the physical and chemical conditions more favorable.

The origin of protoplasm was probably the result of a combination of circumstances which certainly never occurred before in the history of our planet, and which has never happened since. The phenomenon of protogenesis, after taking place once for all, could never have again occurred. Such is the nature of cell division, of sexual reproduction, of growth, and of heredity, that it would be contrary to the course of nature to suppose that it was ever afterward necessary for it to again occur.

**Early Life.** To account for the beginnings of life we have assumed the creation of a primordial microscopic bit of protoplasm. In shape it was droplike, spherical, or oval, its form being due to gravity, as the primary form of all living beings tends by the action of gravity to be round or ovate.

This primordial being had the power of absorbing and digesting food, or the protoplasmic materials round it, and hence of growing; it was contractile and could move automatically, and thus was adapted for moving through the water, sending out from its body rootlike extensions to aid in seizing food and in locomotion. A single chance germ (though in nature there is no such thing as chance) would have been sufficient. Such a primordial cell, by self-division, may have multiplied itself, and in a few hours even become the parent of thousands. These beings were plastic. Already the earth's surface varied in chemi-

#### SPONGE STRUCTURE

1. Exterior of a living bath sponge: the arrows show how the water is sucked into the small pores and expelled from the elevated canal-mouths (oscules).
2. Diagram of canal system, represented by a young sponge with a single excurrent orifice; such a system is represented in a large sponge by each oscule: *a*, oscule; *b*, inhalant pores.
3. Vertical section of a part of a bath sponge: *b*, inhalant pores; *c*, canals; *d, d*, flagellated chambers; *e, f*, skeleton fibres; *g*, maturing eggs.
4. Enlarged view of a part of the canal system: *a*, inhalant pores and passages by which water is drawn into the spherical flagellated chambers and their connecting passages (apopyles) conducting it into larger spaces (*b*) whence it flows out through an oscule (*c*). Cf. Fig. 2.
5. Enlarged view of flagellated cells lining the chambers and canals; and a single cell. *n*, nucleus; *c*, contractile vesicle; *m*, collar; *f*, flagellum.
6. Various forms of siliceous spicules.
7. One form of siliceous fibrous skeleton.
8. Fresh-water sponge; vertical section of Spongilla; the water enters through the dermal pores (*a*) into the subdermal cavities (*b*), then enters the incurrent pores and passages (*c*, colored black), and passes into flagellated chambers (*d*), thence out through the excurrent canals (*e*), into the main central canal or perigastric cavity (*f*), in which the openings (*g*) of these canals from all sides are indicated by the black dots; and the water is finally discharged through the apical oscule (*h*).
9. A bath sponge (*Spongia*).
10. A branching sponge (*Chalinopsilla oculata*), a "finger" sponge, common on the Atlantic coast of the United States.

cal constitution and other physical features. There would follow migrations and the foundation of new colonies in scattered areas. Adaptation to each new environment would take place, and in the course of time variation would set in and the evolution of higher organisms take place. See **EVOLUTION** and the bibliography cited thereunder. Consult: Herbert Spencer, *Principles of Biology* (rev. ed., 2 vols., New York, 1898-1900); Max Verworn, *General Philosophy* (trans. from 2d Ger. ed. by F. S. Lee, ib., 1899); Ernst Haeckel, *History of Creation* (4th ed. rev. by E. R. Lankester, 2 vols., ib., 1906).

**SPONTINI**, spôn-tē'nē, GASPARO LUIGI PACIFICICO (1774-1851). An Italian dramatic composer, born at Majolati, Ancona. In 1791 he studied at the Conservatory della Pietà de' Turchini at Naples. As early as 1803 he had produced 16 operas in the light Italian style of that time. His opera *La finta filosofa* and two imitations of French opera comique, *Julie* and *La petite maison*, met with little success. He then began the study of Mozart and showed a marked change in the one-act opera *Milton* (1804). The Empress Josephine, to whom the score was dedicated, had him appointed chamber composer, and she secured the production of *La vestale* (1807). It proved a success. His grand opera *Ferdinand Cortez* (1809) was equally successful. In 1810, as director of the Italian Opera, he staged Mozart's *Don Giovanni* in the original form for the first time in Paris. In 1820 he was appointed general musical director at Berlin. He wrote for Berlin the festival play *Lalla Rulch* (1821), remodeled as the opera *Nurmahal, oder das Rosenfest von Kaschmir* (1822); *Alcidor* (1825); and *Agnes von Hohenstaufen* (1829). In 1842 he resigned and returned to Paris. He died in his birthplace.

**SPOONBILL**. An ibis-like bird of the family Plataleidae, distinguished by the flat, dilated, spoonlike form of the bill. The species are five or six, in two genera widely distributed. The spoonbills of the Old World belong to the genus *Platalea*, and have the windpipe curiously convoluted. The spoonbills of the New World lack these convolutions, and are placed in a distinct genus *Ajaja*. The roseate spoonbill (*Ajaja ajaja*), the only American species, is abundant within the tropics. It is nearly three feet in length; a beautiful bird, with plumage rose color, the tint deepest on the wings; the tail coverts are carmine. It was formerly abundant in Florida, but is now rare there, but seen along the coast of Texas. It nests in colonies, and builds a coarse platform of sticks, in trees, on which it lays three eggs, white spotted with brown. The only European species is the white spoonbill (*Platalea leucorodia*), common in marshy districts throughout northern Europe and Asia in summer, and in Mediterranean salt marshes in winter. See Colored Plate of WADERS.

**SPOON-BILLED SANDPIPER**. A rare reddish, stintlike sandpiper (*Eurynorhynchus pygmaeus*) of eastern Asia, remarkable only for its spoon-shaped bill. (See Colored Plate of SHORE BIRDS.) It breeds in Siberia, occasionally crossing to the Alaskan coast, and migrates southward in winter to China and India.

**SPOON'ER**, JOHN COIT (1843-1919). An American lawyer and statesman, born at Lawrenceburg, Ind. Having removed with his parents to Wisconsin, he graduated at the university of that State in 1864. He served during the

Civil War first as a private in the Fortieth Wisconsin Volunteers and subsequently as a captain in the Fiftieth Wisconsin, and was brevetted major at the close of hostilities. In 1867 he was admitted to the bar, and from 1868 to 1870 was Assistant Attorney-General of the State. He won distinction and success as a railroad and corporation attorney. He was a member of the State Assembly (1872), and served in the United States Senate (1885-91; 1897 till his resignation in 1907). He was unsuccessful as a candidate for Governor of Wisconsin in 1892. As Senator he took a prominent part in legislation and debates, and became recognized as one of the spokesmen of the McKinley and Roosevelt administrations. Spooner declined the portfolio of the Interior in 1898 and the post of Attorney-General in 1901. He was generally recognized as one of the ablest of the conservative Republican leaders. In 1907 he established himself in law practice in New York City.

**SPORADES**, spôr-â-dēz (Gk., scattered). A group of islands in the southeastern portion of the Aegean Sea between Samos and Rhodes and east of the Cyclades (q.v.) (Map: Greece, H 6, 7). Their principal members are Astropalia, Leros, Patmos, Nicaria, Calimno, Cos, Nisyros, and Scarpanto. Some also include Rhodes, Samos, Chios, and Lesbos with the neighboring islands. In a wider sense the name Sporades is applied to all the islands of the Aegean Sea except the Cyclades proper. The group lying in the western part of the sea, north and east of Eubœa or Negropont, the principal member of which is Scyros, are known as the Northern Sporades, and belong to the Greek Nomarchy of Eubœa. The Sporades proper belonged to Turkey, but during the Turco-Italian War (1911-12) Italy seized 12 of them, and during the Balkan War (1912-13) the Greeks occupied all the islands not held by Italy. For details, see articles on the principal individual islands.

**SPORADIC** (Lat. *sporadicus*, from Gk. σποραδικός, *sporadikos*, from σπείρειν, *speirein*, to sow). Isolated. In medicine, a disease is sporadic when but few cases, widely separated, appear. In botany, sporadic growths are those which are scattered or widely dispersed.

**SPORANGIUM** (Neo-Lat., from Gk. σπόρος, *sporos*, seed + ἄγγειον, *angeion*, vessel). The plant organ within which asexual spores are produced. Among algæ and fungi (qq.v.) the sporangium is usually a single cell (mother cell), which produces few to numerous spores. Among bryophytes there are no distinct sporangia, the spores being produced by a more or less complex capsule which is the essential feature of the characteristic leafless sporophyte (sporogonium) of the group. Among pteridophytes the sporangia are prominent, and their origin is the basis of a fundamental distinction in the group. They are complex, many-celled organs, usually borne on leaves. They originate usually from a single superficial cell, which divides in a plane parallel to the surface, resulting in an outer and inner cell. If the sporogenous tissue is derived from the outer cell, the sporangium is *leptosporangiate*; if it is derived from the inner cell, the sporangium is *eusporangiate*. The ancient ferns, represented to-day by a few tropical forms, were chiefly eusporangiate; while the great host of modern ferns, including the water ferns, are leptosporangiate. It is natural, therefore, to regard the eusporangiate condition as primitive, and the leptosporangiate as derived.

The two other divisions of pteridophytes (horsetails and club mosses) and all the spermatophytes (seed plants) are eusporangiate.

The structure of the ordinary fern sporangium indicates its highly specialized character. It consists of a long slender stalk that bears a spore-containing capsule. The walls of the capsule are thin, except for a single row of thick-walled cells (annulus) which girdles the capsule

TYPES OF SPORANGIA.

1, quillwort; 2, climbing fern; 3, liverwort; 4, club moss; 5, fungus.

like a meridian, from the stalk nearly around to the stalk again. At maturity the annulus acts like a bent spring, and when the thin wall of the capsule begins to yield, straightens violently and rebounds, hurling out a spray of spores.

In most ordinary ferns the sporangia are developed in great numbers upon the under surface of foliage leaves, usually in definite groups (sori), popularly called fruit dots, which are generally protected by a flaplike outgrowth (indusium, q.v.) from the epidermis. In some ferns (e.g., sensitive fern), however, foliage work and spore production are separated, and distinct foliage leaves and sporophylls (spore leaves) occur. This distinction persists in the other groups of pteridophytes (horsetails and club mosses) and in the spermatophytes, the sporophyll being a constant organ in them. In the horsetails (see *EQUISETUM*) and most of the club mosses (*Lycopodiales*, q.v.) the small sporophylls are organized into a conelike cluster (strobilus), which also appears as the so-called cones of pines, and as the equivalent in general of the flowers of angiosperms. In plants which exhibit heterospory (q.v.) the sporangia are differentiated, some producing megaspores (megasporeangia) and others microspores (microsporeangia). This differentiation begins among the pteridophytes, most notably in the club mosses (see *PTERIDOPHYTES*), and is found in all seed plants. Since the two forms of sporangia in seed plants, long called pollen sacs and ovules, are really microsporangia and megasporeangia respectively, stamens and carpels are properly sporophylls and not sex organs, as supposed.

The structure of a complex sporangium, such as occurs among all the vascular plants (fern plants and seed plants), is constant in charac-

ter though diverse in details. In the early stages of a sporangium, when it consists of a mass of similar cells, there is no distinction of regions. Very early, however, a single cell or group of cells becomes differentiated in connection with spore production, dividing more or less and producing in some cases a considerable mass of tissue. In any event, the cells of the last division are called the spore mother cells, because within each one of them four spores are formed, the group of four being known as a tetrad. In a completely formed sporangium, just outside of the mass of mother cells, there is a more or less distinct nourishing layer called the tapetum, outside of which is the sporangium wall, consisting usually of two to five layers of cells, and variously modified for protection, discharge, etc. This general account applies to all sporangia of the higher plants, excepting the megasporeangia or ovules of seed plants, where the ordinary sporangium structure is more or less modified. See Plate of FUNGI, TYPES OF.

**SPORE** (from Gk. σπόρος, *sporos*, seed). In general, a single cell separated from the parent plant for reproduction. In the simplest plants spores are not produced, as in the blue-green algæ (*Cyanophyceæ*, q.v.), but in all other plants they are a prominent method of reproduction. Asexual spores are usually produced by division of one or more cells in a sporangium. Sexual spores are not produced, as in the blue-green algæ spores (zygotes) are produced by the fusion of two sexual cells (gametes), which arise in a simple or complex organ called a gametangium (q.v.).

**Asexual Spores.** The diverse names given to asexual spores usually indicate some peculiar character of the spore or the group of plants which produce it. Among the green algæ (*Chlorophyceæ*, q.v.) the characteristic spore is a zoospore or swarm spore, a minute, naked mass of protoplasm, swimming freely by means of one or more cilia at one end (Fig. 9). Among the brown algæ (*Phæophyceæ*, q.v.) the zoospores are bean-shaped, with two cilia on the concave side. Among the red algæ (*Rhodophyceæ*, q.v.) the spores have no cilia and hence cannot swim, and as each sporangium produces four such spores they are called tetraspores.

Among the fungi, asexual spores, which are produced in great profusion and variety, have received many names. Among the alga-like fungi (*Phycomycetes*, q.v.) they are developed in one-celled sporangia, and in the aerial forms they are mostly light, dry cells, easily scattered by wind. Such are called simply spores, with no designating prefix. Among the sac fungi (*Ascomycetes*, q.v.), however, two conspicuous forms of asexual spores occur: the one, conidia, which are cut off from the tips of filaments; the other, ascospores (Fig. 4), developed within a delicate sac (ascus). Among the rusts (*Uredinales*, q.v.) the greatest variety of asexual spores for one plant is reached; e.g., in wheat rust there are four. Among toadstools (*Basidiomycetes*, q.v.) the characteristic spores are basidiospores, borne two or four together on the tips of pointed branches from a swollen filament, the basidium (Fig. 8). There are several other spores of minor significance among the fungi, each with its distinctive name. Among the bryophytes (liverworts and mosses) and most of the pteridophytes the asexual spores are called simply spores. In heterosporous plants (some pteridophytes and all spermatophytes), however, there

are two kinds of asexual spores, megaspores and microspores (q.v.). Before their character in seed plants was appreciated these two kinds were called respectively embryo sacs and pollen grains. In all of these wind-dispersed asexual spores the spore wall consists of two layers: a delicate inner one (intine or endospore) and a tough outer one (extine or exospore), often variously sculptured, especially in the pollen grains of flowering plants, and sometimes even winged, as in the pollen grains of pines (Fig. 2).

**Sexual Spores.** The name "zygospore" is used to designate sexual spores which result from the union of similar gametes (Figs. 5, 7). (See ISOGAMY.) Oöspores, produced by all but the lowest plants, are formed by the union of dis-

TYPES OF SPORES.

1, megaspore of *Selaginella*; 2, microspore (pollen) of pine; 3, spore of *Equisetum* with elaters; 4, ascospore of lichen; 5, zygospore of *Spirogyra*; 6, zoospore of *Vaucheria*; 7, zygospore of *Mucor*; 8, basidiospores; 9, zoospores of a green alga.

similar gametes (see HETEROGAMY) known as sperms and eggs. The term "zygote" has come into use to designate the sexually formed cell whatever the character of the gametes. See SEX, *In Plants*.

Under suitable conditions any spore begins to form a new plant, the process being called germination. In some cases the germination is immediate; in others it is delayed more or less by unfavorable conditions, as in winter. Spores adapted to delayed germination are called resting or dormant spores—recognized by their unusually heavy protecting wall. See REPRODUCTION.

The methods of spore dispersal are as diverse as the various means of seed dispersal. In many lower forms, as in the algae and some fungi, zoospores may distribute the species over wide areas. Most aerial spores are light and usually small, and thus readily scattered great distances by wind, a fact evidenced by the usually early appearance of ferns on new tropical islands. Mechanical expulsion and special devices for separating or entangling spores, as the elaters of *Equisetum* (Fig. 3), are common.

**SPÖRER**, spē'rēr, GUSTAV FRIEDRICH WILHELM (1822–95). A German astronomer, born in Berlin and educated there. He taught in succession at Bromberg, Prenzlau, and Anklam. At the last place he began in 1860 to observe sun spots with the view of determining the law of solar rotation, and with government aid he erected a solar observatory there. Spörer arrived independently at a conclusion similar to that of

Carrington concerning the equatorial quickening of the sun's movement on its axis. In 1868 he took part in an expedition to Hindustan for observing a total eclipse of the sun. He also investigated the structure of the chromosphere, and showed it to be of the same nature as the vast protrusions from it. From 1874 to 1894 Spörer was observer at the astrophysical observatory at Potsdam.

**SPO'ROPHYLL** (from Gk. σπόρος, *sporos*, seed + φύλλον, *phyllon*, leaf). A leaflike organ that occurs only in spermatophytes and in certain pteridophytes and bears sporangia (spore cases). Though generally unlike ordinary foliage leaves in appearance, they are regarded as foliar organs. See SPORANGIUM.

**SPO'ROPHYTE** (from Gk. σπόρος, *sporos*, seed + φυτόν, *phyton*, plant). The sexless phase in alternation of generations (q.v.).

**SPO'ROZO'A** (Neo-Lat. nom. pl., from Gk. σπόρος, *sporos*, seed + ζῷον, *zōon*, animal). A class of parasitic protozoa comprising the malaria germs, Texas cattle-fever germs, etc. While the sporozoa differ much in structure, they are similar in parasitic habits and development. As a rule they are more or less oval or elongated, with no organs of locomotion except in the early stages. They are very minute, though *Gregarina gigantea*, which lives in the intestine of the European lobster, is of comparatively colossal size, being a little over half an inch in length. They are nourished by the absorption of the fluid in which they live. The young arise as sporoblasts, which when enveloped with a membrane are called spores. The contents of which break up into several small bodies or sporozoites; the latter to complete their development must leave the first host and enter a second one.

Some of the sporozoa are parasites in the interior of cells, such as those lining the intestine of higher animals. Malaria in man has been proved to be due to the presence of a sporozoan (*Hæmamoeba* or *Plasmodium laverani*) which invades and destroys at a certain stage in its life history the red corpuscles of the blood. The sporozoites are developed in a mosquito (*Anopheles*) and are transferred from the salivary glands to man by the sting or proboscis. The bird-malaria germ is communicated by the ordinary mosquito (*Culex*). Another form (*Apiosoma bigeminum*) causes the Texas fever in cattle, the infection being carried by ticks (q.v.). A parasite of the tsetse fly (q.v.), which is a flagellate hæmatozoan, is the cause of the tsetse disease in southern Africa. See INSECT, *Insects and Disease*.

The Myxosporida are generally rather large sporozoa, their hosts being fish and insects. The silkworm disease called pebrine is due to one of the Myxosporida (*Glugea bombycis*), which inhabits all the tissues of the caterpillar.

The Sarcosporida, also called Rainey's or Mieschers's corpuscles, take up their abode in the voluntary muscles of mammals. They form oval cysts, which when ripe inclose spores, each of which contains numerous kidney-shaped sporozoites. Thus *Sarcocystis miescheriana* occurs in the muscles of the pig; *Sarcocystis muris* in the mouse; *Sarcocystis lindemanni* (rarely) in human muscle.

**SPORT** (from OF. *desporter*, to support, banish, amuse, divert). In biology, the appearance at birth of an individual having one or more marked or extraordinary physical or

mental characteristics; a sudden aberration from the type. See EVOLUTION; NATURAL SELECTION.

**SPORTS.** See ATHLETICS.

**SPORTS, BOOK OF** (correctly, the DECLARATION OF SPORTS). A name popularly given to an edict issued by James I of England in 1617 dictating the games which should or should not be played on Sundays after divine service. According to this, "no lawful recreation shall be barred to my good people which does not tend to the breach of the laws of my kingdom and the canons of the established Church." Sports allowed were dancing, archery, leaping, vaulting, May games, Whitsun ales, Morris dances, and setting up May poles. This proclamation was occasioned by the conduct of Puritan authorities in the County of Lancashire, who, by arbitrary repression of the recreations of the people, had created discontent and (in the estimation of the King and his advisers) "had given much comfort to the Roman Catholics" by giving a repulsive aspect to the reformed religion. The unlawful sports were bear baiting, bull baiting, and bowling. In 1644 the Long Parliament ordered all copies of the Book of Sports to be called in and publicly burned.

**SPOT, or LAFAYETTE.** A small food fish (*Leiostomus xanthurus*) of the South Atlantic and Gulf coast, locally called Lafayette (q.v.), goody, and oldwife. It is bluish above and sil-

THE SPOT.

very below, with about fifteen dark, wavy bands slanting down the sides, and a black spot behind the eye. It appears numerous on northern coasts in September, for spawning in the inlets.

**SPOTS/WOOD, or SPOT/TISWOOD, ALEXANDER** (1676-1740). A British soldier and American Colonial Governor. He was born at Tangier, Africa, entered the British army, served with Marlborough, and was wounded at Blenheim. He was appointed Lieutenant Governor of Virginia in 1710, became active in promoting the interests of William and Mary College, and was interested in helping the Indians. To his efforts the improvement in the production of tobacco is attributable, and he favored making tobacco notes a circulating medium. He introduced the manufacture of iron into Virginia, and urged the construction of a line of forts on the western frontier to resist the encroachments of the French. But Spotswood quarreled with Commissary Blair over the right of inducting ministers, and owing to lack of support was superseded in 1722. He remained in America, and in 1730 was appointed Deputy Postmaster-General. Consult *The Official Letters of Alexander Spotswood* in "Collections of the Virginia Historical Society," vol. i.

**SPOTSYLVANIA COURT HOUSE, BATTLE OF.** A series of battles during the Civil

War, between May 7 and May 21, 1864, around Spotsylvania Court House in Virginia, 49 miles north by west of Richmond, between the Federal Army of the Potomac, under General Meade, and the Confederate Army of Northern Virginia, under General Lee. As at the Wilderness (q.v.), the movements of the Federal army were directed by Grant. Both armies paused for breath after the battle of the Wilderness (May 5, 6), and prepared to renew the struggle. The Federal wagon trains were on the 7th drawn to the eastward to clear the direct road to Spotsylvania Court House, upon which a night march had been ordered. This was, however, anticipated by Lee, and Longstreet's corps (under R. H. Anderson) moved towards the same point, which (having a shorter line) they reached early on the 8th in time to oppose the advance of Warren's corps. Anderson had been ordered to begin his march at about the hour when he actually arrived at his destination. Notwithstanding his speed, Watson's division of the Federal cavalry reached the Court House some hours earlier, and had not, as alleged, Sheridan's dispositions been countermanded by Meade, the result might have been different. Anderson immediately intrenched, and, although attacked by Warren, was enabled to maintain his position until heavily reinforced.

By noon of the 9th the relative positions of the opposing forces were—the Confederate line forming a semicircle in front of the Court House, facing north, northwest, and northeast, with Anderson, Ewell, and Hill from left to right. Confronting them, Warren, Sedgwick, and Burnside from right to left, as named; Hancock had not yet arrived, but had been ordered to threaten Lee's left. In the course of these movements the distinguished commander of the Sixth Corps—General Sedgwick—was killed by a sharpshooter, and was succeeded by General Wright. It was discovered that Hancock's movement had caused Lee to draw troops from his right, and Grant thereupon (on the 10th) delivered a blow upon that part of his enemy's line. Combining the fifth, sixth, and part of the Second Corps, all under Hancock, while Burnside was to coöperate (a storming party of 12 regiments under Colonel Upton being a feature of the attacking column), he scaled the enemy's intrenchments and took several guns and hundreds of prisoners. The general attack failed, and was repulsed with loss; it was renewed with success but Upton's men were finally driven back.

A reconnaissance made on the 11th from Hancock's corps discovered a salient, at the right centre of the Confederate intrenchments. At 4 o'clock on the 12th a combined attack of Hancock and Burnside was made, capturing 4000 prisoners, 30 guns, many stands of arms and colors. The captured artillery was turned upon the defenders of the position, who, heavily reinforced, resisted strenuously. Reinforcements hurried to this quarter succeeded in pushing Hancock's men to the outside of the parapet but could drive them no farther. It was 3 o'clock next morning before fighting ceased, after nearly 20 hours of battle. As it was reported that the Confederates were trying to take the offensive in this quarter, at 6 A.M. of the 12th, Wright was ordered by Meade to attack on Hancock's right. This attack against the west angle, lasting all day and well into the night, was one of the fiercest

and bloodiest of the whole war; its memory has been perpetuated in the name since given to the place, the "Bloody Angle." Lee retired to a fresh position in rear of the one previously occupied and strongly intrenched. Until the 18th the two armies lay facing each other, engaging in minor conflicts, and Grant then, on May 19-21, transferred his army to the North Anna River. On the 8th Sheridan had been detached with his command and sent on a raid in the direction of Richmond and against Lee's communications. He was followed by the Confederate cavalry, but succeeded in passing entirely around Lee's army. He had four severe engagements with Stuart's cavalry, and that distinguished leader was mortally wounded. He recaptured 400 Federal prisoners, seized large quantities of supplies and war material, destroyed miles of railroad and telegraph, passed within the outer defenses of the enemy's capital, and after a fortnight reached Grant's headquarters. The Federal losses at Spotsylvania are estimated at 16,141 killed and wounded; those of the Confederates cannot be stated, but were probably much less.

**SPOTTED CAVY.** See PACA.

**SPOTTED FEVER, ROCKY MOUNTAIN;** also known as TICK FEVER, BLACK FEVER, BLUE DISEASE. An acute infectious disease, coming on suddenly with chill, fever, headache, and pains in the joints and bones, appearing in the spring months in certain districts in the Rocky Mountains. It is endemic in the Bitter Root valley of Montana, whence it is spread to Idaho, Wyoming, and Nevada. Mortality varies in different epidemics and is given as from one to three, or even as high as seventy per cent. Infection is spread by means of the wood tick, *Dermacentor occidentalis*, which fastens upon roaming animals, domestic and wild, and is principally communicated to lumbermen, cattle and sheep men, and miners. The incubation period is from one to three days. The temperature rises to 103°, 104°, or even 107° F. In fatal cases death occurs usually between 6 to 12 days. Patients surviving the second week generally recover. Preventive treatment consists in guarding against the bite of ticks at certain seasons. During the attack treatment is purely symptomatic. The rash from which the disease gets its name consists of bright-red macules which gradually become darker and reach their fullest development from the seventh to the tenth day. They are seen on the wrists and ankles and gradually spread to the trunk and abdomen. See TYPHUS FEVER.

**SPOTTED FEVER.** See MENINGITIS.

**SPOTTISWOOD, A.** See SPOTSWOOD.

**SPOT'TISWOODE, SPOT'TISWOOD, SPOTISWOOD, or SPOTS'WOOD, JOHN** (1665-1639). Archbishop of St. Andrews. He was educated at the University of Glasgow and on his father's death in 1683 succeeded him as parson of Calder. For many years an

uncompromising Presbyterian, he afterward adopted English Episcopal ideas, and became the chief instrument of James I and Charles I in their attempts to reconstruct the Scottish church after the English model. He was Archbishop of Glasgow in 1603 and member of the Scottish Privy Council in 1605. In 1610 he was moderator of the Assembly which gave its consent to the introduction of Episcopacy into Scotland. In 1615 Spottiswoode was made Archbishop of St. Andrews and Primate of Scotland. In 1618 he persuaded the General Assembly to accept the Five Articles of Perth, ordaining certain ceremonial innovations, and he subsequently enforced the articles as far as he could. He took part in the revision of the Scottish Prayer Book, but was opposed to the introduction of the Laudian system into Scotland. In 1633 he crowned Charles I at Holyrood, and in 1635 he was made Chancellor of Scotland, a dignity which no churchman had held since the Reformation. He tried to introduce the Prayer Book, according to the King's wishes, but in the resulting disorders found it necessary to flee from Scotland. He was excommunicated and deposed by the General Assembly, Dec. 4, 1638, and Charles asked him to resign the chancellorship. Spottiswoode was the author of the *History of the Church and State of Scotland from the Year of Our Lord 203 to the End of the Reign of King James the VI, 1625*, an official compilation for King James, first printed in London in 1655. Consult David Calderwood, *The True History of the Church of Scotland* (n. p., 1674).

**SPOTTISWOODE, WILLIAM** (1825-83). An English mathematician and physicist, born in London. He was educated at Balliol College, Oxford. His memoirs on the contact of curves and surfaces in the *Philosophical Transactions* and various other scientific journals are important and original. Among his works are: *Meditationes Analyticae* (1847); *Elementary Theorems Relating to Determinants* (1851); a second edition appeared in *Crelle's Journal*, 1856; *A Tarantasse Journey through Eastern Russia* (1857); *Polarization of Light* (1874); *A Lecture on the Electrical Discharge, its Form and Functions* (1881).

**SPOUT SHELL.** See PELICAN'S-FOOT.

**S. P. Q. R.** The abbreviation of *Senatus Populusque Romanus* (the Senate and the Roman people), the motto surmounting the Roman standards.

**SPRAGUE.** A town in New London Co., Conn., 22 miles by rail from New London, on the Shetucket River and on the New York, New Haven, and Hartford Railroad. It contains the Academy of the Holy Family. There are cotton, woolen, and paper mills, and a manufactory of hospital supplies. Pop., 1900, 1339; 1910; 2551.

**SPRAGUE, FRANK JULIAN** (1857- ). An American electrical engineer, born at Milford, Conn. He graduated at Annapolis in 1878, resigned from the naval service in 1883, and became an assistant to Thomas A. Edison. He founded in 1884 the Sprague Electric Railway and Motor Company, and later the Sprague Electric Elevator and Sprague Electric companies. Besides having been a pioneer in electric-railway work, he introduced the high-speed electric elevator, and invented the multiple-unit system of electric-train control. He served as consulting engineer to the Sprague and General

electric companies after 1902, and in the same capacity for other important corporations. In 1892-93 he was president of the American Institute of Electrical Engineers, and he became president of the American Institute of Consulting Engineers. Sprague was awarded a gold medal at the Paris Exposition in 1889 and the Elliott Cresson gold medal of the Franklin Institute in 1904, a grand prize at the St. Louis Exposition in 1904, and the Edison gold medal in 1911. In 1915 he was appointed a member of the Naval Advisory Board.

**SPRAGUE, WILLIAM** (1831-1915). An American manufacturer and politician, born at Cranston, R. I. After studying at the Irving Institute, Tarrytown, N. Y., he entered his father's mills, and afterward became interested in linen weaving and locomotive building. He was elected Governor of Rhode Island, but in the Civil War he offered his services to the United States government, and served with the Rhode Island troops, fighting in the first battle of Bull Run and in the Peninsular campaign. From 1863, when his term as Governor expired, until 1875 he was a member of the United States Senate. He died in Paris.

**SPRAGUE, WILLIAM BUELL** (1795-1876). An American clergyman and compiler of *Annals of the American Pulpit* (9 vols., 1857-69), a comprehensive biographical dictionary of the leading American ministers of all denominations. He graduated at Yale (1815), studied theology at Princeton (1819), had pastoral charges at West Springfield, Mass. (1819-29), and Albany, N. Y. (1829-69), and afterward devoted himself to literary work at Flushing, L. I. Besides the *Annals* mentioned above he wrote numerous books, of which the chief are *Lives of Rev. Edward Dorr Griffin, D.D.* (1838), *Timothy Dwight* (1845), and *Rev. Jedediah Morse* (1875).

**SPRAIN** (Lat. *ex*, out + *premere*, to press), or **STRAIN**. A term employed in surgery to designate a violent stretching of tendinous or ligamentous parts with or without rupture of some of their fibres. Sprains are frequent in the joints of the upper limbs, especially in the wrist and the articulations of the thumb. In the lower extremity the ankle is the joint most frequently affected. In slight ankle sprains the ligaments are only stretched or slightly lacerated; in more severe cases they may be completely torn through or detached from their bony insertions. Sprains are sometimes mistaken for fractures, and vice versa; and the two injuries may coexist. Pain and swelling sometimes make accurate diagnosis difficult, especially if the patient is not quickly seen after the accident; and if any doubt exists the case should be treated as for the more severe injury. An X-ray photograph, however, will clear up the diagnosis. Sprains of the knee are not uncommon, and are characterized by swelling from effusion of fluid within the joint. The treatment of sprains generally must be regulated by their severity. When seen early before swelling has taken place, strapping with adhesive plaster is a most satisfactory procedure. In most cases elevation of the joint, the application of cold, and complete rest in a splint will be sufficient, and as soon as the inflammation subsides massage and pressure movement are necessary to prevent adhesions.

Sprains or strains are common among horses, owing to exertions required of them, often

while they are young and unprepared. Various muscles, ligaments, and tendons are affected, but none more frequently than the large tendons at the back of the fore limbs. In slight cases cold water continuously applied for several hours gives relief; but in all serious cases diligent fomentation with hot water is preferable. Perfect rest is essential; in bad cases the horse may be slung. Blisters, hot oils, firing, and all such irritants are not to be used until inflammation abates and the part becomes cool and free from tenderness. Such remedies are then useful for causing the reabsorption of swelling and loosening of adhesions.

**SPRAT** (from AS. *sprota*, sprout). A small European herring (*Clupea sprattus*), abundant in the northern Atlantic. It is six inches in length when fully grown. Sprats are cured in great quantities, dry salted and in brine, and form a cheap and excellent food. Small and unimportant species have taken the name in America, where the true sprat is not found.

**SPRATT, THOMAS ABEL BRIMAGE** (1811-88). An English vice admiral and hydrographer. He was born at East Teignmouth and entered the navy in 1827. For the most part until 1863 he was engaged in making a survey of the Mediterranean. During the Crimean War he commanded the *Spitfire*, and in 1855 was promoted to captain. He made also important geological investigations in the Greek isles and in Asia Minor, and in 1856 was elected a fellow of the Royal Society. His writings include *Travels in Lycia*, with Edward Forbes (2 vols., 1847), and *Travels and Researches in Crete* (2 vols., 1865).

**SPREADING ADDER**. See HOGNOSE, and the photographic Plate of SNAKES.

**SPRECK'ELS, CLAUD** (1828-1908). An American sugar refiner, born at Darmstadt in Hanover, Germany. He emigrated to Charleston, S. C., in 1846, worked for a time in New York City, and went to San Francisco in 1856. In 1857 he established the Albany Brewery in San Francisco, and in 1863 organized the Bay Sugar Refining Company. Two years afterward he sold his interests and went to Europe, where he studied the manufacture of sugar in all its aspects. Returning to California, he engaged more extensively in business, gaining large interests in manufactures and shipping both in California and in the Hawaiian Islands. He acquired large sugar interests in Hawaii, built large refineries with improved processes, engaged in beet-sugar farming in California, and by the control he exercised over the sugar industry gained for himself the name of the sugar king.

**SPRECKELS, RUDOLPH** (1872- ). An American sugar refiner and financier, born in San Francisco. At an early age he entered his father's sugar refinery at Philadelphia to aid in the unsuccessful fight against the sugar trust. At 22 he purchased his father's holdings in the Hawaiian Commercial and Sugar Company, became its president and made it profitable. After making a fortune he sold his interest and returned, in 1898, to San Francisco to become a banker and head of a gas company. Again he fought a trust, but was successful. He was president of the First National Bank after 1906. In that year he was a member of the committee of 50 organized after the earthquake, and also at that time he organized the graft prosecution against city officials. In 1912,

although a Republican in politics, he supported Wilson and effected an organization of Republicans to that end.

**SPREE**, shprā. A river of Prussia (Brandenburg) which rises in the eastern part of the Kingdom of Saxony, on the borders of Bohemia (Map: Germany, F 3). It flows in a winding northwest course of 226 miles past Berlin, and falls into the Havel at Spandau. Its valley, low, marshy, and dotted with lakes, was formerly, probably, the course of a much larger stream. It becomes navigable for small vessels at Liebsch, and has recently been deepened below Berlin so as to admit large ships to that city. It is connected with the Oder by two canals.

**SPREMBERG**, shprēm'bërk. A town of Prussia, on the Spree, 77 miles southeast of Berlin (Map: Germany, F 3). Its chief industry is cloth manufacture. There are oil mills and mines of lignite. Pop., 1910, 11,706.

**SPRENGEL**, sprēng'el, KURT (1766-1833). A German physician and botanist, born at Boldekow, near Anklam, and educated at Halle. In 1789 he was made professor of medicine there, and in 1797 he was appointed professor of botany as well. He published: *Versuch einer pragmatischen Geschichte der Arzneikunde* (1792-1803; 4th ed., 1846); *Handbuch der Pathologie* (1795-97; 4th ed., 1815); *Historia Rei Herbariæ* (1807-08); *Geschichte der Botanik* (1817-18); *Neue Entdeckungen im ganzen Umfange der Pflanzenkunde* (1819-22).

**SPRENGEL EXPLOSIVES**. See EXPLOSIVES.

**SPRENGER**, sprēng'ër, ALOYS (1813-93). An Orientalist, born at Nassereit, Tirol, and educated at Innsbruck and at the University of Vienna. In 1836 he went to Paris, and thence to London, where he became a naturalized British subject in 1838. In 1843 he proceeded to Calcutta under an appointment to the medical service of the East India Company. From 1844 to 1848 he was principal of the Mohammedan College at Delhi. In December, 1847, he became assistant resident at Lucknow, and was employed for some time in cataloguing the manuscripts in the royal library of the King of Oudh. From 1851 to 1854 he was official Persian translator at Calcutta and principal of the Mohammedan College at Hoogli. During these years he traveled extensively through the Orient, gathering materials for his projected *Life of Mohammed*, the first portion of which was published at Allahabad in 1851. In 1857 he returned to Europe and settled at Heidelberg. From 1858 to 1881 he was professor at the University of Bern. The remainder of his life he spent in retirement at Heidelberg. His works include: *Technical Terms of the Suffees* (1844); *English-Hindustani Grammar* (1845); *Selections from Arabic Authors* (1845); *History of Mahmud Ghaznah* (1847); *The Gulistan of Saadi* (1851), a translation from the Persian; *Leben und Lehre des Mohammed* (3 vols., 1861-65); *Die alte Geographie Arabiens* (1875).

**SPRENGTPORTEN**, sprēngt'pör'ten, GÖRAN MAGNUS, COUNT (1740-1819). A Swedish-Russian politician. He assisted his half brother, J. M. Sprengtporten, in the revolution of 1772, and became colonel and brigadier in Finland (1775). Like his brother, suspicious of the King of Sweden, he was welcomed at the Russian court. After service in France he planned to separate Finland from Sweden and to make

it an independent state under the protection of Russia. He openly opposed the Swedish King, engaged in treasonable correspondence with Russia, and on invitation of Catharine II he entered Russian service (1787). In the Russo-Swedish War (1788-90) he commanded a Russian army corps against Finland. The High Court of Finland condemned him to death as a traitor, and Catharine considered him an impostor, but Emperor Paul reemployed him in diplomatic service. In 1808 he was appointed first Russian Governor-General of Finland, with title of Count, but unpopularity compelled him to resign the next year.

**SPRIGG**, SIR JOHN GORDON (1830-1913). A South African statesman, born at Ipswich, England. In 1858, for the sake of his health, he settled on a farm near King William's Town in Cape Colony. Entering the Cape House of Assembly in 1869 he served there until 1904 and again after 1907. He won distinction by his attacks upon the immoral conduct of the Molteno government, and succeeded Molteno in 1878 as Prime Minister and Colonial Secretary. Subsequently he served as Treasurer (1884-86; 1893-96), and as Prime Minister and Treasurer (1886-90; 1896-98; 1900-04). Sprigg was an ardent Imperialist, and influenced his government to contribute £50,000 a year to the British treasury.

**SPRING** (AS. *spring*, spring). A natural outflow of water from the ground at a single point within a restricted area. If this outflow has no visible current it is called a seepage. Springs may emerge at different points on dry land, or in the beds of streams, ponds, or lakes. They will also show variable volume of flow. Cold spring waters are usually of meteorologic character, rain having soaked into the ground and emerged again as a spring at some other point on a lower level. Hot spring waters may be of igneous origin, or they may represent surface waters heated by contact underground with uncooled igneous rock, as the Yellowstone Park hot springs.

Classified according to their mode of origin, we recognize gravity springs, or those not confined by impervious beds, and artesian springs, in which the water is under pressure because it is confined to a pervious bed or a fissure. Grouped according to the nature of the water-conducting passages springs are: (1) seepage, in which the water seeps out from sand and gravel; (2) tubular, or those formed by tubular passages in glacial drift or easily soluble rocks; (3) fissure, in which the water issues along bedding, joints, fault, or cleavage planes. Where the water follows an underground channel way of somewhat open character, pollution can be carried a distance.

The composition of spring water varies with the character of the surrounding soil or rocks. Volume of flow of any given spring may vary with the season and amount of rainfall. Seepage springs often fail in periods of drought or little rainfall. Nevertheless some springs have a fairly constant and even large volume of flow, and may serve as sources of domestic or municipal water supply. Some are also of medicinal value on account of the dissolved mineral substances which they contain. Consult: Schlichter, "Motion of Underground Water," in *United States Geological Survey, Water Supply and Irrigation Papers*, No. 67 (Washington, 1902); M. L. Fuller, *Domestic Water Supplies for the*

*Farm* (New York, 1912); Ries and Watson, *Engineering Geology* (ib., 1914). See ARTESIAN WELLS; GEOLOGY; GEYSER; MINERAL WATERS.

**SPRING.** A term used in mechanics to designate variously constructed devices of metal or other elastic material adapted to resist concussion, to store up and give out motive power, or to register stress through their property of uniform deformation under stress and their tendency to return to their original form when deforming stress is released. A spiral spring is one which is wound around a fixed point or centre in constantly receding coils, like the mainspring of a watch or clock. Spiral springs are usually made of flat strips or ribbons of steel, but may be made of round or other shaped wire. A helical spring is one which is wound around a cylindrical arbor in advancing spirals like the thread of a screw. Helical springs are usually made from round bars or from square rods of steel, and are perhaps more extensively used than any other form. An elliptical or laminated spring is made of flat bars, plates, or leaves of regularly varying lengths superposed one upon the other. For formulas for calculating the strength and energy of springs of various forms and sizes, consult William Kent, *Mechanical Engineers' Pocket Book* (8th ed., New York, 1913).

**SPRING, GARDINER** (1785-1873). An American Presbyterian clergyman, son of Samuel Spring. He was born at Newburyport, Mass., and was graduated at Yale in 1805. He taught for two years in Bermuda, and was admitted to the bar at New Haven, Conn., in 1808. The next year he entered Andover Theological Seminary. In 1810 he became pastor of the Brick Presbyterian Church, New York City, where he remained until his death. He was one of the founders of the American Bible Society in 1816, the American Tract Society in 1825, and the American Home Missionary Society in 1826. He published many books of a religious character besides his *Personal Reminiscences of his Life and Times* (1866).

**SPRING, SAMUEL** (1746-1819). An American Congregational clergyman. He was born at Northbridge, Mass., and graduated at the College of New Jersey in 1771. In 1775 he joined the Continental army, and accompanied Benedict Arnold as chaplain of the invading army into Canada. In 1776 he was installed pastor at Newburyport, Mass., where he continued until his death. He was one of the founders of Andover Theological Seminary and of the Massachusetts Missionary Society, and to him is attributed the idea of forming the American Board of Commissioners for Foreign Missions. Many of his occasional sermons have been printed, the most notable being *A Sermon on the Death of Washington* (1799) and *A Discourse in Consequence of the Late Duel* (1804)—that between Burr and Hamilton. Consult Gardiner Spring, *Personal Reminiscences of his Life and Times* (2 vols., New York, 1866).

**SPRING BALANCE.** An instrument used to determine the weight of a body by the extension or compression of a spring. In its usual form a spring of coiled wire is contained in a metal case and incloses a central rod to which is attached at one end a hook, and at the other a projection which extends through a slit in the case and moves over a graduated scale. The central rod can also be connected by means of a rack and toothed wheel with an axle on

which is fastened a pointer moving over a circular scale or dial. The spring balance measures the amount of attraction of the earth at any particular place; consequently, readings at the equator would be different from those at the poles or other places on the earth's surface. The ordinary balance, on the other hand, would give the weight for a body irrespective of its position. The force of the spring varies with temperature, which alters the length and elasticity of the wire and renders impossible precise measurements. In practice many spring balances are inaccurate, due to faulty design and construction, and in some communities weights and measures officials prescribe standards for their construction.

**SPRING BEAUTY.** See CLAYTONIA.

**SPRING'BOK'** (Dutch, springing goat). A South African gazelle (*Gazella euchores*). It is larger than the common deer, and its neck and limbs much longer and more delicate. The general color is fulvous brown on the upper parts, pure white beneath, the colors separated on the flanks by a broad band of deep vinous red. The head is white, except a broad brown band on each side from the eye to the mouth, and a brown spot in the centre of the face. The springbok derives its name from the prodigious leaps which it takes either when alarmed or in play, often to the height of seven feet, and sometimes of 12 or 13 feet. It is one of the most sought-after game animals of South Africa, yet remains numerous. Consult authorities cited under ANTELOPES, and see Plate of GAZELLES.

**SPRING EEL.** A fish of the small order Opisthomi and family Mastacembelidæ, several species of which occur in the fresh waters of the East Indies; they are eel-like in form, with the dorsal fin very long and the forepart of it composed of low free spines. Allied to this is a small curious eel (*Derichthys serpentinus*) dredged from the depths of the North Pacific. See Plate of EELS.

**SPRING'ER, ALFRED** (1854- ). An American chemist, born in Cincinnati, Ohio. He took degrees of A.M. and Ph.D. at Heidelberg and after 1873 was a member of a firm of manufacturing chemists in Cincinnati. He published studies on *Glycocholic Ether* (1879), *Pentachloramyl Formate* (1881), and *Reduction of Nitrates by Ferments* (1883), in which he announced his discovery of denitrifying ferments among the microorganisms of the soil, and forming a sort of link between the plants and their nitrogenous constituents; also, *A Latent Characteristic of Aluminum* (1891) and *Increase of Segmental Vibrations* (1897). He was one of the inventors of the torsion balance.

**SPRINGER, ANTON** (1825-91). A German art critic and historian. He was born at Prague and studied philosophy and the history of art at the universities of Prague, Munich, and Berlin. As a historian and politician at Prague he took a prominent part in the struggles following the revolution of 1848, advocating liberal views and Prussian supremacy in Germany. In disfavor with the government, he left Prague to study art in the Netherlands, France, and England. From 1852 he taught the history of art at Bonn, where he was appointed professor in 1859; then at Strassburg and (from 1873) at Leipzig. He wrote a number of historical works, important for their day, but no longer standard; but his contributions to art

history, particularly during the Renaissance, are of permanent value. They are characterized by scholarly historical research and sound, appreciative criticism. The most important are: *Bilder aus der neueren Kunstgeschichte* (1867); *Raffael und Michelangelo* (1877); *Grundzüge der Kunstgeschichte* (1887-88; 8th ed., as *Handbuch der Kunstgeschichte*, 5 vols., 1907); *Albrecht Dürer* (1892). Consult the posthumous *Aus meinem Leben* (Berlin, 1892).

**SPRINGER, WILLIAM MCKENDREE** (1836-1903). An American jurist and political leader, born at New Lebanon, Ind. He graduated at the Indiana State University in 1858, and for four years was a newspaper correspondent and editor. He was admitted to the bar in 1859, and in 1872, having become a resident of Illinois, was elected a member of the Illinois Legislature. He was a member of Congress (1875-95), where he introduced a resolution, carried by a large majority, declaring that it would be unwise for one man to serve more than two terms in the presidency. He was United States Judge of the Northern District of Indian Territory and Chief Justice of the United States Court of Appeals there (1895-99).

**SPRINGFIELD.** The capital of Illinois and the county seat of Sangamon County, 185 miles southwest of Chicago, on the Illinois Central, the Chicago and Alton, the Chicago, Peoria, and St. Louis, the Baltimore and Ohio Southwestern, the Cincinnati, Hamilton, and Dayton, the Wabash and the Illinois Traction railroads (Map: Illinois, E 6). It is regularly laid out with wide streets. The most prominent edifice is the State capitol, a handsome building begun in 1867, and completed twenty years later. It is 399 feet long and 286 feet wide, and has a massive dome 364 feet high. Other interesting structures are the old capitol, now used as the county courthouse, and the Lincoln residence, now under State supervision. The Lincoln Monument and Mausoleum of gray granite, the cost of which was borne by several States, is situated a little more than a mile from the heart of the city. There are the Bettie Stuart Institute (female), Concordia Seminary, St. Agatha's School, and the Academy of Our Lady of the Sacred Heart. The State Library has 50,000 volumes, and the Public more than 42,000 volumes. There are also the State Historical Library, that of the Illinois State Museum of Natural History, the Lincoln Library, and the Supreme Court Library. Other noteworthy features are the State armory, the Supreme Court Building, the city hall, post office, Governor's mansion, the high-school and the Odd Fellows' buildings, the Orphanage of the Holy Child, the Springfield and St. John's hospitals, and the David Prince Sanitarium.

Springfield is the centre of a rich farming and coal-mining region, which also has important horse-breeding interests. The census of manufactures in 1914 showed an invested capital of \$9,078,000 and an output of \$11,753,000. The Illinois Watch Company maintains a large establishment here, and there are also engine works, boiler works, car shops, foundries and machine shops, lumber, woolen, and flour mills, breweries, and manufactories of soap, saddlery, mattresses, brick, clothing, automobile tires, electric meters, etc. The commission form of government has been adopted. For maintenance and operation the city spent in 1913, \$733,000, the principal items being: schools, \$295,000; high-

ways, \$44,000; fire department, \$77,000, police department, \$52,000; and water works, \$60,000. The water works are owned by the municipality. Pop., 1890, 24,963; 1900, 34,159, 1910, including annexed suburbs, 51,678; 1915 (U. S. est.), 59,468; 1920, 59,183. First settled in 1819 and laid out in 1823, Springfield was incorporated as a town in 1832, and was chartered as a city in 1840. In 1837 it was chosen as the State capital, and the State Legislature assembled here for the first time in 1839. For many years it was the home of Abraham Lincoln. Consult Power, *History of Springfield* (Springfield, 1871).

**SPRINGFIELD.** A city and the county seat of Hampden Co., Mass., 99 miles by rail west-southwest of Boston, on the Connecticut River and on the Boston and Albany, the Boston and Maine, the Central New England, and the New York, New Haven, and Hartford railroads (Map: Massachusetts, B 4). Several bridges here span the river. There are 1605 acres in the public park system. In Court Square are the Soldiers' and Sailors' Monument and a statue of Miles Morgan. "The Puritan," by Saint-Gaudens, near the library, is a work of great merit. Among prominent buildings of Springfield are some designed by H. H. Richardson, the most notable of which, perhaps, are the county courthouse and the Church of the Unity. The new municipal group consists of three fine edifices—the Administration Building, the Auditorium, and Campanile Tower. The United States arsenal is conspicuously situated within extensive grounds, where small arms are made for the United States government. (See SMALL ARMS.) Other prominent structures are the Springfield Science Museum, Art Museum (containing the George Walter Vincent Smith collection, one of the best in the country), the Federal Government Building, the Public Library, containing 190,000 volumes, and the buildings of the Springfield Fire and Marine Insurance Company, the Massachusetts Mutual Life Insurance Company, the Union Trust Company, and the Third National Bank. Springfield is the seat of the American International College, and of the International Y. M. C. A. College. The most important charitable institutions and hospitals include the City Almshouse, the Union Relief Association, the Home for Friendless Women and Children, the Good Will Home, the Rescue Mission, Industrial Charities, Springfield Hospital, Wesson Memorial Hospital, Mercy Hospital, and the Hampden Homeopathic Hospital.

The Federal census of 1909 gave the capitalization of the industrial establishments as \$28,658,000 and the value of the output as \$31,773,000. The leading manufactures are motor cycles, steam and electric cars, skates, revolvers, confectionery machinery, foundry and machine-shop products, paper and envelopes, tobacco, cigars and cigarettes, brass castings, lumber and lumber products, buttons, electrical apparatus and supplies, confectionery, automobiles, rubber and elastic goods, cotton and woolen goods, tools, etc. Springfield is a port of entry, and it has some foreign trade. The government is vested in a mayor, annually elected, and a bicameral council. The city spent in 1915, \$3,808,000, the principal items being: schools, \$894,000; police department, \$272,000; fire department, \$283,000; health and sanitation, \$202,000. The water works are owned and operated by the municipality. The system comprises 213 miles of mains.

The net debt of the city in 1914 was \$7,549,328, the assessed valuation of real and personal property, \$180,129,031. Pop., 1800, 2230; 1850, 11,330; 1870, 26,703; 1880, 33,340; 1890, 44,179; 1900, 62,059; 1910, 88,926; 1915 (State census), 102,941; 1920, 129,503.

Springfield was first settled in 1636 by a party from Roxbury headed by William Pynchon. Until 1640, when it received its present name, it was known as Agawam. On Oct. 4, 1675, during King Philip's War, it was attacked by Indians and burned. During Shays's Rebellion it was the scene (September, 1786) of a riot headed by Shays. Later (Jan. 25, 1787) occurred a sharp skirmish between a small body of State militia and about 2000 insurgents led by Shays, the latter being easily defeated. Consult: Green, *Springfield, 1636-1886* (Springfield, 1888); Burt, *The First Century of the History of Springfield, The Official Records from 1636-1736* (Springfield, 1898-99); Charles H. Barrows, *The History of Springfield for the Young* (ib., 1909); James E. Tower (ed.), *Springfield Past and Prospective* (Springfield, Mass., 1906).

**SPRINGFIELD.** A city and the county seat of Greene Co., Mo., 200 miles southeast of Kansas City, on the St. Louis and San Francisco and the St. Louis, Iron Mountain, and Southern railroads (Map: Missouri, C 4). The city is in the Ozark Mountains (altitude 1300 feet), and is surrounded by beautiful forest and prairie scenery. It is the seat of Drury College (non-sectarian), opened in 1873, and of Loretto Academy. Other features include the United States government building, Carnegie Library, the high school, courthouse, city hall, and Federal building, St. John's Hospital, Burge-Deaconess and Springfield hospitals, U. S. Weather Bureau Station, U. S. Land Office, Doling Park, and the State Normal School. The national cemetery here has 1703 graves, of which 737 are of unknown dead. Situated in the mineral belt of southwest Missouri, Springfield has also important agricultural, lumbering, and stock-raising interests. The leading establishments are carriage and wagon factories, ironworks, lumber mills, flouring mills, furniture factories, foundries, and shops of the St. Louis and San Francisco Railroad. The commission form of government was adopted in 1916. Pop., 1900, 23,267; 1910, 35,201; 1915 (U. S. est.), 39,513; 1920, 39,631.

**SPRINGFIELD.** A city and the county seat of Clark Co., Ohio, 45 miles west of Columbus, at the confluence of Lagonda Creek and Mad River, and on the Erie, the Cleveland, Cincinnati, Chicago, and St. Louis, the Ohio Electric, and the Detroit, Toledo, and Ironton railroads (Map: Ohio, C 6). It is the seat of Wittenberg College (Lutheran), opened in 1845, and has the Warder Public Library, with more than 31,000 volumes. Noteworthy also are the city hall, the United States government building, the buildings of four State fraternal homes, Masonic, Pythian (two), and Independent Order of Odd Fellows, Clark Memorial Home for Aged Women, city hospital, Memorial Hall, Babies' Fresh-Air Camp, and 250 acres of parks, the largest reserve being Snyder Park. Excellent water power has aided in making an important industrial city.

The census of 1914 showed that there was invested in the various industries capital to the amount of \$29,082,000. Their output was valued at \$27,722,000. More than five-sevenths

of the capital and nearly two-thirds of the output were represented by the manufactures of agricultural implements, and foundry and machine-shop products. Other manufactured articles include electric motors, motor trucks, caskets and vaults, piano plates, emery wheels, gas and gasoline engines, automobile tires and tubes, incubators, railway frogs, etc. The commission-manager form of government has been adopted. The water works, which represent an investment of \$2,000,000, are owned by the municipality. Springfield was first settled in 1799. Pop., 1900, 38,253; 1910, 46,921; 1915 (U. S. est.), 50,804; 1920, 60,840.

**SPRINGFIELD.** A city in Bon Homme Co., S. Dak., 30 miles west of Yankton, on the Missouri River and on the Chicago, Milwaukee, and St. Paul Railroad (Map: South Dakota, F 5). It is the seat of the Southern State Normal School. Pop., 1900, 525; 1910, 675.

**SPRINGFIELD.** A town and a village in Windsor Co., Vt., 14 miles north of Bellows Falls, on the Black River and on the Springfield Electric Railway (Map: Vermont, D 7). It has machine shops, a brass foundry, large shoddy mills, etc. Pop. (town), 1900, 3432; 1910, 4784.

**SPRING FROG.** See GREEN FROG.

**SPRINGHILL.** A town in Cumberland County, Nova Scotia, Canada, on the Cumberland Railway and Coal Company Railway, about 75 miles north-northwest (direct) of Halifax (Map: Nova Scotia, G 5). It has manufactures and important coal mines. Pop., 1901, 5178; 1911, 5713.

**SPRING HILL COLLEGE.** A Roman Catholic institution for higher education founded in 1830 under the direction of the Society of Jesus and located at Spring Hill, Ala. Its courses are preparatory (two years), commercial (five years), and classical (seven years). The students in 1914-15 numbered 225, and the faculty 26. The buildings and grounds were valued at about \$250,000. The annual income is about \$42,000. The library contains about 19,000 volumes. The president in 1915 was E. Cummings, S. J.

**SPRINGING USE.** A use which is limited to take effect on the happening of a future event and not depending upon any preceding use or estate. This is a peculiar form of future estate and differs from a shifting use, which operates in derogation of some other estate, and from a remainder which must be limited upon some particular or preceding estate. It may be limited to rise either upon a certain or uncertain and contingent event. See REAL PROPERTY; LIMITATION OF ACTIONS; SHIFTING USE; ESTATE. Consult Gilbert, *On Uses*.

**SPRING LAKE.** A borough in Monmouth Co., N. J., 11 miles south of Long Branch, on the Atlantic Ocean and on the Pennsylvania and the Central of New Jersey railroads (Map: New Jersey, D 3). Spring Lake is a popular summer resort, having a fine beach and several excellent hotels and beautiful residences. It contains also the Ann May Hospital and the Maloney Memorial. Pop. (summer), 20,000; (resident), 1915 (State census), 1492.

**SPRING-RICE, SIR CECIL ARTHUR** (1859-1918). A British diplomat. He was born in England and was educated at Eton and at Balliol College, Oxford. After being private secretary to Earl Granville and précis writer to the Earl of Rosebery, he was successively

Secretary of the British legations at Brussels, Washington, Tokyo, Berlin, and Constantinople. He was appointed chargé d'affaires at Teheran, Persia (1900), and British Commissioner of the Public Debt at Cairo (1901); was First Secretary of the British Embassy at St. Petersburg (1903-05); Minister and Consul General at Teheran (1906-08); Minister to Sweden (1908-12); and in 1912 became British Ambassador to the United States, in succession to James Bryce (q.v.). He was knighted (K.C.M.G.) in 1906 and was given the Grand Cross of the Victorian Order in 1908.

**SPRING SWIFT.** Any lizard of the iguanid genus *Sceloporus*, which contains a great number of small species whose heads are not spiny and which have flat scales and no gular fold. They vary in color, but are generally dull above, with one or two light lines along each side and black cross lines or blotches on the back. The inferior surfaces, however, are likely to be brilliantly colored. These lizards are conspicuous objects everywhere in the southwestern United States and Mexico. One small species, variable in color, *Sceloporus undulatus*, is the common "fence lizard" of the Eastern and Central States. They are swift and spry, but harmless, and increase by means of eggs laid in the sand and left to hatch by the sun's warmth. In captivity they do not become tame, but in a dry cage with an abundance of sunlight and a diet of mealworms they will thrive for years.

**SPRINGTAIL.** Any one of the minute insects of the families Poduridæ, Smynthuridæ, Entomobryidæ, and Papiiriidæ, of the thysanuran suborder Collembola. These insects leap by the tail-like organ arising from the under side of the penultimate or antepenultimate segment of the abdomen, reaching forward horizontally when at rest, nearly to the head. This organ when suddenly drawn towards the perpendicular throws the insect high in air and sometimes several feet away. The springtails are found in great numbers on the surface of the ground or just beneath in boreal and even Arctic regions. In the northern United States on bright sunny days in spring when the snow is melting, they occur in great numbers on the surface of the snow. One species (*Achoreutes nivicola*) is commonly known as the snow flea.

**SPRINGTAIL DUCK.** See PINTAIL.

**SPRING VALLEY.** A city in Bureau Co., Ill., 5 miles east of La Salle, on the Illinois River and on the Chicago, Rock Island, and Pacific, the Chicago and Northwestern, and the Chicago, Burlington, and Quincy railroads (Map: Illinois, F 3). Noteworthy features are the high and vocational school, Carnegie library, and St. Margaret's Hospital. Pop., 1900, 6214; 1910, 7035.

**SPRINGVILLE.** A city in Utah Co., Utah, 6 miles south of Provo, on the Denver and Rio Grande, and the San Pedro, Los Angeles, and Salt Lake railroads (Map: Utah, C 2). Fruit and stock raising, dairying, and canning are the chief industries. Pop., 1900, 3422; 1910, 3356.

**SPRING WHEAT.** See FLOUR; WHEAT.

**SPRIT** (AS. *sprēot*, pole). A light spar extending from the peak (see SAIL) to a sliding becket on the mast. In the early days of square-rigged ships, square sails set on yards under or over the head booms were called the spritsail, sprit topsail, and sprit topgallant sail. When the square spritsails of the head

booms were replaced by fore-and-aft jibs and staysails, the various spritsail yards were no longer used, but as a spreader was needed for the jib guys, whisker booms (see SHIP AND SHIPPING) were devised, and these are occasionally called spritsail yards, though they are in two parts, one on each side of the bowsprit cap.

**SPROULE**, sproul, THOMAS SIMPSON (1843- ). A Canadian physician and legislator. He was born in York County, Ontario, and was educated at the University of Michigan and in medicine at Victoria University, Cobourg. He practiced his profession for a brief period in Michigan, but returned to Canada, entered political life, and represented East Grey as a Conservative in the Dominion Parliament in 1878-1911, being appointed in the latter year Speaker of the House of Commons. In December, 1915, he was appointed a member of the Senate. He held decided views in favor of Protestant supremacy in Canada, took a prominent part in the Equal Rights agitation (see PARTY NAMES), and supported the unsuccessful attempt of the Dominion government to give Manitoba separate schools. He was grand master of the Loyal Orange Association of British North America in 1901-11, and in 1911 was elected president of the Imperial Grand Orange Council of the World.

**SPRUCE** (from ML. *Prussia*, Prussia), *Picea*. A genus of about 30 species of coniferous trees, indigenous to the Northern Hemisphere, nearly half being natives of North America. The genus was formerly combined with *Abies* (see FIR), from which it differs in having pendulous cones, leaves jointed on the twigs, keeled on both sides and not arranged in ranks, but scattered and pointing in every direction. They occur farther north than most trees, forming forests within the Arctic circle, and extending south, especially in the mountains, as far as the Pyrenees in Europe, the Himalaya in Asia, and North Carolina and Arizona in the United States. The white spruce and also the black cover extensive areas in Canada almost totally excluding other trees. In Europe the Norway spruce is similarly distributed. The species are pyramidal in habit, the lower branches drooping when old. The Norway spruce (*Picea excelsa* or *Picea abies*), the principal European species, is of rapid growth, attains a height of 150 feet or more, and is extensively planted both for forests and for ornament. The timber is valuable for fuel and for housebuilding, and is largely exported from Norway and Sweden for masts and spars of sailing vessels. The tree yields resin and turpentine; its bark is used in tanning and for basket making, etc. The wood is also used for wood pulp and paper manufacture. In North America the prevailing species over the greatest extent of territory are the white and the black spruce (*Picea canadensis* and *Picea mariana*), although in lumbering the two species are seldom distinguished. The former is found from New York to British Columbia and northward to Newfoundland, Hudson Bay, and Alaska—a handsome tree 50 to 150 feet high. The wood is light, soft, compact, nearly odorless, light yellow, and with scarcely distinguishable sap wood. It is largely used for general building, spars, flooring, etc., and also yields some of the spruce gum of commerce. The black spruce has a distribution somewhat similar to the white except that

it descends along the mountains to Virginia—a somewhat smaller tree, but otherwise very similar to the white spruce. It forms immense forests in Maine, New York, Canada, and elsewhere, and is largely used for wood pulp and paper. A third species, the red spruce (*Picea rubra*), a valuable timber tree, has much the same distribution as the others except it is found along the mountains as far south as Georgia. These species are the chief and best source for wood-paper making. The gum of the black spruce is used for chewing. The branches are used in the preparation of essence of spruce. The bark contains tannin and is used to some extent in tanning leather. The roots are often split into narrow strips and made into baskets, coarse mats, ropes, etc. The Sitka or tideland spruce (*Picea sitchensis*) is a larger tree occurring abundantly from northern California to Alaska, following the coast as far as the island of Kodiak. It is one of the largest trees of North America, attaining in low regions a height of more than 300 feet and a diameter of 7 or 8 feet at 100 feet from the base. Specimens upon the islands in southeastern Alaska measured more than 200 feet in height and 25 feet in circumference 4 feet from the ground. The timber is very valuable, entering into all kinds of building operations. In the tree-planting operations in the West the spruces, especially the white and the Norway, have proved among the most adaptable of evergreens. The black, being slow growing, less ornamental, and not well adapted to dry soils, is less frequently planted. For ornamental planting none excels the blue spruce, which is of rather slow growth. A tree known as Douglas spruce or Douglas fir (*Pseudotsuga douglassi*) is one of the important timber trees from the Rocky Mountain region to the Pacific and north to British Columbia. Upon the Pacific coast it attains a height of more than 300 feet and a diameter of 10 to 12 feet. The timber is fine, straight-grained, heavy, and very strong, and is useful for all kinds of building, masts, etc. It has been very successfully planted in Minnesota, where it is believed it will supersede the other species.

**SPRUE, or PSILO'SIS.** This is a chronic catarrhal inflammation of the gastrointestinal mucous membrane and is characterized by anemia, wasting, uncontrollable diarrhoea, and profound weakness. The mouth is inflamed and spotted with aphthæ; as the disease progresses erosions and ulcerations appear on the mucous surfaces of the whole gastrointestinal tract; and still later atrophic changes take place. Sprue is a disease of the tropics, particularly of the Orient, although it is also found in the West Indies. It is equally frequent in women and men, and is prone to attack Europeans who have resided for some time in hot climates. The essential cause of sprue was, until recently, obscure. It has been variously assigned to a protozoön and to yeast fungi, but in 1915 Maj. B. K. Ashford of the Medical Corps of the U. S. army, in Porto Rico, ascribed the disease to a species of *Monilia*, a yeastlike body producing mycelial threads in its vegetative state, in contradistinction to the true yeasts—saccharomyces—which reproduce by ascospores. Ashford says: "The organism is a typical *Monilia*. Its biologic characteristics are that it ferments glucose, levulose, and maltose; that it causes an acid reaction in these three, and in saccharose and galactose; that it does not

liquefy gelatin or serum; does not coagulate or render milk acid, but, on the contrary, renders it alkaline; and that all other sugar mediums lose rapidly in acidity." Ashford followed the usual treatment, consisting of a dietary in which *Monilia* does not flourish and in which it cannot ferment. Three types of diet are employed: (1) a strict milk diet, to which may be added lactic acid bacilli; (2) a strict meat diet; (3) a simple fruit diet in which bananas may form the principal feature. As the patient improves, vegetables, fruits, and eggs are cautiously added to these. Under this treatment, of 69 cases of sprue 12 were cured, 32 greatly improved, 19 were not improved, 2 became worse, and 4 died. In the Orient the disease, although sometimes undergoing remissions, is generally fatal.

**SPRUE.** See THRUSH.

**SPRUNER VON MERZ**, shprö'nër fön mërts, KARL (1803-92). A German cartographer, historian, and poet, born at Stuttgart. He entered the corps of cadets at Munich in 1814, became lieutenant in 1825 and lieutenant colonel in 1855, when King Maximilian II appointed him his aid-de-camp. Favored with that monarch's special confidence, he was a steadfast advocate of Pan-German and liberal principles at the Bavarian court. In 1864 King Ludwig II appointed him his adjutant general and in 1883 general of infantry. He retired from service in 1886 and died in Munich. His principal work is the great *Historisch-geographischer Handatlas* (118 maps, 1837-52; 4th ed. by Sieglin, 1893 et seq.); besides which he published a model *Atlas zur Geschichte von Bayern* (1838); *Handatlas für die Geschichte des Mittelalters und der neueren Zeit* (90 maps; new ed. by Menke, 1879); *Historisch-geographischer Schulatlas* (10th ed., 1880); and others. He wrote a *Leitfaden zur Geschichte von Bayern* (1853); *Pfalzgraf Rupert der Kavalier* (1854); *Charakterbilder aus der bayrischen Geschichte* (1878); several historical dramas and anonymously, *Jamben eines greisen Ghibellinen* (1876), and *Aus der Mappe des greisen Ghibellinen* (1882), both strictly Christian, but antipapal.

**SPULLER**, spu'lar', EUGÈNE (1835-96). A French publicist and political leader, born at Seurre (Côte d'Or). After the proclamation of the Republic in 1870 he became Gambetta's secretary and one of his most trusted supporters, and with him escaped from Paris in a balloon on Oct. 7, 1870, in order to assist him in reorganizing the provincial governments. He was elected by a Paris constituency to the Chamber in 1876, and became one of the most influential leaders of the Union Republic group. Upon the formation of Gambetta's short-lived cabinet, in November, 1881, Spuller was made Under-secretary of State for Foreign Affairs. He returned to the Chamber in the following year, and in 1884 was chosen one of the vice presidents of the body. He was Minister of Public Instruction in the Rouvier cabinet in 1887, and Minister of Foreign Affairs in the Tirard cabinet in 1889-90. In 1892 he was elected Senator, and in 1893-94 held the portfolio of Public Instruction in the cabinet of Casimir-Périer. He published: *Petite histoire du second empire* (1870); *Ignace de Loyola et la compagnie de Jésus* (1876); *Michelet, sa vie et ses œuvres* (1876).

**SPUNKIE.** See IGNIS FATUUS.

SPRUCE

NORWAY SPRUCE AND CONES

DOUGLAS SPRUCE AND CONES

**SPUR** (AS. *spora*, spur). Originally spurs were made with a single point or prick and were known as the prick-spur or goad-spur, but they soon developed into the rowel. In some instances the spur proper consisted of a ball from which projected a sharp point. Although the rowel is first met with in the thirteenth century, it was not common until the middle of the fifteenth century. In the Middle Ages the use of the spur was limited entirely to knights, who were granted their spurs as a symbol that they had won their right to knighthood. Similarly, the hacking off of his spurs denoted the public disgrace and degradation of the knight. Throughout modern European armies generally, the gilt spur denotes an officer of field rank, and the steel spur a mounted officer of regimental rank. In the United States army the spurs of mounted officers are of non-corrosive metal without ornamentation and without rowels. The rank and file wear a similar spur made of steel. The spur is used to train and control the horse, not to punish him.

**SPURGE** (Lat. *espurgare*, to purge),

*Euphorbia*. A genus of about 600 species, mostly tropical shrubs or trees or temperate climate herbaceous species of the family Euphorbiaceæ, characterized by a resinous, milky, usually acrid juice. There are two large classes, those having normal leaves, and those with abortive leaves which fall early. To the first class belong most of the species found in temperate climates, the others abound in Africa. Some of the green-stemmed, fleshy, and spiny African species so resemble certain cacti in their habit of growth as to render their identification more or less uncertain when not in flower. The

CYPRESS SPURGE  
(*Euphorbia cyparissias*).

leaves are either wanting or fall off early, and the functions of assimilation are performed by the stems. The flowers of many species, especially of *Poinsettia*, have bright-colored bracts that make them very ornamental. About forty species are indigenous or introduced in the eastern United States, all being herbaceous plants, mostly weeds.

**SPURGE LAUREL**. See **DAPHNE**.

**SPURGEON**, CHARLES HADDON (1834-92). A celebrated English preacher. He was born at Kelvedon, Essex, attended school at Colchester, and spent a few months at an agricultural college at Maidstone. His family intended him for an Independent minister, but his own sympathies drew him towards the Baptists, whom he joined in 1851. Removing to Cambridge, he began to deliver lay sermons in the neighborhood. At 18 he had charge of a small Baptist congregation at Waterbeach, Cambridgeshire. In 1854 he entered upon the pastorate of the New Park Street Chapel, London. The Surrey Music Hall was for some time engaged for his

use, and finally his followers built for him the well-known Metropolitan Tabernacle, opened in 1861. Many evangelistic and philanthropic agencies grew up in connection with this great institution, such as the Stockwell Orphanage; a pastor's college, where hundreds of young men were trained for the ministry under Spurgeon's direction: the Golden Lane Mission, etc. He died at Mentone, France, where he had gone for his health. His sermons were published weekly from 1854, and yearly volumes were issued from 1856. They had an enormous circulation, and many of them were translated into various languages. Spurgeon also published many volumes, including: *The Saint and his Saviour* (1857); *Morning by Morning, and Evening by Evening* (1866-68); *John Ploughman's Talks* (1869); *The Treasury of David* (a commentary on the Psalms, largely from Puritan writers, 1870-85); *Lectures to my Students* (1875-77); *Commenting and Commentaries* (1876); *John Ploughman's Pictures* (1880); and after 1865 he edited a monthly magazine, *Sword and Trowel*.

In theology he was a pronounced Calvinist, in biblical science an extreme conservative, in policy an open-communion Baptist, in politics a Liberal Unionist, in all things independent. He attacked the Low Church party in the Church of England because it countenanced, he asserted, the Prayer Book teaching of baptismal regeneration, and in 1864 withdrew from the Evangelical Alliance because this doctrine was supported by it. He attacked his own coreligionists for their alleged rationalism and sympathy with modern views of the Bible, and withdrew in 1887 from the Baptist Union. Consult: *Autobiography, Compiled from his Diary, Letters, and Records by his Wife* (4 vols., London, 1897-1900); R. H. Conwell, *Life of Charles Haddon Spurgeon* (Philadelphia, 1892); C. H. Lorimer, *Charles H. Spurgeon, the Puritan Preacher of the Nineteenth Century: A Monograph* (Boston, 1892); J. J. Ellis, *Charles Haddon Spurgeon* (new ed., London, 1902); W. M. Higgs, *The Spurgeon Family* (ib., 1906).

**SPURRY** (Dutch *spurrie*, spurry). Plants belonging to the genera *Spergula* and *Spergularia* of the family Caryophyllaceæ. Spurry is a weed sometimes cultivated as a forage crop. Corn spurry or common spurry (*Spergularia arvensis*) is an annual from 6 to 12 inches high, producing a tangled mass of succulent stems with numerous whorled linear leaves. It prefers sandy soil, upon which it is often planted as a green manure and as a soiling crop for sheep and cattle. The plant readily reseeds, but need not become a pest; it is sometimes a catch crop. Giant spurry (*Spergularia maxima*), by many botanists not regarded as distinct from the above, is larger than common spurry. The species of *Spergularia* are called sand spurry.

**SPURS, BATTLE OF THE**. See **COURTNEY**; **GUINEGATE**.

**SPUR-WINGED GOOSE, PLOVER, ETC.** Many terrestrial birds have the bend of the wing armed with one or more spurs or bony knobs, which they use for attack and defense. This armament is conspicuous in the geese of the African family *Plectropteridæ*, of which there are four species, and here it is based upon one of the wrist bones, instead of on the metacarpus, as is usual elsewhere. The spur-winged plover (*Hoplopterus spinosus*), one of the commonest birds of the Nile valley, is only one of

many tropical plovers so armed, the largest and finest spurs being those of a Chilean plover (*Belonopterus chilensis*): its spur is situated just at the base of the thumb, and, as in other cases, is sheathed with horn, and sharp at the

ANATOMY OF WING SPURS.

a, spur of the spur-winged plover; b, relative positions of the two wing spurs of the screamer (q.v.).

end. Some of the jacanas have wing spurs, and others a peculiar bladelike enlargement of the forearm. Lastly, the large, turkey-like South American screamers (q.v.) have two wing spurs, the larger of which is an inch and a quarter long. Consult F. A. Lucas, "Weapons of Birds," in *Bird Lore*, vol. iv (New York, 1902). For illustration of Egyptian Spur-winged Plover, see Plate of PLOVERS.

**SPURZHEIM**, spöürts'him, JOHANN KASPAR (1776-1832). A German phrenologist, born near Treves. After studying medicine at Vienna he became the pupil and later the colleague of the phrenologist Franz Gall (q.v.). He lived and lectured in France and England alternately, and in 1832 went to the United States on a lecturing tour, but died suddenly in Boston. His works as translated into English include: *Education* (1821; in print, 1912); *Phrenology* (1825; rev. ed., 1911). Consult N. Capen, *Reminiscences of Dr. Spurzheim and George Combe* (q.v.) (New York, 1881). See PHRENOLOGY.

**SPUTUM**. See EXPECTORATION.

**SPUYTEN DUYVIL** (spí'ten drívil) CREEK. A channel connecting the Hudson with the Harlem River, at the north end of Manhattan Island (q.v.) (Map: New York City and Vicinity, E 2).

**SPY** (OF, *espíe*, to spy). A person employed to obtain information regarding an enemy in a clandestine manner and by deception by entering the latter's territory, lines, or camp, his naval yards and other depots, and employing any possible means or methods by which to attain his ends. The status of the spy while generally recognized was not defined explicitly until formulated in "The Rules of Land Warfare," contained in the Annex to The Hague Convention, No. IV, Oct. 18, 1907, which give the international definition of the word *spy* and the regulations governing such a person as follows: "Art. 29. A person can only be considered a spy when, acting clandestinely or on false pretenses, he obtains or endeavors to obtain information in the zone of operations of a belligerent, with the intention of communicating it to the hostile party.

"Thus, soldiers not wearing a disguise who have penetrated into the zone of operations of the hostile army, for the purpose of obtaining information, are not considered spies. Similarly, the following are not considered spies: soldiers and civilians, carrying out their mission openly,

intrusted with the delivery of dispatches intended either for their own army or for the enemy's army. To this class belong likewise persons sent in balloons for the purpose of carrying dispatches, and, generally, of maintaining communications between the different parts of an army or a territory."

"Art. 30. A spy taken in the act shall not be punished without previous trial."

"Art. 31. A spy who, after rejoining the army to which he belongs, is subsequently captured by the enemy, is treated as a prisoner of war, and incurs no responsibility for his previous acts of espionage."

Spies, war traitors, and war rebels are not exchanged according to the common law of war. The spy is punishable with death, whether or not he succeed in obtaining the information or in conveying it to the enemy. The condition that determines the offense is dissimulation; there must be a violation of good faith. Consult Edmonds and Oppenheim, *Land Warfare* (London, 1912); *Rules of Land Warfare, United States Army, 1914*. See INTERNATIONAL LAW, *Land Warfare*.

**SPY**, spê. One of the most important archaeological sites in Europe. See MAN, SCIENCE OF.

**SPY, THE**. A novel by James Fenimore Cooper (1821), giving the story of Harvey Birch, a spy employed by Washington in 1780 in Westchester Co., N. Y.

**SPY SLANGE**. See NAJA.

**SPY WEDNESDAY**. See HOLY WEEK.

**SQUADRON** (from It. *squadra*, squad). The basis of all European cavalry organization is the squadron, usually commanded by a captain, sometimes by a major assisted by a captain. The European squadron numbers, on a war footing, from 120 to 150 sabres. Regiments contain from three to six squadrons. In the United States cavalry, the squadron, commanded by a major, is composed of four troops each commanded by a captain. At war strength the squadron consists of 15 officers and 401 enlisted men. The regiment, commanded by a colonel, consists of three squadrons (12 troops), and, at war strength, numbers 51 officers and 1236 enlisted men. Consult *Tables of Organization, U. S. Army* (Washington, 1914). See ARMY ORGANIZATION. For the application of the word in the navy, see TACTICS, NAVAL.

**SQUALODON** (Neo-Lat., from Lat. *squalus*, sort of sea fish + Gk. *δδός*, *odous*, tooth). An extinct genus of whale based on fossil skulls and teeth found in Miocene and Pliocene deposits. See CETACEA; MAMMALIA, *Fossil Mammalia*.

**SQUALORAJA** (Neo-Lat., from Lat. *squalus*, sort of sea fish + *raja*, ray, skate). A fossil shark of the Lower Lias of England, ancestral to the modern *chimaera* (q.v.).

**SQUARCIONE**, skwâr-chô'nâ, FRANCESCO (1394-1474). An Italian painter of the early Renaissance, founder of the school of Padua. He developed under the influence of the antique and was a teacher rather than a painter. From the large number of his pupils he has been styled the "Father of Painting," and the influence of his school was dominant throughout northern Italy. His method of teaching differed from that of other masters in that he had his pupils copy antique statues rather than his own works. The chief characteristics of their art are the statuesque character of the figures and the wealth of antique ornamentation, combined,

however, with a trenchant realism. It is impossible to distinguish the works ascribed to him at Padua and elsewhere from those of his pupils, only one, the "Madonna of the Lazzaro Family" (Berlin Museum), being signed.

**SQUARE**, IN GEOMETRY. See PARALLELOGRAM.

**SQUARE**, MAGIC. See MAGIC SQUARE.

**SQUARE KNOT**. See KNOTTING AND SPLICING.

**SQUAREMOUTH**. See CHISELMOUTH.

**SQUARE ROOT**. See INVOLUTION AND EVOLUTION.

**SQUARES**, METHOD OF LEAST. See LEAST

SQUARES, METHOD OF.

**SQUARING THE CIRCLE**. See CIRCLE; QUADRATURE.

**SQUASH** (from North American Indian *askutasquash*, pl. of *asq*, green, unripe). The common name for the fruits and plants of various varieties of *Cucurbita maxima*, *Cucurbita pepo*, and *Cucurbita moschata*. The term is frequently applied in America to what are known in Europe as pumpkins. Squashes are cooked as a vegetable and also used for making pies. They are of divers forms, with early, late, and midseason varieties of each. Squashes like a warm fertile soil. They are planted about the same time as corn in hills from six feet apart each way for early varieties to 12 feet apart each way for late varieties. Bush varieties may be planted as close as four by four feet. From four to six seeds are put in each hill, which should be made rich with a few shovels of well-rotted manure placed in the bottom. The winter varieties are gathered upon the approach of frosty weather and left in the sun to cure for a while, being covered at night with hay or like material. Before cold weather sets in the fruits should be stored on shelves one deep in a dry, cool, not cold, room. For diseases and pests of the squash, see CUCUMBER DISEASES and MELON INSECTS. See Plate of CUCUMBER ALLIES.

**SQUASH**. A ball game belonging to the family of tennis, which it is considered to have preceded in origin. It is played with a racquet and ball in an inclosed court of varying size without any affixed standard, but generally less than 40 feet by 20 feet, divided by a central line on the floor and a cross line into four spaces. The underlying principle of squash is that two players try alternately to hit the ball up against the front wall above a "tell-tale" line. Whichever first fails to do so before the ball's second bounce from the floor loses the point. There are various rules governing the placing of the ball and of scoring. Consult Eustace Miles, *The Game of Squash* (New York, 1901), and Toombs (ed.), "Court Games," in *R. Spalding's Athletic Handbooks*, No. 50 (ib., 1914).

**SQUASH BUG**. See SQUASH INSECTS.

**SQUASH INSECTS**. The insect fauna of the squash and the pumpkin are practically identical; several insects which feed upon these plants also attack melons, cucumbers, etc. (See MELON INSECTS.) The most important in the United States are the squash bug (*Anasa tristis*) and its closely similar relative, the horned squash bug (*Anasa armigera*), the squash-vine borer (*Melittia satyriniformis*), and the squash ladybird (*Epilachna borealis*). The squash bug is a dull-grayish-brown musky-smelling bug of the family Coreidae, a little over half an inch long, hibernating in the adult stage. Its

large golden-brown eggs are laid in the spring on foliage. The young bugs grow rapidly and molt five times, and suck the plant juices. Hand-picking the bugs before eggs are laid,

COMMON SQUASH BUG (*Anasa tristis*).

kerosene sprayed upon vines started early to act as decoys, and destruction of bugs on vines and fruits after the crop has been gathered, are the only feasible remedies. The squash-vine borer, a clear-winged moth of the family Sesiidae, has an orange or red and black and bronze abdomen and hairy hind legs, red or orange on the outer surface, and black inside. Young caterpillars hatched from eggs laid on the stems in late spring bore into the stem, which wilts and dies. In midsummer they pupate in a tough cocoon beneath the ground, whence the adult emerges in spring. In the South a second generation appears in August. The best preventive measures consist in late fall harrowing and deep spring plowing. The squash ladybird, belonging to the genus *Epilachna*, which contains the only plant-feeding species of the family Coccinellidae (see LADY-BIRD), is a black-spotted, yellow, hemispherical species of wide distribution. The adult beetles hibernate and lay their eggs upon the leaves in May or June. The yellow, spiny larvæ chew circular holes in the leaves, reach full growth in from two to four weeks, and transform to pupæ, attaching themselves by the tip of the body to a leaf or stem. There are two or more generations each year; the insect is readily controlled by an arsenical spray.

The pickle worm, melon caterpillar, certain plant bugs, and flea beetles (qq.v.) are also troublesome. Consult: G. B. Smith, *Manual of Economic Entomology* (Philadelphia, 1896); Chittenden, in *Department of Agriculture, Division of Entomology, Bulletin 19* (Washington, 1899).

**SQUATTER SOVEREIGNTY**. See POPULAR SOVEREIGNTY.

**SQUAWFISH**. A fresh-water fish (*Ptychocheilus oregonensis*) of California, where it is locally known as Sacramento pike. It is the largest American species of the carp family (see CYPRINIDÆ) and reaches a length of from 3 to 5 feet. Another local name is Chappaul. See Plate of DACE and MINNOWS.

**SQUAW VINE**. See PARTRIDGE BERRY.

**SQUAXON**. See SALISHIAN STOCK.

**SQUEAKER**. See GROUND BEETLE.

**SQUEERS**, WACKFORD. In Dickens's *Nicholas Nickleby*, the heartless, ignorant Yorkshire schoolmaster of Dotheboys Hall.

**SQUETEAGUE**, skwê-têg', or DEEP-WATER TROUT. A fish (*Cynoscion regalis*) latterly far more widely known as weakfish (q.v.).

**SQUID** (of uncertain etymology). A cephalopod mollusk, differing from the nautilus in having no outer shell, the body being supported by an inner, pen-shaped, horny structure, or, in

the cuttle of the Mediterranean, by a calcareous bone, flattened oval in shape. The body of the squid is somewhat fishlike, pointed behind, with two fins, while the head is large and armed with ten long arms, bearing cup-shaped suckers, two of the arms being longer than the others. The eyes are large and perfect. The mouth is armed with two powerful black teeth, shaped like the jaws of a parrot. At the base of the smaller jaw is the lingual ribbon (radula). With this they divide their food. The squid is provided with an ink sac, and when attacked it will discharge the water in its mantle through its siphon, the ink passing out with the water as if from a syringe; thus the water is colored, and under cover of the inky cloud the squid darts backward. Squids are active and powerful; they will enter a school of fish, dart to the right or left, seize a fish, biting it in the nape of the neck, and kill it instantly. The body is beautifully tinted and spotted with many colors, and the animal rapidly changes hue, this being due to the contraction and dilatation of the pigment cells or chromatophores. (See METACHROSIS.) Flying squids (see SQUID) are oceanic decapods of the genus *Ommastrephes*.

Ordinary squids are from 1 to 2 feet in length. The largest squid known is *Architeuthis princeps*, nearly 19 feet long in body; the longer arms measure about 29 feet, the entire animal, with extended arms, reaching a length of 40 feet. Another species (*Architeuthis monachus*) has a body about 7 feet long, with the two longer arms 24 feet in length. (For fossil squids, see BELEMNITES.) Consult Verrill, "The Cephalopods of the Northeastern Coast of America," in *Transactions of the Connecticut Academy*, vol. v (New Haven, 1879-80). Compare CEPHALOPODA and DECAPODA.

**SQUIER**, skwir, EPHRAIM GEORGE (1821-88). An American archaeologist and traveler, born at Bethlehem, N. Y. After varied experience he became known to science through his study of the antiquities of the Mississippi valley. In 1849 he went on a diplomatic mission to Central America, which he revisited in 1853 in the interest of an interoceanic railway and of archaeology. In 1863 he was appointed United States Commissioner to Peru, where he investigated Inca remains. He was first president of the Anthropological Institute (1871). He published: *Serpent Symbols* (1852); *Nicaragua: its People, Scenery, and Monuments* (1852); *The States of Central America* (1857 and 1870); *Tropical Fibres and their Economic Extraction* (1861); and *Peru: Incidents and Explorations in the Land of the Incas* (1877).

**SQUILL** (Lat. *squilla*, squill), *Scilla*. A genus of bulbous-rooted plants of the family Liliaceæ, with a spreading perianth, a three-parted ovary, and a three-cornered capsule with three many-seeded cells. Many of the species are plants of humble growth, with scapes like those of hyacinths and beautiful flowers. The American species formerly classed in this genus are now referred to *Quamasia*. The squill used in medicine as an expectorant, diuretic and emetic is prepared from the bulbs of *Urginea scilla*.

**SQUILLA**. A mantis shrimp (q.v.).

**SQUINT**. See STRABISMUS.

**SQUIRREL** (Gk. *σκιῶπος*, *σκιά*, *scia*, shadow + *οὐρά*, *oura*, tail). A rodent mammal of the family Sciuridæ, subfamily Sciurinae. The

Sciurinae are a group of seven genera with compressed incisors, rather slender bodies, and long, hairy tails. The number of species is still a matter of doubt, owing to the remarkable range of color variation among the individuals. Squirrels are found in all parts of the world except Australia, and are most abundant in India and southern Asia. They range from the size of a mouse to that of a cat. In color squirrels tend towards gray, reddish brown, or black, though many species are white underneath, and the Oriental species are often handsomely variegated. The pelages differ locally in texture, being affected apparently by the climate. Some of the northern species have a fine, dense fur, and their skins have considerable commercial value, while some of the tropical species have the hair scanty and rather stiff, and in one genus spines are present comparable to those of a porcupine. The genus *Sciurus* includes nearly three-fourths of all known squirrels, and all but five of the American species.

The commonest and most widely distributed of these is the red squirrel or chickaree (*Sciurus hudsonius*), which ranges from the northern and the mountainous parts of the United States to the limit of trees in British America. It is a small species only eight inches long, not including the tail. Its upper surface is bright ferruginous or chestnut red; the lower surface is pure white, and there is a black stripe along the sides. The ears are commonly tipped with a little tuft of hairs. In its habits the chickaree is a typical squirrel, very active, almost exclusively arboreal, and very fond of nuts, which are one of the most important items in its bill of fare. The diet is, however, diversified, as is true of most squirrels, for while nuts and grains are doubtless the staple articles, birds and their eggs and young, insects, young twigs, and fruit are often eaten. Many ornithologists, indeed, consider this squirrel one of the most deadly enemies of the common song birds, and this enmity is frequently expressed by the birds themselves. The home of the chickaree is usually in some hollow tree, though frequently a special nest is constructed out of branches, twigs, and leaves. The young are born in the spring, three or four in a litter. The chickaree is a rather noisy little animal, and, though not gregarious, several are usually found within calling distance of each other. The sounds uttered are rapidly repeated notes, making a shrill, scolding chatter.

East of the great plains and south of the chickaree's range occur the fox squirrels, the largest and handsomest of the American Sciuridæ. They are a foot or more in length, besides the beautiful bushy tail, which is somewhat longer than the head and body. The color ranges from gray with a reddish tinge to jet black. The largest form is the black squirrel (*Sciurus niger*) of the South Atlantic and Gulf States, which is usually very dark colored, but always has the nose and ears white. The fox squirrel of the Middle States (*Sciurus cinereus*) is usually reddish, with the tips of the hairs whitish, giving it a grizzled appearance, but black specimens are common. The fox squirrel of the Mississippi valley (*Sciurus ludovicianus*) is more strongly and constantly reddish and is rarely, if ever, black. These large squirrels all agree in their habits, which are not essentially different from those of the chickaree, except that fox squirrels seem to do less harm to the birds.

# SQUIRRELS

1

5

6

7

1. GROUND SQUIRREL: CHIPMUNK (*Tamias striatus*).

2. RED SQUIRREL (*Sciurus hudsonicus*).

3. FLYING SQUIRREL (*Sciuropterus volans*).

7. AMERICAN GRAY SQUIRREL (*Sciurus carolinensis*).

4. NEW MEXICAN SQUIRREL (*Otoxiurus aberti*).

5. BLACK-MUSTACHED EAST INDIAN SQUIRREL.

6. COMMON EUROPEAN SQUIRREL (*Sciurus vulgaris*).

They are intelligent and in captivity make interesting pets. They have a considerable antipathy to the chickaree.

The gray squirrels are a third group of common American species, somewhat smaller than the fox squirrels and more widely distributed, ranging as far west as California. They have a considerable tendency towards melanism in certain regions. They are white or whitish underneath. The common Eastern species (*Sciurus carolinensis*) is about 10 inches long, besides the somewhat longer tail. It is one of the popular game animals of New England, where the fox squirrel is very rare, and not only is it prized for food, but the skin has some commercial value. It is also often kept as a pet, and, like the fox squirrel, can be taught simple tricks. Two or three other species of gray squirrel occur in the southwestern United States and California, of which the chestnut-backed gray squirrel (*Sciurus aberti*) is notable for having the ears tufted as in the chickaree. This is a very handsome species, with a broad band of chestnut on the back and a black stripe on each side; melanistic specimens are common. The California gray squirrel (*Sciurus fessor*) is remarkable for its large size and black tail.

Of the remaining sixty or seventy members of the genus *Sciurus* the most important is the common squirrel of Europe (*Sciurus vulgaris*), which ranges from Ireland to Japan and from northern Italy to Lapland. It is a little larger than the chickaree, and, like that species, it is brownish red above and white beneath. In winter it undergoes some change of pelage, becoming gray or even almost white. The ears are tufted with little pencils of hair. A handsome Oriental squirrel (*Sciurus caniceps*) is remarkable as the only known instance among mammals of the temporary assumption during the breeding season of a distinctly ornamental pelage. During most of the year this squirrel is gray, but in December the black becomes a beautiful orange yellow, which becomes gray again late in March, after the breeding season is over. Of the remaining genera one contains only a single species, a large and very handsome Bornean species (*Phithrosciurus macrotis*), which is very remarkable for certain peculiarities of the skull and particularly for the vertical grooves on the front surface of the incisors. The tail is also unusually long, the ears have long tufts, and the coloration is peculiar, the sides being banded with black and white. The genus *Xerus* includes four species known as "spiny squirrels," on account of the pelage, which is coarse and prickly, the hairs being intermingled with spines. They are ground-loving species, and live in burrows which they themselves dig. They are somewhat larger than the chickaree and are all natives of Africa. The genus *Tamias* includes the small ground squirrels, chiefly American, which connect the tree squirrels with the spermophiles. They are all similar in size and habits to the common chipmunk (q.v.). The remaining genera, mainly Old World species, are remarkable for their powers of sailing from one tree to another. They are described in the article FLYING SQUIRREL.

Consult: Coues and Allen, *Monograph of North American Rodentia* (Washington, 1877); E. T. Seton, *Life Histories of Northern Animals* (New York, 1909); Stone and Cram, *American Animals* (new ed., ib., 1914); W. T. Hornaday, *The American Natural History* (ib., 1915).

**SQUIRREL CORN.** See DICENIRA.

**SQUIRREL FISH** (so called from the sound made by the fish when taken from the water, which resembles the bark of a squirrel). Any of several brilliantly colored tropical fishes. One group is the family Holocentridae, allied to the mullets, many species of which abound about coral reefs and are numerous in American tropical waters. The best-known species (*Holocentrus ascensionis*) is about two feet long and bright red, with shining streaks along the rows of scales. Another group is the genus *Diplec-trum* of the sea-bass family, among which one very handsome species (*Diplec-trum formosum*) is common from Charleston to Montevideo, and is also called sewano and sandfish. It is about a foot long, brownish, with blue markings.

**SQUIRREL MONKEY.** One of the names applied to certain small, active, bushy-tailed tropical American monkeys of the marmoset group, and especially of the golden-haired genus formerly called *Chrysothrix*, because of their squirrel-like size, manners, and appearance. A well-known species is one of the titis (*Chrysothrix* or *Saimiri sciureus*), whose crown, muzzle, and rings about the eyes are black, giving a likeness to a human skull, so that it is known as the death's-head squirrel monkey.

**SQUIRTING FUNGUS.** See MUCORACEÆ; PILORULUS.

**ŚRĀDDHA**, shrād'hā (Skt, faith, related to Lat. *credere*, to believe). The funeral ceremony of the Hindus, in which offerings of water are made to deceased ancestors or to the pitris (q.v.) collectively. This ceremony was usually accompanied by the offering of the *pinḍa* or ball of meal. The *śrāddha* is especially performed for a parent recently deceased, or for three paternal ancestors, and secures the residence of the souls of the dead in the heaven of the pitris at the end of a year. This term is also applied to the daily offerings to the manes in general, and to other domestic offerings, as at the birth of a son. In case of the offering to the deceased, the performance of the sacrifice devolved upon the nearest male relative, unless the patrimony was divided contrary to the parent's wishes, when this right was sometimes lost. The *śrāddha* is still offered in certain parts of India, as at Gaya in Behar. The entire ceremony is based on the fear of malignant ghosts, since the dead man might return to seek revenge for any neglect shown him. See GHOSTS. Consult: *Alt-indischer Ahnenkult* (Leyden, 1893); Hillebrandt, *Ritual-Litteratur* (ib., 1897); E. W. Hopkins, *Religions of India* (Boston, 1895); L. D. Barnett, *Antiquities of India* (London, 1913).

**ŚRĀVAKA**, shrā'vā-kā (Skt., Pali *sāvaka*, disciple, from *śru*, to hear). Originally any true disciple of Buddha. The term was later applied to those who were on the fourfold road to Nirvana (q.v.). The four classes of śrāvakas are usually the *śrōtāpannas* (Pali *sōtāpanna*), neophytes or converts; the *sakaraḡāminas* (Pali *sakadāḡamin*), who are so purified that they need be reborn on earth only once; the *anāḡāminas* (Pali *anāḡamin*), who will be reborn in heaven; and the arhats (Pali *arahā*), perfected saints. The general name among the Northern Buddhists for the Southern sect is śrāvakas. See BUDDHISM; JAINISM.

**SRĪ-HARSHA-DEVA**, srē-hār'shā-dā'vā. See HARSHA.

**SRINAGAR**, srē'nā-gūr', or **SERINAGUR**, se-rē'nā-gūr'. The capital of the native State of Kashmir, India, on the Jhelam River, 195 miles by rail northeast of Rawal Pindi (Map: India, C 1). It is in the Vale of Kashmir, a region noted for its picturesque lakes, lofty mountain peaks, and interesting ruins. The Jhelam River flows through the city, and canals extend in all directions. Within the wall-girt citadel are the city fort and a summer residence of the Maharaja. Dal Lake, a beautiful sheet of water on the east of the city, was formerly a favorite resort of the Mogul rulers. Srinagar is surrounded by a rich agricultural section, and manufactures paper, papier maché, silver and copper ware, and leather. The city was founded in the sixth century, and came under British protection in 1846. Pop., 1901, 122,618; 1911, 126,344.

**SRIRANGAM**, srē-rūng'am, or **SERINGHAM**, sē-ring'hām. A town in the Province of Madras, India, two miles north of Trichinopoly, on an island of the same name in the Kaveri River. It is connected with the mainland by a bridge of 32 arches and is noted for its temple to Vishnu. (See **INDIAN ART**.) The temple of Jambukeshwar, about a mile distant, and the neighboring anikuts or dams of the Kaveri River are noteworthy. Pop., 1901, 23,039; 1911, 24,973.

**SRIRANGAPATAM**, srē-rūng'ā-pā-tām'. A town of Mysore, India. See **SERINGAPATAM**.

**ŚRUTI**, shrū'tē (Skt., hearing). In Sanskrit literature, the technical term for works which are regarded as divine revelation. It originally applied only to the texts of the Vedas (q.v.) and to the Brahmanas (see **BRAHMANA**), but later it included also the Upanishads (q.v.). The term *śruti* is therefore contrasted with *smṛti* (see **SMṚTI**), or tradition. Consult A. A. Macdonell, *History of Sanscrit Literature* (London, 1913).

**SS**, COLLAR OF. A collar composed of a series of the letter S, either linked together or set in close order, on a blue and white ribbon, with the ends connected by two buckles and a trefoil-shaped link, from which hangs a jewel. Such collars have been much worn in England by persons holding great offices in the state, as well as by gentlemen of various ranks. The origin of the device is not known. Among conjectures regarding its meaning, one is that the letter S stands for "Souveraigne," the favorite motto of Henry IV; others have suggested "Seneschal." Collars of SS are still worn with certain recognized distinctions by the Lords Chief Justices, the Lord Chief Baron of the Exchequer, the Lord Mayor of London, heralds, and the sergeant at arms.

**SSU-MA KUANG AND TS'EN**. See **SZE-MA KUANG AND TS'EN**.

**STAAL**, stāl, MARGUERITE JEANNE [CORDIER] DELAUNAY, BARONESS DE (1684-1750). A French writer of memoirs and letters of much historic value, born in Paris. Her father was an artist. Having studied in a convent at Rouen, she became maid to the Duchess of Maine (1711), took part in Cellamare's plot to deprive the Duke of Orléans of the regency, and was imprisoned (1718-20) in the Bastille. She attained prominence in court circles and finally a leading rôle in Paris society. She afterward married (1735) Baron de Staal, captain in the guard of the Duke of Maine. She spent the rest of her life at the ducal court at Sceaux and died in Paris. Consult her letters and two comedies

in her *Œuvres* (Paris, 1821); *Mémoires*, edited by Adolphe de Lescure (2 vols., Paris, 1877; Eng. trans. by S. Bathurst, London, 1877), remarkable for keen observation, sincerity, and irony, and for their style; also C. A. Sainte-Beuve, *Portraits littéraires*, vol. iii (2d ed., Paris, 1864).

**STABAT MATER**. A famous mediæval hymn, describing the sufferings of the Virgin Mary as she stood by the cross of Jesus. It is generally spoken of by the above name, from the first words:

Stabat mater dolorosa  
Juxta crucem lacrymosa,  
Dum pendebat Filius.

It was formerly attributed to various authors, including Pope Innocent III, St. Bonaventura, and St. Bernard; but it is now generally ascribed to Jacopone da Todì (q.v.).

**STABIÆ**, stā'byā. See **CASTELLAMARE DI STABIA**.

**STABILI**, stā'bē-lē, FRANCESCO DEGLI. See **CECCO D'ASCOLI**.

**STABILITY** (from Lat. *stare*, to stand). The property of a body by virtue of which it tends to return to a position of equilibrium if it receives an impulse acting to displace it from this position. In the case of a body in equilibrium under the action of gravity, this is therefore stable if work must be done to alter the position of its centre of gravity. Thus a pendulum would be said to be in stable equilibrium, as also would be a well-ballasted ship. To satisfy this condition the centre of gravity must occupy such a position that when it is displaced it is raised with respect to its original position. If under the action of a force the centre of gravity is moved to a lower position the body is said to be in unstable equilibrium. Stability of floating bodies is an important consideration in ship-building (q.v.). See **BOUYANCY**; **EQUILIBRIUM**; **HYDROSTATICS**; **MECHANICS**; **METACENTRE**.

**STABLE FLY**. A biting fly (*Stomoxys calcitrans*) of the family Muscidae, probably introduced into the United States from Europe long ago. It resembles the common house fly so closely as to deceive most untrained observers. It frequents dwellings late in autumn only, and on the approach of rain; this gives rise to the common expression that flies begin to bite before a rain. The larvae feed in fresh horse manure, and the flies live chiefly on the blood of vertebrates, frequently causing annoyance to horses and cattle and biting human beings. The stable fly has been indicted on the ground that it carries the germs which cause infantile paralysis. Another cosmopolitan muscid fly (*Muscina stabulans*) is sometimes known as stable fly.

STABLE FLY.

**STACCATO**, stā-kā'tō (It., detached). In music, a term implying a detached, abrupt mode of performance. A certain amount of time is subtracted from the proper value of any note played staccato, and a slight rest substituted. A dot placed over a note indicates that it is to be played staccato. A dash implies a greater degree of staccato; a very light degree of staccato is expressed by uniting the dot with the slur.

**STACHAU**, HANS KARL GEORG VON KALTENBORN-. See **KALTENBORN-STACHAU**, H. K. G. VON.

**STACHYS**, stā'kis (Lat., from Gk. *στάχυς*, ear of corn, spike). A genus of plants of the

family Labiatae, containing numerous species widely distributed in temperate and tropical climates except Australia and New Zealand. *Stachys sylvatica*, hedge nettle, common in Europe in shady places, is a coarse herb 2 to 3 feet tall with ovate, heart-shaped leaves on long stalks and whorls of purple malodorous flowers. *Stachys palustris*, common to moist places in Europe, Asia, and North America, proves troublesome in meadows. It was formerly used as a vulnerary, hence the name "woundwort." Several species are cultivated. To this genus some botanists refer the common betony or wood betony (*Stachys betonica*), plentiful in woods and thickets in Europe. It is a hairy-stemmed plant one or two feet high, has oblong heart-shaped leaves, whorls of purple or white flowers, and a fetid smell. A Japanese species (*Stachys sieboldi*, often called *Stachys tuberifera*) has small edible tubers an inch or two long, used as a vegetable in China and Japan; in the latter country they are known as chorogi, under which name they have been introduced into America. There are a dozen or more species introduced or native to the United States.

**STADE**, štã'de. A town in the Province of Hanover, Prussia, on the Schwinge, an affluent of the Elbe, about 4 miles from its mouth (Map: Germany, C 2). It manufactures machinery, ships, trimmed lumber, salt, bricks, wine, and cigars. Stade became a city as early as the tenth century. Pop., 1900, 10,575; 1910, 11,078.

**STADE, BERNHARD** (1848-1906). A German theologian, born at Arnstadt and educated at Leipzig and Berlin. In 1875 he was appointed professor of theology at Giessen. He wrote *De Isaia Vaticiniis Æthiopicis Diatribe* (1873), *Ueber die alttestamentlichen Vorstellungen vom Zustand nach dem Tode* (1877), *Lehrbuch der hebraischen Grammatik* (1879), and *Geschichte des Volkes Israel* (vol. i, 1881-84; vol. ii, with O. Holtzmann, 1888). In collaboration with Karl Siegfried (q.v.) he published (1893) a *Hebräisches Wörterbuch zum alten Testament*. In 1871 he became the editor of the *Zeitschrift für alttestamentliche Wissenschaft*.

**STADIA** (Lat. *stadium*, standard of length, furlong). An attachment fitted to the telescope of a transit and used in surveying to measure distances. Stadia surveying is a modification of transit surveying, and is effected by the use of the stadia or gradienter attachment. The telescope of the ordinary transit (see SURVEYING INSTRUMENTS) contains a vertical and a horizontal wire dividing the field of vision into four quadrants; but the stadia telescope contains extra horizontal wires mounted on an independent diaphragm, so that the distances between the respective wires are adjustable. The principle of its operation is simple. If the space between two auxiliary wires, one on each side of the horizontal wire of the telescope, is so adjusted as to subtend 1 foot on a rod 100 feet away, the space will subtend 2 feet on a rod at 200 feet, and so on. Thus by proper adjustment approximate distances to near-by points can be calculated by reading the rod. If from any point in a field the corners are all visible and the stadia instrument is set at this point, the distance to each corner can at once be read and also the angles between these lines. Thus with two sides and the included angle of each triangle, areas of the different parts and that of the whole field can be calculated. This plan is known as the method of radiation. The gra-

dienter attachment is a micrometer screw which takes the place of the tangent screw to the axis of the telescope. A mounted scale registers the number of turns of a micrometer screw. The value of the thread is usually such that one revolution of the screw moves the horizontal wire of the telescope over a space of 1 foot on a rod at the distance of 100 feet. If the micrometer screw is divided into 100 spaces it is clear that when the screw is turned through 25, 50, or 75 spaces, or  $\frac{1}{4}$ ,  $\frac{1}{2}$ , or  $\frac{3}{4}$  of a space on the scale, the wire of the telescope will pass over  $\frac{1}{4}$ ,  $\frac{1}{2}$ , or  $\frac{3}{4}$  of a foot on the rod, etc. See SURVEYING.

**STADIMETER** (from Gk. *στάδιον*, *stadion*, standard of length + *μέτρον*, *metron*, measure). A nautical instrument invented by Lieutenant (later Admiral) Bradley A. Fiske, United States navy, and designed for measuring the distance of objects when their height is known. It is somewhat similar to the sextant, but its readings are in yards instead of angular measure. See RANGE FINDER.

**STADIUM** (Lat., from Gk. *στάδιον*, *stadion*, standard of length, furlong). The name for the Greek race course, for foot races, within which also other athletic contests took place. It was used only for contests, not apparently as a place for exercise. The spectators stood or sat on high banks of earth at the sides and across the ends. In some cases one end was curved like a horse-shoe, and at times one end was open. At Olympia (q.v.) there seem to have been no permanent seats at the sides, but we hear that at Athens Herodes Atticus (see ATTICUS HERODES, 2) fitted the stadium with Pentelic marble seats. The floor of the stadium was sand or loose earth. The course was straight away, and at each end was usually a long strip of marble serving to mark the start and the finish. The length of the course was always 600 Greek feet, but as the foot varied in different localities the stadium was not of uniform length. (See EX PEDE HERCULEM.) At Athens the standard foot seems to have been 0.2957 meter, like the Roman foot, and the stadium was 177.42 meters. This seems to be the length of the stadium used commonly as a measure of distance, of which  $8\frac{1}{4}$  made a Roman mile, and a little more than 9 an English mile. The antique stadium, modified by features derived from the Roman circus, has been revived in modern times as a place for athletic contests. That at Athens, built for the first revival of Olympic sports in 1896, is said to accommodate 80,000 spectators. Other open-air edifices for a like purpose have been built for various colleges and universities in the United States and for international exhibitions, and called "stadia," but the term is in most cases not strictly correct, as many are elliptical amphitheatres, some are open on one side, and none conforms to the classic measure of the *stadion*. Consult: Friedrich Hultsch, *Griechische und römische Metrologie* (2d ed., Berlin, 1882); Dörpfeld, in *Deutsches Archäologisches Institut, Mitteilungen: Athenische Abtheilung* (Athens, 1882); E. N. Gardiner, *Greek Athletic Sports and Festivals* (London, 1910).

**STADHOLDER**, stãt'hôl'dër (Dutch *stadthouder*, stead holder). The title bestowed on William of Orange (q.v.) by the Dutch provinces which rose in revolt against the tyranny of Alva in the sixteenth century. (See NETHERLANDS.) On the assassination of William in 1584 his son Maurice of Nassau was appointed to the office. The stadholderate was considered to be **at an**

end on the death of William III in 1702, but in 1747 William IV, descended from a collateral branch of the house of Nassau, was proclaimed stadholder, captain general, and admiral in chief of the United Provinces. His son, William V, the seventh stadholder, was driven from the country by the French in 1795 and resigned his office in 1802.

STAËL-HOLSTEIN, stä'el hól'stĭn, *Fr. pron.* stĭl ôl'stĕn', ANNE LOUISE GERMAINE, BARONNE DE, commonly called MADAME DE STAËL (1766-1817). A French authoress, born in Paris, April 22, 1766. She was the daughter of the Genevese banker and distinguished French Minister of Finance, Jacques Necker (q.v.), and of his wife, Suzanne Churchod, Gibbon's youthful beloved. She passed her childhood in one of the most brilliant literary salons of Paris, where her active mind was stimulated by association with the wits and critics of the pre-Revolutionary decade, chief among them F. M. Grimm, Thomas, Marmontel, and Raynal. In this vortex of disintegrating ideas she assimilated the intellectual spirit of that age. She married in 1786 the Swedish Minister, Baron de Staël-Holstein, by whom she had three children. She was independent, positive, self-assertive, and rather vain, writing much, but publishing nothing until the appearance of her *Lettres sur Jean Jacques Rousseau* (1788), whose social ideas she admired. She had fallen also under the spell of Goethe's *Werther*, and thus sympathized with the Revolution till the King's imprisonment caused a revulsion to an equally indiscreet incivism. She abused her ambassadorial right of asylum, and, fearing the consequences, left Paris before the massacres of September, 1792, going to Coppet, near Geneva, where she gathered some political sympathizers. In 1793 she tried to make herself the centre of a more important group in England, not without some personal scandal. For nine years (1794-1803) she played at politics in Paris, with brief visits to Coppet. She was amicably separated from Baron de Staël in 1797, and irritated Napoleon by her epigrams till the consular police banished her from Paris (1803). She went to Germany, and in her unwearying search for noted people to talk to she came in the winter of 1803-04 to Weimar. Goethe, at first excusing himself on the score of ill health, saw her, and later in his *Annalen* spoke of "her brilliant way of showing her readiness of thought and repartee." Schiller found her "with little ideality or poetry and no feminine reserve." The Romanticists were more attracted, and A. W. Schlegel (q.v.) became her companion and counselor. Thus the German ideas that she introduced into France were seen through Schlegel's eyes, far from impartially, as is constantly obvious in her *De l'Allemagne*, written in 1809-10 and printed in England in 1813. Before her exile Madame de Staël had written three essays, *De l'influence des passions* (1796); *De la littérature considérée dans ses rapports avec les institutions sociales* (1800), and *Des circonstances actuelles qui peuvent terminer la révolution et des principes qui doivent fonder la république en France*, written in 1799, but not printed until 1806. Her literary power was first revealed in the novel *Delphine* (1802), a half autobiography of the "misunderstood woman," to be exploited later by George Sand. Much finer is a second story, *Corinne* (1807), wherewith she made the novel carry artistic discussion, as Goethe and Richter had done in Germany.

In 1810 she published her *De l'Allemagne* in Paris, but Napoleon condemned the entire edition and expelled her from France. She retired to Coppet, and in 1811 married secretly a young officer, De Rocca, over twenty years her junior. In that year she traveled in Russia, Sweden, and England, and after Napoleon's fall returned to France, though spending some time abroad, for her health was failing, as her last book, *Considérations sur la révolution française* (1818), witnesses. Of her three children by her first husband, Auguste (1790-1827) became known as the author of *Lettres sur l'Angleterre*; Albertine (died 1838) married the Duke Achille de Broglie, and Albert became a Swedish officer and fell in a duel. By her second husband (Rocca) she had one child.

In person Madame de Staël was not attractive. In conversation she often repelled. If one considers only language and style she was not a great writer, but she had great enthusiasms, faith in human progress and in democracy. Studiously cosmopolitan, she compelled France to contrast and compare her ideals of letters and art with those of Germany and England. Thus the French Romantic movement, one of the greatest literary regenerations in history, is in large measure the work of Madame de Staël.

**Bibliography.** Madame de Staël's complete works, edited by her son, Baron Auguste de Staël-Holstein, and with a biography by her cousin, Madame Necker de Saussure (17 vols., Paris, 1820-21); C. A. G. Jaeck, *Madame de Staël and the Spread of German Literature* (ib., 1915).

**STAFF** (AS. staf, staff). In military and naval usage, the aids or assistants of a commanding officer. The staff of an army comprises the assistants of the general in chief and of his generals, and their duties are to relieve the chief of the details to which he cannot personally attend.

In the United States this body is divided into the military staff and the administrative staff. The former is charged with the more purely military duties, and comprises the chiefs of staff (the assistants and executive officers of the generals in the office and in the field), the adjutants general (who attend to the correspondence, orders, etc.), the inspectors general (who are charged with the inspection of the troops), the

chief of artillery (the assistant and adviser in all matters relating to the artillery and responsible for the artillery material and personnel), the chief of cavalry, the chief of engineers, the chief signal officer (responsible for the military telegraph, signal stations, balloons, and aeroplanes), the provost marshal general (who has charge of the police, prisoners, deserters, secret service, and post office), and the aids-de-camp (attached more directly to the person of a general, assisting him by carrying orders, studying and reporting on portions of the field, and attending to a part of the correspondence). The administrative staff is charged with the service of administration and supply and comprises the judge advocate (who supervises the proceedings of military courts and boards), the chief mustering officer (who supervises the muster and pay rolls, and makes musters into and out of the service), the chief ordnance officers (who are charged with the supply of ordnance material), the chief quartermasters (providing transportation, forage, clothing, camp and garrison equipment and commissary stores, and who pay the troops), and the medical directors and their respective assistants.

The foregoing relates especially to a state of war. In peace the staff service is represented at Washington by various officers, such as the adjutant general, the quartermaster-general, the inspector general, etc., representatives of whose departments and corps are attached to the various great headquarters both in the United States and abroad, such as the Eastern Department and the Philippine Department. In time of peace there is no provost marshal general, nor is there as yet a chief of cavalry.

**General Staff Corps.** Since the passing of the General Staff Bill, which was approved on Feb. 14, 1903, and which entered into legal effect August 15 of the same year, a general staff organization has been instituted as follows: The general staff corps establishment consists of officers detailed from the army at large under such rules as may be prescribed by the President. The duties of the general staff corps are to prepare plans for national defense and mobilization of troops in time of war; to investigate and report on questions relating to the efficiency of the army and its preparation for war; to aid and assist the Secretary of War or other general officers and commanders, and to act as their agents in informing and coordinating other officers who are subject to the supervision of the chief of the staff; and to perform such other military duties as may be prescribed by the President.

The general staff corps consists of two general officers, one of whom shall be the chief of staff, four colonels, six lieutenant colonels, and 12 majors from corresponding grades, 12 captains from grades of captain and first lieutenant. The chief of coast artillery and the chief of the division of militia affairs are additional members of the general staff corps. Time of detail four years, unless otherwise relieved. When relieved these officers return to their former branch of the army, and are not eligible for service in the general staff corps until they have served two years in that branch of the army in which they hold their commission, except in case of war or emergency.

The chief of staff supervises all troops of the line, and the adjutant general's, inspector general's, judge advocate's, quartermaster's, medical

and ordnance departments, corps of engineers and signal corps, and performs such other military duties as may be assigned by the President. All duties previously prescribed by statute for the commanding general, as member of the Board of Ordnance and Fortification and of the Board of Commissioners or of the Soldiers' Home, are performed by the chief of staff or other officers designated by the President. Acts or sections of acts authorizing aids-de-camp and military secretaries do not apply to officers of the general staff corps.

In Great Britain the army is administered primarily by the Army Council, composed of the Secretary of State for War, the chief of the Imperial general staff, the adjutant general to the forces, the quartermaster-general to the forces, and the master general of the ordnance, with three secretaries, the civil and the finance members, who are civilians, and the secretary proper. Each of these members is, in turn, the head of a department; the officers assisting the chief of the general staff are denominated general staff officers, and are of three grades, according to rank. They are assistants respectively of the director of military operation, of the director of staff duties, and of the director of military training. The civilian members have duties chiefly administrative and are assisted mostly by civilian functionaries. The other departments are likewise divided into directorates, each with its own staff, who, however, are not called general staff officers. There are two "inspections," one for the Home, the other for the Oversea Forces. The various commands, regiments, and corps of the British army naturally have their respective staffs, on the nature of which it is not necessary to dwell. The Army of India has a headquarters staff, with general staff, adjutant general's, quartermaster-general's, medical, ordnance, and military works branches.

The staff in Germany comprises three principal classes: first, the general staff proper; second, the *Adjutantur*; third, orderly officers. The Prussian general staff is composed of: first, the great general staff, second, the general staff serving at corps and at division headquarters, and third, in fortress commands. This great general staff is charged with the preparation in peace of all questions bearing upon the conduct of war, such as armament, tactics, plans of campaign, etc. It studies possible theatres of war, estimates the worth of foreign armies, and takes note of the political situation in foreign lands. It is responsible for the proper development of military sciences in the army. In conjunction with the war ministry it has charge of the mobilization of the army and the consequent use of railroads. The chief of the general staff reports on these matters to the Emperor, and is charged with the preparation of plans for setting the army in motion, upon a declaration of war, and for the conduct of eventual operations. He is assisted by four so-called *oberquartiermeister* (general officers). The work of the great general staff is done by various sections as follows: central section, personnel, organization and administration; under the first *oberquartiermeister*, railroad section; second section; German army organization and a special railroad section; under the second, France, England, and the remainder of west Europe, America, Africa, Australia (third section); fortresses (fourth section); under the third, Russia and Scandinavia, Austria, Rumania, the

Balkans, Italy, Switzerland, Persia, China, Japan (fifth section); under the fourth, the survey and map section. The sixth section, directly under the orders of the chief, has charge of manœuvres, the War Academy, staff rides, history, archives, and library. Under the chief stand the War Academy, the railway brigade, the administration of military railways, and the military railway superintendents.

Officers of the general staff fall into two classes: the *Haupt Etat*, or military staff proper, and the *Neben Etat*, which has charge of learned or scientific matters, and does not wear the uniform of the staff. It is composed chiefly of line officers detailed. The general staff officers serving at corps and division headquarters are charged with duties relating to marches, mobilization, quarters, staff rides, manœuvres, etc., within their troop units. Those at fortress headquarters have to do with the proper equipment and defense of the fortresses.

Württemberg and Saxony have no general staff. Bavaria has its own, formed somewhat on the lines of the Prussian. As a rule, general staff officers must be graduates of the War Academies of Berlin and Munich. To the *Adjutantur* are assigned graduates of the war academies who have not gone into the general staff; but this rule is not absolute. The duties of the *Adjutantur* include the publication of orders, interior economy, reports, recruiting, in short, matters of an administrative character. Orderly officers are selected by the generals from the troops under their orders. Usually they are appointed only for campaigns or manœuvres. Only armies and army corps may have a chief of staff.

In France the general staff is not a permanent organization, but is composed of officers temporarily assigned from the line. The staff of the army is under the direction of a general officer chosen from the Supreme Council of War. This officer has the title of chief of the general staff. He is assisted by a general of division (lieutenant general) taken from the division commanders who have commanded a division for at least one year. The staff of the army comprises three groups. The first, under the orders of a general officer, is divided into three bureaus: military operations and general training; organization and tactics of foreign armies; railroads and marches. The second group, under a general of brigade (major general) or colonel, deals with: the organization and mobilization of the army; African matters; history. The third group, under a general of brigade or a colonel, deals with: the personnel of the staff service; current affairs of the staff of the army; administration. The chief of the general staff investigates personally all questions bearing on the organization of the army for war, its mobilization, and concentration; he directs military studies, and the war school. To the staff of the army is joined the so-called *comité d'état-major*, which investigates among other things all questions touching the technical staff service, referred by the Minister of War, as well as those brought up by its members during their annual inspections, and thought to be necessary to the welfare of the army. Although it forms no part of the staff properly so called, mention must nevertheless be made of the *Conseil Supérieur de la Guerre* (supreme war board), whose president is the Minister of War, and of which the chief of the general staff, the chief of staff of the army, and 10 generals of

division are the members. These 10 must have commanded an army corps for at least one year. This council must of necessity be consulted upon all matters affecting the constitution of the army and its state of preparation for war. Fundamental questions are treated by the *Centre de Hautes Etudes Militaires*, at the War School, under the direction of the chief of staff of the army. Troop units in general, the artillery and engineers, the military governments of Paris and Lyons, etc., have their staffs, whose functions, military and administrative, call for no special mention here.

In Italy military affairs are first of all under the direction of the Supreme Defense Board, comprising admirals as well as generals and various ministers. An army council composed of ministers and officers of the very highest rank passes upon questions of interest to the army. The staff corps, whose functions are analogous to those of the great German general staff, is formed of officers who have passed the War School with credit. It has charge of organization and equipment, mobilization, concentration, railways, and in general the defensive organization of the state. The chief of staff, in addition to his duties as such, has the direction of the War School, and of the Geographic Institute. He is assisted by two generals, and a number of other officers of lower grade, including the *applicati*, who are captains of cavalry and of infantry detailed to the staff.

In Russia staff officers must be graduates of the Nikolas General Staff Academy. Topographical duties in Russia do not fall to the general staff, but belong to the military topographers. The number of officers of the staff is not fixed; various classes of officers are considered as forming part of the staff, e.g., the chief of staff of the various military districts, military attachés, the professors of the three military academies, etc. The general staff has to do principally with army organization, manœuvres, camps, fortifications, promotions, rewards, equipment, remounts, geography and topography, home and foreign transport, literature, etc.

The Austrian general staff is a closed corps, composed, as a rule, of graduates of the War School. Its functions are exceedingly broad, including military missions, education, archives, the war ministry, military history, technical committees. Its officers are charged further with the usual and normal duties of the general staff, such as service with troops, and the general subject of preparation for war. The chief is especially responsible for the railway and telegraph regiment, the War School, the archives of the War Department, and the Geographic Institute, whose duties are to map and survey.

**Regimental Staff.** The commissioned staff of a regimental commanding officer would consist of such officers as are not duty officers in the battalion, squadron, or regiment, as the regimental adjutant, quartermaster, commissary, etc.

**The Noncommissioned Staff** consists of noncommissioned officers not forming part of the company establishment proper and who have relationship only to the battalion, squadron, or regiment, as sergeant major (battalion or regimental), quartermaster sergeant (regimental), commissary sergeant (regimental), chief musician, chief trumpeters, and principal musician. In the United States army noncommissioned officers doing duty as part of the permanent establishment of an army post or fort are termed the

FINGAL'S CAVE, ISLAND OF STAFFA

*post noncommissioned staff*, which ordinarily consists of an ordnance sergeant, post quartermaster sergeant, electrician sergeant, etc. Throughout the armies of Europe battalion, regimental, and post (depot or fortress) staffs, commissioned or noncommissioned, include practically the same descriptions of officers. See **STAFF COLLEGES AND SCHOOLS**; **ARMY ORGANIZATION**; and sections on *Army* in articles on the different countries.

The *aids-de-camp* of a general officer constitute his staff, together with such departmental and technical officers as may be temporarily detailed to assist the general in some specific undertaking.

**Naval Staffs.** In navies the scope and organization of the general staff is different; and its character, duties, and control are not even similar in any two great navies. In most of them even the word "staff" is not used in this connection. In the United States service staff officers are those who do not belong to the executive or combative branch, such as surgeons, paymasters, chaplains, etc. The centralized functions of the general staff are divided between the Naval War College (see **NAVAL SCHOOLS OF INSTRUCTION**), the General Board, and the Chief of Operations, assisted by the Office of Naval Intelligence. The General Board is composed of officers of high rank, and its duties are to pass upon plans presented to the Department through the War College, the fleet, or from other sources; to prepare plans for all probable contingencies in conjunction with the Naval War College; and to advise the Secretary of the Navy upon all matters of naval policy. The Chief of Operations, the executive of all plans involving control of the fleet and allied matters, is a member of the General Board.

**Bibliography.** *Die Heere und Flotten der Gegenwart*, edited by C. von Zepelin (Berlin, 1897 et seq.); Toulorge, *Le service d'état-major en campagne* (Paris); Lasalle, *Manuel de l'organisation de l'armée* (French army); Von Schellendorf, *General Staff Duties*, English translation by W. A. H. Hare (London, 1877); Spenser Wilkinson, *The Brain of an Army* (new ed., ib., 1895); United States Adjutant-General's Office, *Staffs of Various Armies* (Washington, 1899). Special texts exist for considerable countries, and official documents should in each case be consulted. See **GENERAL STAFF**.

**STAFF, IN MUSIC.** See **MUSICAL NOTATION**, *The Stave*; **NEUMES**.

**STAFFA**, staf'fä. A celebrated but uninhabited Scottish islet, one of the Inner Hebrides (q.v.), 7 miles west of Mull (Map: Scotland, B 3). It rises to a height of 144 feet, is 1½ miles in circumference, and oval in shape. Except on the northeast its cliffs hollowed by caverns rise from the water 84 to 112 feet high. There are seven caves, of which the most remarkable is Fingal's or Great Cave. The entrance, formed by regular basaltic columnar ranges on each side, supporting a lofty arch, is 33 feet wide and 65 feet high. The length of the cave is 230 feet. As a fine specimen of natural architecture it is much frequented by tourists.

**STAFF COLLEGES AND SCHOOLS.** Military training schools for officers candidates for staff appointments. To prepare officers for duty on the staff of an army special colleges or schools have been instituted by all the leading military nations. The United States staff colleges are

the War College at Washington and the Staff College at Fort Leavenworth, Kans. In England officers, to qualify for staff appointment, must have had five years' service in the army, undergo the two years' course at the Staff College at Sandhurst, and serve at least four months at Aldershot in some arm of the service other than the one to which they belong. The rule in Germany is to select officers for the general staff from among the graduates of the war academies of Berlin and Munich having the best qualifications and the highest rank. In France staff officers are educated at the Higher War School at Paris, which was first organized as a staff college at the beginning of the nineteenth century, and reorganized in 1875 as the permanent college for general staff candidates. Austria-Hungary sets apart the Kriegsschule at Vienna for instruction in staff work. The Italian general staff school is at Milan, where about 24 officers graduate each year. The Nicholas Academy at St. Petersburg is the staff school of Russia, entrance to which is competitive to all officers of three years' service and upward. See **STAFF**.

**STAFFORD.** The county town of Staffordshire, England, on the Sow, 29 miles northwest of Birmingham (Map: England, D 4). Tanning and the manufacture of cutlery and of shoes are the chief branches of industry. Pop., 1901, 20,900; 1911, 23,383. Stafford was of importance before the Conquest, is mentioned in Domesday, and King John confirmed and enlarged the privileges of an old charter.

**STAFFORD.** A town, including the borough of Stafford Springs, in Tolland Co., Conn., 20 miles north by west of Willimantic, on the Willimantic River, and on the Central Vermont Railroad (Map: Connecticut, F 2). It is a summer resort, with mineral springs, and contains the Johnson Memorial Hospital. It manufactures woollens. There is a public library. Pop., 1900, 4297; 1910, 5233.

**STAFFORD, HENRY**, second DUKE OF BUCKINGHAM (c.1454-83). An English nobleman and political intriguer, the grandson of the first duke succeeding to the title in 1460. He was a prominent adherent of the Duke of Gloucester, afterward Richard III, while the latter, then Protector, was conspiring to seize the throne, and assisted him in his efforts against Earl Rivers and Lord Grey. After their downfall he received the office of Chief Justice and constable of the royal castles in Wales, and later that of Lord High Constable of England. Afterward he joined the Lancastrians to overthrow Richard, but his projects were frustrated, and he was tried and beheaded at Salisbury in 1483.

**STAFFORD, WILLIAM HOWARD**, VISCOUNT (1614-80). An English statesman, the fifth son of Thomas, Earl of Arundel and Surrey. He was educated as a Roman Catholic. In 1634 he married a sister of the thirteenth Baron Stafford, and on the latter's death assumed the title. This marital claim was disputed, but finally decided in his favor, and a new creation was made by the King, declaring him Baron and afterward Viscount Stafford. During the Civil War he was an adherent of the King, but after the Restoration (q.v.) frequently opposed the royal will from the House of Peers. In 1678 Stafford was denounced by the infamous Titus Oates (q.v.) as a conspirator in the pretended popish plot. He was impeached for high treason, and, despite a spirited defense against suborned testimony,

was found guilty and publicly executed on Tower Hill. In 1824 the Act of Attainder was reversed by Parliament.

**STAFFORDSHIRE.** An inland county of England (Map: England, D 4). Area, 1128 square miles; pop., 1901, 671,490; 1911, 738,991. In the north wild moorlands in long ridges, separated by deeply cut valleys, extend from northwest to southeast. The surface is low and undulating in the midland regions, but becomes hilly again in the south. The Pottery coal field occupies the north, and the Black Country coal field, remarkable also for its abundant and rich iron ores, occupies the south, while in the centre are the extensive Cannock Chase collieries. The Black Country, lying between Birmingham and Wolverhampton, some 15 miles in length, is one of the chief iron and steel manufacturing districts in England and is practically one continuous town. The Trent, flowing first southeast through the county, then northeast along its eastern border, is the chief river. The climate is humid, much of the soil is clayey, and agriculture is in a backward condition. The manufactures, however, are extensive and varied, including iron and steel in every form, chemicals, bricks, pottery, shoes, and glass, and cotton, silk, and leather goods. Stoke-on-Trent is the chief seat of the pottery industry, while Burton-on-Trent is famous for its breweries. Consult *Victoria History of the County of Stafford*, vol. i (London, 1908).

**STAFF TREE.** See WAXWORK.

**STAG, or RED DEER.** See ANTLERS; DEER.

**STAG BEETLE.** Any member of the *Lucanidae*, a family of beetles including about 750 species. The common name is derived from the shape of the mandibles of the males, which are developed in some species so as to equal in length nearly that of the entire body, and are armed with spines or teeth. The males are of varying size and exhibit remarkable differences in the development of the head and mandibles. *Lucanus cervus* is the common English species. *Lucanus dama* is the commonest North American species. In the Southern States *Lucanus elaphus*, the giant stag beetle, occurs. See Colored Plate of BEETLES.

**STAGE, THE.** A term frequently employed to designate the theatre (q.v.), the drama (q.v.), or the profession of the actor.

**STAGGERBUSH.** See ANDROMEDA.

**STAGGERS.** Various affections of animals. In horses, mad or sleepy staggers is attributed to inflammation of the brain and is considered fatal. Grass or stomach staggers is said to result from indigestion. In sheep the gid tape-worm in the brain cavity is held accountable for the phenomenon.

**STAGGERS, BLIND.** See MEGGRIMS; MENINGITIS, *Cerebro-Spinal*.

**STAGHOUND.** See HOUND.

**STAGING.** Staging and scaffolding are interchangeable terms for the temporary frameworks of timber erected about a building under construction or repair, to furnish platforms for the workmen and for the materials and implements of construction in immediate use. For exterior work the staging may be built up in one of three ways: by series of movable trestles or horses supporting planks in successive tiers or stages; by putlogs projecting horizontally through temporary holes in the masonry, to support the platforms; or by rows of lofty poles or posts standing on or in the ground, to which

are nailed, bolted, or lashed with ropes the necessary girts and crosspieces, with braces to prevent the sidewise racking of the frame. In cities a strong staging is built of heavy timbers over the sidewalk for the protection of passers-by. Materials are hoisted by derricks or construction elevators. Stagings erected to support the trusses of bridges while building are called falsework.

**STAGIRA, stá-jí'rá, or STAGIRUS, -rús.** An ancient town in southeast Macedonia, on the Strymonic Gulf, celebrated as the birthplace of Aristotle. It was founded in 655 B.C. by a colony from Andros, but declined after its capture by Brasidas during the Peloponnesian War. The modern village of Stavro is on its site.

**STAGIRITE, stáj'í-rit, THE.** A name frequently given to Aristotle (q.v.) from his birthplace, Stagira.

**STAGNELIUS, stág-ná'lé-us, ERIK JOHAN (1793-1823).** A Swedish poet, born on the island of Oland, and educated at Upsala and Lund. He was deeply interested in Gnosticism and treated all sides of this question in his books. He is considered a master of form. He published the epic poem *Vladimir den store* (1817), the philosophico-religious *Liljor i Saron* (1821), *Martyrerna*, his best drama (1821), and the tragedy *Baccanterna* (1822). C. Eichhorn edited his complete works (1868), and F. Böök a standard edition in 1912 et seq.; German translation by K. F. L. Kannegieser (6 vols., 1851). Most of his works are translated into French, Finnish, and Latin.

**STAHL, shtäl, ERNST (1848- ).** A German botanist, born at Schiltigheim, Alsace, and educated at Strassburg, Halle, and Würzburg. He became professor in Strassburg in 1880 and professor and director of the botanical gardens at Jena the following year. He visited Ceylon and Java in the winter of 1889-90. Among his books are *Entwicklung und Anatomie der Lenticellen* (1873); *Einfluss des Lichtes auf den Geotropismus einiger Pflanzenorgane* (1884); *Regenfall und Blattgestalt* (1893); *Sinn der Mykosrhizenbildung* (1900); *Die Blitzegefahr der verschiedenen Baumarten* (1912).

**STAHL, FRIEDRICH JULIUS (1802-61).** A German politician and political philosopher. Born in Munich of Jewish parents, he turned Protestant in 1819, studied at Würzburg, Heidelberg, and Erlangen, and in course of time became professor of law at Erlangen, Würzburg, and Berlin. In 1840 he became a member of the Upper House of the Prussian Legislature, and in 1850 a member of the Erfurt Parliament. Stahl was a leader in the Lutheran church, and a most powerful influence for reaction in Germany. He stood for an absolute monarch and an absolute church that should control the monarch. The basis of his political philosophy was the conception of the subserviency of all things lay and clerical to the will of God as expounded by the clergy. In 1858 he was forced to retire from the Upper Church Council. His most important work is the *Philosophie des Rechts nach geschichtlicher Ansicht* (1830; 5th ed., 1878). Others are: *Ueber Kirchenzucht* (1845); *Das monarchische Prinzip* (1845); *Der christliche Staat* (1847); *Die Revolution und die konstitutionelle Monarchie* (1848); *Die lutherische Kirche und die Union* (1859); and, posthumous, *Die gegenwärtigen Parteien in Staat und Kirche* (2d ed., 1868).

**STAHL, GEORG ERNEST (1660-1734).** A

German physician and chemist, born at Ansbach. He became court physician at Weimar in 1687, and in 1694 was called to the chair of medicine, anatomy, and chemistry in the newly founded University of Halle, whence he removed to Berlin in 1716, and was appointed physician to the King of Prussia. Stahl was one of the ablest chemists of his time. He destroyed numberless absurd opinions then in science, and propounded the first general theory of chemical transformations (see CHEMISTRY), universally accepted till the time of Lavoisier. His works, according to Haller, number 250, the most important being *Theoria Medica Vera* (1707, and 1831-33), containing his medical theory, and *Experimenta, Observationes et Animadversiones Chymico-Physicæ* (1731), in which his chemical opinions are set forth. Consult Charles Lasègue, *De Stahl et sa doctrine médicale* (Paris, 1846), and Albert Lemoine, *Le vitalisme et l'animisme de Stahl* (ib., 1864).

**STAHL, ROSE** (?- ). An American actress, born in Chicago. She made her début in Philadelphia in 1870, toured with Daniel Brandmann in 1888, and appeared in New York in 1897. In 1902-03 she starred as Janice Meredith in the play of that name. She first appeared in her rôle of Patricia O'Brien in 1904 in the sketch called *The Chorus Girl*, which she carried to London in 1906, and she reappeared in New York in the revised four-act play, *The Chorus Lady*, in which she made a sensation and which continued to be her vehicle till 1911. Afterward she played in *Maggie Pepper* (1911), *Moonlight Mary* (1916), etc. She was married to William Bonelli, an actor.

**STAHL EAR.** See STIGMA.

**STAHR**, shtär, **ADOLF WILHELM THEODOR** (1805-76). A German author and art critic, born in Prenzlau, Prussia. After study at the University of Halle he went to the Gymnasium at Oldenberg, and in 1836 became professor there. While on a tour through Italy in 1845, which was afterward described in *Ein Jahr in Italien* (1847-50), he met the author Fanny Lewald, whom he married in 1855, after separating from his first wife. Perhaps the most noteworthy of his writings are his classical studies, which include translations from Aristotle, Suetonius, and Tacitus, and also *Bilder aus dem Altertum* (1863-66) and *Torso: Kunst, Künstler, und Kunstwerke der Alten* (2 vols., Brunswick, 1854-55; 2d ed., 1878). His miscellaneous works, some of which have been translated into English, include: *Charakteristik Immermanns* (1842); *Die Republikaner in Neapel* (1849); *Die preussische Revolution* (1850); *G. E. Lessing, sein Leben und seine Schriften* (1858); and several works of travel.

**STAINED GLASS.** The term used technically as well as popularly to designate windows made of colored glass, whether the color be produced: (1) by metallic oxides in the melting pot; (2) by coating the surface with a film of colored glass, thus making flashed glass, which is ground or etched away where the color is not desired; (3) by applying under fire a solution of silver (yellow stain) which turns yellow the surface of crystal (colorless) glass, and of the ground-away portions of flashed glass, and by which light-blue glass is turned green; (4) by painting the surface with colored enamels that are afterward fused into the substance.

Frequent mention of stained-glass windows is found in Greek and Latin writers of the fourth

century A.D. In the fifth century Sidonius Apollinaris, in a poem for the dedication of a church in Lyons, describes the stained-glass windows. In the ninth century Anastasius says that Pope Leo III decorated windows of St. Peter's with glass of different colors; and the pontificals assert that Benedict XIII adorned the windows of St. Mary's in Trastevere with colored glass. The glass of early windows, especially of those constructed in Mohammedan countries, of which there are several small examples in the Metropolitan Museum of Art, New York, was sometimes set in plaster, instead of being held together with ribbons of lead. A sixth-century writer speaks of "sheets of glass to-day being set in lead which formerly were set in plaster."

Whether any of these windows were picture windows is uncertain. They may have been made in decorative designs only, without the introduction of human figures and subject interest. But we do know that by the twelfth century the art of story representation in glass was well developed. This is proved by windows that remain, and also by the *Diversarum Artium Schedula* of the monk Theophilus, who in great detail describes all the processes of making this glass, leads, etc.

The most ancient stained-glass window that bears the name and portrait of the donor is in the church of the abbey of St. Denis, near Paris, installed in the twelfth century by Suger (born 1081), famous as churchman, statesman, and historian. In 1122 he was elected abbot of St. Denis, and in 1142 he dedicated the new church, built to take the place of the smaller one that dated from the reign of Charlemagne. In the book that gives the history of the administration of Suger as abbot, he says: "We have had painted by the skilled hands of many masters of different nations an extensive series of splendid new windows."

Of especial interest to English-speaking people is the late twelfth-century window in the cathedral of Sens that tells in detail the story of the life of Thomas à Becket (q.v.). It was at Sens that St. Thomas sought refuge before he became reconciled to Henry II and returned to Canterbury to be assassinated. The pontifical garments of St. Thomas that are still carefully preserved in the cathedral of Sens differ in many important points from those worn by archbishops now, but are exactly reproduced in the window that commemorates his life.

The development of Gothic architecture in northern France vastly increased the size of windows, made stained glass the important color factor in the decoration of churches, and caused it to supplant fresco painting. The cathedral of Chartres has no less than 146 important windows, in which appear 1359 pictures, containing about 5000 human figures. It is a perfect example of how a church should be lighted. Through ancient thirteenth-century glass the whole interior is bathed in a sea of living colors marvelously grouped for composite effect. The cathedral of Bourges has 183 stained-glass windows, but many of them are of later date. Twenty-eight of the windows at Chartres were given by the local trades guilds. Consequently we see the different trades pictured in the windows: the tanners at the bottom of the window that tells the story of St. Thomas in 22 picture medallions; the shoemakers beneath the window of St. Martin of Tours; the masons beneath St.

Sylvester. Also at Le Mans and to a less degree at Rheims and Rouen were preserved whole series of the windows that in the thirteenth century set the style for other countries.

The characteristics of the earliest Gothic windows are: multiplication of small figures in many separate compositions grouped in tiers or rows of framed medallions; rich and dark coloring; wide decorative borders; heavy leads bent so as to outline the figures or cut them in the deep shadows; brown enamel used to produce outlines, and shadows and modeling.

The development during the fourteenth century was towards lighter coloring, larger figures, narrow borders, more ornamentation, more delicate gradations of color, and increase of modeling, loss of simplicity, and tendency to mannerisms, while in the fifteenth century much clear glass was introduced into the backgrounds, and inscribed ribbons and architectural accessories became conspicuous. The designers of the Gothic age did not, to any great extent, give the details of their pictures on glass as their successors—Renaissance and modern—mistakenly attempted to do, but obtained their superb effects by a clear knowledge of the interaction of colors, by juxtaposition of complementary colors, and the effect of distances; the technique being that of glass colored not on the surface, but in the mass either by stain or incorporation. This branch of art was, therefore, governed by totally different artistic principles from those governing opaque painting (fresco, oil, tempera, tapestry, etc.), and these principles were thoroughly understood.

During the latter part of the thirteenth century the art was carried to England, Germany, and Italy, where it did not really flourish before the following century. In Italy the imperfect understanding of Gothic methods did not allow of the use of such immense windows, and the art never became thoroughly carried out. At Arezzo Cathedral are some windows by a French artist, Guillaume de Marcillati, proving the transmission from France. Other interesting examples are in San Francesco at Assisi, San Petronio in Bologna, and the cathedral and Santa Croce in Florence. Many of the best Italian examples belong rather to the early Renaissance than to the late Gothic. England would still possess some very fine series, as is shown by the examples at York and Canterbury, had it not been for the vandalism of the Reformation. In Spain there are fine windows at Toledo and León, very close to French models. Germany, however, ranks next to France in the importance of its remaining windows, beginning in the fourteenth century with those of the choir of Cologne Cathedral, those of the cathedrals of Freiburg, Strassburg, and Regensburg, and the churches at Oppenheim, Esslingen, and Nuremberg. German works, however, do not approach the French in quality either of technique or art.

In the fourteenth century the introduction of yellow stain gradually led to the less frequent use of the rich reds and blues that had previously been dominant. The glass, more perfectly fused, became constantly more transparent and was used in larger pieces. About the middle of the sixteenth century the movement towards transparent crystal glass and paint culminated in the invention of colored enamels that could be used on glass as freely as oil paints on canvas. To be sure they were fused in, not merely varnished over. But the principle was the same, and windows made in this way lack what is the most

important part of stained glass—the rich polychrome jeweled effect. In recent years a serious attempt has been made, particularly in England, to return to ancient methods.

The so-called American glass is an entirely different product. From cast sheets of opalescent glass, with enamels for the modeling of faces and hands only, John La Farge and Louis B. Tiffany developed an art that is absolutely and completely original. The iridescent effects are extraordinary, and the colors are rich but apt to be too opaque. Drapery effects are very skillfully produced with so-called drapery glass, large sheets of which, partly by design and partly by accident, give the required lines and shadows. Especially important in the process is the artificial selection of natural variations that come about in the making of the sheets of glass.

**STAINER**, shtn'ēr, JAKOB (1621–83). A German violin maker, born at Absam, Tirol. He was the son of poor peasants, but at an early age began to make violins and subsequently studied at Cremona under the best makers of his time. His extravagances kept him in continual poverty and he died in an insane asylum in Absam. Stainer violins are rare and command high prices, though they do not rank with the instruments of Guarnerius, Stradivarius, or the Amati (qq.v.). Consult F. Lentner, *Jakob Stainer's Lebenslauf im Lichte archivarischer Forschung* (Leipzig, 1898).

**STAINER**, stān'ēr, SIR JOHN (1840–1901). An English composer and organist, born in London. In 1854 he became organist and choir-master of St. Benedict and St. Peter's Church, but continued to study composition with Bayley and Steggall and organ with George Cooper. He held this appointment for three years. In 1863 he was appointed organist of Magdalen College, Oxford, and conductor of the two musical societies. In 1865 he was made doctor of music, and in 1866 became one of the examiners for musical degrees. He succeeded Sir John Goss as organist of St. Paul's, London, from 1872 to 1888, when he was knighted by Queen Victoria, and the following year was appointed to the chair of

music at Oxford University. He was also professor in the Royal College of Music. In 1878 he was made Chevalier of the Legion of Honor. His compositions are nearly all for the Church and include the oratorio *Gideon* and the cantatas *The Daughter of Jairus* (1878), *St. Mary Magdalene* (1883), and *The Crucifixion* (1887). Other compositions include numerous anthems, services, canticles, and songs. In conjunction with W. A. Barrett he wrote a dictionary of musical terms (1876; 3d ed., 1880). His textbooks, including a number of primers, are among the best in English.

**STAINVILLE**, DUC DE CHOISEUL-. See CHOISEUL-STAINVILLE.

**STAIR**, VISCOUNT and EARLS OF. See DALRYMPLE.

**STAIRCASE SHELL**. A collector's name for the low, conical, handsomely colored tropical shells of the mollusks of the family Solaridiæ, and especially of the genus *Solarium*. In this

STAIRCASE SHELLS.

1, the common existing species (*Solarium perspectivum*).  
2, a fossil form (*Solarium leyerici*) from the Upper Cretaceous of Belgium.

genus the umbilicus is widely open, and the sculptured edges of the whorl seen within it are comparable to a spiral staircase. These mollusks are related to the wentletrap (q.v.).

**STAIRS**, MOVING. See ELEVATOR.

**STAIRS AND STAIRWAYS**. Stairways became necessary whenever buildings were first erected of more than one story, but they do not appear to have attained architectural importance until the Middle Ages. Previous to the Roman Empire nearly all classes of buildings were of one story only. While ordinary stairways of utilitarian character are known to have been used in Crete, 2000 B.C., and in Greek temples and Roman basilicas, theatres and amphitheatres, to give access to galleries, the only monumental stairways of ancient times known to us are that to the terrace of Persepolis and those leading up to the podia (see PODIUM) of Roman temples. In the Middle Ages they appear in churches having high choirs above crypts, to connect the nave with the two levels thus created; while the multiplication of towers led to the building of winding stairs. It was the Renaissance that gave the stairway architectural dignity and even splendor, first in Italian palaces and later in France, where both the spiral type (as at Blois and Chambord) and the rectangular type were treated with great magnificence. Italy then took up and imitated the French practice (Braschi Palace, Rome; Caserta; palaces at Naples and Turin). In modern architecture the most splendid example is that of the Paris Opera House. Very fine stairways in America are those of the State Capitol at Albany, N. Y., and of the Congressional Library, Washington, D. C.

In modern practice stairs are built of wood, stone, iron, or concrete or combinations of these. Each step has a riser or face, from 5 to 8 inches high; a tread or top, from 9 to 15 inches wide, and an end. The projecting molding in front

and across the end is the nosing. If the stairs are supported on inclined beams, these are called carriages or strings. In an open-string stairway the steps are set above the string; in a closed-string stairway the outer ends abut against the outer string. A balustrade or parapet with a hand rail protects the outer ends. The stairs between two successive landings, or between a landing and a floor, constitute a run. Building laws in cities prescribe the limits of width for stairways of certain classes of buildings and the manner in which they should be safeguarded against fire. Consult: Julien Guadet, *Éléments et théorie de l'architecture* (new ed., 4 vols., Paris, 1905); Morris Williams, *Stair Builders' Guide* (New York, 1914); W. H. Wood, *Practical Stair Building and Hand Railing* (ib., 1915).

**STALACTITE** (from Gk. σταλακτός, *stalaktos*, oozing, and STALAGMITE (from Gk. σταλαγμός, *stalagmos*, dripping). Elongated masses of lime, chalcedony, or other mineral substances that depend from the roof or rise from the floor of caves. Water impregnated with carbonic acid will dissolve lime, and as rain and surface water contain more or less carbonic acid, they take in passing through the earth to the roofs of caves a certain amount of lime. When the water is exposed on the roof or floor of the cave, evaporation follows; both the bulk of the water and its solvent power are reduced, and a thin pellicle of solid carbonate of lime is deposited. When this occurs at the roof of the cave, long icicle-like pendants are formed, called stalactites; when the water drops upon the floor a stalagmitic layer is formed, building up at points where the largest supply of material exists as pillars to meet the overhanging stalactites. See CALCAREOUS TUFF; CAVE.

**STALACTITE, STALACTITE WORK**. A form of architectural ornament in nearly all Mohammedan styles, composed of an assemblage of minute brackets and niches so combined as to form systems of corbeling, niche caps, cornices, pendentives, and even capitals.

**STALEY**, CADY (1840- ). An American civil engineer and educator, born at Minaville, N. Y. He graduated at Union College in 1865, prospected for gold in the foothills of the Rockies, became a civil engineer on the Central Pacific Railway, in 1867 became assistant in civil engineering at Union College, and in 1868 professor of that subject, and from 1876 to 1886 was dean. Thenceforth until 1902 he was president of the Case School of Applied Science at Cleveland, Ohio. Besides an edition of Gillespie's *Roads and Railroads. Notes on Bridge Engineering* (1875), his publications include *Strength of Materials and Stability of Structures* (1876) and *The Separate System of Sewage* (1882; 3d ed., 1899), with G. S. Pierson.

**STALK BORER**. A caterpillar which bores commonly into the stems of potatoes, geraniums, spinach, cauliflower, dahlias, corn, and many other plants. It is the larva of a brown noctuid moth (*Papaipema nitela*) commonly found throughout the eastern United States. The whitish-brown striped larva bores longitudinally within the stalks, which wilt. When full grown they burrow in the ground, where they pupate until fall, when the moths emerge and hibernate. Many other insects bore in the stalks of the plants mentioned.

**STALKER**, STALK'ER, JAMES (1848-1927). A minister of the Free church of Scotland, born at Crieff, in Perthshire. He was educated at the

university and at New College, Edinburgh, and studied also at Halle and Berlin. In 1902 he accepted the chair of Church history in the United Free Church College, Aberdeen. He delivered the Lyman Beecher lectures at Yale in 1891, and lectured on other foundations in Britain and the United States. His works were widely read by English-speaking people, and some of them were translated into several languages. Among them are: *The Life of Jesus Christ* (1879); *The Life of Saint Paul* (1884); *Imago Christi* (1889); *The Preacher and his Models*, lectures delivered at Yale (1891); *Men and Morals* (1892); *The Two Saint Johns* (1895); *The Four Men and Other Chapters* (1892); *The Christology of Jesus* (1899); *The Ethics of Jesus* (1909); *Know Thyself* (1914); *Christian Psychology* (1915).

**STALLBAUM**, štáll'baum, JOHANN GOTTFRIED (1793-1861). A German classical scholar, born at Zausch, in Saxony. He studied at the University of Leipzig. From 1820 to his death he taught at the Thomasschule in Leipzig; from 1835 he was rector there. From 1840 also he was extraordinary professor at the University of Leipzig. He published a complete text of Plato (1821-25), and an edition, with full prolegomena and notes, in Latin (1827-60). The latter work is of great importance in the history of Platonic study.

**STALWARTS**. The name applied to those members of the Republican party in New York State in 1881 and afterward who adhered to Senators Conkling and Platt and were opposed to the half-breeds (q.v.), who favored the administration of Garfield. See CONKLING, ROSCOE.

**STALYBRIDGE**, stál'i-bríj. A municipal borough, partly in Lancashire and partly in Cheshire, England, on the Tame, 8 miles east of Manchester (Map: England, E 3). It has fine municipal buildings and is noted for its cotton manufactures, which date from 1776; print works, iron and brass foundries, and machine shops are numerous and important. Pop., 1901, 27,700; 1911, 26,513. Consult Butterworth, *Historical Account of Stalybridge* (Ashton, 1842).

**STAMBUL**, stám-bool'. The Turkish name of Constantinople (q.v.) proper.

**STAMBULOFF**, stám-bool'f, STEPHEN (1855-95). A Bulgarian statesman, born at Tirnova of poor parentage. He studied for the priesthood at Odessa, but was expelled from Russia for complicity in the revolutionary propaganda of the Nihilists. Upon his return to Bulgaria he engaged in several conspiracies looking towards the liberation of his country from the Turks. In 1879 he was elected to the Sobranje, or national assembly, of which he became president in 1884. Stambuloff combated Russian influence in Bulgaria (q.v.) and lent support to the annexation of eastern Rumelia in 1885. He was in the regency after the abduction of Prince Alexander in August, 1886, until the election of Prince Ferdinand, in July, 1887, then became Premier, and for nearly seven years ruled autocratically, establishing amicable relations with the Porte, but antagonizing Russia. His course gained him bitter enemies and aroused the dissatisfaction of Ferdinand. In May, 1894, the Minister resigned. On July 15, 1895, Stambuloff was set upon by three assassins in the streets of Sofia and was left for dead, expiring three days later. The murderers had only nominal terms of imprisonment. A

confession made by one of them in 1902 implicated men then in power, and tended to cast suspicion on Prince Ferdinand. Consult A. H. Beaman, *M. Stambuloff* (London, 1895), and id., *Twenty Years in the Near East* (ib., 1898).

**STAMEN** (Lat., warp, thread, fibre, stamen). The organ in flowers which produces pollen (q.v.). It is usually differentiated into two regions: (1) a stalklike portion, called the filament, and (2) the terminal anther which bears the pollen sacs. See FLOWER.

**STAMFORD**. A market town in Lincolnshire, England, on the Welland, 16 miles by rail northwest of Peterborough (Map: England, F 4). It is remarkable for its history and its antiquities, of which four fine churches, two old gateways, and the ruins of a priory remain. Its charter dates from 982. Pop., 1901, 8300; 1911, 9647. Consult Neirnsen, *History of Stamford* (London, 1879).

**STAMFORD**. A city in Fairfield Co., Conn., 33 miles northeast of New York City, on Long Island Sound and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, A 5). It is attractively situated, and contains the homes of many New York business men. It has the Ferguson Library, the public library, Halloween, Central, West, and St. John's parks, and the Stamford Hospital. Its manufacturing industries are many and important. They include hardware, locks, dyestuffs, pianos, typewriters, insulated wire, chocolate, paints, wood-working machinery, and foundry and machine-shop products. In 1915 the city's 78 industrial establishments represented an invested capital of approximately \$16,000,000, gave employment to 5585 persons, and yielded products valued at \$12,000,000. Pop., 1900, 15,997; 1910, 25,138; 1915 (U. S. est.), 29,958; 1920, 35,086. Stamford was settled in 1641 by a company from Wethersfield, some of whom were natives of Stamford, England. Until 1662, when the Connecticut and New Haven colonies united, it was under the jurisdiction of the latter. Consult: Huntington, *History of Stamford* (Stamford, 1868); Gillespie, *Historical Sketch* (ib., 1892); and article, "Stamford—1641-1900," in *Connecticut Magazine*, vol. vi (Hartford, 1900).

**STAMITZ**, shtá'míts, JOHANN WENZEL ANTON (1717-57). A Bohemian composer, the creator of the modern instrumental style. He was born in Deutsch-Brod, June 19, 1717. At the coronation festivities of Emperor Charles VII at Frankfurt in 1742 the young man attracted the attention of Prince Karl Theodor, who engaged him as his chamber musician. After the Prince had become Elector Palatine he appointed Stamitz his musical director in 1745, a position which the latter retained till his death. Under his direction the Electoral Orchestra of Mannheim won the reputation of being the finest body of instrumentalists in the world, while his style of composition was immediately adopted by many of his contemporaries, notably Johann Christian Bach, Boccherini (q.v.), Dittersdorf, and Gossec. Stamitz died in Mannheim, March 26 or 27, 1757. Dr. Hugo Riemann published a number of his works in *Denkmäler der Tonkunst in Bayern* (III, 1; VII, 2; VIII, 2). Stamitz wrote 50 symphonies, 10 trios for orchestra, 12 violin concertos, a number of sonatas for violin solo and for violin and piano. See MUSIC, HISTORY OF, XIX; ORCHESTRA; SONATA; SYMPHONY.

**STAMMERING** (from Ger. *stammern*, to stammer). Imperfect enunciation of words, due to irregular or spasmodic action of the muscles of articulation. The trouble is sometimes a form of chorea (q.v.), sometimes entirely an emotional incoördination. In the ordinary classification of speech defects stammering is known as dyslalia; in this form there is difficulty of utterance. Pseudolalia embraces slight deviations from normal speech, e.g., slurring or omitting certain elements or the substitution of one element for another. Stammering is not always confined to a disturbance directly concerned with the mechanism of enunciation, but other muscles may be involved in the spasm, especially when great effort is made to overcome it. On the other hand in phlegmatic individuals there may be but little noticeable spasm, the victim will only stand and stare. This is sometimes known as the silent form of stammering. In many sufferers the difficulty lies in the enunciation of the initial syllables of certain words, especially if they begin with *b*, *p*, *t*, or *d*. In some cases, when once pronounced, the syllable is involuntarily repeated many times. This variety of stammering is sometimes termed stuttering.

Among predisposing causes heredity is most important. The trouble begins soon after the child, who is generally of a nervous temperament, begins to talk, and lasts through youth and even to old age. Sex is a predisposing factor, 84 per cent of all cases reported being in males; other authorities give the proportion of males to females as  $4\frac{1}{2}$  to 1. Besides attention to the general health, such conditions as eyestrain, hypertrophied tonsils, adenoid growths, and deficient nasal breathing, must be taken into consideration and remedied. In many children the condition must be considered a true neurosis, following nervous shock, fright, or injury. Ridicule, scolding, or disciplinary measures tend to make the condition worse. Stammerers can usually sing without difficulty, and on this fact are based most successful methods of cure. The patient is taught to breathe properly and to sing or intone his speech, every advantage being taken of the sense of rhythm, until finally new habits of normal coördination are established. Consult E. W. Scripture, *Stuttering and Lispering* (New York, 1912).

**STAMP** (AS. *stempian*, to stamp). A small piece of paper with an imprint of a mark or device authorized by law, adapted for attachment to an object chargeable with a duty or tax of some nature. Stamps are usually gummed on the back and attached to the instrument or article by adhesion, and are usually made to represent different values to suit the requirements of the tax law or revenue act under which they are imposed.

The British government has long employed stamps for the above purposes, and the United States government for the purpose of raising revenue during the Civil War imposed a stamp tax upon legal instruments and a great variety of other articles of property. The stamp is required to be affixed to an article before it can be sold, this being done by the manufacturer. During the Spanish-American War and also during the Great War the United States government passed war-revenue acts requiring stamps on legal instruments and certain articles of commerce. Such acts are generally repealed when the necessity for the increased revenue has ceased. Internal-revenue stamps are re-

quired on tobacco, snuff, liquors, cigars, etc., under excise laws, as this is the most satisfactory method of collecting revenue upon such articles. Where a stamp tax is imposed on legal instruments the revenue act usually provides that an instrument shall be void unless properly stamped. The courts usually hold an instrument good if the parties have omitted the stamp inadvertently. Consult: N. J. Highmore, *The Stamp Laws* (2d ed., London, 1902); T. M. Cooley, *Treatise on Constitutional Limitations* (7th ed., Boston, 1903); Theophilus Parsons, *Law of Contracts* (9th ed., 3 vols., ib., 1904). See POSTAGE STAMPS.

**STAMP ACT.** In American history, an act passed by the British Parliament and signed for George III (then insane) March 22, 1765, "for granting and supplying certain stamp duties, and other duties, in the British colonies and plantations in America, towards further defraying the expenses of defending, protecting, and securing the same." This act, which was to go into effect on November 1, prescribed (1) that stamped paper be used for legal and official documents, diplomas, and certificates; (2) that stamps be placed on playing cards, dice, books (excepting in the schools), newspapers, pamphlets, calendars, almanacs, and other articles; and (3) that jury trial be denied offenders at the discretion of authorized prosecuting officers. Lord Grenville had given notice in March, 1764, of an intention to introduce such an act, and various Colonies had protested vigorously through their authorized agents, but had been unable to suggest any satisfactory substitute. News of its passage reached America early in May, 1765, and immediately opposition everywhere manifested itself on the ground that the colonists were not represented in Parliament and could not legally be taxed without their consent. It was urged that the duties would be burdensome and would cause the withdrawal from circulation of what little specie there was in various Colonies. The stamp agents were nearly everywhere compelled by the Sons of Liberty (q.v.) to resign or to destroy their stamps, while many of them were mobbed and much property destroyed; so that by the time it was to go into effect the act had been virtually nullified. Resolutions, moreover, were passed by many of the Colonial assemblies, notably by Virginia (May 30) (see HENRY, PATRICK), insisting on the general rights of the colonists as British subjects, and denying the jurisdiction of Parliament over the Colonial pocketbook. The famous Stamp Act Congress, composed of delegates from New York, Massachusetts, Connecticut, Rhode Island, New Jersey, Pennsylvania, Delaware, Maryland, and South Carolina, assembled at New York on October 7, in pursuance of a circular letter sent out June 8 by Massachusetts, and issued a dignified "Declaration of Rights and Grievances," a formal address to the King, and petitions to each House of Parliament. Many able pamphlets were written to oppose the act, and on November 1, when it was to go into effect, bells were tolled, flags were at half-mast, and newspapers put in mourning. Finally, on March 18, 1766, after a long and bitter debate, Parliament repealed the objectionable measure, having previously, however, passed (March 7) a "Declaratory Act" asserting a right to "bind the colonies and people of America . . . in all cases whatsoever." The repeal caused great rejoice-

ing throughout America, though dissatisfaction was soon expressed with regard to the Declaratory Act. The whole affair has been regarded as one of the chief immediate causes of the Revolution. For the text of the act, consult Pickering's *Statutes at Large*, xxvi. Consult: M. C. Tyler, *Literary History of the American Revolution* (2 vols., New York, 1897-98); G. E. Howard, *Preliminaries of the Revolution* (ib., 1905); Richard Frothingham, *Rise of the Republic* (10th ed., Boston, 1910).

**STANCHFIELD, JOHN BARRY** (1855-1921). An American lawyer and Democratic politician, born at Elmira, N. Y. He graduated from Amherst in 1876, and attended the Harvard Law School in 1877-78. Admitted to the bar in the latter year he was then a law partner of David B. Hill at Elmira until 1885, and continued to practice there until 1900, when he moved to New York City. He was district attorney of Chemung Co., N. Y., in 1880-85, mayor of Elmira in 1886-88, and assemblyman and Democratic minority leader in 1895-96. Stanchfield was an unsuccessful Democratic candidate for Governor of New York in 1900, and for United States Senator in 1901. He made a wide reputation as a lawyer. In 1915 he was a delegate to the New York State Constitutional Convention.

**STANCHIO**, stän'kyô, or **STANKO**, stän'kô. See COS.

**STANDARD.** A battle flag; in a broader sense the emblem of a ruler or a nation. On the Egyptian monuments are representations of standards, usually consisting of the image of some sacred animal, a fan or semicircular disk, an ostrich feather, the symbol of victory, the name of the king, or some other symbolic device. The Bible refers to the use of banners or standards to mark the divisions and subdivisions of the children of Israel on their march from Egypt to Palestine. The Assyrian monuments show standards attached to the chariots. According to Xenophon the Persian standard was a golden eagle. The Greeks do not seem to have used flags or standards of any kind, though we hear on some occasions that the signal was given by displaying a scarlet cloak on a spear or pole.

Legend claimed that the first Roman standard was a wisp of hay (*manipulus*) on a pole. In historic times, however, we find a thorough system of military standards or signa. One of these belonged to each manipule (consisting of two centuries), and their details naturally differed from the legion and the nature of the troops, for the auxiliaries and cavalry naturally bore ensigns not like those of Roman legionaries. As represented on the monuments, the signum of the manipule of the legion was a long pole, shod with metal, and near the top a crossbar, on which seems to have been a plate with the name of the company. From the ends of this bar hung ribbons tipped with silver oak leaves. Below the bar along the pole are a number of metal disks, which seem to have been marks of

distinction, and consequently vary with the legion and company. Above the bar is sometimes a disk, or a hand, the emblem of fidelity, or the figure of an animal, though these latter seem to appear on the standards of native troops in the Roman service. Another standard bore the image of the Emperor. The standard of the legion was a golden eagle, with spread wings, and usually holding a thunderbolt in its claws. Another form of standard was the vexillum, a piece of fringed cloth, hanging from a crossbar on a pole. This was a very old form, as it was the banner hoisted when the Comitia Centuriata was in session. It gave the signal for battle when raised over the general's tent, and was used by any division on detached duty. It was carried by the cavalry of the legion, and seems sometimes to have been attached to the signum. The color of the cloth was red or white.

In the United States army the term standard designates the national and regimental silk flags carried by regiments of cavalry and field artillery.

In a narrower sense the standard of a country is the personal flag of the ruler, and is hoisted on a building, or ship, when he is in the building or on board. In Great Britain the royal standard displays the English leopards, Scottish lion, and Irish harp, quartered as on the field of the royal arms. France has the tricolor with the initials of the President in gold on the central stripe. In the United States the standard is usually called the President's flag, and is a blue field with the national coat of arms in colors. The same flag with a white field is used by the Vice President, and with a red field by the Secretary of the Navy. The flag of the Secretary of War is of scarlet hunting, carrying the coat of arms in the centre and a five-pointed white star in each corner. That of the Assistant is the same, with colors reversed. In addition to flags, there are colors of silk for the President and the two secretaries. See COLORS; ENSIGN; FLAG; HERALDRY; NATIONAL ARMS; NATIONAL FLAGS.

**STANDARD, BATTLE OF THE.** A name frequently given to the battle fought between the English and the Scotch, Aug. 22, 1138, near Northallerton (q.v.), in which the latter were defeated.

**STANDARD OF LIVING.** In economics, the term used to designate the degree of comfort or enjoyment derived from the use of material goods which each social class regards as essential to tolerable existence. For a high standard of living control is demanded over a large and varied quantity of consumption goods; those whose wants are few and tastes inexpensive have a low standard of living. The terms are usually without moral connotations, injurious and degrading modes of consumption entering into a "high" standard of living, as well as consumption of goods which exercise a refining influence. In some sociological studies, however, the test of a high standard of living is its moral influence. Students of the housing problem (q.v.) regard the development of a higher standard with respect to house room as an advance in the standard of life, although this may result in lessening other expenditures. In a developing society like that of the United States, the gradations of standards of living are numerous. The professional and business classes have a higher standard of living than

artisans; the standard of the latter is higher than that of the laborer. The American standard of living is generally higher than the European, which in turn is higher than the Asiatic.

Much emphasis has been laid upon the influence of the standard of living upon wages. If a social class has a high standard, each individual in it will exert himself to the utmost to maintain the same control over goods as his fellows. A rising standard thus acts as a spur to those whose individual wants would demand no great degree of exertion. To raise the standard of backward races or classes is therefore regarded as a prerequisite to industrial improvement. In the second place, a high standard, assuming that it consists in the consumption of goods which improve the physical and mental condition of the laborer—e.g., good food, clothing, housing, a thorough education and technical training for children—tends in the long run to increase industrial efficiency. Thirdly, it is difficult for an employer to beat down wages of laborers whose standard is high. Thus a greater share in the social dividend may be diverted to labor. Fourthly, men whose standard is high refuse to marry until they have a fair prospect of bringing up their children in a way in keeping with class standards. Hence the supply of labor is kept from exceeding the demand for it and wages are kept from falling to a subsistence level. See **POLITICAL ECONOMY: WAGES.**

**STANDARD OF VALUE.** See **MONEY.**

**STANDARD OIL COMPANY.** A group of business interests, varying in form of organization according to exigencies of business and law, and holding since 1880 a dominant position in the petroleum industry. The foundations of the group were laid in 1867 with the formation of the firm of Rockefeller, Andrews, and Flagler, reorganized in 1870 under the name of the Standard Oil Company of Ohio. This concern controlled not more than 10 per cent of the industry, but in 1880 the company, together with other companies in which the same men were interested, controlled 90 per cent of the industry. This control had been attained partly through efficiency of operation, but more largely through a manipulation of rates of transportation which placed competitors of the allied Standard Oil interests at a ruinous disadvantage. In 1882 the capitalists forming the Standard Oil group replaced their informal working agreements by an organization known as the Standard Oil Trust. The entire stock holdings of 14 companies and the majority holdings in 26 other concerns were placed in the hands of nine trustees having irrevocable powers of attorney. In return the stockholders of the several companies combined received trust certificates on which dividends were declared. The trust certificates amounted to \$70,000,000 par value, of which the nine individuals acting as trustees owned \$46,000,000. In 1892, in consequence of an adverse decision in the Ohio courts involving the legality of the trust form of organization, the trust was formally dissolved and the stocks in the several companies distributed to the holders of trust certificates on a pro rata basis which in fact left the interests of the shareholders of these companies practically as inextricable as under the trust. In 1899 the device of a holding company, the Standard Oil Company of New Jersey, was adopted to attain the same end as had been attained by the trust. This company acquired the stocks still in the

hands of the trustees, issuing its own securities in return for them. It also acquired on the same basis stock that had been already distributed to individuals by the trustees. The authorized capital of the Standard Oil Company of New Jersey was \$110,000,000. It controlled, along with refining plants, a number of crude-oil-producing companies, most of the pipe lines, a number of important marketing companies, and natural-gas companies. An important feature of the new concern was the number of subsidiary companies launched by it in the foreign field. As a result of the development of new petroleum fields, the proportion controlled by the Standard Oil Company was less under the new form of organization than under the old. But in 1904 the Standard refineries consumed 84.2 per cent of the crude oil of the whole country and produced 86.5 per cent of the refined oil. Standard Oil exports amounted to 87 per cent of the total.

In 1906 suit was brought against the Standard Oil Company in the United States Circuit Court at St. Louis, under the Sherman Antitrust Law. The company was convicted and its dissolution ordered in 1909. Under appeal the decision of the Circuit Court was affirmed by the Supreme Court May 15, 1911, and the corporation was given six months' time for working out a plan of dissolution. The plan adopted resulted in the distribution of stock in the subsidiary companies on a pro rata basis which, as in the case of the dissolution of the earlier trust, left the interests of the several stockholders combined and rendered serious competition in the industry impossible.

The profits of the Standard Oil combinations have since the beginning been large. The earnings under the trust, from 1882 to 1891, never fell below \$8,000,000, and from 1886 averaged above \$15,000,000. In the years after the ostensible dissolution, from 1892 to 1896, the earnings increased from \$19,174,878 to \$34,077,517. Under the corporate form between 1899 and 1905 earnings rose from \$34,420,314 to \$57,459,356. Since 1906 no figures have been published for the aggregate earnings of the concerns formerly constituent of the Standard Oil Company and still operating harmoniously.

Consult: G. H. Montague, *The Rise and Progress of the Standard Oil Company* (New York, 1904); *Report of the Commissioner of Corporations on the Petroleum Industry* (Washington, 1907); *Brief for the United States, Standard Oil Co. et al., defendants v. United States of America, October term 1909* (2 vols., ib., 1909); I. M. Tarbell, *History of the Standard Oil Company* (new ed., 2 vols., New York, 1911).

**STANDARDS, UNITED STATES NATIONAL BUREAU OF.** A bureau of the Department of Commerce of the United States government, charged by law with the custody of the national standards of weights and measures, the comparison with them of the standards used in scientific investigations, engineering, commerce, and educational institutions, the construction or reproduction of such standards, their multiples and subdivision, testing and calibration of standard measuring apparatus, the solution of problems arising in connection with standards, and the determination of physical constants and the properties of materials, when such data are of great importance to scientific or manufacturing interests and are not to be obtained with sufficient accuracy elsewhere. The Bureau of Standards, which took the place of the former Office

of Standard Weights and Measures, was organized by Act of Congress approved March 3, 1901, with Dr. S. W. Stratton as its first director, who continued in that position in 1916. The laboratories and other buildings are located in the suburbs in the northwest section of Washington, D. C., about 3.5 miles from the White House. In 1914 there were 144 members of the scientific organization, in addition to other employees concerned with the office and general administration. The total appropriations for the fiscal year 1914 amounted to \$839,215. The scientific work of the bureau is organized in divisions, as follows: Weights and Measures, Heat and Thermometry, Electricity, Optics, Chemistry, Structural Engineering and Miscellaneous Materials, Engineering Research, and Metallurgy.

In a fireproof vault are maintained the national standards of length and mass, two platinum-iridium meter bars, and two standard kilograms of the same material made at the Bureau Internationale, Sèvres, France, and by law the fundamental standards of weights and measures in the United States, to which such customary units as the foot and pound are referred and legally defined.

The Bureau of Standards prepares official specifications for much of the material purchased by the government, and also tests the quality of supplies when delivered. It undertakes researches to determine methods of testing and manufacture, and in cooperation with various manufacturing and industrial organizations aims to establish national standards which shall be adapted for universal use. It tests and calibrates accurate measuring devices for the various departments and their bureaus. It maintains several useful series of publications, which have achieved a high scientific reputation, and the services of its staff are in constant demand from various scientific and other organizations, especially in making investigations where ordinary commercial testing facilities are lacking, or methods have not been developed. The Bureau of Standards, in addition to its laboratories in Washington, maintains a special laboratory for the testing of structural materials at Pittsburgh, where a ten-million-pound Olsen testing machine is maintained. It also maintains an elaborate equipment of special cars for testing railway-track scales.

For further information consult *Annual Reports of the Director, Bureau of Standards*, and various bulletins listed in a bibliography published from time to time by the bureau.

**STANDARD TIME.** See **TIME**, **STANDARD**.

**STANDARD-WING.** Either of two African nightjars of the genus *Macrodipteryx*, in which the second primary wing quill of the male is enormously elongated, so as to look like a pennant floating from the wing as the bird flies. In one species it has no vane except near the tip; and when the bird sits upon the ground these feathers stand upright. See **Plate of NIGHTJARS**, ETC.

One of the birds of paradise (*Semioptera wal-lacti*) is also known by this name.

**STANDING FISHES BIBLE.** See **BIBLE**, **CURIOUS EDITIONS OF**.

**STANDING STONES.** See **MEGALITHIC MONUMENTS**.

**STANDISH, MILES or MYLES** (1584-1656). An American colonist, born in Lancashire, England. He served in the English army in the Netherlands, and emigrated to America in 1620,

being a passenger on the *Mayflower*. He was active among the Plymouth colonists as an explorer and Indian fighter, becoming military leader. In the summer of 1625, the Colony being in straits, Standish was sent to England to seek government intervention against the merchant adventurers, but was unsuccessful. He returned to the Colony in 1626 with supplies, and became one of the proprietors and settlers of Duxbury, Mass., where he held for life the office of magistrate. A granite monument to his memory has been erected in Duxbury. The second courtship of Standish is the subject of Longfellow's poem, *The Courtship of Miles Standish*. (See **ALDEN, JOHN**.) Consult: J. S. C. Abbott, *Miles Standish, Captain of the Pilgrims* (New York, 1898); Tudor Jenks, *Captain Myles Standish* (ib., 1905); William Bradford, *History of Plymouth Plantation, 1606-1646*, edited by W. T. Davis (ib., 1908).

**STANDPIPE.** See **WATER WORKS**.

**STANFIELD, CLARKSON** (1793-1867). An English marine and landscape painter. He was born of Irish parents in Sunderland, Durham, and was self-taught in art, having commenced his career as a sailor and a scene painter. In 1835 he became Royal Academician, and, after painting many Italian, French, and Dutch views, in 1848 settled at Hampstead, where he executed some of his finest pictures, including "The Abandoned" (1856), and the "Battle of Trafalgar," painted for the United Service Club. He is represented in the Tate Gallery and the South Kensington Museum. He painted in a broad effective style, but his coloring is cold.

**STANFORD, SIR CHARLES VILLIERS** (1852-1924). A British composer, born in Dublin. He studied composition under O'Leary and Stewart, and singing at Queens' College, Cambridge. In 1873 he became organist of Trinity College and the following year a conductor of the university chorus. In 1883 he received the appointment of professor of composition and conductor of the orchestra at the Royal College of Music and in 1887 succeeded Macfarren as professor of music at Cambridge. Stanford was conductor of the Bach Choir (1885-1902), of the Leeds Philharmonic Society (from 1897), and of the Leeds Festival (1901-10). In 1902 he was knighted. His compositions include several operas, notably *Savonarola* (1884) and *Shamus O'Brien* (1896); incidental music to Tennyson's *Queen Mary* and *Thomas à Becket*, *Æschylus' Eumenides*, Sophocles' *Edipus Rex*; some symphonies, concertos, etc.; the oratorio, *The Three Holy Children* (1885); a mass, a requiem, a *Stabat Mater*; numerous choral works with orchestra. Consult C. V. Stanford, *Pages from an Unwritten Diary* (New York, 1914).

**STANFORD, LELAND** (1824-93). An American capitalist and patron of education. He was born at Watervliet, N. Y. In 1849 he removed to Wisconsin and for a time practiced law in Port Washington. In 1856 he established a commercial business in San Francisco. He was elected Governor of California on the Republican ticket in 1861. In the same year he became president of the new Central Pacific Railway Company, and, repairing to Washington, successfully urged upon Congress the passage of a bill granting government aid to the project. In the construction of the road he personally undertook the responsibility and supervision of that part of the road crossing the ridge of the

Sierra Nevada Mountains, and as a result 530 miles of mountain road were constructed in 293 days. The road was completed in 1869. Stanford was elected United States Senator in 1884 and in 1890. He founded Leland Stanford Junior University (q.v.) at Palo Alto, California, as a memorial to his son.

His wife, JANE LELAND STANFORD (1825-1905), was born at Albany, N. Y., and was married in 1850 to Mr. Stanford. She devoted herself largely to the development of Stanford University, particularly in connection with its notable architectural scheme. She also established a system of kindergarten schools in San Francisco, and a children's home at Albany, N. Y. She died at Honolulu.

STANG, stång, EMIL (1834-1912). A Norwegian statesman, son of Fredrik Stang. He studied law in Christiania and in 1884, two years after his election to the Storting, was reckoned the leader of the Conservative party. In 1891 he was forced to retire after two fairly successful years as Prime Minister and became an assessor of the Christiania Supreme Court.

He was called upon again in 1893 to form a ministry and stayed in office through the confusion of the early part of 1895. The dispute as to the division of the consular offices between the two kingdoms caused his overthrow. Stang then returned to his former post in the Supreme Court.

STANG, FREDRIK (1808-84). A Norwegian statesman, leader of the Conservative party and Norway's first Prime Minister. He represented Christiania in the Storting in 1859-60, in 1861 formed a ministry, and in 1873 became first Prime Minister under the new cabinet regulations. He became popular owing to his part in the introduction of railroads and telegraphs and kept office in spite of a large radical majority in the Storting until 1880, when he voluntarily resigned. Stang was a national authority on jurisprudence and constitutional law, his principal works being *Systematisk fremstilling af Kongeriget Norges konstitutionelle eller grundlovsbestemte ret* (1833) and *Om den kongelige sanktionsret efter Norges grundlov* (1833).

STANG, FREDRIK (1867- ). A Norwegian jurist and statesman, born in Christiania. He studied, with stipend, in Germany and England (1893-94), became advocate before the Supreme Court in 1896, and in 1897 was appointed professor of law in Christiania University. In Paris he studied French and comparative law of property in 1905-06. He was member of the Christiania City Council (1905-08) and leading conservative member of the Storting (1906-09), to which he declined reelection in order to continue his work at the university and his literary activities. In 1911 appeared his important work *Norsk Formuesret* (Norwegian Law of Property), vol. i. In 1912 he served the Bratlie ministry as chief of the Department of Justice.

STANGE, sthång'ē, CARL (1870- ). A German Protestant theologian. He was born at Hamburg, and was educated at Halle, Göttingen, Leipzig, and Jena. He became privat-docent at Halle in 1895, and professor of systematic theology at Königsberg in 1903, at Greifswald in 1904, and at Göttingen in 1912. His writings include: *Die christliche Ethik in ihrem Verhältnis zur modernen Ethik* (1892); *Die systematischen Prinzipien in der Theologie des*

*Johann Musäus* (1897); *Das Dogma und seine Beurteilung in der neueren Dogmengeschichte* (1898); *Einleitung in die Ethik* (2 vols., 1901-02); *Der Gedankengang der Kritik der reinen Vernunft* (1902; 3d ed., 1907); *Luthers älteste ethische Disputationen* (1904); *Theologische Aufsätze* (1905); *Das Frömmigkeitsideal der modernen Theologie* (1907; 3d ed., 1908); *Schleiermachers Glaubenslehre* (1910); *Christentum und moderne Weltanschauung* (1913); *Die Gemeinschaft mit dem lebendigen Gott* (1913).

STANGELAND, stång'e-lünt, KARIN MICHAELIS. See MICHAELIS, SOPHUS.

STANGL, sthång'ī, THOMAS (1854- ). A German classical scholar, born at Aufhausen, Ober-Pfalz. He studied at Regensburg, and at the University of Munich. He traveled often, for purposes of study, in Italy, Greece, Sicily, and France. In 1908 he became professor of classical philology at the University of Würzburg. His publications include: *Boethiana* (1882); editions of Cicero, *Orator* (1885), *Brutus* (1886), *De Oratore* (1893); *Virgiliana* (1891); *Tulliana* (1898); an edition of Q. Curtius Rufus (1902); *Pseudoasconiana* (1909); *Asconiana* (1910); *Ciceronis Oratorum Scholiastæ*, vol. ii, *Commentarios Continens* (1912).

STANHOPE, stån'op, CHARLES, third EARL (1753-1816). An English statesman and scientist. He was born in London and was educated at Eton and at Geneva. Returning to London, he married the eldest daughter of Lord Chatham (1774), was elected to Parliament (1780), and succeeded to his father's peerage (1786). Sympathizing with the French Revolution, he introduced into the House of Lords a motion against English interference in the affairs of France. As his motion had no support, he was thereafter known as "the minority one." He was caricatured as "Citizen" Stanhope. He devised several mechanical inventions, of which the most important was an iron hand press, called the Stanhope printing press. He also perfected a process of stereotyping, and constructed two calculating machines. Consult Stanhope and Gooch, *Life of Charles, Third Earl Stanhope* (New York, 1914).

STANHOPE, LADY HESTER LUCY (1776-1839). The eldest daughter of Charles, third Earl Stanhope. In 1803 she went to reside with her uncle, William Pitt, and became his most trusted confidant and private secretary. Till his death she exercised her imperious instincts. After that a pension of £1200 a year was assigned her by the King. She left England and wandered in the Levant, finally settling among the semicivilized Druses of Mount Lebanon in a convent, which she fortified, at the village of Djoun. Here she adopted Eastern manners and by her strong character obtained a curious ascendancy among the rude races around her. She was regarded with reverence as a sort of prophetess, and gradually came so to consider herself. Assuming the garb of a Mohammedan chieftain, she adopted a religion which seems to have been sincere and was compounded in about equal proportions from the Koran and the Bible. Consult: C. L. Meryon, *Memoirs of Lady Hester Stanhope* (3 vols., London, 1845); id., *The Seven Years' Travels of Lady Hester Stanhope* (ib., 1846); Mrs. Charles Roundell, *Lady Hester Stanhope* (ib., 1909); Frank Hamel, *Lady Hester Lucy Stanhope: A New Light on her Life and Love Affairs* (New York, 1913).

**STANHOPE, JAMES**, first EARL (1673-1721). An English soldier, born in Paris and educated at Oxford. He took an important part in the siege of Barcelona in 1705, and in 1706 was appointed Minister to Spain. In 1708, under Eugene's orders, he captured Port Mahon, and in 1710 saw the final success of his policy of offensive action in the victories of Almenara and Saragossa. But at the close of the year, separated from his allies and surprised by the swift approach of the Bourbon army under Vendôme, after a brief defense he surrendered at Brihuega. Upon his return to England (1712) he entered politics; became Secretary of State for the Southern Department in 1714; and, after being Chancellor of the Exchequer, was again Secretary of State. His foreign policy was vigorous and excellent, especially in the formation of the Quadruple Alliance in 1718 between England, France, Austria, and Holland.

**STANHOPE, PHILIP DORMER**. See CHESTERFIELD, P. D. STANHOPE, fourth EARL.

**STANHOPE, PHILIP HENRY**, EARL (1805-75). An English historian, born at Walmer and educated at Christ Church, Oxford. To his efforts are largely due the National Portrait Gallery, the Historical Manuscript Commission, and the copyright law (1842). Though not a great historian, as Macaulay said, he was clear, concise, and exhibited "great diligence in examining authorities, great judgment in weighing testimony, and great impartiality in estimating characters." His most important works are: *The War of the Succession in Spain; A History of England from the Peace of Utrecht to the Peace of Versailles, 1713-1783*, in 7 vols.; *The History of England, Comprising the Reign of Queen Anne, until the Peace of Utrecht* (4th ed., 1872). The two works last named are the most elaborate. He also wrote a *Life of the Right Hon. W. Pitt*.

**STANIMAKA**, stā'nē-mākā. A town of Bulgaria, 12 miles southeast of Philippopolis (Map: Balkan Peninsula, E 3). It has a trade in wine. Pop., 1893, 13,080.

**STANISLAS I LESZCZYŃSKI**, lyësh-chin'y'skē (1677-1766). King of Poland from 1704 to 1709, and again in 1733. He was born at Lemberg, Galicia, of one of the greatest among the old Polish noble families. He was Palatine of Posen at the time of the war between Augustus II (q.v.) of Saxony and Poland and Charles XII (q.v.) of Sweden, which cost Augustus the Polish throne, and conducted negotiations between them in such a manner as to win the regard of the Swedish King, who secured the election of Stanislas to the Polish throne in 1704. In 1709, when Charles XII was crushed by Peter the Great in the battle of Poltava, Augustus recovered Poland. The property of King Stanislas was confiscated and he joined Charles at Bender, in Bessarabia. He was Governor of Zweibrücken, in the Palatinate, from 1714 until the death of Charles XII, when he took up his residence in Alsace. His daughter Maria became the wife of Louis XV of France in 1725, and this alliance enabled Stanislas to obtain the election to the Polish throne on the death of Augustus II, in 1733. The latter's son, Augustus III, was, however, installed with the support of a Russian army. The War of the Polish Succession ensued, and by the preliminary Treaty of Vienna, in 1735, Augustus III was recognized as King of Poland. Stanislas retained his estates and received the duchies of Lorraine and

Bar (after his death to fall to France), together with a pension of two million francs. He was also allowed to retain the title and dignity of King of Poland. He maintained a court at Lunéville and Nancy, encouraged letters, established institutions of learning, and earned the title *le bienfaisant*. He left four volumes, *Œuvres du philosophe bienfaisant* (1767). Consult Marquis des Réaulx, *Le roi Stanislas et Marie Leczinska* (Paris, 1895).

**STANISLAS II AUGUSTUS** (1732-98). The last King of independent Poland (1764-95). He was the son of Count Stanislas Poniatowski (q.v.) and was born at Wolczyn. In 1752 he was elected to the Diet and afterward was sent as a representative to the Russian court. There he gained the favor of the future Catharine II, who, after the death of Augustus III of Poland (1763), successfully exerted her influence to bring about the election of Stanislas to the throne in September, 1764. Although he was very well educated and was a fine specimen physically he lacked force of character, and the anarchic condition of the country in his reign brought spoliation by Russia, Austria, and Prussia. On the third and final partition of the Kingdom, in 1795, he laid down his crown. See POLAND.

**STANISLAU**, stā'n's-lou (Pol. *Stanisławów*). A town in the Crownland of Galicia, Austria, on the Bistritza, 75 miles southeast of Lemberg (Map: Austria, J 2). There are railway construction shops, flour mills, dyeworks, and tanneries. Stanislaw was occupied, but later evacuated, by the Russians in the Great War which began in 1914. See WAR IN EUROPE. Pop., 1900, 29,628; 1910, 33,328.

**STANKEVITCH**, stā'n'kē-vich, NIKOLAI VLADIMIROVITCH (1813-40). A Russian literary leader. He was born in the Province of Voronezh and studied at Moscow University, where began the intellectual leadership that culminated in the formation of the famous "Circle of Stankevitch." This circle, in contradistinction to a rival group of intellectuals constituting the "Circle of Herzen" (see HERZEN, A. I.), was held together by a common interest in philosophy, art, and literature and thus counteracted the utilitarian and materialistic thought of the day. In this way Stankevitch, through his intimate intercourse with the great writers of his time, exercised a dominant influence on his contemporaries—an influence which is the more remarkable from the fact that he himself wrote nothing worth mentioning.

**STANLEY**, ARTHUR PENRHYN (1815-81). An English scholar and divine. He was born at Alderley, of which his father (afterward Bishop of Norwich) was rector. From 1829 to 1834 he was at Rugby, and was profoundly impressed by the influence of Dr. Arnold, head master, which molded his whole life. His own position in the school was one of marked power, the impression of which is reproduced in Hughes's *Tom Brown's School Days*, though Hughes and Stanley were not, as is supposed, intimate friends at Rugby. He entered Balliol College, Oxford, in 1834. In 1838 he was elected a fellow of University College, was ordained deacon in 1839, and priest in 1843, and soon acquired a great influence, taking a definite stand in favor of latitude and liberality in religious matters, defending Ward and Hampden, as later he defended Jowett and Colenso. He was made canon of Canterbury in 1851, regius professor

of ecclesiastical history and canon of Christ Church in 1856, and dean of Westminster in 1864. Here he assumed a commanding position, and used it, as the recognized leader of the Broad Church party in England, for widening the bounds of the national church. His preaching was more ethical than doctrinal, and his intercourse with those outside the Church of England, whom he welcomed to the abbey and even to its pulpit, although it offended many strict churchmen, gained him a wide popularity. He accompanied the Prince of Wales (later King Edward VII) on his tour through the East in 1862, and was closely associated with Queen Victoria—her chaplain for many years. In 1863 he married Lady Augusta Bruce, daughter of the Earl of Elgin. He traveled in the United States in 1878, and made memorable addresses. His most important literary work was his *Life and Correspondence of Dr. Arnold* (1844, new ed., 1903). Other noteworthy books were his *Historical Memorials of Canterbury* (1855, new ed., 1906); *Sinai and Palestine* (1856, new ed., 1903); *Lectures on the History of the Eastern Church* (1861, new ed., 1907); *Lectures on the History of the Jewish Church* (1863-76, new ed., 1901-02); *Memorials of Westminster* (1868, new ed., 1899); *Essays on Church and State* (1870); *Christian Institutions* (1871, new ed., 1906). Consult: R. E. Prothero, *Life and Correspondence of Dean Stanley* (2 vols., London, 1893, new ed., 1909); id., *Letters and Verses of Dean Stanley* (ib., 1895); C. G. Bradley, *Recollections of A. P. Stanley* (ib., 1883); Bryce, *Studies in Contemporary Biography* (New York, 1903); Julia Wedgwood, *Nineteenth Century Teachers* (London, 1909); Paul Thurau-Dangin, *English Catholic Revival in the Nineteenth Century* (2 vols., ib., 1914).

**STANLEY, CHARLES.** See MONCK, CHARLES STANLEY, fourth VISCOUNT.

**STANLEY, DAVID SLOANE** (1828-1902). An American soldier, born in Cedar Valley, Ohio. He graduated at West Point in 1852. During 1861 he served in Kansas and Missouri, taking part in the battle of Wilson's Creek, and in 1861 was appointed brigadier general of volunteers. In 1862 he commanded a division of the Army of the Mississippi in operations at New Madrid and Island Number 10, and in the battles of Iuka and Corinth. In 1862 he became chief of cavalry of the Army of the Cumberland, and on November 29 was promoted major general of volunteers. He was in the battle of Stone River, in the Atlanta campaign, in the movement of concentration about Nashville, and in the engagement at Franklin, Nov. 30, 1864. A wound received there terminated his active campaigning. For gallantry in this battle he received the brevet of major general, U. S. A. After the war he became colonel of the Twenty-second Infantry and was actively engaged against the Indians in the Northwest. In 1884 he became a brigadier general, retiring in 1892.

**STANLEY, EDWARD HENRY SMITH.** An English statesman, fifteenth Earl of Derby (q.v.).

**STANLEY, SIR HENRY MORTON** (1841-1904). A British African explorer. He was born at Denbigh, Wales, the son of John Rowlands, who died when the boy was two years old. After spending nine years in a workhouse and then living with various relatives, he shipped at 18 as a cabin boy on a sailing vessel to New Orleans. There he found employment through the help of a merchant named Stanley, whose name

he took. While living in Arkansas he enlisted in the Confederate army. In the battle of Shiloh (1862) he was captured, but after two months in prison he enlisted in the Federal artillery (his sympathies had really been with the North). Discharged after severe illness, he returned to his Welsh relatives, but was not received. In 1864 he enlisted in the United States navy and became a ship's writer. A swim of 500 yards under fire to fix a line to a Confederate steamer was an exploit for which he became noted. After the war he left the navy and wrote for newspapers, had various adventures in Asia Minor (1866), and in 1867 acted as newspaper correspondent in one of the Indian campaigns in the West. By this time he had gained a reputation for enterprise and for vivid and able journalistic writing. In 1868 he was sent by the New York *Herald* to Abyssinia with the British expedition under Sir Robert Napier. In 1869 James Gordon Bennett (q.v.) of the *Herald* dispatched Stanley to find David Livingstone (q.v.) in Central Africa, but because of certain other commissions given him, Stanley did not reach Zanzibar until Jan. 6, 1871. He left for the interior March 21, with about 200 men, and on November 10 met the feeble and almost helpless Livingstone at Ujiji, on Lake Tanganyika (see TANGANYIKA), nursed him back to better health, and, since Livingstone declined to return to Europe, gave him the supplies needed to continue his explorations. After taking part with Livingstone in an exploration of the northern end of Lake Tanganyika, Stanley returned to Europe in 1872, and in 1873 was sent by the *Herald* to west Africa to report the British campaign against the Ashantis.

In 1874 Stanley determined to take up the exploration of Africa where Livingstone, dying, had left it. The New York *Herald* and the London *Daily Telegraph* shared the expense of fitting out this expedition. On Nov. 11, 1874, Stanley left Zanzibar, with 356 native followers, two white companions, and a white servant. Stanley's first great work was a boat survey of the coasts of the Victoria Nyanza (q.v.), to the west of which he discovered Lake Edward (q.v.). or Edward Nyanza, one of the head reservoirs of the Nile. He found that the Kagera or Alexandra Nile, rising near Lake Tanganyika, was the most important feeder of the Victoria Nyanza. Arriving at Tanganyika (1876), he sought in vain for its outlet, the fact being that the level of the lake was then so low that no water was passing through the Lukuga into the Congo (q.v.). His expedition had been greatly enfeebled by fever and smallpox, but he pushed westward to Nyangwe, on the Lualaba, which Livingstone and Cameron had visited. Stanley determined to make his way down the great river, and in November, 1876, embarked on the perilous journey. He was frequently attacked by cannibals, thousands of whom sometimes pursued him in canoes, and if it had not been for his guns his expedition would undoubtedly have perished. After a voyage of over 1500 miles, in the course of which he twice crossed the equator, he emerged on the Atlantic coast, having lifted the veil that had hitherto hung over the Congo, which was thus shown to be the same river as the Lualaba. On Aug. 9, 1877, the party marched into Boma, on the lower Congo, having traveled more than 7000 miles. Besides his three white companions, Stanley lost 170 of his porters. In the spring of 1879 he sailed again

for Africa, under the auspices of the African International Association (q.v.), which King Leopold II (q.v.) of Belgium had been instrumental in founding. (This organization developed into the International Association of the Congo.) Stanley now began five years of incessant toil, founding stations from Vivi, on the lower Congo, to Stanley Falls, about 1300 miles up the river, acquiring treaty rights from more than 400 native chiefs, building a road through the cataract country, and having all his supplies and even steamboats (in sections) carried 235 miles around the rapids of the lower Congo. The years 1885 and 1886 were a period of comparative rest for the explorer, who had now been the recipient of honors from learned societies all over the world and was the most distinguished of living explorers.

In 1886 Stanley was placed at the head of an expedition for the relief of Emin Pasha (q.v.), Governor of the Equatorial Province of the Egyptian Sudan. In March, 1887, he reached the mouth of the Congo, ascended it to the Aruwimi, pushed on to the head of navigation on this tributary, and then struck out through the equatorial wilderness in the direction of the Albert Nyanza. (See LAKE ALBERT.) The party for months had to hew their way through seemingly interminable tropical forests, and did not reach the Albert Nyanza until Dec. 13, 1887. In April, 1888, the intrepid Emin Pasha made his appearance on the shores of the lake. Stanley now retraced his steps to the Aruwimi in order to bring up a detachment of men which he had left there. For the third time he crossed the vast forest, and in January, 1889, with the remnant of his men, only one-third of the original number, he rejoined Emin, with whom he proceeded to the coast. On this journey Stanley made his second crossing of Africa, emerging at Zanzibar, Dec. 6, 1889, after learning the extent of the great forest, and discovering the water connection of Lake Albert with Lake Edward, the snow-capped Ruwenzori mountain chain between the two lakes, and the southwestern prolongation of the Victoria Nyanza. This expedition ended his active career in Africa, about which continent he had given to the world more knowledge than any other man. The successful founding of the Congo Free State (see CONGO, BELGIAN) was largely due to the confidence he inspired and the friendships he won. At the same time he did not hesitate to fight the Africans with every resource at his command if their hostility threatened the destruction of his expeditions or imperiled his enterprises.

Stanley was married to Miss Dorothy Tennant, an artist, in 1890. The next year he became again a subject of Great Britain, and in July, 1895, he entered Parliament for North Lambeth, as a Liberal Unionist, but did not seek reelection in 1900. He paid a last visit to Africa in 1897. In 1899 he was made G.C.B. He died in London, May 10, 1904, and after a funeral in Westminster Abbey was buried at Pirbright, Surrey. The dean of Westminster refused to have him buried in the abbey because of a belief that Stanley had been inhuman to the African natives, but this belief has since been discredited by authoritative writers. His books, which are among the most notable of their kind and most of which have been translated into several languages, comprise: *How I Found Livingstone* (1872); *My Kalulu* (1872); *Coomassie and Magdala* (1874); *Through the Dark Continent*

(1878); *The Congo* (1885); *In Darkest Africa* (1890); *My Dark Companions and their Strange Stories* (1893); *Slavery and the Slave Trade in Africa* (1893); *My Early Travels and Adventures in America and Asia* (1895); and *Through South Africa* (1898). Consult Stanley's *Autobiography*, edited by his wife (London, 1909); also A. J. Wauters, *Stanley's Emin Pasha Expedition* (London, 1890).

**STANLEY, THOMAS** (1625-78). An English translator, born at Cumberlow, Hertfordshire, and educated at Cambridge. During the Civil War he traveled on the Continent, returning near its close and taking rooms in the Middle Temple, where he devoted himself to literature. He wrote considerable verse, and translated many classical writers. Long famous were his edition of *Æschylus* with a Latin translation (1663) and his compilation under the title *History of Philosophy* (4 vols., 1655-62). Consult Stanley's *Poems and Translations*, edited with memoir by S. E. Brydges (London, 1814-15), and his translations of *Anacreon*, edited by A. H. Bullen (Bohn's Classical Library, ib., 1893).

**STANNARD, HENRIETTA ELIZA VAUGHAN** (PALMER) (1856-1911). An English novelist, born at York. She became well known under the pseudonyms John Strange Winter and Violet Whyte. In 1884 she married Arthur Stannard, a civil engineer. Of her stories Ruskin said that they were the most faithful of studies of the character of the British soldier. She was first president of the Writers' Club in 1892 and president of the Society of Women Journalists in 1901-03. Her first great successes were *Sketches of Cavalry Life* (1881), *Bootles' Baby* (1885), and *Houp-la* (1885). Among later writings are: *On March* (1886); *Garrison Gossip* (1887); *A Blameless Woman* (1895); *Heart and Sword* (1898); *The Married Miss Binks* (1900); *A Blaze of Glory* (1902); *Marty* (1903); *Cherry's Child* (1904); *Little Vanities of Miss Whittaker* (1904). She also wrote some 70 other books, mostly novels and stories.

**STANNITE**, or **TIN PYRITES**. A sulphostannate of copper and iron occurring in isometric tetrahedral crystals. It is found with other tin ores in Cornwall.

**STANNOTYPE**. See PHOTOGRAPHY, *Photo-mechanical Processes*.

**STANOVOL (stă'nô-voi') MOUNTAINS**. A mountain range of east Siberia. It begins on the Mongolian frontier south of Lake Baikal, where it merges with the Altai Range and is known as the Yablonoi Mountains (Map: Asia, P 3). Thence it extends northeast in a large zigzag line 2400 miles, following for a part of its length the shores of the Sea of Okhotsk, and terminating in the East Cape on the Bering Strait. It reaches its highest altitude, over 8000 feet, in Mount Tehokhondo, or Sokhondo, in the extreme southern part, where it consists of rounded ridges covered with birch and larch forests; from this point the heights decrease northward until they lose their mountain character and become an irregular collection of plateaus, hills, and small peaks, the water parting between the Pacific and Arctic oceans.

**STANSFELD, SIR JAMES** (1820-98). An English politician, born at Moorlands, Halifax. He graduated from University College, London, in 1840, and was called to the bar in 1849. He became an intimate friend of Mazzini, and from 1859 to 1895 was a member of Parliament, where he advocated the cause of Italian unity.

In 1863-64 he served as Junior Lord of the Admiralty, was successively Undersecretary of State for India, Third Lord of the Treasury, Financial Secretary to the Treasury, President of the Poor Law Board, and finally served as President of the Local Government Board in 1871-74 and in 1886. In 1895 he was created G.C.B.

**STANTON, EDWIN McMASTERS** (1814-69). An eminent American statesman, born at Steubenville, Ohio, Dec. 19, 1814, of Quaker descent. He studied at Kenyon College from 1831 to 1833, later studied law, and was admitted to the bar in 1836. He first practiced in Cadiz, Ohio, and in 1837 became prosecuting attorney of the county. Later he practiced in Steubenville, Ohio, and in Pittsburgh, Pa., where he became the leader of the bar, and gained a high reputation, in particular, for his conduct of cases. In 1856 he removed to Washington, practicing before the United States Supreme Court. In 1858 he was in California as counsel of the United States in important land cases. After Lincoln's election in 1860, on the reorganization of Buchanan's cabinet, Stanton became Attorney-General, succeeding Jeremiah Black. In politics he had been a Jacksonian Democrat, but later became an antislavery advocate, and while in Buchanan's cabinet took a firm stand for the Union, declaring that the surrender of Sumter would be a public crime. In March he retired with the outgoing cabinet, but in January, 1862, was recalled by Lincoln, and given the portfolio of Secretary of War, in which office he shared with the President the burden of vast war operations. His administration was marked by integrity, judgment, determination, and force, which won admiration, though provoking some just criticism.

After the assassination of President Lincoln Stanton tendered his resignation, but was induced by President Johnson to remain. After the breach between President Johnson and Congress over questions growing out of reconstruction Stanton strongly supported Congress. The President called for his resignation on Aug. 5, 1867. Stanton refused to resign, on the ground that his withdrawal would interfere with the execution of the reconstruction acts, to which the President was bitterly opposed, and was encouraged by the Republican leaders to hold to the office. On the 12th of August the President suspended him, and, Congress being in recess till November, Stanton felt obliged to yield, and General Grant became Secretary ad interim by an executive order. On the reassembling of Congress, Stanton was restored, Grant retiring. Later, Johnson again tried to displace him, but impeachment (q.v.) intervened. Stanton afterward resumed the practice of his profession, but with failing health. On Dec. 20, 1869, President Grant nominated him an associate justice of the Supreme Court, and he was at once confirmed by the Senate. He died four days after this appointment. Consult: G. C. Gorham, *Life and Public Services of Edwin M. Stanton* (2 vols., Boston, 1899); D. M. DeWitt, *The Impeachment and Trial of Andrew Johnson* (New York, 1903); F. A. Flower, *Edwin McMasters Stanton* (Akron, Ohio, 1905).

**STANTON, ELIZABETH CADY** (1815-1902). An American reformer and pioneer leader in the woman's suffrage movement. She was born at Johnstown, N. Y., and married Henry B. Stanton (q.v.), the antislavery reformer. She became interested in the antislavery and other

reform movements at an early age, and through acquaintance with Lucretia Mott (q.v.) was led to sign the call for the first woman's rights convention, held in Seneca Falls, N. Y., in 1848. This convention made the first formal demand for the extension of the suffrage to women, and of the National Woman's Suffrage Association there formed Mrs. Stanton became the first president, retaining that office until 1893. From 1848 she devoted much time to traveling from State to State, addressing political conventions and State Legislatures in behalf of woman's rights. In 1868 she was a candidate for Congress. She was connected editorially with various reform periodicals, and was joint author with Susan B. Anthony and others of *A History of Woman Suffrage* (4 vols., 1887-1902). For her daughter, also a leader in the woman's suffrage movement, see BLATCH, HARRIOT STANTON. Consult Mrs. Stanton's autobiography, *Eighty Years and More* (New York, 1898).

**STANTON, FRANK LEBBY** (1857-1927). An American poet and journalist, born at Charleston, S. C. He was connected editorially with newspapers in Atlanta, and finally joined the staff of the *Atlanta Constitution*. Some of his poems were collected as *Songs of the Soil* (1894); *Comes One with a Song* (1898); and *Little Folks down South* (1904). Stanton's verse has distinct literary merit, presenting faithfully the folklore and crude poetry of the Southern negro.

**STANTON, HENRY BREWSTER** (1805-87). An American reformer and journalist, born in Griswold, Conn. In the Abolition movement he became prominent and allied himself with the political Abolitionists in opposition to the followers of William Lloyd Garrison, who did not favor political action. In 1840 he married Elizabeth Cady, and proceeded to London, where he was secretary of the World's Antislavery Convention. Later he studied law, and practiced in Boston, and later in Seneca Falls, N. Y., being elected from there to the State Senate in 1849 and 1851 as a Free-Soil Democrat. He took part in the organization of the Republican party. He was a member of the staff of the *New York Tribune* for several years, and an editor of the *New York Sun* from 1868 until his death. He published *Sketches of Reforms and Reformers in Great Britain and Ireland* (1849), and *Random Recollections* (1886).

**STANWIX, JOHN** (1690-1766). An English soldier. He entered the army in 1706, and in 1756 he came to America as commander of the Sixtieth or Royal Americans, and was put in charge of the southern district with headquarters at Carlisle, Pa. He was sent to Albany in 1758 and erected Fort Stanwix at the Oneida portage. At the time of Wolfe's expedition against Quebec Stanwix commanded in Pennsylvania and repaired and strengthened Fort Pitt. He returned to England in 1760, and was appointed Governor of the Isle of Wight. He was drowned while crossing St. George's Channel.

**STANYHURST, RICHARD** (1547-1618). A translator of Vergil, born in Dublin, Ireland, and educated at Oxford. He contributed a "Description of Ireland" and a "History of Ireland" (during the reign of Henry VIII) to Holinshed's *Chronicles* (1577). Two years later he passed over to the Continent never to return. At Leyden he published his translation of the first four books of the *Aeneid* into English hexameter verse (1582). The work is curious as an

attempt to base English verse on quantity rather than on stress or accent. He thereafter devoted himself to histories and theological treatises in Latin prose. Having become a Roman Catholic, probably not long after he had left England, and having entered the priesthood of his church, Stanyhurst was appointed chaplain to Archduke Albert, the Spanish ruler of the Netherlands, and was involved in the intrigues against Elizabeth. He died at Brussels. Consult the reprint of the *Translation of Vergil*, edited, with introduction, by Arber (London, 1895).

**STANYUKOVITCH**, stán-yŭ'kô-vich, KONSTANTIN MIKHAILOVITCH (1844-1903). A Russian writer, born at Sevastopol. He received a military education and entered the navy, in which he served till 1864. Afterward he went to St. Petersburg to devote himself to literature. Having incurred government displeasure by his advanced opinions, he was banished to the Province of Tomsk. The three years' exile gave him leisure to elaborate the abundant material he had gathered while in the navy. The immediate results were his *Letters of a Famous Foreigner* and *Sea Tales*, the latter perhaps his best-known and most representative work. His writings have been repeatedly published (12 vol. ed., St. Petersburg, 1906-07, with a biographical sketch of the author). Notable are his novels, *The Two Brothers*, *The Unconcerned*, and *No Way Out*. Stanyukovitch's great service to Russian literature consisted in graphically depicting the life of sailors, as Tolstoy had portrayed military life.

**STAPFER**, stâp'far', PAUL (1840- ). A French essayist, born in Paris, where he was educated at the Bonaparte Lyceum. He was tutor in the family of Guizot, and afterward became a professor of foreign literature in the faculty of Grenoble. In 1883 he accepted a similar chair at Bordeaux. Stapfer's essays are remarkable for their clearness of style, perfection of finish, and accuracy of detail. Among his works are: *Petite comédie de la critique littéraire de Molière selon les trois écoles philosophiques* (1866); *Causeries guernesiaises* (1881); *Shakespeare et l'antiquité* (1883); *Goethe et ses deux chefs-d'œuvre classiques* (1881); *Racine et Victor Hugo* (1886); *Rabelais, sa personne, son génie, son œuvre* (1889); *Montaigne* (1894); *La grande prédication chrétienne en France: Bossuet, Adolphe Monod* (1898); *Des réputations littéraires et Victor Hugo et la grande poésie satirique en France* (1901); *Questions esthétiques et religieuses* (1906); *Vers la vérité* (1909). He edited the *Grands écrivains* series.

**STAPH'YLOCC'CUS**. See BACTERIA.

**STAPH'YLO'MA** (Neo-Lat., defect of the eye within the cornea). A protrusion of the cornea (rarely of the sclera) of the eye due to weakening of its coats through injury or ulceration. Excessive intraocular tension is often a factor. The iris is generally prolapsed or incarcerated. Staphyloma of the cornea may be total, partial, or multiple, depending on whether the entire cornea or a circumscribed portion of it is involved. The affection is accompanied by pain, loss of vision, and disfigurement. The treatment is purely surgical. It may often be prevented by the use of compression during the healing of a perforating ulcer, until a firm cicatrix is formed. When staphyloma is fully established ablation of the apex may be practiced, the lens being removed at the same time, and the wound allowed to

heal under a compress bandage, with or without stitching. When this is not successful, removal of the contents of the globe (exenteration) or enucleation of the eye must be resorted to.

**STAPH'YLOS'APHY**. See PALATE.

**STAPLE** (AS. *stapel*, prop, post). In England, a town officially designated by the government as a market for sale and exportation of the staple commodities. All towns were not staple towns. They were originally for the convenience of the tax collector, but their inhabitants appreciated the monopoly and jealously guarded their privileges. Consult: Charles Gross, *The Guild Merchant* (2 vols., Oxford, 1890); A. L. Jenckes, *The Origin, the Organization and the Location of the Staple of England* (Philadelphia, 1908); William Cunningham, *Growth of English Industry and Commerce* (5th ed., 3 vols., Cambridge, 1910-12).

**STAPLES**, stâ'plz. A city in Todd Co., Minn., 132 miles northwest of Minneapolis, on the Northern Pacific Railroad (Map: Minnesota, C 4). It has railroad repair shops. Pop., 1900, 1504; 1910, 2558.

**STAPLES, THE**. See FARNE ISLES.

**STAPLES, WILLIAM READ** (1798-1868). An American jurist and historian, born in Providence, R. I. He graduated at Brown University in 1817, studied law, and in 1819 was admitted to the bar. He rose rapidly in his profession, was an associate justice of the Supreme Court of Rhode Island from 1835 to 1854, and from 1854 to 1856 was Chief Justice. He was an authority on Rhode Island history and published *Annals of Providence to 1832* (1843); *Proceedings of the First General Assembly for the Incorporation of Providence Plantations in 1647* (1847); *Rhode Island Farm-Book* (1859). He edited vol. ii of the Rhode Island Historical Society's *Collections* and Samuel Gorton's *Simplicities' Defense Against Seven-Headed Policy* (1835).

**STAPPEN**, Fr. pron. stâ'pân', CHARLES PIERRE VAN DER (1843- ). A Belgian sculptor, born at St. Josse-ten-Noode, near Brussels. He studied in the studio of Portaels, and afterward independently in Paris under the influence of Rude, Mercié, and Carpeaux. Among his early works are "Faun's Toilet" (1869, gold medal, Brussels), the "Man with the Sword" (1876, Brussels Museum), and "Orchestration," a pediment for the Brussels Conservatory. Maturer works, such as a youthful "David" (Munich Academy), resulted from a sojourn in Italy. In 1883 he was appointed professor at the Brussels Academy, and thereafter produced the group "Instruction in Art" (Palais des Beaux-Arts), "Saint Michael" (Hôtel de Ville), the statue of "William the Silent" (Place du Petit Sablon); "The Wrestlers," "The City Builders," the "Chimera Fountain" (all in Brussels). He also fashioned portrait busts of great vivacity, and various objects of industrial art, notably a silver centrepiece for the municipality of Brussels. Van der Stappen was one of the founders of the modern Belgian realistic school. His work has fine decorative quality, is skillfully executed, and combines grace with power. In 1898 he was appointed director of the Brussels Academy and received the great gold medal in Berlin.

**STAR** (AS. *steorra*, star). One of those heavenly bodies which remain apparently immovable with respect to one another. Hence they were early called fixed stars, a name which they retain, though their perfect fixity has been

disproved in numerous cases, and the theory is not now held. Twinkling or scintillation is another mark which distinguishes stars from planets. The first thing the observer notes is the apparent daily motions of the stars. Many appear to rise in the east, describe small or great arcs in the sky, and set in the west; while others describe complete circles around the celestial pole. These apparent motions arise from the rotation of the earth. (See EARTH.) With few exceptions the distance of the fixed stars is unknown, and must in all cases be enormous. Since the time of Bradley many attempts have been made to measure what is called the annual parallax (q.v.) of the stars, and thus determine their distances. When we consider that the motion of the earth round the sun alters our position in space a whole diameter of its orbit (185,000,000 miles) in six months, we should expect a change in the relative positions of certain stars as seen from two opposite points of the orbit. But no such change is seen to take place, and this was one of the early objections to the theory of Copernicus (q.v.). The only answer that the Copernicans could give was that the distance of the stars from us is so great that the diameter of the earth's orbit shrinks into insignificance when compared with it. The detection of the parallax of the fixed stars depended upon the perfection of instruments. If the parallax amounted to a second the distance of the star would be at least 206,000 times that of the sun; and when the measurement of angles came to be reliable to a second and still no parallax was discernible, astronomers could say that the distance of the nearest stars must be more than 206,000 times that of the sun, i.e., 206,000 times 93,000,000 miles.

The first successful measurement of the parallax of a star was made by Bessel (q.v.) in 1838. He employed in his observations a remarkably fine heliometer (q.v.) and adopted what is called the differential method, in which the position of a star suspected of having a measurable parallax is determined at different times during the year with reference to certain smaller stars apparently near it, though from their minuteness presumably at a much greater distance and consequently possessed of negligible parallax. The star chosen by Bessel for observation was 61 Cygni, a star of large proper motion and hence one which might reasonably be supposed to be one of our nearest neighbors. Bessel made 96 observations in all, extending from August, 1837, to September, 1838, and from them deduced for the parallax of 61 Cygni the value  $0.3136''$ , which he announced to the world in December, 1838, anticipating by a few weeks only Henderson's publication of the parallax of  $\alpha$  Centauri. This observation of Bessel's is one of the most famous in the annals of astronomy.

When quite a number of stars came to have known parallaxes, their distances were found to be too great to be expressed conveniently in miles. Therefore astronomers invented a new unit, the "light year," for the distance traversed by light in one year. As light travels about 180,000 miles per second, it will be seen that the light year is a unit of stupendous magnitude, and well fitted to measure the profound distances of stellar space. With the exception of  $\alpha$  Centauri, the stars given in the following table of sensible parallaxes are all visible in northern latitudes:

STAR	Magnitude	Parallax	Distance in light years
$\alpha$ Centauri, . . . . .	1.0	0.76"	4.3
Lalande 21,185, . . . .	7.5	0.47	6.9
61 Cygni . . . . .	6.1	0.41	8.0
Sirius, . . . . .	—1.4	0.3	8.7
$\nu$ Draconis, . . . . .	4.9	0.32	10.2
$\tau$ Ceti . . . . .	3.7	0.32	10.2
Procyon, . . . . .	0.7	0.30	10.9
Altair . . . . .	0.9	0.23	14.2
Aldebaran, . . . . .	1.2	0.11	29.6
Polaris, . . . . .	2.1	0.074	44.0

The ancients grouped the stars into constellations which, although entirely fanciful and devoid of anything like systematic arrangement, still serve astronomers as the basis of stellar nomenclature. (For the names of the constellations, see CONSTELLATION.) The several stars belonging to the same constellation are usually distinguished from one another by Greek letters, beginning the alphabet with the brightest; and when these are not sufficient, by Roman letters and by numbers. Many of the most brilliant stars have special names. They are also divided according to their brightness into stars of the first, second, third, etc., magnitudes, a division which is necessarily somewhat arbitrary. The smallest stars discernible by the unaided eye are usually called stars of the sixth magnitude. The quantity of light given by a star of any magnitude is taken as 2.512 times as great as the quantity given by a star one magnitude fainter. This number is called the "light ratio," and it is so chosen that a diminution of five magnitudes corresponds to a division of stellar light by just 100 ( $2.512 = \sqrt[5]{100}$ ). In other words, 100 average stars of the sixth magnitude should give as much light as one of the first magnitude.

But the whole matter of stellar photometry is subject to some uncertainty. According to the *Harvard Photometry* the following are the brightest stars in the order of lucidity: Sirius, Canopus\*,  $\alpha$  Centauri\*, Vega, Capella, Arcturus, Rigel, Procyon,  $\alpha$  Eridani\*,  $\beta$  Centauri\*, Altair, Betelgeux,  $\alpha$  Crucis\*, Aldebaran, Pollux, Spica, Antares,  $\alpha$  Piscis Australis\*,  $\alpha$  Cygni, Regulus. Those marked with an asterisk are not visible in northern latitudes. No real magnitude in the proper sense of the word has yet been observed in any star. In the best and most powerfully magnifying telescopes even the brightest stars of the first magnitude appear, not with small disks as all the planets do, but as luminous points without any visible diameter. We are, therefore, totally ignorant of the real size of the fixed stars; nor could it be determined though we were sure of their distances, for the apparent diameter is an essential element in the calculation. We cannot, then, say whether the greater brilliancy of one star, when compared with another, arises from its greater nearness, its greater size, or the greater intensity of its light; but it is certain that the fixed stars are self-luminous. In spite of the deceptive appearance of the heavens at night, the stars visible to the unaided eye in the Northern Hemisphere amount only to about 3000. Stars of the first magnitude visible north of  $35^\circ$  south declination are reckoned by Heis at 14, of the second at 48, of the third at 152, of the fourth at 313, of the fifth at 854, and of the sixth at 2010; in the following classes the numbers increase very rapidly, so that an accu-

rate census of the heavens becomes impossible. The total number of stars in both hemispheres has been estimated by Chapman at between 1000 millions and 2000 millions, half of them being brighter than a magnitude between 23 and 24, which is the faintest that could possibly be photographed with the most powerful telescope at present available.

That the fixed stars are not really immovable is seen in the phenomenon of double or multiple stars—systems of two or more stars that revolve about one another, or rather about their common centre of gravity. Galileo discovered their existence and proposed to make use of them in determining the yearly parallax of the fixed stars. After a long time Bradley, Maskelyne, and Mayer directed attention to the phenomena of double stars, but nothing important was made out respecting them until the observations of the elder Herschel, which led to the most remarkable conclusions as to their nature. The apparent angular distance between two stars must be less than about thirty seconds in order that they may be counted a double. The theory of probabilities renders it almost certain that this vast number of double stars could not exist unless there were some real physical connection between the component numbers of a double. Still, there is always a possibility of doubleness being merely apparent, the two stars lying nearly in the same direction in space, but one far beyond the other. Such apparent doubles are called optical doubles, and those in which a real physical connection has been demonstrated by observed gravitational rotation of the component members are called binary stars. The two members of double stars are mostly of one color when the two components are nearly equal; but a difference of color is often observed when components are widely different in size. In many cases the one color is the complement of the other. It was Sir W. Herschel who first advanced the view (since confirmed) that multiple stars are connected systems of two or more stellar bodies revolving in regular orbits around their common centre of gravity. Their motions are found to follow the same laws as prevail in the solar system, and the orbits are elliptical. These distant bodies are therefore subject to the Newtonian law of gravitation. The period of revolution has, in many cases, been computed; the shortest is estimated at  $5\frac{1}{2}$  years; others are set down at hundreds. In cases where the parallax is known the size of the orbits can be determined. Thus the orbit described by the two components of the double star  $\alpha$  Centauri about each other is 24 times as large as that of the earth around the sun. Even the masses of these stars have been calculated as being together twice that of our sun. In addition to the double stars that can be seen to revolve and change their relative positions there are others, called spectroscopic doubles, the components of which are so close together that even our most powerful telescopes fail to separate them. These doubles are known to exist from peculiarities in their spectra. They show a doubling of the spectral lines that must be caused by a duplicity in the source of light, and where this doubling is shown to occur periodically we must conclude that the two sources of light are revolving in some way or other.

The proper motion of stars is of another kind. It consists in a displacement in various direc-

tions of the individual stars, so that the configuration of constellations is slowly changing. The annual proper motions yet observed vary from nothing to  $8.7''$ . The proper motion of the binary star 61 Cygni amounts to  $5.2''$ , so that in 360 years it would pass over a space equal to the moon's diameter. It must thus take thousands of years to alter sensibly the aspect of the heavens; although, taking into account the enormous distances, the actual velocities must be great. But the observed proper motions of the stars do not give us very accurate information as to their real motions and velocities. In the first place, it is only the angular change of the star's position that we observe; and we cannot tell the corresponding linear shift unless we know the distance of the star from the earth. And even where this distance is known we can obtain only the transverse motion, as projected on the sky. There may be also a component of motion directly towards us or away from us. This radial component remained entirely unknown until recently, when it became possible to measure it with the spectro-scope.

It was first observed by Sir W. Herschel that there is a perceptible tendency in the proper motions, as observed, to make the stars generally diverge or open up in one quarter of the heavens, and draw together in the opposite quarter; and this he attributed to a proper motion of our sun with his planets in the direction of the former point. The apparent motion thus caused is complicated with the real independent motions of individual stars. The point towards which the motion is directed, which is called the "solar apex," was fixed by Herschel in the constellation Hercules. The result of recent researches gives a point situated very near Vega, the brightest star in the neighboring constellation Lyra. The velocity has been calculated at about 11 miles per second, a figure still very uncertain. In this connection mention should be made of Kapteyn's researches on the proper motion of the stars. He found that there are really two regions of the sky where the stellar density tends to increase, and not one, as Herschel supposed; and that the stars may be separated into two great streams, each with its own apex. The two streams are almost equivalent in point of numbers, distributions, distance, and brilliancy of the component stars, but one moves about half as fast again as the other. Kapteyn's conclusions have been confirmed by Dyson, Eddington, Beljawsky, and others whose investigations, although in each case directed to different classes of stars, lead to results which agree very closely. Dyson found that the apparent motions of the streams could be resolved into a motion of the solar system with a velocity 1.55 towards a point not far removed from Herschel's solar apex, and a motion of two streams to and from a point about halfway between Pollux and Aldebaran with a relative velocity 4.04.

Coming now from a consideration of stellar motions and velocities to their physical characteristics, we must again have recourse to information derived from a study of star spectra. Fraunhofer was the first to study them, and after the discovery of Kirchhoff's Law it became possible to identify in the stars many of the terrestrial chemical elements. The real founders of stellar spectroscopy, however, were Sir William Huggins and Father Secchi. Having

subjected more than 4000 stars to examination with the spectroscope, Secchi in 1863 proposed a fourfold classification of the stars based on the character of their spectra. Later researches by Vogel and others have revealed the existence of a number of well-marked subclasses, but the four types defined by Secchi still form the basis of the various classifications in use at the present time. Secchi's four classes are as follows: I, Sirian stars, comprising nearly half the total number examined. They are blue, or bluish white, in color, and their spectra are mostly characterized by the breadth and intensity of the dark absorption bands due to hydrogen and by the presence of comparatively few metallic lines. In some cases, however, the absorption is largely due to helium, and these stars constitute the important subclass of helium stars. Sirius, Canopus, Vega, Altair, and Rigel belong to this class, the last mentioned being a helium star. II, Solar, or yellow stars, the spectra of which resemble that of the sun, being distinguished by the presence of innumerable fine dark lines. They are almost as numerous as the Sirian stars. Capella, Arcturus, Procyon, Aldebaran, and the sun are examples of this type. III, Antarian, or red, stars. Their spectra show dark absorption bands or flutings which are sharply defined in the violet and gradually disappear towards the red. They number about 500, Antares and Betelgeux being the most conspicuous examples. IV, Carbon stars, showing spectra similar to those of Class III, but with the bands most sharply defined in the red, the absorption being due to carbon or its compounds. They are deep red in color, and about half as numerous as the stars of Class III. They are without exception faint, the brightest being of about the fifth magnitude. About 100 stars exhibit spectra of a peculiar character, in which dark lines and bands, many of them of unknown origin, and also bright lines, appear to be superimposed on a continuous spectrum. The first of these was discovered by Wolf and Rayet in 1867, and hence they are known as Wolf-Rayet stars. They are gaseous stars, and are almost entirely confined to the Milky Way. It is generally agreed that they stand first in the order of stellar development and form a class quite distinct from the helium and Sirian stars, which come next in succession.

Many stars exhibit well-marked periodic alterations of magnitude, and are hence called variable stars. Perhaps the most remarkable of these are Mira (the wonderful) in Cetus (q.v.), and Algol (q.v.) in Perseus. Variable stars are classified into nonperiodic variables, in some of which the brightness suffers a slow but continuous change, while in others it fluctuates irregularly; and periodic variables, which are further subdivided into three classes: long-period variables, like Mira, in which the periods range from 10 to 18 months; short-period variables, like  $\beta$  Lyræ, the periods seldom exceeding 12 days; and Algol, or eclipsing, variables. The last class, of which Algol is typical, comprises between 30 and 40 variables of short periods (in few cases exceeding five days), in which the variation is due to the periodical interposition of a dark companion star across the line of sight so that the light of the brighter star is greatly diminished during a comparatively short interval of the entire period.

Temporary Stars, or Novæ, are stars which burst suddenly into great splendor and then

dwindle until invisible except by the aid of powerful telescopes, or disappear entirely. During the past 400 years 24 such stars have been observed. Since the application of photography to astronomy the discoveries of these stars have been of comparatively frequent occurrence. One of the most famous novæ was that observed at the end of 1572 by Tycho Brahe in the constellation Cassiopeia. It was then of the first magnitude, and in less than a month was so bright as to be visible in broad daylight, but in about six months it had vanished. Another was the star observed in 1604 by Kepler in the constellation of Ophiuchus, which, at its brightest, was as brilliant as Jupiter.

In more recent times two novæ, both first detected by the same observer, Dr. Anderson of Edinburgh, have been carefully studied. The first, *Nova Aurigæ*, was observed by him at the end of January, 1892. It blazed up to the fourth magnitude, and after some variation began to fade rapidly at the beginning of March until, at the end of the month, it was only of the 12th magnitude. Later in the year its brightness increased again, and after fluctuating for nearly a year finally decreased to insignificance. The second of Anderson's discoveries was *Nova Persei*, which he first observed about the end of February, 1901. It was then of about the third magnitude, but in two days its brightness had increased until it was the third brightest star in the heavens. It then faded slowly and, after going through a series of fluctuations during March and April, settled down to a telescopic star.

Spectroscopic observations indicate that most of the novæ recently observed have themselves become nebulous or are in some way connected with nebulous matter.

Star Systems. Sir W. Herschel came to the conclusion that the stars forming our firmament do not extend indefinitely into space, but are limited in all directions, the mass having a definite shape. He conceived the shape to be some-

STAR SYSTEM.

thing like that of a huge millstone, having one side cleft and the two luminæ set apart at a small angle. Let the diagram represent a vertical section of such a broad flat stratum and suppose the solar system situated as at S. To a spectator looking on either side, in the direction of the thickness, as SB, the stars would appear comparatively sparse, but all round in the direction of the breadth (as SA) there would appear a dense ring, which would separate into two branches (SE, SD), in the direction of the cleft side. This supposition accounts for the appearance of the Milky Way.

**STAR.** A frequent charge in heraldry (q.v.). See ESTOILE.

**STAR AND GARTER.** A former London tavern in Pall Mall, the meeting place of the Literary Club.

**STAR ANISE.** See ILLICIUM.

**STAR APPLE** (*Chrysophyllum cainito*). A West Indian tree about 20 or 30 feet high, introduced in other warm countries, beyond which it is not hardy. It is named from the starlike cross section of its large white or rose-colored, green, and yellow fruits, which have an agreeably flavored soft, sweet pulp. The tree is very beautiful in foliage.

**STARAYA LADOGA**, stä'rá-yá lá'dô-gä. A small village in the Government of St. Petersburg, Russia, on the Volkzhov, a few miles south of Lake Ladoga. It is one of the oldest Russian settlements and has considerable historic interest.

**STARAYA RUSSA**, rus'sä. An ancient town and noted health resort in the Government of Novgorod, Russia, 181 miles south-southeast of St. Petersburg (Map: Russia, D 3). It is well built, and has a number of fine parks. The saline springs are used both for drinking and bathing. Pop., 1910, 19,986.

**STARA-ZAGORA**, stä'rá-zä'gô-rä. See ESKI-ZAGRA.

**STARBOARD.** A naval term to denote the right side of a vessel to an observer looking forward. See HELM.

**STAR CATALOGUE.** See ASTROPHOTOGRAPHY.

**STARCH** (AS. *stearc*, strong, stiff). A form of carbohydrate (see CARBOHYDRATES), occurring as stored food in all plants. Its composition corresponds to the empirical formula  $C_6H_{10}O_5$ , but its molecular formula, and, of course, its constitution, are as yet doubtful. The number of atoms in its molecule is probably very large. As ordinarily obtained, starch consists of minute uncrystallizable granules insoluble in water. However, when starch is acted upon by hot water, the outer coats of the granules are

ruptured and their contents form a viscous liquid that is usually referred to as starch paste and that turns to a firm solid on cooling. Several methods have been described by which ordinary starch can be transformed into soluble starch. Both starch paste and soluble starch give an intense blue coloration with iodine, a reaction exhibited by no other known substance; the composition of the blue starch-iodine compound is not definitely known. Starch is largely used as a food and for laundry purposes; it is used industrially for dressing cloth, for sizing cotton goods and paper, for making dextrin (q.v.) and British gum, etc. The processes employed in the manufacture of starch vary with the source as well as with the use to which the starch is to be applied. The simplest process is involved in making starch from potatoes: here the potatoes are simply reduced to a pulp, and the latter is washed with water in fine sieves, which allow the starch granules to pass through, while the cellulose of the potatoes is held back.

Starch is formed as a condensation product from sugar by the action of certain specialized portions of the protoplasm of plant cells. The typical starch formers are leucoplasts (q.v.), which occur in all cells where starch is permanently stored. But the chloroplasts of the leaves may form starch when the green cells become overloaded with sugar. Thus leaves are often found to contain large quantities of starch, especially at the end of a long period of bright illumination. The sugar formed by the process of photosynthesis (q.v.) is constantly diffusing away into other parts of the plant, but during periods of bright light it is formed more rapidly than it can diffuse, and it is then condensed by the chloroplasts to form starch. During periods of darkness or of weak illumination, when the photosynthetic process ceases or lags, the starch of leaves is reconverted into sugar by the enzyme diastase (q.v.), and then diffuses to other regions of the plant. Thus leaves seldom contain starch in the morning or on cloudy days. But by far the greater part of the starch found in any plant is organized into grains by leucoplasts. By the action of these bodies, sugar which comes from the green leaves is condensed or polymerized into starch. Starch is thus formed in all parts of plants, being especially plentiful in tubers, in thickened roots, and in the endosperm and embryo of seeds. See ALCOHOL; DEXTRIN.

**STAR CHAMBER.** A celebrated English tribunal, which met in the council chamber of the old palace of Westminster. The origin of the name is unknown. According to Sir Thomas Smith it was derived from a decoration of gilded stars on the ceiling. This theory is unsupported by evidence, but it is now well established that since the middle of Edward III's reign the Star Chamber (Camera Stellata) was the usual meeting place of the King's council, or Privy Council, as it was afterward known. The history of the Star Chamber Court is particularly associated with the Act of 3 Henry VII, c. 1. By this statute the "chancellor and treasurer of England for the time being and keeper of the King's privy seal, or two of them, calling to them a bishop and a temporal lord of the King's most honorable council and the two chief justices of the King's Bench and Common Pleas for the time being, or other two justices in their absence," are given jurisdiction in seven offenses: unlawful maintenance; giving of

liveries, signs, or tokens; retainers by indentures, oaths, writings, or otherwise; embraceries of the King's subjects; untrue demeanings of sheriffs in the making of panels, and other untrue returns; taking of money by juries; and great riots and unlawful assemblies. Since the days of Elizabeth it has been very commonly held that the historical Star Chamber was created by this act; and that its proper jurisdiction was restricted to the offenses just enumerated. Recent research has shown that such was not the case. The Star Chamber claimed and possessed the entire jurisdiction of the King's council. As a criminal court, it could inflict any punishment short of death, and had cognizance of all cases that might be brought under the head of contempt of the royal authority. Jurors were there punished for verdicts against the crown. Offenders against the royal proclamations or the religious laws were there condemned. The form of proceeding was by written information and interrogatories, except when the accused person confessed, in which case the information and proceedings were oral. Abuses grew out of this; forced confessions, pressure, torture prevailed. Admissions of the most immaterial facts were construed into confessions; and fine, imprisonment, and mutilation were inflicted on a mere oral proceeding, without hearing the accused, by a court consisting of the immediate representatives of prerogative. The proceedings of the Star Chamber had always been viewed with distrust by the commons; but during the reign of Charles I its excesses reached a height that made it absolutely odious to the country at large; and in the last Parliament of that sovereign a bill was carried in both Houses (16 Car. I, c. 10) which decreed its abolition. Consult C. L. Scofield, *A Study of the Court of Star Chamber* (Chicago, 1900) and *Select Cases before the Court of Star Chamber* (ed. by I. S. Leadam for the Selden Society, 2 vols., London, 1903-11). See CAMERA, IN.

**STARE DECISIS**, stā'rê dê-sî'sis (Lat. *Stare decisis, et non quæta movere*, "to stand by decisions and not to disturb matters once settled"). A phrase employed to describe a doctrine prevailing in most judicial systems of modern times, which, briefly expressed, is that the courts will follow the principles of law declared in former decisions where they are not contrary to the ordinary principles of justice. The theory on which this doctrine was established is that when a point of law is once decided it will be followed by the public as a guide. The doctrine of stare decisis does not apply to a decision until the time for appeal has elapsed; and a superior court may at any time overrule or repudiate the principles of a case previously decided in an inferior court and never appealed. Under such circumstances the original case erroneously decided would not be affected, and would remain res judicata between the parties thereto, but would no longer be cited as an authority. Courts of equal jurisdiction in the same State are not bound by each other's decisions, and one United States circuit court is not bound by the decisions of another. The United States courts will usually follow the decisions of the courts of the various States where an interpretation or application of their laws is involved. The courts of one State are not bound by the decisions of the courts of another, nor by those of a foreign country.

The courts are especially averse to disturbing the principles of law involving titles to and interests in real estate. The policy seems to be not to do so where it is only a question of expediency, and to do so with caution even where the principles of a decision are erroneous and will tend to work injustice in the future. Consult J. C. Wells, *Treatise on the Doctrines of Res Adjudicata and Stare Decisis* (Des Moines, 1878), and James Kent, *Commentary on American Law* (14th ed., Boston, 1896).

**STARFISH.** Echinoderms with a starlike or pentagonal body, with two or four rows of ambulacral feet or tentacles on the oral side. The body is covered with small, short spines, often arranged in groups. The nervous system is pentagonal, with nerves extending into the arms. Most of the species are bisexual; the young usually pass through a metamorphosis, the starfish budding out from the water-vascular system of the pluteus, bipinnaria, or brachiolaria form, which previously passes through a

A PALEOZOIC STARFISH.

a, ventral aspect of *Aspidosoma petaloides* (Lower Devonian); b, ambulacral surface of an arm, in detail, c, dorsal plates of an arm.

cleavage, gastrula, and cephalula stage. Starfish are covered with scattered pedicellariae, pincer-like spines consisting of two prongs. Sense organs (spharidia) are also present. They have the sense of smell, supposed to be localized in the suckers at the back of the eye-plate.

Starfish crawl or glide by means of from two to four rows of slender tubular processes or feet, with a sucker at the end. These ambulacral feet are thrust out, fastened to the bottom, and by means of them the body is warped along over mussel or oyster beds, rocks, or weeds, the arms being capable of slow but rather complete bending movements. At the end of each arm is the red eye, terminating the radial nerve. Starfish are very destructive to oysters, clams, mussels, barnacles, snails, worms, and small crustacea. By a steady strain on the valves they open and devour oysters. The injury to the oyster beds of Rhode Island caused by starfish in one year was estimated at \$100,000. See ECHINODERMATA (and Plate); OYSTER.

Fossil starfish are found first in the Ordovician rocks, and they occur sparingly in later formations, with some increase in the Devonian and Carboniferous, but they are never of geological importance. Some Mesozoic sandstone formations of middle Europe have furnished abundant casts, and they are found also in a few Tertiary localities. The Paleozoic species are grouped in the subclass Encrinasteriæ, in which the ambulacral ossicles alternate with each other along the middle line of the ambulacra; while the Mesozoic and Tertiary species

and also the recent, are included in the Euastridae, which have the ambulacral ossicles opposite each other.

Consult G. J. Romanes, *Jellyfish, Starfish, and Sea Urchins*, in "International Scientific Series," vol. xlix (New York, 1893), and A. D. Mead, "Natural History of the Starfish," in *United States Fish Commission, Bulletin*, 1899 (Washington, 1900).

**STARGARD**, stür'gärt. A town in the Province of Pomerania, Prussia, situated on the navigable Ihna, 22 miles east-southeast of Stettin (Map: Germany, F 2). It is the most important town in the eastern part of the province. The town manufactures railway supplies and other machinery, has foundries, and is a woolen and cotton and also a horse and cattle market. It belonged to the Hanseatic League and was strongly fortified. Pop., 1900, 26,858; 1910, 27,551.

**STAR GAZER**. See CATFISH.

**STAR GRASS**. A popular name for several grasslike plants whose flowers or other parts resemble stars in outline. Among them are species of *Hypoxis*, *Callitriche*, *Aletris*, and *Rhynchospora*. See Colored Plate of AMARYLLIDACEÆ.

**STARHEMBERG**, shtil'rem-bërk, ERNST RÜDIGER, COUNT VON (1638-1701). An Austrian general, born at Graz and educated for the army by Montecucoli. He was present at St. Gotthard in 1664, and gained especial glory by his brave defense of the city of Vienna for nine weeks in 1683 against the Turkish army. The Emperor Leopold made him a field marshal and Minister of State. Three years afterward he was wounded at Bude and forced to retire from active service. He settled in Vienna and became president of the Council of War.

**STARK**, JOHN (1728-1822). An American soldier, born at Londonderry, N. H. In early life he was a farmer, but in the French and Indian War he served with Rogers's Rangers, first as lieutenant and later captain. At Cambridge early in 1775 he was commissioned colonel and, with a regiment raised in one day by himself, took part at Bunker Hill. Later he served in the Canada expedition and then under Washington in New Jersey, distinguishing himself at Trenton and Princeton; but, resenting promotions over him, he resigned in April, 1777, and returned home. On the approach of Burgoyne he accepted an independent command from New Hampshire, and defeated a force of Hessians in the battle of Bennington (q.v.), Aug. 16, 1777. For this he was made brigadier general and formally thanked by Congress. With New Hampshire recruits he took part in the Saratoga campaign, and in 1778 and again in 1781 he commanded the Northern Department. Consult Caleb Stark, *Memoir and Official Correspondence* (Concord, N. H., 1860), and Edward Everett, "John Stark," in Jared Sparks, *American Biography*, vol. v (new ed., New York, 1902).

**STARK'EY**, THOMAS ALBERT (?1871- ). A Canadian hygienist. He was born at Hartford, England, and graduated in medicine at London University in 1894. After a course in London hospitals he went to India for research work in the cure and prevention of the bubonic plague and cholera and was engaged thereon at the Imperial Research Laboratory, Bombay, in 1899-1901. He next took charge of the sanitation of two large districts in India, continued

his researches in public health work on his return to England, and was bacteriologist to the London County Council. In 1902 he was appointed professor of hygiene at McGill University. He was elected a fellow of the Royal Sanitary Institute (London) in 1906 and in 1910 became the first president of the Canadian Public Health Association.

**STARK'IE**, WILLIAM JOSEPH MYLES (1860-1920). An Irish classical scholar, born at Sligo. He was educated at Shrewsbury School, Trinity College, Cambridge, and Trinity College, Dublin. He held important administrative positions in educational matters in Ireland, being Resident Commissioner of National Education after 1899. In 1914 he was made Privy Councillor for Ireland. His publications include elaborate editions of plays of Aristophanes, the *Wasps* (1897), the *Acharnians* (1909), the *Clouds* (1911); *Recent Reforms in Irish Education* (1902); *A History of Irish Primary and Secondary Education during the Last Decade* (1911); *Continuation Schools* (1912).

**STARK'VILLE**. A city and the county seat of Oktibbeha Co., Miss., 103 miles by rail north of Meridian, on the Illinois Central and the Mobile and Ohio railroads (Map: Mississippi, H 4). It is the seat of the Mississippi Agricultural and Mechanical College. There are important stock-raising interests, and a lumber yard and cotton and cottonseed-oil mills. Pop., 1900, 1986; 1910, 2698.

**STARLING** (AS. *stær*, starling). A European bird (*Sturnus vulgaris*) of the family Sturnidæ, famous for its song and powers of mimicry. It is rather smaller than the American meadow lark, its nearest analogue in the New World, and is brown finely glossed with black, with a pale tip to each feather. It was introduced into New York City in 1890, and in the subsequent 25 years spread rapidly over most of the northeastern States. It did a great deal of damage to fruit and in driving away native birds and may in time become as great a pest as the English sparrow.

The starling family is a large one, containing about 200 species, mostly living in the tropics of Africa and Asia. They fall between the Corvidæ and Icteridæ, and are divisible into two sections: one containing the more typical terrestrial starlings, the oxpeckers, the pastors, the mynas, pied starlings (*Sturnopastor*), and wattled starlings (*Dilophus*). In the second group, often regarded as a separate family (Eulabetidæ), distinguished by the absence of rectal bristles and by the fact that they lay spotted eggs, whereas the true starlings lay blue unspotted eggs, are the African glossy starlings (*Lamprolornis*), with richly colored plumage, and the grackles or hill mynas. Consult Richard Lydekker, in *Standard Natural History* (London, 1895), and E. H. Forbush, "The Starling," in *Massachusetts State Board of Agriculture, Fifty-eighth Annual Report* (Boston, 1915).

**STARNBERGER** (shtärn'bër-gër) **LAKE**. A lake in South Bavaria, 15 miles southwest of Munich. Its length from south to north is about 18 miles; its altitude nearly 2000 feet. The Würm flows through the lake. The shores are picturesque and covered by lordly villas affording splendid views.

**STAR-NOSED MOLE**. See MOLE.

**STAR OF BETHLEHEM** (so called from its star-shaped flowers, which are white within),

*Ornithogalum*. A genus of about seventy species of bulbous-rooted plants of the family Liliaceæ. The species are natives almost exclusively of the Eastern Hemisphere—only a few are grown in flower gardens. The common star of Bethlehem (*Ornithogalum umbellatum*), a native of Europe, the Levant, etc., cultivated and escaped from gardens in the United States, has racemes of six to nine large white fragrant flowers, which open about 11 o'clock in the morning and close about three or four in the afternoon. The plant is hardy and may be grown three or four years without being disturbed. *Ornithogalum arabicum* is a tender species often grown in glasses like hyacinths. It produces large creamy-white fragrant flowers. The hardy species flourish in well-drained garden soil. Propagation is effected by offsets from the bulbs, which are planted in the fall about nine inches deep in sheltered places.

**STAR OF INDIA, ORDER OF THE.** A British order with three classes founded by Queen Victoria in 1861, consisting of the sovereign, the Viceroy of India, and 246 members, in addition to an unrestricted honorary membership. The decoration is an oval medallion bearing a bust of Victoria in onyx, surrounded by a blue band with the device *Heaven's Light our Guide*, and surmounted by a diamond-studded crown.

**STAROKONSTANTINOV**, stü'rô-kôn'stân-tyë'nôf. A district town in the Government of Volhynia, Russia, 86 miles southwest of Zhitomir (Map: Russia, C 5). The chief manufactures are tobacco and soap; mineral waters are marketed. Pop., 1911, 24,439.

**STAROBRADTSY AND STAROV-YERTSY.** See RASKOLNIKI.

**STARR, FRANCES (GRANT)** (1886- ). An American actress, born at Oneonta, N. Y. She first appeared on the stage at Albany, N. Y., in 1900, and played in San Francisco, Cal., in 1903. In 1906 she appeared in *Gallops*, and then starred in *The Music Master* in New York City. As leading lady she achieved a great success as Juanita in *The Rose of the Rancho* (1906-08), and afterward as Laura Murdock in *The Easiest Way* (1909-11). In 1911-13 she played in *The Case of Becky*, and in 1915-16 in *Marie Odile*.

**STARR, FREDERICK** (1858- ). An American anthropologist, born at Auburn, N. Y. He studied at the University of Rochester and at Lafayette, where he graduated in 1882. He was registrar of Chautauqua University in 1888-89, and after being for two years in charge of ethnology in the American Museum of Natural History, New York (1889-91), was assistant professor (1892-95), and thereafter associate professor of anthropology in the University of Chicago. In 1905-06 he made a careful study of the pygmy races of Central Africa, and made investigations in the Philippine Islands in 1908, in Japan in 1909-10, and in Korea in 1911. His publications include a *Catalogue of Collections of Objects Illustrating Mexican Folklore* (1899); *Indians of South Mexico* (1900); *The Ainu Group at the Saint Louis Exposition* (1904); *The Truth about the Congo* (1907); *In Indian Mexico* (1908); *Filipino Riddles* (1909); *Japanese Proverbs and Pictures* (1910); *Liberia* (1913); *Mexico and the United States* (1914).

**STARR, M(oses) ALLEN** (1854- ). An American neurologist, born in Brooklyn, N. Y. He graduated from Princeton (1876) and from

the College of Physicians and Surgeons, New York (1880). At the latter institution, which became part of Columbia University, he was lecturer (1887-89) and professor of diseases of the mind and nervous system (1889-1909), and professor of neurology from 1903 till his retirement in 1915. In 1896-97 he served as president of the American Neurological Association, and he became a corresponding member of foreign societies. Besides being connected editorially with the *Journal of Nervous and Mental Diseases* and the *Psychological Review*, Dr. Starr published many articles and: *Familiar Forms of Nervous Diseases* (1893); *Brain Surgery* (1895); *Atlas of Nerve Cells* (1897); *Nervous Diseases, Organic and Functional* (1913).

**STAR-ROUTE FRAUDS.** Frauds in the management of the star-route postal service during the administration of President Hayes. A star designated in the Postal Guide the routes over which, owing to lack of railroads and steamboats, mail was carried by horse or wagon. A ring, including Brady, Second Assistant Postmaster General, and Senator S. W. Dorsey, of Arkansas, and certain mail contractors, was alleged to have been formed to defraud the government by increasing payments to certain mail contractors. Operations included 135 mail routes wherein compensation for carrying the mail was raised from \$143,169 to \$622,808. This was accomplished by securing petitions from the localities interested for an increase in the number of trips, the schedule time for each trip being shortened. The frauds were brought to light early in Garfield's administration, and the chief participants were prosecuted and the frauds stopped.

**STARS.** See STAR.

**STARS AND BARS.** The popular name applied to the flag adopted by the Confederate States of America early in 1861. See FLAG.

**STAR SAPPHIRE.** See GIRASOL.

**STAR-SPANGLED BANNER, THE.** A national hymn of the United States, written by Francis Scott Key (q.v.) on board the frigate *Surprise* during the bombardment of Fort Mchenry, Md.; by the British, in 1814. He directed that the words should be sung to the tune "Anacreon in Heaven," composed in England by John Stafford Smith between 1770 and 1775. "The Star-Spangled Banner" was first sung in a tavern near the Holiday Street Theatre, Baltimore, by Ferdinand Durang. Consult: Johnson, *Our Familiar Songs* (New York, 1881); FitzGerald, *Stories of Famous Songs* (London, 1898); O. G. T. Sonneck, *The Star Spangled Banner* (Washington, 1914), containing "various versions both of text and of music with notes as to the historical evolution."

**STARTER.** See MOTOR VEHICLE.

**STAR THISTLE.** See CENTAUREA.

**STARVATION** (AS. *steorfan*, to die), or INANITION. Emaciation, enfeeblement, lowered vitality, and finally death, resulting from insufficiency of or total deprivation of food. The fact is stated, quoted from Chossat, that death from starvation occurs after the loss of four-tenths of the body weight. The same observer recounts the following phenomena: (1) Dropsical effusion. (2) Softening and destruction of the mucous membrane. (3) Blackening of the viscera, especially of the liver. (4) Bluish, livid, yellow, and reddish stains during life in the transparent parts of the skin. (5) Hectic fever, and a continuous decrease in the power of the

body to resist cold. (6) At first a scanty excretion of dry, bilious, grass-green feces, and afterward diarrhea of liquid saline matter. (7) Convulsions similar to those in death by hemorrhage. (8) Death by starvation seems to be in reality death by cold; since the temperature of the body is not much diminished until the fat is nearly consumed, when it rapidly falls, unless kept up by heat applied externally. (9) Young animals succumbed soonest. (10) Results of insufficient food were in the end the same as those of total deprivation, the amount of loss being almost the same, but the rate being less, so that a longer time was required to produce it.

Death supervenes earlier when liquids as well as solid food are withheld. During the famine of 1847 in Ireland, the symptoms observed were: pain in the stomach, relieved by pressure; pallor and emaciation; bright and wild eyes; parched mouth, thick and scanty saliva; intolerable thirst; fetor; tottering gait. See FAST.

The time during which life can be supported under entire abstinence from food and drink varies much. In one case, reported by Sloan, a healthy man, aged 65 years, survived 23 days' imprisonment without food in a coal mine, having impure water for the first ten days of this period. He died three days after rescue. The average healthy individual will survive a week or 10 days of complete abstinence from food and water. Consult: Leeson, "Death from Starvation," in *Dublin Medical Press* (Dublin, 1847); Davies, "Starvation," in *Popular Science Monthly*, vol. xxvi (New York, 1884-85); Fernet, "Amaigrissement extrême et mort par inanition," in *Bulletin et mémoire de la Société médicale de l'hôpital de Paris* (Paris, 1901); F. G. Benedict, *A Study of Prolonged Fasting*, published by the Carnegie Institution (Washington, 1915).

**STARWORT.** See CHICKWEED.

**STARY-OSKOL**, stā'rě-ös-köl'. A district town in the Government of Kursk, Russia, on the river Oskol, 92 miles east-southeast of Kursk (Map: Russia, E 4). It has tanneries and tobacco factories. Pop., 1910, 27,310.

**STAS**, stās, JEAN SERVAIS (1813-91). A Belgian chemist. He was born in Louvain, studied under and later assisted Dumas, and was for many years professor in the Royal Military School at Brussels. Later he held a post in the royal mint. In 1872 he retired from active service. Stas devoted years to the determination of the atomic weights of the elements, and it is principally for this research that he is celebrated. His impulse was from discussion as to whether the atomic weights are or are not exact multiples of the atomic weight of hydrogen—a question connected with Prout's hypothesis that the several chemical elements are derived from hydrogen and are not essentially different substances. But the results of Stas's work have been of much further-reaching importance, and its precision has but recently been surpassed. His collected works appeared in three volumes (Brussels, 1894). Consult Spring, *Notice sur la vie et les travaux de J. S. Stas* (Brussels, 1893).

**STASINUS** (Lat., from Gk. Στασινος). A Greek epic poet, born in Cyprus. The dates of his birth and death are unknown. He was author of a poem, in 11 books, called the *Cypria* (q.v.). Internal evidence shows that this poem

was written later than the *Iliad*. For a good account of the *Cypria* consult the Appendix to D. B. Monro's edition of the *Odyssey* (Oxford, 1901).

**STASIS**, **INTESTINAL** (from Gk. στάσις, *stasis*, a standing, stagnation, from ἵστημι, *histēmi*, to stand, to stagnate). A medical term introduced by Sir William Arbuthnot Lane, designating a stoppage or retardation of the passage of the contents of the intestinal tract, in consequence of the presence of angulations, kinks (Lane's kink), or constrictions (Jackson's membrane) of the gut brought about by the growth of fibrous bands or peritoneal processes. The origin of these bands has not been settled. They have been considered as the results of atavistic development, or as products of inflammation in neighboring organs, i.e., the gall bladder, liver, or appendix, or as caused by low-grade bacterial infection of the gut itself. Lane and his followers, regarding the intestinal canal merely from the standpoint of drainage, and attributing the indefinite congeries of symptoms, called autointoxication, to retention and absorption of fecal matter, assert that by severing these constricting bands and restoring the normal patency of the intestinal canal, intestinal stasis, and consequently autointoxication, will be entirely relieved, unless there is insufficiency of the ileocecal valve. Short circuiting, i.e., resecting of a greater or less length of the bowel and suturing the severed ends together, is also practiced. Diagnosis is largely made by means of the X ray after the patient has ingested bismuth to render the intestine opaque to the rays.

While Lane and his followers claim great success for their operations, others severely criticize and condemn it. These surgeons point out that the intestines may be matted together after peritonitis, also that many individuals suffer from so-called stasis and even constipation, without the production of autointoxication; they also ridicule the theory of atavistic development. About 80 per cent of such patients, it is stated, are relieved by the wearing of a proper abdominal support and the administration of mineral oil. This mineral oil (in contradistinction from animal and vegetable oils) is not absorbable by the body and acts mechanically on the faces and bowels, but being a refined product of petroleum, should only be used after absolute elimination of the higher hydrocarbons, so dangerous to the kidneys and urinary system.

**STASSFURT**, shtās'furt. A town in the Province of Saxony, Prussia, on the Bode River, 20 miles south of Magdeburg. There are iron mills, and the important royal salt works, which mine potash and rock salts. Extensive chemical works are also found here. Pop., 1900, 20,031; 1910, 16,794. The town has been known since 806.

**STASSOV**, shtās'ōf, VLADIMIR VASSILIEVITCH (1824-1906). A famous Russian musical critic. He gained his musical views from a general study of the world's great composers and from association with Serov (q.v.). For half a century after 1847 he wrote musical criticism. A firm believer in nationalist music, he vigorously championed the new Russian school of composers founded by Balakireff (q.v.). Although his criticism was often too polemic—sometimes vitriolic—his general influence in spreading correct ideas on musical art was important. His writings include: *L'Abbé Santini et sa col-*

*lection musicale à Rome* (1852); *Liszt, Schumann, and Berlioz in Russia* (1889); and monographs on Glinka, Borodin, and other Russian composers. He published also noteworthy editions of the letters of Glinka, Dargomyzhsky, Serov, and Mussorgsky.

**STATANT** (heraldic Fr., standing). In heraldry, a term applied to an animal standing still, with all the feet touching the ground. If the face be turned to the spectator, it is said to be statant gardant, or in the case of a stag, at gaze. See **HERALDRY**.

**STATE** (Lat. *status*, state), **THE**. The theory of the state in its broadest sense may be taken to cover the whole field of political philosophy, involving the comprehensive examination of the laws underlying political phenomena. (See **POLITICAL SCIENCE**.) In a narrower sense, the theory of the state is concerned primarily with the essential nature of the state, its origin and basis, its various forms, and proper function or purpose.

The essential elements of the state, together distinguishing it from other social groups, are generally considered to be the following: a territorial basis serving as its physical foundation, a population constituting its citizenship, and a more or less complete form of political organization exercising the power of life and death. Finally, the state is a sovereign body, supreme over all persons on its territory and independent internationally.

The origin and basis of the state have been explained in various ways. It has been held that the state owes its genesis and continuance to the will or command of God, a doctrine used in the defense of all forms of government, including democracy. The origin of the state has been traced by others to the family, and explained as a development of the power of the early patriarchs. Others have maintained that the state was created by and exists in virtue of a voluntary contract to which the parties were either (1) the government on the one hand and the people on the other; or (2) separate individuals who agreed to form a political society and a government by a contractual process. Again it is argued that the foundation and support of the state is superior force. The modern theory is that the state owes its being to a historical process in which many or all of the foregoing factors may have played a part. The explanation of the present existence of a coercive power over individuals is generally found in a variety of motives for obedience. Of these the principal ones are custom or habit, fear, utility, or the calculation of accruing advantages and disadvantages, and the element of conscious and rational consent. The general tendency of political development is toward a state based on general perception of its utility, and consequent consent to its laws.

The forms of the state are three, monarchy, aristocracy, and democracy, according as political power rests with one, the few, or the many. All other forms of government may be resolved into the three forms enumerated. Thus, theocracy is any one of these three forms in which the rulers are supposed to possess a special divine sanction for their government. The so-called federal state may be resolved either (1) into a union of many states for certain general purposes; or (2) one state with a dual form of government and with sovereignty vested in the

group as a whole. Plutocracy and oligarchy are perverted forms of aristocracy. Constitutional, despotic, free, when applied to states, have reference to the method in which the government is organized or administered, rather than to the form of the state, and might be applied to any of the three types.

As to the function or purpose of the state, it has been held that its proper function is the development of the moral or religious nature of its subjects, and that this should be the controlling purpose of its activity. Again it has been maintained that its function is merely to preserve order among its citizens and to protect them from external attack, leaving all else to the domain of individual initiative. It is also held that the function of the state is to further the general welfare of its subjects, including in this all sides of their life. In modern times the contest lies between the advocates of the legal state and those of the paternal state, holding respectively the individualistic and the socialistic conceptions of the function of organized political society. One of these theories has been carried to the extreme of a demand for anarchy, and the other to the opposite pole of a demand for the extension of the functions of government to the immediate control of industrial activity. At present the most widely accepted doctrine is that no general principle governing the activity of the state can be laid down, but that each case of proposed state action must be decided in accordance with what appears to be the greatest good to the greatest number.

A philosophy of politics was first developed by the classical school of which Plato, Aristotle, and Cicero were the leading exponents. The most marked characteristics of the political thinking of this time were the development of political theory from the city as a basis—the city state—the complete subordination of the individual to the state in the discussion of political problems and the constant confusion of political and ethical theory. In the next great period, that of the Middle Ages, political theory was interpreted in the light of Christian theology. A system of politics was deduced from the joint authority of the Scriptures, the writings of the Fathers, the philosophy of Aristotle, and the Roman law—all analyzed and presented with the subtlest refinement of which Scholasticism was capable. The point around which political speculation centred was the true and proper relation between church and state. Thomas Aquinas (*Summa Theologica* and *De Regimine Principum*) was the most successful champion of the church; Marsilius of Padua (*Defensor Pacis*) and Dante (*De Monarchia*) of the state. During the Renaissance and the Reformation political theory made important advances. By the work of Machiavelli (*Il principe*, *Discorsi*) politics was divorced from theology and ethics, and elevated to the position of an independent science. Jean Bodin, reviving the method and spirit of Aristotle, laid the foundations of modern systematic politics in his epoch-making treatise, *De Republica*. In the revolutionary period of the seventeenth and eighteenth centuries the so-called natural-law philosophy was dominant. The fundamental premise of this system was the universal prevalence of an immutable law of natural justice, under which and independently of any government all men hold certain rights, e.g., life,

liberty, and property. From this premise followed the theory of a contract as the basis of all legitimate government, the administration of government for the good of the parties to the contract, and the right of revolution whenever government is perverted to selfish ends by the rulers. Of these doctrines John Locke (*Two Treatises of Civil Government*) and Jean Jacques Rousseau (*Le contrat social*) were the most influential expounders. During the same period the opposing doctrines of the divine right of kings and governmental absolutism were developed by Robert Filmer (*Patriarcha*) and Bosuët (*Politique tirée de l'écriture sainte*), while Thomas Hobbes turned the natural-law theory to the defense of absolutism (*The Leviathan*). As opposed to the a priori conception of these writers, Montesquieu (*Esprit des lois*) placed the study of political science upon an historical basis.

The modern theory of politics, dating from the reaction against the excesses of the French Revolution, is based on the historical-scientific premise that all institutions are the product of an evolutionary movement in which the conscious will of individuals plays a comparatively unimportant part. The method followed is historical and comparative, in contrast to the deductive style of the preceding school. The numerous problems arising out of the development of modern democracy, those involved in nationalism, federalism, and imperialism, and the determination of the proper function of government, are the questions upon which general attention is fixed.

**STATE, DEPARTMENT OF.** One of the 10

executive departments of the government of the United States, presided over by a secretary who is a member of the cabinet (q.v.) and next in the line of succession to the presidency after the Vice President. In rank the Department of State stands first among the other departments and is also the oldest in point of origin. It was in fact the logical successor of the old Department of Foreign Affairs created in 1781 and presided over first by Robert R. Livingston and afterward by John Jay. The Department of State is the organ of communication between the government of the United States and all foreign governments, as well as with the governors of the individual States. The Secretary of State conducts all such correspondence and has charge of the negotiation of all treaties and conventions; he preserves the originals of all treaties, public documents, and correspondence with foreign governments as well as of the laws of the United States; he publishes all statutes and resolutions of Congress and proclamations of the President; he is the custodian of the great seal which is affixed to all commissions of appointment requiring the consent of the Senate, proclamations, warrants for extradition, pardons, etc., emanating from the President; deals with the ambassadors to foreign countries; issues and keeps a record of passports granted to American citizens traveling abroad; issues warrants for the extradition of criminals to be delivered to foreign governments; presents foreign ministers to the President; etc. He makes an annual report of the conduct of foreign affairs for the year, publishes the consular reports and the "foreign relations" of the United States, and performs such other duties relative to the conduct of foreign affairs as the President may direct.

The following is a list of the Secretaries of State from the organization of the department in 1789 to the present, with the dates of their appointment: John Jay, holding over (as former Secretary of Foreign Affairs), March, 1789; Thomas Jefferson, September, 1789 (seated March, 1790); Edmund Randolph, January, 1794; Timothy Pickens, December, 1795; John Marshall, May, 1800; James Madison, March, 1801; Robert Smith, March, 1809; James Monroe, April, 1811; John Q. Adams, March, 1817; Henry Clay, March, 1825; Martin Van Buren, March, 1829; Edward Livingston, May, 1831; Louis McLane, May, 1833; John Forsyth, June, 1834; Daniel Webster, March, 1841; Hugh S. Legaré, May, 1843; Abel P. Upshur, July, 1843; John Nelson, February, 1844; John C. Calhoun, March, 1844; James Buchanan, March, 1845; John M. Consult *History of the Department of State* (Washington, 1901).

**STATE CONSTABULARY.** See **MILITARY POLICE.**

**STATE FORESTRY.** See **LUMBER INDUSTRY.**

**STATEN** (stät'en) **ISLAND.** An island of New York constituting Richmond County, and since 1898 the Borough of Richmond, New York City (q.v.) (Map: New York City and Vicinity, B 8). It is distant a little more than five miles from the southern extremity of Manhattan Island, and is separated from Long Island on the east by The Narrows, which connect the upper New York bay with the lower bay. Staten Island is triangular in form, about 13½ miles long from northeast to southwest, and nearly eight miles wide. Its area is about 70 square miles. Two ranges of hills occur in the northeastern portion of the island, and here the highest altitude, 400 feet, is reached, one mile from the shore line of The Narrows. From this point the land slopes to the south to the level of the coastal plain, while along the west coast there are considerable areas of salt marshes. The Narrows are commanded by Forts Tompkins and Wadsworth. The chief villages are New Brighton, West New Brighton, Port Richmond, Stapleton, and Tompkinsville along the north shore, and Tottenville (Bentley Manor) on the southwest coast. Part of the island was granted by the Dutch West India Company in 1636 to David Pietersen de Vries, who established a settlement at Oude Dorp, near South Beach, in 1641. In the Billopp mansion, built by Captain Christopher Billopp about 1668 and still standing, a peace conference was held on Sept. 11, 1776, between Lord Howe and Benjamin Franklin, John Adams, and Edward Rutledge.

**STATE RIGHTS, or STATES' RIGHTS.** A term referring to the rights of individual states as compared with the Federal government. In the United States, the term is used to denote a view prevailing in some sections with regard to the nature of the Union. According to this view the Union was a compact of sovereign and independent States; the Federal government was the mere agent of the States as principals; the primary allegiance of the individual was to his State rather than to the United States. In effect this view upheld the right of a State to interpose its authority when the central government enacted oppressive or unconstitutional laws. (See **NULLIFICATION.**) Many political leaders had contended for this view with reference to the controversy over slavery. Many of the Southern States held to the States'-rights view of the Constitution, although some of them were not nullifiers. Early in the nineteenth century, particularly at the time of the War of 1812, the States'-rights view was strong in the North and East, and was not entirely abandoned, but became the view and support of the slavery interest. It is no longer a constitutional question. In the German Empire, States' Rights, or Particularism, as the Germans call it, is very strong, and has caused many great constitutional struggles in that country. The Imperial Constitution recognizes a large sphere of autonomy of the individual states, and some of those in south Germany enjoy rights which are survivals of the Confederation. See **DARTMOUTH COLLEGE CASE.**

**STATES, POPULAR NAMES OF.** *Badger State;* Wisconsin, from the animal.—*Bay, or Old Bay,*

*State;* Massachusetts, from the earliest settlements on the bay, called "Bay Colony."—*Bayou State;* Mississippi, from the number of its bayous (rivulets).—*Bear State;* Arkansas, from the animal.—*Beaver State;* Oregon, from the animal.—*Blackwater State;* Nebraska, formerly so called from the dark color of its rivers; now known as the Tree-planter State.—*Blizzard State;* South Dakota. The word "blizzard," of obscure origin, was used early in the sense of a blow or discharge from a gun; now a severe storm.—*Blue Grass State;* Kentucky, from its blue grass.—*Blue Hen State;* Delaware. The term is said to have originated from gamecocks of a breed of blue fowl. This lacks proof.—*Blue Law State;* Connecticut. See **BLUE LAWS.**—*Bread and Butter State;* Minnesota, from its wheat and dairy products.—*Buckeye State;* Ohio, because of the horsechestnut, popularly called buckeye.—*Bullion State;* Missouri, from the sobriquet "Old Bullion," applied to Senator Thomas Hart Benton of that State from his stand for gold and silver currency.

*Centennial State;* Colorado, admitted into the Union in the Centennial year, 1876.—*Central State;* Kansas, from its location.—*Corn Cracker State;* Kentucky, perhaps because of the great use of corn as food.—*Cotton State;* Alabama, the central State of the cotton belt.—*Cracker State;* Georgia, from the poor white population, often called Crackers.—*Creole State;* Louisiana, from its many descendants of French and Spanish settlers.—*Dark and Bloody Ground;* Kentucky, in early times the scene of frequent Indian wars.—*Diamond State;* Delaware, from its small size.—*Dominion, Ancient or Old;* Virginia, from early documents in which there are allusions to "the Colony and Dominion" of Virginia, or "the Dominion" of Virginia, and "the Ancient Colony and Dominion."—*Egypt;* Southern Illinois, from its alleged intellectual darkness or its fertile soil.—*El Dorado;* California. El Dorado (q.v.) was the name of a fictitious region or city abounding in gold.—*Empire State;* New York, from its size, wealth, and population.—*Empire State of the South;* Georgia, from its enterprise.—*Evergreen State;* Washington.—*Excelsior State;* New York, from the motto on its seal (adopted 1778).

*Freestone State;* Connecticut, from its freestone quarries.—*Gem of the Mountains;* Idaho, a rendering of the State name (Indian).—*Golden State;* California, from its gold mines.—*Gopher State;* Minnesota, from the animal.—*Granite State;* New Hampshire, from its granite hills.—*Green Mountain State;* Vermont, from the Green Mountains.—*Hawkeye State;* Iowa. Apparently an allusion to J. G. Edwards, familiarly known as "Old Hawkeye," editor of the *Burlington Patriot*, now the *Hawkeye and Patriot*.—*Hoosier State;* Indiana. Its origin is obscure.—*Jayhawker State;* Kansas, from a derisive epithet applied to James Montgomery and his men, who took part in the territorial troubles.—*Keystone State;* Pennsylvania, probably because it was the central State of the Union at the formation of the Constitution.—*Lake State;* Michigan.—*Land of Steady Habits;* Connecticut. See **BLUE LAWS.**—*Little Rhody;* Rhode Island, from its small size.—*Lone Star State;* Texas, from the single star in the flag of the Texas Republic (1830-45).—*Lumber State;* Maine.—*Magnolia State;* Mississippi, from its many magnolia trees.—*Mormon State;* Utah.—*Mother of Presidents;* Virginia, because the

birthplace of eight Presidents.—*Mother of States*; Virginia, because the first settled of the States.

*New England of the West*; Minnesota.—*Nutmeg State*; Connecticut, in allusion to the alleged manufacture of wooden nutmegs there.—*Old Colony*; That part of Massachusetts which up to 1692 was the Plymouth Colony.—*Old Line State*; Maryland, probably from the "Maryland Line" distinguished in the Revolution.—*Old North State*; North Carolina.—*Palmetto State*; South Carolina, from the device on its seal.—*Panhandle State*; West Virginia, from the irregular section of the State northward between Pennsylvania and Ohio.—*Pelican State*; Louisiana, from the device on its seal.—*Peninsula State*; Florida, from its location.—*Pine Tree State*; Maine, from the device on its seal, adopted in 1820.—*Prairie State*; Illinois, from its prairies.—*Sage-Brush State*; Nevada, from the plant.—*Silver State*; Nevada, from its silver mines.—*Sucker State*; Illinois, because in early days the miners returned from "up river" at the season when the sucker migrated. The term was first used about 1833.—*Sunflower State*; Kansas.—*Tree-planter State*; Nebraska.—*Turpentine State*; North Carolina.—*Volunteer State*; Tennessee, from its number of enlistments in old wars.—*Web-Foot State*; Oregon, from the quantity of rain which falls there.—*Wolverine State*; Michigan, from the animal.

**STATESBORO**, stäts'bür-ö. A city and the county seat of Bulloch Co., Ga., 60 miles northwest of Savannah, on the Central of Georgia and the Savannah and Statesboro railroads (Map: Georgia, E 3). It contains the First Congressional District Agricultural College and a good high school. There is a cottonseed-oil mill, and a trade in cotton, watermelons, and cantaloupes is carried on. Pop., 1900, 1197; 1910, 2529.

**STATE'S EVIDENCE** (or, in England, **KING'S or QUEEN'S EVIDENCE**). A popular phrase used to denote the testimony given by an accomplice in the commission of a crime against the other accomplices on their trial, under an agreement or understanding with the prosecuting officer that the witness shall not be brought to trial for his part in the crime, in consideration of his aid to the state. Such an agreement or understanding on the part of the prosecution is not valid and enforceable as a matter of law, but in practice such agreements are usually adhered to by the prosecutor as a matter of good faith and are countenanced by courts as a justifiable and proper means of securing convictions for crime. Where a confession is obtained under promise of immunity by the prosecutor, who subsequently revokes the promise and puts the offender on trial it is the general rule that the confession cannot be used against the person making it. In several states there are statutes providing that there shall be no conviction for crime upon the uncorroborated testimony of an accomplice. In applying this statute, whether a witness is an accomplice whose testimony requires corroboration is a question for the jury, unless the facts are undisputed or the question rests upon some rule of law, where it must be passed upon by the court. See **ACCESSORY**; **ACCOMPLICE**; **PRINCIPAL**.

**STATES-GENERAL** (Fr. *états-généraux*). The name given to the convocation of the representative body of the three orders of the French Kingdom, representing the nobility, clergy, and bourgeoisie or *tiers état* (Third

Estate). As early as the time of Charlemagne, there were assemblies of clergy and nobles twice a year to deliberate on matters of public importance, and in these assemblies the extensive body of laws bearing the name of the Capitularies of Charlemagne was enacted. These national convocations seem to have ceased to be held at the time of the final disruption of the Carolingian realm, about 70 years after Charlemagne's death. From that time there is no trace of a national assembly in France till 1302, when the *états-généraux*, including the three orders, clergy, nobles, and citizens, were convoked by Philip the Fair, with the view of giving weight to the King's course in his quarrel with Pope Boniface VIII. In 1303 Philip obtained from the states-general a condemnation of the Knights Templars. During the Hundred Years' War (1337-1453) they were frequently convoked, and played an important rôle in connection with revenue and taxation. Not a law-making body, they enabled the voice of the nation to assert itself against abuses of royal power. As royalty became more absolute, and a standing army made the sovereign less dependent upon financial grants from his subjects, the summoning of the states-general gradually ceased. The advisers of Louis XIII convoked the states-general, after a long interval, in 1614, but they were soon dismissed for looking too closely into the finances; from that time there was no convocation of the states-general till the memorable meeting in 1789, initiating the French Revolution. The states-general voted by orders, but in 1789 the Third Estate refused to abide by a regulation which enabled the other two orders to combine against it. They insisted that the vote should be by members in a single body (with the Third Estate as numerous as the other two orders combined), and they achieved their object by constituting themselves the National Assembly. See **FRENCH REVOLUTION**.

The name States-General is also applied to the existing legislative body of the Kingdom of the Netherlands (q.v.), as was formerly the case in the Republic of the Netherlands from 1593 to 1795.

**Bibliography.** A. C. Thibaudau, *Histoire des Etats-généraux en France* (2 vols., Paris, 1843); Théodore Juste, *Histoire des Etats-généraux des Pays-Bas* (2 vols., Brussels, 1864); A. Desjardins, *Etats-généraux, leur influence sur le gouvernement, etc.* (Paris, 1871); Van Riemsdyk, *De Griffie van Hare Hoog Mogenden* (The Hague, 1885); G. Picot, *Histoire des Etats-généraux 1355-1614* (Paris, 1888); Adalbert Wahl, *Studien zur Vorgeschichte der französischen Revolution* (Tübingen, 1901).

**STATES OF THE CHURCH.** The territory in Central Italy formerly under the temporal sovereignty of the holy see. For their history, see **PAPAL STATES**; and for the theory involved, **TEMPORAL POWER**.

**STATES' RIGHTS.** See **STATE RIGHTS**.

**STATESVILLE.** A city and the county seat of Iredell Co., N. C., 44 miles north of Charlotte, on the Southern Railway (Map: North Carolina, B 2). One of the State experiment farms is just outside the city limits. There are furniture factories, flour mills, cotton mills, tanneries, foundries, tobacco factories, a large herbarium, and ironworks. Here are the Statesville Female College and Long's Sanitarium. Pop., 1900, 3141; 1910, 4599.

**STATE TRIALS.** In English law, a phrase

employed to denote trials involving offenses against the state, or which determine questions concerning the duties and privileges, etc., of important officers of the crown. The first collection of State Trials appeared in 1719; a second in 1730; a third in 1742; Hargrave's edition in 10 volumes in 1776-81; and between 1809 and 1826 the fifth edition in 33 volumes was published. This edition is the one now used, and is known as "Howell's State Trials," after the real editor, Thomas Bayley Howell, who compiled the work, although the name of one Cobbett appears as editor on the title-page of volume i. A new series covering years from 1820 to 1858 was published, under the supervision of a Parliamentary Committee, in eight volumes (1888-08), including all important cases in constitutional and international law.

**STATIA.** See EUSTATIUS ISLAND.

**STATIC** (stát'ík) **ELECTRICITY.** See ELECTRICITY.

**STATICS**, stát'íks (from Gk. *στατικός*, relating to standing). That branch of mechanics which treats of the properties of material bodies when, under the action of forces, their motion is not changing. They are then said to be in equilibrium. See EQUILIBRIUM; GRAPHIC STATICS; MECHANICS.

**STATIC SENSE.** In close anatomical connection with the cochlea of the inner ear there are in man and most other vertebrates three bent tubes of bone inclosing three membranous tubes, filled with and floating in a fluid, and near the otolith apparatus. (See EAR, *Internal Ear*, and Illustration.) We now have evidence for regarding them and the otolith apparatus as the organs of a static sense, by which is meant (1) that they constitute a physiological apparatus for the maintenance of equilibrium (probably, also, for the maintenance of muscular tonicity); (2) that any irregularity in their operation makes itself felt mentally as giddiness or dizziness; and more doubtfully (3) that an acceleration or a diminution of the rate of movement of the body as a whole so affects them as to set up sensations which are interpreted as what has very loosely been termed a "sense of translation." Consult: Mach, *Bewegungsempfindungen* (Leipzig, 1875); Wundt, *Physiologische Psychologie* (6th ed., ib., 1908; Eng. trans. by Titchener, New York, 1905); McKendrick, *The Internal Ear*, in E. Schäfer, "Textbook of Physiology," vol. ii (ib., 1900); Titchener, *Textbook of Psychology* (ib., 1910).

**STATIONERS' HALL.** The guildhouse of the "Master and Keepers or Wardens and Commonalty of the Mystery or Art of Stationers of the City of London," now situated near Ludgate Hill in London. This company, which had been preceded by a voluntary association as early as 1403, was incorporated in 1556. For nearly 300 years it regulated the publication of all books in England. Since the passage of the copyright law (1842), registration is no longer compulsory, but it is necessary for securing copyright. For a history of the company, consult the first volume of E. A. Arber's valuable *Transcript of the Stationers' Registers, 1554-1640* (5 vols., London, 1875-94).

**STATIONS** (Lat. *statio*, from *stare*, to stand). A name applied in the Roman Catholic church to certain places which are appointed to be visited as places of prayer at which a ritual is appointed on specified "station days." The word is also employed in reference to a

popular devotional practice of the Roman Catholic church, known as that of "the stations of the cross," which became common after the middle of the seventeenth century. The number of the stations is commonly fourteen; the subject of all is a sort of pictorial narrative of the passion. The devotional exercise is performed by kneeling at the several stations in succession, and reciting certain prayers, or joining in their recitation by the priest. Consult Herbert Thurston, *The Stations of the Cross* (London, 1906). See VIA DOLOROSA.

**STATISTICS.** Etymologically, the science of states. The word seems to have been introduced into England about the beginning of the nineteenth century. It came into use in Germany about half a century earlier, and was there applied to lectures or books upon descriptive political science, of which the *Statesman's Year Book* and the *Almanach de Gotha* are typical modern representatives. If either of these annual publications be imagined stripped of its numerical statements, a fair notion is left of Achenwall's *Outlines of Modern Political Science* ("Abriss der neuesten Staatswissenschaft," etc., 1749), which opens with the statement: "The notion of statistics so called, i.e., the political science of the several kingdoms, is very differently understood, and among the many books on the subject it is not easy to find any one that agrees with the rest in the number and the arrangement of its parts." The title "Statistics" thus adopted by Achenwall established itself as the prevailing name for a sort of descriptive political science, which had existed long before as the *Elzevir Republics* and the writings of Conring illustrate, and which maintained itself at the universities and before the public in Germany until into the nineteenth century.

Meantime in England a different line of work had begun about the middle of the seventeenth century, after the disastrous visitations of the plague had aroused interest enough in the mortality it did so much to swell to cause weekly reports of the burials and later of the christenings in London to be published. The keen interest in the methods of observation and measurement which culminated in and were reinforced by the Royal Society, chartered in 1662, induced Capt. John Graunt to apply methods of observation, induction, and measurement to the births and deaths of London. He presented to the Royal Society in 1662 his "Observations on the Bills of Mortality," the foundation of statistics as that word is now understood. It was then called "political arithmetic." Stüssmle in 1741 hailed Graunt as a scientific Columbus who had discovered a new continent and confessed himself Graunt's disciple, but showed no knowledge of Achenwall's work and made no use of the name "statistics." Gradually the word "statistics" spread to Great Britain, where, in 1798, Sir John Sinclair published his *Statistical Account of Scotland*. The word was taken up by Malthus in editions of his *Principle of Population* after the first, and in such connection as to indicate that he borrowed it from Sinclair. Malthus's subject matter was in the line of previous writers on political arithmetic. Meantime the study of political arithmetic, born in England, extended to the Continent, gradually displacing the older statistics of Achenwall, sometimes called "university statistics," from its prevalence as a subject of university lectures. Perhaps the most strik-

ing difference between the two notions of statistics, the older and the newer, is that the former is purely descriptive and takes no account of the underlying notion of modern science, the notion of causation, while the latter subordinates description to explanation, or an attempt at explanation. At the same time it would be inconsistent with present usage to limit the word statistics any further than to say that it refers to the results that may be obtained in any field of reality by methods of counting and that these methods are mainly employed in the study of societies politically organized into states.

Methods of counting apply especially to the study of human societies, because in them the individual units are widely different, and it is with the differences almost as much as with the resemblances between individuals that science is concerned. In the organic sciences and to a less extent in the sciences of plant and animal life, the units taken for purposes of investigation resemble one another far more closely than human individuals do, or at least their resemblances are far more obvious and for man's purposes more important than their differences. In other than the social sciences, therefore, the observation of one or a few units may serve as a basis for general statements about the group, but in human societies it is frequently necessary to ascertain the existence, or nonexistence, of a particular characteristic in every member of the group. This involves counting, and results in a statement in some numerical form, as a percentage, an average, or a series of figures showing the distribution of the characteristic among the members of the group. This indicates a fundamental reason for the imperfect development of methods of measurement in the social sciences and a reason that statistics or the science of measuring aggregates of units, as distinct from individual units, is more necessary and has a wider range of applications in the study of social sciences than it has in the study of natural sciences. There is, therefore, much ground for the opinion of those who define statistics as the numerical study of social facts, or the numerical investigation of man's social life. But it seems more correct to hold that, e.g., an enumeration through the century of the number of auroras observed each year and an observation through the same period of the extent of spots on the sun, and an arrangement of these two measurements in such a way as to show that they have fluctuated in close conformity, are to be included in statistics.

**Theory.** The United States Census reported, in 1900, 27,765,707 persons in the country who were over 15 years of age and married; in 1910 this class of the population numbered 35,777,287. On computing the ratios it was found that among each 1000 adults 557 were married in 1900 and 572 in 1910. The Bureau of the Census reported 691,594 deaths in the registration area in 1908, of which 6086 were caused by railroad accidents, and, in 1911, 839,284 deaths, of which 7696 were due to the same cause; so that railroad accidents caused, in 1908, 881 deaths and, in 1911, were responsible for 926 deaths out of each 100,000 reported. The foregoing will serve to illustrate a regularity or uniformity often, but not always, traceable in the distribution of conditions or the recurrence of events in society. Upon this uniformity in the characteristics of, and this regu-

larity in the events occurring in, social groups, which has been called "the law of large numbers," the statistical method rests. These uniformities and regularities do not exist in the individual or even in the small group, and if they could not be traced in the large group the laborious and uninviting statistical method would add little to information. It is this "law of large numbers," or the permanence of numerical relations in social life, that makes it possible to describe human societies with accuracy in quantitative terms, to frame inductions from their past, which are found to hold for their future, to forecast the influence of a given change upon their life and so in multitudinous ways to control that life. Perhaps the best illustration of the importance of the "law of large numbers" is found in the business of insurance, which could not exist were it not for that law as a foundation. In social phenomena it is seldom possible to carry the isolation of causes to the perfection it has reached in the natural world. The marriage of an individual man or woman is influenced by so many complex considerations that it is impossible to perceive in the vast majority of marriages taken separately any effect of so subsidiary a cause as the price of bread or the spread of business depression. What this subsidiary cause loses, however, in power over each individual instance it gains by the number of individuals it reaches and the fact that its effect is uniformly in the same direction, while the influence of age, of example, of personal affection, of gain or loss of property, etc., though in many individual cases far more powerful, is felt sometimes in one direction and sometimes in another. Such causes, therefore, are as powerless on the aggregate as they are potent on the individual, and, on the contrary, the society as a whole betrays the undeniable effects of slight causes, which perhaps few individuals therein would admit to have swayed their action. The "law of large numbers" thus assumes that the causes of any social phenomenon may be divided into two groups, the individual, accidental, or disturbing causes, and the essential or primary causes, and that causes of the former sort have no constant tendency to act in one direction rather than another, and, accordingly, no tendency to move the group as a whole in any one direction. If a sufficiently large number of instances be taken, the disturbing or individual causes cancel and allow the influence of the essential or group causes to be traced. How large a number of instances must be enumerated to eliminate these individual causes with any specified degree of completeness is a mathematical problem dealt with by the calculus of probabilities.

**Bibliography.** For the only survey of the history in English, consult August Meitzen, *Geschichte, Theorie und Technik der Statistik*, Eng. trans. by R. P. Falkner, published by the American Academy of Political and Social Science (Philadelphia, 1891; 2d Ger. ed., Stuttgart, 1903). For the theory of the subject, see the latter part of the foregoing book; also Harald Westergaard, *Die Grundzüge der Theorie der Statistik* (Jena, 1890), and A. L. Bowley, *Elements of Statistics* (London, 1909), strong in English methods, in wage statistics, and in the mathematical basis of the subject; Fernand Faure, *Éléments de statistique* (Paris, 1906); Hermann Hasse, *Die Statistik als Hilfsmittel*

der Sozialwissenschaften (Leipzig, 1911); A. D. Webb, *The New Dictionary of Statistics* (New York, 1911); W. J. King, *The Elements of Statistical Method* (ib., 1911; new ed., 1914); G. U. Yule, *An Introduction to the Theory of Statistics* (2d ed., London, 1912); Carl Ballod, *Grundriss der Statistik* (Berlin, 1913); Georg von Mayr, *Statistik und Gesellschaftslehre* (Tübingen, 1913-14).

**STATISTICS, VITAL.** See VITAL STATISTICS.

**STATIUS**, stā'shi-ūs, PUBLIUS PAPINIUS (c.40-c.96 A.D.). A Roman poet, born at Naples. He became famous for his poetic gifts, especially for his skill in extemporaneous verse, and three times gained the prize in the Alban contests. But finally, having been vanquished in the quinquennial games, he retired with his wife, Claudia, to his birthplace, Naples, where he died. He is polished and correct, and his verses, especially in the *Silvæ*, often have much charm, but one frequently feels the note of artificiality in his writings. He wrote a dull and laborious epic entitled *Thebais*; the *Silvæ*, five books of miscellaneous poems; and an epic of the Trojan cycle, *Achilleis*, of which only a portion has survived. The best modern editions are: of the *Silvæ*, by Baehrens (Leipzig, 1876); Vollmer (Leipzig, 1898), with extensive German commentary; Klotz (Leipzig, 1900); and Phillimore (1904); of the *Achilleis* and the *Thebais*, by Kohlmann (Leipzig, 1879), and Garrod (1906). There are English translations, in whole or in part, by Pope, Howard, Stephens, Lewis, and Slater (Oxford, 1908; the Introduction treats Statius's life and work). Consult H. E. Butler, *Post-Augustan Poetry* (Oxford, 1909); W. S. Teuffel, *Geschichte der römischen Literatur*, vol. ii (6th ed., Leipzig, 1910); Martin Schanz, *Geschichte der römischen Literatur*, vol. ii, part ii (3d ed., Munich, 1913).

**STA'TUS EPILEPTICUS.** See EPILEPSY.

**STA'TUS LYMPHATICUS** (Lat., state, condition). A condition, occurring usually in children, characterized by overgrowth of the thymus gland, the lymphatic and lymph tissues generally, including the bone marrow and spleen. There is also a tendency towards enlargement of the tonsils, and sometimes of the thyroid gland, with anæmia. The condition is associated with a marked tendency towards death from slight causes, such as the administration of antitoxin, general anæsthesia, and minor operations. Status lymphaticus is particularly of interest in connection with hypertrophied tonsils, since such patients are apt to die during the first stage of anæsthesia induced for their removal, and the cause of death is only discovered at autopsy. Where any suspicion that status lymphaticus exists an X-ray photograph should be taken of the thymus region when, if lymphatism is present, this gland will be seen to be hypertrophied; and an examination should also be made of the general lymphatic system before any operative procedure is undertaken. See THYMUS GLAND.

**STATUTE** (Lat. *statutum*, statute). A law enacted or promulgated in writing by the supreme legislative body of a government or by its authority. Statute law is sometimes spoken of as written law to distinguish it from common or unwritten law, established exclusively by judicial decision. All statutes have their source in the official action of the legislative body, their form varying according to the form of government under which it acts. The validity of a

statute in any given case depends not only upon lawful constitution of the legislative body, but on its constitutional authority to act. (See CONSTITUTIONAL LAW.) Statutes may be enacted by indirect legislation—by some subordinate legislative body whose acts derive validity from the sanction of the supreme legislative body. Thus, in England Orders in Council and the various rules of court adopted under the judicature acts, and in the United States the ordinances of Boards of Aldermen, and of Boards of Health under the various public health acts, are examples of statutes enacted by indirect legislation.

For the procedure by which statutes are created, see PARLIAMENT; CONGRESS; LEGISLATION; ETC. In England the acts of Parliament have the full force of statutory law without the approval of the sovereign, but it is the established custom for the sovereign to promulgate statutes "by and with the advice and consent of the Lords Spiritual and Temporal in this present Parliament assembled." In the United States the acts of Congress require the signature of the President, and the acts of the various legislatures require signatures of the governors of their respective States to give them validity. See VETO.

Statute laws may be classified with reference to the purpose for which they are enacted, and to the subject matter of the statutes, and also to compliance with the statute required. With reference to their purpose, statutes are said to be (a) declaratory, when passed for the purpose of affirming a rule of the common law which is indefinite, or a statute of doubtful meaning; (b) remedial, when passed for the remedying of defects or supplying omissions in the statute or common law; (c) penal, when passed to prohibit acts specified in the statute and imposing a penalty for violation. With reference to subject matter, they are said to be (a) public, when applicable to the entire community, and (b) private (see explanation of these terms under LAW; LEGISLATION; PUBLIC LAW; ETC.), as distinguished from public when applicable to a single individual or corporation, or to a limited number of individuals. The distinction between public and private statutes, first made in the reign of Richard II, now is important, owing to statutory and constitutional provisions requiring the publication of public and private statutes separately. Statutes have also been classified with reference to the extent of territory to which they apply. Those statutes are said to be (a) general, when they apply to the entire territory subject to the legislative jurisdiction of the law-making body, and (b) local, when they extend only to a limited political division of such territory, as statutes enacted by State legislatures which apply only to a single town, city, or county. With reference to the subject matter also, statutes are classified as Enabling acts, which confer rights or privileges, as the Married Women's Enabling acts; and Disabling acts, which take away rights or privileges hitherto enjoyed, as statutes requiring legal voters to have new or additional qualifications.

With reference to the compliance required statutes are said to be (a) mandatory when they direct an act to be done with the consequence that if it is not done all acts or proceedings taken under the statute are invalid. Thus statutes formulating the procedure for organizing corporations or authorizing civil arrest are

mandatory, since they must be strictly complied with, or all acts under them have no validity. (b) Directory, when failure to comply with the statute does not affect the validity of acts done under it or entail the imposition of any penalty for failure to comply with it. Many statutes specifying the time and manner of filing official reports are directory only. There is no penalty for failure to comply with the statute, and compliance with it can be compelled only by mandamus (q.v.). (c) Prohibitory, when they forbid the doing of any act either with or without penalty for failure to comply with the statute. (d) Permissive, when they allow acts to be done not before permitted, or give to them some additional legal effect, although such acts are not required to be done, as the various statutes permitting the disposition of property by will.

A statute may contain four distinct parts: title, preamble, enacting clause, and purview. The title is a brief description of its purport, e.g., An Act Prohibiting Sabbath Breaking. In some states this is of great importance, because of constitutional provisions requiring statutes to have titles descriptive of the subject matter. In the absence of this, it is usual to omit the title. The preamble is an introductory and explanatory statement setting forth the reason and purpose of the statute. It is only an aid in interpreting the purview of the statute following. All early English statutes included the preamble, but it is now seldom used. The enacting clause is a brief direction that the statute be enacted: as, "Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled." The purview is that portion of the statute following the enacting clause, and is the only part of the statute which has the effect of law. It may contain various subdivisions or clauses known as provisos, exceptions, the saving clause, the repealing clause—terms self-explanatory.

At common law a statute was deemed to take effect as upon the first day of the session in which it was enacted. This was modified by Statute 33 Geo. III, c. 13, which provided that all statutes should become operative from the date of their receiving the royal assent. It is now generally the rule in the United States that statutes shall become operative from the date of their receiving the assent of the Executive, unless a different date is otherwise specified in the statute itself.

Courts will take judicial notice of all public statutes operative within their jurisdiction, and it is therefore not necessary generally to plead or prove a public statute upon which a litigant founds an action or defense. In the case of statutes or ordinances passed by legislative bodies not of supreme authority, such as a city board of aldermen, proof is generally required. Some rule of public policy may, however, require a public statute to be pleaded in special cases, as the Statute of Limitations (see LIMITATION OF ACTIONS) and Statute of Frauds (see FRAUDS, STATUTE OF). But private statutes are required to be pleaded, and the statutes of foreign states and countries, being regarded as matters of fact, are required to be pleaded and proved like other matters of fact.

The volume of statute law enacted each year in the United States is so large that lawyers with great difficulty keep themselves informed concerning it. For the layman the task is very great. The best annual summary of American

statute law appears, beginning with 1915, in the *Report of the American Bar Association*. Many problems connected with statute law come from faulty and careless bill drafting. To remedy this, many States have created legislative drafting departments for expert assistance in framing legislation. The American Bar Association has a special committee devoted to this, which is preparing a Manual of Instructions to Draftsmen, with model clauses for constantly recurring legislative provisions. Portions of this have been published in the Reports for 1913, 1914, and 1915.

For discussion of the amendment and repeal of statutes, consult those topics respectively; and for a discussion of the interpretation of statutes, see ABROGATION; CONSTITUTIONAL LAW; INTERPRETATION; LAW; REVISED STATUTES. See references under LAW; LEGISLATION.

**STATUTE DE DONIS CONDICIONALIBUS.** See DONIS CONDICIONALIBUS, STATUTE DE. **STATUTE OF FRAUDS.** See FRAUDS, STATUTE OF.

**STATUTE OF LIMITATIONS.** See LIMITATION OF ACTIONS.

**STATUTE OF PROVISOIRS.** See PROVISOIRS, STATUTE OF.

**STATUTE OF USES.** See USES.

**STATUTE QUIA EMPTORES,** or **QUIA EMPTORES TERRARUM.** The Statute of Westminster III, 18 Edw. I, c. 1 (1289), generally known as the Statute Quia Emptores, provided that there should thereafter be no reservation, in grants of estates in fee simple, of rent service, reversion, or other interest which should establish feudal tenure as between grantor and grantee. The effect of this statute was the abolition of subinfeudation. The question of whether these provisions are in force at the present day in the various States of the United States has been much discussed, although the general abolition of feudal tenure has made the point one of academic rather than practical interest. For a detailed description of the rules of law and statutes bearing upon this mooted question in the individual States, consult: Gray, *The Rule against Perpetuities* (3d ed., Boston, 1915); A. G. Reeves, *Treatise on the Law of Real Property* (2 vols., Boston, 1909); and authorities cited under REAL PROPERTY. See FEUDAL SYSTEM; SUBINFEUDATION; TENURE.

**STATUTES OF JEOFAILS,** jef'älz. English statutes permitting amendments to pleadings or curing certain mistakes or omissions in proceedings in an action. The name was derived from the old phrase *jeo faile* (I have failed), by which the leader acknowledged an error in his pleadings or proceeding, after which he could take advantage of the provisions of these statutes. The procedure acts in practically all of the United States provide for the amendment of pleadings, but the term *jeofails* is not commonly applied to such acts. Consult Chitty, *Treatise on Pleading* (16th Am. ed., Springfield, 1876); Perry on *Common-Law Pleading* (Boston, 1897); Stephen, *Principles of Pleading* (2d ed., Chicago, 1901).

**STAUBBACH,** stoub'bäch. A celebrated waterfall in the southern part of the Canton of Bern, Switzerland, 8 miles south of Interlaken. It is one of the highest in Europe, having a descent of between 800 and 900 feet. Long before it reaches the bottom it is blown into a dust of spray, whence its name *Staubbach* (dust stream).

**STAUNTON**, stān'ton. A city in Macoupin Co., Ill., 38 miles northeast of St. Louis, Mo., on the Wabash, the Litchfield and Madison, and the Illinois Traction railroads (Map: Illinois, E 7). There are in the vicinity several coal mines and large oil and gas wells. The Labor Temple is a notable structure. Pop., 1900, 2786; 1910, 5048; 1915 (State census), 6495.

**STAUNTON**. A city and the county seat of Augusta Co., Va., 135 miles northwest of Richmond, on the Baltimore and Ohio and the Chesapeake and Ohio railroads (Map: Virginia, E 3). It is the seat of the Western State Hospital for the Insane and of the Virginia School for the Deaf and Blind and has the Mary Baldwin Seminary, Virginia Female Institute, and Staunton Military Academy. Other prominent features are the city hall, courthouse, Masonic Temple, and Gypsy Hill and Highland parks. Staunton manufactures pennants, bricks, building material, organs, flour, overalls, machine-shop products, and agricultural implements. The city-manager form of government was adopted in 1909. The water works and the electric-light plant are owned and operated by the municipality. Staunton is the birthplace of Woodrow Wilson (q.v.). Pop., 1900, 7289; 1910, 10,604; 1915, 11,485; 1920, 10,623.

**STAUNTON**, SIR GEORGE THOMAS (1781-1859). An English traveler and Orientalist, born near Salisbury. In 1792 he went with his father, Sir George Leonard Staunton (1737-1801), to China, where he learned to speak and write the language. After two terms at Cambridge he was appointed writer in Canton for the East India Company's factory. He introduced vaccination into China in 1804 by translating George Pearson's treatise. He translated from Chinese: *La Tsing lew lee, Being the Fundamental Laws of China* (1810), the first book translated from Chinese into English; the *Narrative of the Chinese Embassy to the Khan of the Tourgouth Tartars* (1821), and wrote: *Miscellaneous Notices Relating to China* (1822; 3d ed., 1850); *Notes of Proceedings and Occurrences during the British Embassy to Peking* (1824); *Observations on our Chinese Commerce* (1850); *Memoir of Sir J. Barrow, Bart.* (1852).

**STAUNTON**, HOWARD (1810-74). An English chess master and Shakespearean scholar. In 1843 he defeated St. Amant, then the chess champion of Europe, and three years afterward won from the German experts Harwitz and Horwitz. His plans at all times displayed great originality in attack, fertility in defense, and untiring patience. He founded the *Chess Player's Chronicle* in 1840, which he edited until 1854, and from 1844 until his death conducted the chess column of the *Illustrated London News*. His Shakespearean researches resulted in an edition of the plays and poems (1857-60), edited and analyzed with shrewdness and good taste, a facsimile of the 1623 folio, and a series of articles contributed to the *Athenæum*, on "Unsuspected Corruptions of Shakespeare's Text" (1872-74). His other writings include: *Chess Player's Hand-Book* (1847; new ed., 1909); *Chess Player's Companion* (1849); *Chess Praxis* (1860); *Chess: Theory and Practice* (1876).

**STAUPITZ**, shtou'pits, JOHANN VON. A friend and spiritual guide of Martin Luther (q.v.).

**STAUROLITE**, stā'rō-lit (from Gk. *σταυρός*, *stauros*, cross + *λίθος*, *lithos*, stone), or FAIRY

**STONE**. A mineral hydrated iron-aluminium silicate crystallized in the orthorhombic system. It has a subvitreous to resinous lustre and is dark brown to black in color. The crystalline varieties are frequently cruciform, owing to twinning. On account of their resemblance to a cross these forms are popularly believed to have fallen from heaven, and are used to some extent not only as ornaments but also as charms. These peculiar forms occur in crystalline schists, and are usually associated with garnet, syenite, and tourmaline.

**STAUROSCOPE**, stā'rō-skōp (from Gk. *σταυρός*, *stauros*, cross + *σκοπεῖν*, *skopein*, to view). A variety of polariscope (q.v.) adapted to the study of crystals, and consisting essentially of a mirror, two Nicol's prisms, and a revolving stage. By it sections cut from crystals along any desired direction are examined by use of parallel rays of plane polarized light. See CONOSCOPE; CRYSTALLOGRAPHY.

**STAVANGER**, stā'vàng-ēr. A seaport of southwest Norway, on the south shore of the wide entrance to the Stavanger or Bokn Fiord, 190 miles southwest of Christiania (Map: Norway, C 7). It has a Gothic cathedral, one of the finest in Norway. The town produces woolen, linen, and cotton goods, soap, preserves, oleomargarine, hardware, pottery, and bricks. There are iron foundries, and the harbor is provided with shipyards. Fisheries and the curing of fish are important industries. The principal exports are fish, preserved foods, butter and margarine, marble, and manure. Pop., 1901, 30,613; 1910, 37,261.

**STAVROPOL**, stāv'rō-pōl'y'. A government of Ciscaucasia (Map: Russia, F 5). Area, 23,398 square miles. The surface is largely steppe-like in character, and only the southwestern part is mountainous, the highest point being about 2200 feet. The principal rivers are the Kuma and the Great Egorlyk. Agriculture and stock raising are the principal occupations, though fruit raising engages a large proportion of the population. The chief cereals are wheat, oats, and barley. In 1910 there were in the government over 4,000,000 head of live stock, including nearly 3,000,000 sheep. Four fairs are held here annually. Pop., 1912, 1,294,400, of whom the Russians constituted 90 per cent.

**STAVROPOL**. The capital of the Russian government of the same name, situated about 700 miles south-southeast of Moscow (Map: Russia, F 5). Farming and gardening are the main occupations. Pop., 1911, 60,527.

**STAWELL**, stā'el. A town of Borung County, Victoria, Australia, 150 miles by rail northwest of Melbourne, the centre of a rich gold-producing region (Map: Australia, G 6). There are important freestone quarries. Pop., 1901, 5296; 1911, 4410.

**STAWELL**, SIR WILLIAM FOSTER (1815-89). An Australian chief justice, born in County Cork, Ireland. After graduating from Trinity College, Dublin, in 1837, he was admitted to the Irish bar in 1839 and to the Melbourne (Australia) bar in 1843. He advocated the separation of Port Phillip from New South Wales, and when it was formed into the separate Colony of Victoria was its first Attorney-General in 1851-55. After the adoption of the new constitution in 1856 Stawell was returned as a member of the House of Representatives of Victoria, and was a member of the first responsible ministry as Attorney-General in 1856-57.

Thereafter until 1886 he was Chief Justice, and in 1887-89 served as Lieutenant Governor of Victoria. Knighted in 1858, he was made a K.C.M.G. in 1886.

**STAY** (from MDutch *staeye*, a stay). In law, a suspension of legal proceedings by order of a court. A stay is usually granted by the court in which an action or proceedings are pending, and is commonly ordered for the purpose of compelling a party to an action to comply with some condition or order of the court, as to pay costs on some interlocutory motion, or to give security for costs, etc. In a few instances the courts may grant absolute stays, as, e.g., where an unfounded action is begun merely to harass or annoy the defendant. It is customary for the United States courts to stay the proceedings in all actions pending against a bankrupt in State courts during the pendency of the bankruptcy proceedings. A temporary stay of execution may usually be obtained, especially where the defeated party desires to appeal. No rights are destroyed by a stay, as it only operates to suspend proceedings and does not involve their merits. Where an inferior court is taking cognizance of matters beyond its jurisdiction the proper practice is to obtain a writ of prohibition from a superior court. See Chitty, *Treatise on Pleading* (16th Am. ed., Springfield, 1876).

**STEAD**, stéd, ALFRED (1877- ). An English journalist and author, son of William T. Stead. He was educated privately and at University College, London. Entering journalism, he became associated with his father on the *Review of Reviews*, traveled extensively, especially in the British possessions and the Far and Near East, and wrote numerous letters to the newspapers. A student of international politics, he worked in behalf of the Anglo-Japanese Alliance and for the resumption of diplomatic intercourse between Britain and Serbia after it had been discontinued by reason of the murder of King Alexander and Queen Draga. In 1912-13 he was editor of the *Review of Reviews*. He published: *South Africa* (1899), with W. D. MacKenzie; *China and her Mysteries* (1901); *Japan, our New Ally* (1902); *Japan by the Japanese* (1904); *Great Japan* (1905); *Japanese Patriotism* (1906); *Modern Roumania* (1908).

**STEAD**, FRANCIS HERBERT (1857- ). An English clergyman and social reformer. He was born at Howdon-on-Tyne, Northumberland County, and was educated at Owens and Aire-dale colleges, at Glasgow University, and in Germany. He was a reporter on provincial newspapers in 1874-76, studied for the Congregational ministry (1876-84), and was pastor of a church at Leicester (1884-90) and editor of the *Nonconformist and Independent* (1890-92). Actively identifying himself with social-betterment work, he became warden of the Robert Browning Settlement in 1894, and afterward initiated the conferences with Charles Booth (q.v.), in which the National Committee on Old Age Pensions (1898) originated. He was the convener of the Browning Hall Conference on housing and locomotion in 1901, and initiated Labor Week in 1910. He published: *Handbook on Young People's Guilds* (1889); *The Kingdom of God, a Plan of Study* (1894); *How Old Age Pensions Began to Be* (1909).

**STEAD**, WILLIAM THOMAS (1849-1912). An English journalist, born at Embleton, Northum-

berland. After a brief schooling he went into business, but in 1871 was appointed editor of the *Northern Echo* (Darlington). Here he remained until 1880, when he was called to be assistant editor, under John Morley, of the *Pall Mall Gazette*. He was editor of this paper from 1883 to 1889 and in the next year founded the *Review of Reviews* (monthly). He established similar publications in the United States (1891) and Australia (1894). As editor of the *Pall Mall Gazette*, a daily, he introduced American journalism into England, in the way of the interview, illustrations, and "extras," and in 1884 he compelled the Gladstone government to send Gordon to Khartum. No British newspaper before had attempted to control details of government policy. He became known as a vigorous opponent of social evils, a steadfast advocate of international peace, and, though patriotic, an apologist of Russia. His *The Truth about the Navy* (1884) led to the laying down of more ships in the following year. In 1885 his *The Maiden Tribute of Modern Babylon*, an exposure of legally permissible outrages upon women and children, landed him for a three months' term in Holloway Gaol, but it was followed by the enactment of the Criminal Law Amendment Bill. An active member of the British Society for Psychical Research, Stead conducted a journal called *The Borderland* (1893-97) which recorded spiritualistic experiences. In 1898 he started *War against War*, a weekly devoted to the opposition of the Anglo-Boer War. He was one of the victims of the Titanic disaster. His publications include: *The Truth about Russia* (1888); *The Pope and the New Era* (1889); *The Story that Transformed the World* (1890); *If Christ Came to Chicago* (1893); *The Labor War in the United States* (1894); *Satan's Invisible World: A Study of Despairing Democracy* (1897); *The United States of Europe* (1899); *Mr. Carnegie's Conundrum* (1900); *The Americanization of the World* (1902); *The Last Will and Testament of Cecil John Rhodes* (1902); *Peers or People* (1907). Consult Estelle W. Stead, *My Father* (London, 1913).

**STEALING**. See LARCENY.

**STEAM** (AS. *stēam*, Fris. *stoame*, Dutch *stoom*, steam; of unknown etymology). Water in a gaseous condition. It is a dry, colorless gas with a specific gravity of 0.625 as compared with air at the same pressure. The white cloud of vapor which rises from boiling water and which is commonly called steam is a vapor composed of minute particles of water suspended in the air and formed by the condensation of the true steam gas coming in contact with the cool air. When water is subjected to the action of heat, it is converted into invisible steam gas. Though a change takes place in the physical condition of the substance, the chemical composition of the steam is in no way different from that of the water from which it was generated. If heat be applied to the bottom of a vessel containing water, the air contained in the water will first appear as little bubbles which rise to the surface. Then the water in immediate contact with the heated portion of the vessel will be converted into steam, which will form as bubbles on the bottom of the vessel, and these will rise through the liquid, but at the commencement of the operation they will be at once condensed by the cold upper layers of water. Finally, however, the water becomes

heated through, when the bubbles rise to the surface and the steam exudes upon the air, and we have the phenomenon known as boiling. As the steam passes into the air, it is cooled and collects into small particles of water which are visible as a white cloud above the surface, and the phenomenon is called condensation. This is visible on calm surfaces of lakes or ponds which have been heated by the sun by day, and which keep on vaporizing after the lowered temperature of nightfall has begun. If all the particles of this white cloud were collected into one mass, there would be a volume of water equal to the volume of water in the original mass which had been converted into the steam forming the cloud. Boiling occurs only when the water in the vessel has reached a certain temperature. This temperature varies with the pressure. At the atmospheric pressure of 14.7 pounds at mean sea level, it is  $212^{\circ}$  F., but it would be somewhat less on the top of a high mountain and somewhat greater at the bottom of a deep mine. See *HYPSONETER; HYPSONOMETRY*.

The boiling temperature or boiling point of water thus varies with the pressure upon it. At a pressure of 5 pounds per square inch it is as low as  $162.3^{\circ}$  F., and at a pressure of 100 pounds per square inch it is as high as  $327.58^{\circ}$  F. Condensation takes place at any temperature lower than the boiling temperature.

To explain more fully the action of heat in the formation of steam, reference will be made to the accompanying diagrams. In Fig. 1 let the cylinder contain one pound of water at  $32^{\circ}$  F., and let the pressure of the atmosphere be represented by the weighted piston. Then, if heat be applied to the bottom of the cylinder, the temperature of the water will rise higher and higher until it reaches  $212^{\circ}$  F.; the piston will up to this point remain stationary except for the small expansion of the water. On continuing the heat the water shows no further rise in temperature, but steam begins to form and to force the piston upward as shown by Fig. 2, and

to heat the steam in the cylinder Fig. 3, its temperature will rise above that of saturated steam, and the piston will move upward, and we shall have *superheated steam*. If now we take the cylinder Fig. 3 and plunge it into a vessel of cold water, as shown by Fig. 4, the heat will be taken away from the steam and it will condense to water. When this water has cooled to  $32^{\circ}$  F., the whole heat taken away is exactly equal to the whole heat added during the operations illustrated by Figs. 1, 2, and 3.

The amount of this added and abstracted heat may now be considered. First, let us assume that the cylinder Fig. 1 has an area of one square foot and that it contains one pound of water. The height to which the water rises in the cylinder is 0.016 foot. The pressure on the piston from the air is 14.7 pounds  $\times$  144 square inches = 2116.8 pounds. Now on applying heat to the water it will at first gradually rise in temperature from  $32^{\circ}$  F. to  $212^{\circ}$  F. before evaporation commences. Then  $212^{\circ} - 32^{\circ} = 180$ , or the number of heat units required to raise water from  $32^{\circ}$  F. to the boiling point at atmospheric pressure. Steam now begins to form and the piston to rise until all the water is converted into steam at a temperature of  $212^{\circ}$  F. This steam, as before stated, occupies a space of 26.56 cubic feet. The heat required to perform this operation is 966 units. Hence the total heat required first to raise the water from  $32^{\circ}$  F. to  $212^{\circ}$  F. and then to convert it into steam is  $180 + 966 = 1146$  units. It is quite clear how the heat required to raise the water from  $32^{\circ}$  F. to  $212^{\circ}$  F. has been expended, but it is not so clear how the 966° F. required to convert the water at  $212^{\circ}$  F. into steam at  $212^{\circ}$  F. has been expended. It will be observed that two things have happened in this last operation. First, the water has been converted into steam, which occupies 1660 times the space occupied by the water from which it was generated. Second, the piston has been raised from the surface of the water in Fig. 1 to the surface of the steam in Fig. 3. Therefore the heat has been expended in two ways: first, in overcoming the internal molecular resistance of the water in changing its condition from water to steam, and, second, in overcoming the external resistance of the piston to the increasing volume of the steam during formation. The first task performed is called the internal work of the steam, and the second task is called the external work. Now the share of the heat expended in each operation may be calculated as follows: The total heat expended is, as already stated, 1146 units. To raise the piston with a pressure on it of 2116.8 pounds through a height of 26.56 feet requires 56,179 foot pounds of energy. As the energy of one heat unit is 778 foot pounds, then  $56,179 \div 778 = 72.2$  heat units expended in raising the piston. Adding this to 180, the number of heat units required to raise water from  $32^{\circ}$  F. to  $212^{\circ}$  F., we have 252.2 units consumed in heating the water and raising the piston. This amount subtracted from the total heat expended gives.  $1146 - 252.2 = 893.8$ , which is the number of heat units expended in internal work. We can now summarize the distribution of the heat as follows:

In raising temperature of water.....	180 units
In doing internal work.....	893.8 units
In doing external work.....	72 2 units
Total.....	1146.0 units

this continues until the last drop of water is converted into steam and we have the condition illustrated by Fig. 3.

Before proceeding further, it must be noted first that no steam began to form until the water reached a temperature of  $212^{\circ}$  F.; hence this is evidently the lowest temperature at which steam will form under normal atmospheric pressure. Second, we must note that in the condition illustrated by Fig. 3 we have one pound of steam occupying the least possible volume at atmospheric pressure. In actual figures this volume is 26.36 cubic feet. Steam in this condition is known as *saturated steam*. If now we continue

Having gone through the phenomenon of steam generation in detail, we can summarize some of the general facts that have been brought out. The temperature of the water gradually rises until it reaches the temperature at which steam is formed. This temperature will depend upon the pressure or the load on the piston. If this pressure is the normal atmospheric pressure of 14.7 pounds per square inch, steam begins to form at a temperature of 212° F.

As soon as 212° F. is reached steam will begin to form and the piston will steadily rise, but no matter how hot the fire may be, the temperature of both water and steam will remain at 212° F. until all the water is evaporated. We had one pound of water at 32° F. and at 14.7 pounds absolute pressure, and found that steam formed at a temperature of 212° F. and remained at that temperature. We added 180.9 B. T. U. (British Thermal Units), the heat of the liquid, to bring the water from 32° to the boiling point. To convert water at 212° into steam at 212°, we added 965.7 B. T. U. more. This quantity, known as the latent heat, or heat of vaporization, makes the total heat 1146.6 B. T. U. If we should measure the volume carefully after all the water was evaporated, we should find that there was just 26.56 cubic feet of dry saturated steam. We had one pound of water, and therefore must have one pound of steam, for none of it could escape; hence one cubic foot will weigh  $\frac{1}{26.56} = 0.03765$  pound, which is known as the density of steam at 14.7 pounds absolute pressure, or 212° F. In the table of properties of saturated steam all these quantities are found in the order given and at the pressure of 14.7 pounds above vacuum.

Suppose now we place a weight of 85.3 pounds on the piston. The pressure is 85.3 pounds plus 14.7 pounds, or 100 pounds absolute. We shall now find that no steam will form until a temperature of 327.58° is reached. Starting with water at 32°, it will be necessary to add 298.9 B. T. U. before a temperature of 327.58° is reached, and also we must add 883 B. T. U. more to vaporize it, making a total heat of 1181.9 B. T. U. Under this greater pressure the steam occupies a volume of only 4.39 cubic feet, or one cubic foot of it weighs  $\frac{1}{4.39} = 0.2278$  pound.

We have already seen that any change in the temperature of saturated steam produces a change of pressure, and that every change of pressure corresponds to a certain change in temperature. There are several properties of saturated steam that depend upon the temperature and pressure; and the values of all these different properties when arranged for all temperatures and pressures are called steam tables. The following are the principal items that are found in such tables:

(1) The absolute pressure in pounds per square inch; it is equal to the gauge pressure plus the atmospheric pressure of 14.7 pounds.

(2) The temperature of the steam, or boiling water, at the corresponding pressure.

(3) The heat of the liquid; or the number of B. T. U. necessary to raise one pound of water from 32° F. to the boiling point corresponding to the given pressure.

(4) The heat of vaporization, or the latent heat; this is the number of B. T. U. necessary to change one pound of water at the boiling point into dry saturated steam at the same temperature and pressure.

(5) The total heat; or the number of B. T. U. necessary to change one pound of water from 32° F. into steam at the given temperature or pressure. The total heat is evidently equal to the sum of the heat of the liquid and the heat of vaporization.

(6) The density of the steam, i.e., the weight in pounds of one cubic foot of steam at the given temperature or pressure.

(7) The specific volume, or volume in cubic feet of one pound of steam at the required temperature or pressure. Evidently the specific volume is equal to  $\frac{1}{\text{density}}$ .

All these properties have been calculated by means of various formulas which have been deduced from the results of actual experiment. They have been worked out and arranged in elaborate tables, such as those of Marks and Davis, *Steam Tables and Diagrams* (New York, 1909); G. A. Goodenough, *Properties of Steam and Ammonia* (ib., 1915); H. L. Callendar, *The Callendar Steam Tables* (ib., 1916).

We have seen that a saturated vapor contains just enough heat to keep it in the form of a vapor; if it loses heat it will condense. A superheated vapor is one that has been heated after vaporization; it can lose this extra heat before any condensation will take place. A vapor in contact with its liquid is saturated; one heated after removal from the liquid is superheated.

For saturated steam there is a fixed temperature for every pressure. If we know either the pressure or the temperature, we can find the other in the steam tables. For instance, if the gauge pressure of a boiler is 60.3 pounds and we wish to know the temperature, we simply add atmospheric pressure and turn to our tables and find it to be 307° (approximately).

With superheated steam the case is entirely different, for there is no longer the same direct relation between the temperature and pressure. In fact, the relation between temperature and pressure of superheated steam depends upon the amount of superheating. Superheated steam at 60.3 pounds' gauge pressure may have a temperature considerably above 307° F. At a given pressure the temperature and volume of a given weight of superheated steam are always greater than the temperature and volume of the same weight of saturated steam. The properties of superheated steam at given pressure are not constant, as is the case with saturated steam.

If superheated steam were a perfect gas, we could determine the relation of  $p$ ,  $v$ , and  $t$  by the equation  $p v = c t$ ; but superheated steam is not a perfect gas, hence we must modify our equation. Zeuner devised the following general formula for superheated steam:

$$p v = 0.6496 t - 22.58 \sqrt{p},$$

in which  $p$  = absolute pressure in pounds per square inch,  $t$  = temperature in degrees F,  $v$  = volume in cubic feet.

Consult Wm. Kent, *Mechanical Engineers' Pocket-Book* (New York, 1916), and works mentioned under STEAM ENGINE.

**STEAM CARRIAGE.** See **AUTOMOBILE; MOTOR VEHICLE.**

**STEAM ENGINE.** A motor in which the expansive force of steam is employed as the medium for transforming the energy of heat into useful work. Ordinarily the steam acts upon a piston inclosed within a cylinder in such a manner as to be capable only of *reciprocating*

motion, but in certain forms of engines it acts upon an inclosed piston or vane, which rotates around an axis. The rotary engine has the advantages of compactness and of being capable of applying its power directly, while the reciprocating engine has to have the rectilinear motion of the piston transformed into the rotary motion of a flywheel or shaft by an intermediate mechanism. These advantages of the rotary engine, except the turbine type, are, however, more than counterbalanced by its decided lack of economy in steam consumption, which has as yet prevented it from successfully competing commercially with the reciprocating engine.

**Early History.** The first instance of the use of steam as a motive power is generally assumed to have been the *xolipile* of Hero of Alexandria (q.v.). As early as 1543 a Spanish captain, named Blasco de Garay, is reputed to have shown in the harbor of Barcelona a steamboat of his own invention. A French engineer, Salomon de Caus, describes in 1615 a steam machine, which was merely a contrivance for forcing the water contained in a copper ball through a tube by applying heat. An Italian engineer, Giovanni Branca, invented, in 1629, a sort of steam windmill; the steam, being generated in a boiler, was directed by a spout against the flat vanes of a wheel, which was thus set in motion. See STEAM TURBINE.

In England the first successful effort was that of the Marquis of Worcester, who in 1663 describes a steam apparatus by which he raised a column of water to the height of 40 feet. The first patent for the application of steam power to various kinds of machines was taken out in 1698 by Thomas Savery. His engines were the first used and seem to have been employed for some years in the drainage of mines in Cornwall and Devonshire. The essential improvement in them over the older ones was the use of a boiler separate from the vessel in which the steam did its work.

To Denis Papin, a celebrated Frenchman, is due the idea of the *piston*.

The next great step in advance was made about 1705 in the "atmospheric" engine, conjointly invented by Newcomen, Calley, and Savery. In this engine, which is shown in Fig. 1, the previous inventions of the separate boiler and of the cylinder with its movable steam-tight piston are utilized, although in a new form. The "beam," which has been so largely in use in pumping engines, was used for the first time, and for the first time also the condensation of the steam was made an instantaneous process instead of a slow and gradual one. To one end of a beam moving on an axis, *I*, was attached the rod, *N*, of the pump to be worked; to the other, the rod, *M*, of a piston moving in a cylinder, *C*, below. The cylinder was placed over a boiler, *B*, and was connected with it by a pipe provided with a stopcock, *V*, to cut off or admit the steam. Suppose the pump rod depressed, and the piston raised to the top of the cylinder—which was effected by weights suspended at the pump end of the beam—the steam cock was then turned to cut off the steam, and a dash of cold water was thrown into the cylinder by turning a cock, *R*, on a water pipe, *A*, connected with a cistern, *C'*. This condensed the steam in the cylinder, and caused a vacuum below the piston, which was then forced down by the pressure of the atmosphere, bringing with it

the end of the beam to which it was attached, and raising the other along with the pump rod. The cock was then turned to admit fresh steam below the piston, which was raised by the counterpoise; and thus the motion began anew. The opening and shutting of the cocks was at first performed by an attendant, but there is a legend that in 1713 a boy named Humphrey Potter devised a system of strings and levers by which the engine was made to work its own valves. In 1717 Henry Beighton invented a simpler and more scientific system of "hand gear," which rendered the engine completely *self-acting*.

The next essential improvements on the steam engine were those of Watt. The first and most important improvement made by Watt was the separate condenser, patented in 1769. He had observed that the jet of cold water thrown into the cylinder to condense the steam necessarily reduced the temperature of the cylinder so much

FIG. 1. NEWCOMEN'S ENGINE.

that a great deal of the steam flowing in at each upward stroke of the piston was condensed before the cylinder got back the heat abstracted from it by the spurt of cold water used for condensing the steam in the cylinder. The loss of steam arising from this was so great that only about one-fourth of what was admitted into the cylinder was actually available as motive power. Watt, therefore, provided a separate vessel in which to condense the steam, and which could be kept constantly in a state of vacuum, without the loss which arose when the cylinder itself was used as a condenser. The principal improvements since have been either in matters relating to the boiler or in details of valve gear and of construction consequent on increased manufacturing facilities, together with more effective governing of speed and greater knowledge of the strength of materials.

**Analysis.** The motor element of the engine is the cylinder and piston (Fig. 2). The cylinder, *C*, is a hollow cylinder of metal closed at both ends, except for small openings for the entrance and escape of steam and for the passage of the piston rod. Inside the cylinder is the piston *P*, a circular disk of metal fitting steam-tight and capable of movement lengthwise in the cylinder. The openings *S*<sub>1</sub> and *S*<sub>2</sub> provide

for the admission of steam into the cylinder, and the openings  $E_1$  and  $E_2$  provide for the exhaust of steam from the cylinder. These passages are opened and closed by valves. These valves operate in pairs; when valves  $S_1$  and  $E_1$  are open valves  $S_2$  and  $E_2$  are closed and vice versa. If steam be admitted by opening valve  $S_1$ , its pressure forces the piston  $P$  to the opposite end of the cylinder. Valves  $S_1$  and  $E_1$  now close and

Fig. 2.

valves  $S_2$  and  $E_2$  open, and steam entering at  $S_2$  forces the piston to return and press, as it advances, the previous cylinderful of steam out of the exhaust port  $E_2$ . The repeated and alternate opening and closing of the two pairs of valves, as described, causes the piston to reciprocate back and forth in the cylinder. This motion is carried outside of the cylinder by means of the piston rod  $R$ . This is a cylindrical rod attached rigidly to the piston and passing out of the cylinder through a steam-tight orifice in the cylinder head. At its outer end the piston rod is attached to a rectangular piece,  $H$ , called the crosshead, which slides between two guides,  $GG$ . To the opposite end of the crosshead is hinged the rod  $S$ , called the connecting rod, the forward end of which is journaled to a crank  $K$ , which operates the flywheel  $W$ .

In the steam engine, as actually constructed, these different parts and their movements are variously modified, but the essential operating parts of all reciprocating steam engines are: the cylinder and piston; the valves and valve gear; the piston rod; the crosshead and guides; the connecting rod; the crank and crank shaft or flywheel.

The ordinary unit of measure of the work done by a steam engine is the horse power (q.v.). The whole of the theoretical horse power, however, is never available for useful work, owing to the friction of the moving parts and other causes.

**Classification.** Steam engines may be classified (I) according to the nature of their mechanism, (II) according to the manner in which the steam is used, and (III) according to the use to which the engine is to be put.

I. Reciprocating engines may be grouped according to the position of the axis of the piston into horizontal engines, vertical engines, and inclined or diagonal engines. Fig. 2 shows the position of the parts of a *horizontal engine*, i.e., an engine with the axis of the cylinder and piston horizontal. The advantages of such an engine are convenient access from the ground to all parts of the mechanism, distribution of the weight over a large area, and the location of the centre of gravity of the machine close to the foundation; its disadvantages are greater friction and wear of the cylinder owing to the fact that the piston is supported upon the bottom of the cylinder.

In the *vertical engine* the axis of the cylinder and piston is vertical; if the cylinder is carried by a frame above the crank shaft so that the piston rod extends downward, the engine is called an *inverted vertical engine*; and if the cylinder is below, with the piston rod extending upward to a crank shaft above, the engine is called a *direct vertical engine*. The advantages of the vertical engine are that the cylinder friction and consequent cylinder wear of the horizontal engine are largely avoided and that a comparatively small area of ground is occupied by the engine. Its disadvantages are that the weight of the piston, piston rod, crosshead, and connecting rod acts with the steam in one direction and against the steam in the other direction, thus producing unequal effort on the crank on alternate strokes, which has to be counteracted by special constructions; that the different parts of the mechanism are at different heights, requiring more at-

tendants; that the centre of gravity of the machine is high, reducing its stability. The limited foundation area required for the vertical engines especially adapts it to places where room is scarce or expensive, as in steamships and city power houses. See STEAM NAVIGATION.

Inclined engines possess in a measure the advantages and disadvantages of both the horizontal and the vertical engine. In such engines the axis of the cylinder is at an inclination between the vertical and horizontal, and the cylinder is usually set below with the piston rod projecting diagonally upward to the crank shaft. They have been used chiefly in side-wheel steamboats of shallow draft and in ferryboats.

An engine in which the motion of the piston is transmitted by a connecting rod direct to the crank, as shown by Fig. 2, is called a *direct-acting engine*. As applied to pumps this term has a somewhat different meaning. (See PUMPS AND PUMPING MACHINERY.) In contradistinction to direct-acting engines we have *beam engines*, of which the engine shown by Fig. 1 is an early example. In the beam engine the connecting rod is journaled to one end of a beam rocking on a horizontal axis. To the other end of the beam is journaled a pitman rod which connects with the crank shaft. The engines for side-wheel steamboats are usually beam engines; and they are also used for pumping engines.

Besides the forms of engines mentioned there are various special forms, a few of which are sufficiently important to merit mention. The *oscillating engine* dispenses with the connecting rod, the piston rod connecting directly to the crank, and the cylinder is mounted upon suitable trunnions so that it can oscillate in conformation to the swaying of the piston rod in operating the crank. The *trunk engine* dispenses with the piston rod, the connecting rod being attached directly to the piston, which takes the form of a hollow cylinder closed at one end. The *back-acting engine* has the connecting rod extending back from the crosshead to a crank shaft back of the engine instead of extending forward as shown by Fig. 2.

II. The method in which the steam is used in the engine is also a basis for a scheme of classification. The fact that the same number of foot pounds of energy per minute may be secured by a small piston working at high speed or a larger

piston working at a slower speed gives us our first classification, viz., *high-speed* and *low-speed* engines. The high-speed engine has the advantage of small dimensions and small weight for a given power, and, because the strokes are so frequent, of meeting variations in resistance more quickly than a slow-speed engine. Its disadvantages are its comparatively greater waste of steam, the greater wear of the moving parts, the greater danger of heating, and consequently the higher cost of construction and operation. Altogether, experience shows the slow or moderate speed engine to be superior to the very high-speed engine where circumstances permit its use. Between 600 and 800 feet per minute is regarded as a moderate piston speed, and over 900 feet per minute as a high piston speed. Referring to Fig. 2, it will be observed that the steam acts first against one side of the piston and then against the other side. Such an engine is called a *double-acting engine*. When the pressure of the steam is exerted against one side of the piston only, the engine is called a *single-acting engine*. The single-acting principle is utilized in the well-known Cornish engine for pumping and in certain high-speed rotative engines for electric light and power service. In the latter form of engine two cylinders are used which are coupled to separate cranks on the same shaft in order to secure continuous action. Two familiar forms are the Westinghouse and the Winans, and both are inverted vertical trunk engines. Owing to their single action and the omission of the connecting rod, these engines escape many of the disadvantages of the double-acting high-speed engine.

The Cornish single-acting pumping engine deserves particular notice because of its essentially peculiar steam-cylinder mechanism. It appears in two forms, the beam form and the direct-acting form. The beam Cornish engine has a vertical cylinder from whose top the piston rod extends, and has the usual connecting-rod connection with one end of a beam pivoted at the centre, to whose other end are attached the pump rods. The direct-acting Cornish engine

FIG. 3.

has the cylinder located directly over the mouth of the shaft and the piston rod passing out of its bottom connects directly with the pump rods. This form of Cornish engine is usually called the *Bull Cornish*, from the name of its first adopter. In both forms of Cornish engine the action of the steam is simply to raise the heavy pump rods, whose weight in falling displaces the water to be pumped. The cylinder of the Cornish engine has three valves, one for the admission of steam, one for the exhaust of the steam, and an equilibrium valve, these being shown in Fig. 3 at *S*, *D*, and *E*, respectively.

The cycle of operations is as follows. The pump rods being at the bottom of their stroke, the piston *P* of a beam Cornish engine will be at the top of the cylinder. The steam valve *S* and the exhaust valve *D* will be opened and the equilibrium valve *E* will be closed. The pressure of the steam drives the piston to the bottom of the cylinder, lifting the pump rods. When this operation has been completed, valves *S* and *D*

are closed and valve *E* is opened. The opening of valve *E* permits the steam above the piston to flow freely beneath it, equalizing the pressure on the two sides of the piston and leaving it free to return to the top of the cylinder under the pull of the heavy pump rods. The valves of the Cornish engine may be worked by a special device called a *cataract*, when it is desired to have a pause or interval of some seconds between strokes. This consists of a weighted piston working in a cylinder, having a large intake valve and a small discharge valve, whose opening can be adjusted to various dimensions. During the working stroke of the pump this weighted plunger is lifted, drawing water into its cylinder through the large inlet valve. When the pump makes its return stroke the weighted plunger is released and gradually descends as its weight presses the water out of its cylinder through the small discharge valve. The main engine meanwhile is at rest. This return stroke of the weighted plunger at its end actuates the valves of the steam cylinder of the pump so as to cause another working stroke.

The third subdivision of engines according to the method of using the steam comprises expansive and nonexpansive working engines. To understand the nature of this subdivision it will be found convenient to refer to the diagram Fig. 4. In this diagram the full lines represent the cylinder, piston, and piston rod. Now if steam be admitted behind the piston it will force it forward to the position which it occupies in the diagram. The steam may be made to perform this operation in two ways, nonexpansively and expansively. When used nonexpansively the steam enters the steam port at boiler pressure, and as this port remains open until the piston has completed its stroke, boiler pressure is maintained behind the piston during the whole stroke. If we assume the broken line *ad* to represent the steam pressure in pounds per square inch and the broken line *dc* to represent the stroke in feet, then the work in foot pounds per square inch of piston area per stroke is represented by the dotted rectangle *abcd*; the pressure *bc* at the end of the stroke is the same

FIG. 4.

as the pressure *ad* at the beginning of the stroke, and a cylinderful of steam at full pressure has to be exhausted in order to make the return stroke. When the steam is used expansively the steam valve is closed when the piston has reached some intermediate point, as *e*, called the point of cut-off, in its forward stroke, and no more steam is admitted into the cylinder. Full steam pressure is, therefore, maintained against the piston for the portion *ae* of its stroke, but afterward this pressure gradually decreases as the steam expands until at the end of the stroke it is represented by the line *cf*. The work done by the steam is represented by the area *aeofd*, which, as will be readily seen, is less than the area *abcd*, representing the work done when using the steam nonexpansively. The excess of energy in the early part of the stroke is normally stored in the flywheel and in the masses of the reciprocating parts to be given out towards the end of

the stroke. When the steam is used expansively, however, the weight of steam at boiler pressure which is consumed at each stroke is represented by the rectangle whose base is  $ae$  and whose height is  $ad$ , as compared with the rectangle  $abcd$ , representing the weight of steam at boiler pressure consumed at each stroke in nonexpansive working. Evidently, from the diagram, the weight of steam used in proportion to the work done is less in expansive working than in nonexpansive working. This advantage has made the expansive-working engine practically universal where circumstances will permit.

The fourth subdivision of steam engines according to the method of using the steam comprises condensing and noncondensing engines. In a noncondensing engine the waste steam from the cylinder is exhausted into the air at air pressure, or 14.7 pounds per square inch. In the condensing engine it exhausts into a vacuum and is condensed into water. Thus, in a noncondensing engine the steam has to force the piston against a back pressure of 14.7 pounds per square inch, while in a condensing engine this back pressure is obliterated, with a consequent gain of 14.7 pounds per square inch in the effective working pressure of the steam. The practical advantage of the condensing engine may, therefore, be expressed by saying that it will give out the same power with a smaller cylinder and greater power with the same cylinder, as compared with a noncondensing engine. (See CONDENSER.) A fifth subdivision of steam engines according to the method in which steam is used comprises simple engines, compound engines, and multiple-expansion engines. In a simple engine the steam, after having done its work in forcing the piston through its stroke, is exhausted into the air or into a condenser. In a compound or multiple-expansion engine the steam, after having done its work in one cylinder, is exhausted into a succeeding cylinder of larger size, where it continues to perform work. The operation may be explained by the diagram, Fig. 5. Steam enters the cylinder  $HP$ , which is connected with cylinder  $LP$  by two passages  $a$  and  $b$  closed by valves, and here performs the work of driving piston  $P_1$  to the front end of the cylinder. This steam, instead of being exhausted into the air or into a condenser to allow the return stroke of the piston  $P_1$ , is exhausted through the passage  $a$  into cylinder  $LP$ , where it acts to drive forward piston  $P_2$ . Were the size of the cylinder  $LP$  the same as that of the cylinder  $HP$ , it is evident that the propulsive effect of the steam on piston  $P_2$  would be exactly counterbalanced by the back pressure on piston  $P_1$ , and, therefore, that there would be no increase, but rather a loss, in the work done. If, however, cylinder  $LP$  is made twice the diameter of cylinder  $HP$ , then the forward pressure on piston  $P_2$  is greater than the back pressure on piston  $P_1$ , and a positive or working effect is obtained by the second use of the steam. A two-cylinder engine like Fig. 5 using steam as described is called a *compound engine*. Were the exhaust steam from the second cylinder to enter a third and larger cylinder and continue working, we should have a *triple-expansion engine*. If a fourth cylinder were added to the set we should have a *quadruple-expansion engine*. The expansive working of steam has not been successfully carried beyond four expansions. A tandem compound with the cylinders set vertical is called a *steeple engine*. When the cylinders

are placed side by side, but some distance apart so as to allow space for a flywheel between them, the engine is commonly called a *cross-compound engine*. Modern marine engines for screw vessels are nearly always inverted vertical compound or multiple expansion engines. (See Plates under SHIP AND SHIPPING.) The arrangement of the cylinders of triple and

FIG. 5.

quadruple expansion engines varies considerably. The great practical advantage of the compound or multiple-expansion engine is the economy resulting from the expansive use of steam, as indicated in discussing expansive and nonexpansive working engines.

III. A very usual classification of steam engines is based upon the service or use to which the engine is to be put. It includes the following groups, *stationary engines*, *locomotive engines*, and *portable engines*. The first group or stationary engines include mill engines, power-house engines, pumping engines, blowing engines, air compressors, hoisting engines, and others. Locomotive engines include locomotives, marine engines, traction engines, steam road rollers, self-propelled fire engines, and others. Portable engines include a wide variety of engines, such as agricultural engines, so designed that the engine and boiler are self-contained and do not require a foundation or permanent structure of any kind.

**Structural Details.** The supporting frame of a steam engine is usually a structure of cast or forged iron or steel varying in shape to suit the form of engine of which it is a part. The working parts of an engine comprise the cylinder and piston, the valves and valve gear, the governor, the piston rod, crosshead, and connecting rod, and the crank shaft and flywheel. The function of the engine frame is to constitute a fixed link in a kinetic chain, and to perform this function it must be essentially rigid and strong. In a horizontal engine, as shown in Fig. 2, it will be evident that the duties of the frame are to support the cylinder  $C$  at one end, and the flywheel  $W$  at the other end, and to steady and align the transforming mechanism connecting these two parts. The frame of a vertical engine performs an exactly similar duty, but of course differs in construction to suit the different arrangement of the moving parts. Thus in an inverted vertical engine there is a broad base plate, on which the crank shaft is directly supported. From this base plate rises a columnar structure supporting the cylinders and guiding the reciprocating parts. Cast iron and cast steel are particularly adapted

to furnish the rigidity and massiveness desired, and are, therefore, the materials commonly employed for engine frames. In certain classes of engines, such as the locomotive and the marine engine, where lightness combined with great strength is an essential, forged steel frames are used.

The engine *cylinder* is a barrel-shaped or box-shaped casting, with its interior bored out into the form of a perfect cylinder. The ends of this cylinder are closed by cover-like castings fastened by studs or bolts to the body. The front head has a circular orifice at the centre to allow for the exit of the piston rod, and where a tail rod is used a similar orifice is necessary in the back head. The barrel or body of the cylinder has one or more orifices for the admission and exhaust of the steam, and these orifices are covered by a boxlike chamber called the *steam chest*, inside of which work the *valves*. The body and often the ends of the cylinder casting are usually covered with a *lagging* or envelope of some material which is a poor conductor of heat and whose purpose is to prevent the condensation of steam in the cylinder by the loss of heat due to radiation from its outer walls. The *piston* is a circular disk of metal of sufficient strength to resist distortion by the steam pressure. In the edge of this disk are set rings of metal so arranged that they are constantly pressed outward against the walls of the cylinder, either by their own elasticity or by the elasticity of springs pressing against them from behind. These rings are called *packing rings*, and their function is to make the piston fit steam-tight in the cylinder and at the same time render its movement as free from friction as possible.

The function of the valves and valve gear is to control the admission and exhaust of the steam. The functions of the *valve* are both primary and secondary. The primary function is to admit the steam from the boiler to one side of the piston, while the exhaust steam filling the other end of the cylinder is permitted to escape with the least possible resistance. The secondary functions are to close the admission of steam at the point necessary to give the expansion desired and to close the exhaust orifice at such a point in the return stroke that a certain volume of steam shall be caught and compressed behind the piston to serve as an elastic cushion. It is necessary also that the opening of the inlets and outlets of the cylinder should be so timed with respect to the stroke of the piston that pressure may not be brought too soon against the piston head, nor the exhaust opened until the expanding steam has done its entire work for that stroke. The valves for admitting and distributing steam in an engine cylinder may open the ports which they control, either by lifting from their seats or by sliding upon their seats. When the engine is a double-acting one there must be provision to connect each end of the cylinder with the boiler and each end with the exhaust pipe. When the engine is single-acting it is only necessary to connect one end to the boiler and exhaust pipe alternately. Apparently the simplest arrangement would be to have four valves, as shown by Fig. 2, one at each end for steam, and one at each end for exhaust. This is the arrangement in the *Corliss engine*. An important type of engines makes use of a separate valve for admitting steam at each end, while the exhaust is controlled by a

single valve for both ends. Such engines are called *three-valve engines*. Another arrangement is to have one valve for admitting steam to both ends and another controlling the exhaust for both ends. Such engines are called *two-valve engines*. A fourth class has one *single valve*, so designed as to perform the inlet and outlet functions for both ends.

The simplest form and also the most common form of single valve is the D-shaped *slide valve*. In the diagram, Fig. 6, *W* represents a portion of the top wall of the cylinder, *S* and *S<sub>1</sub>* being the steam ports to the two ends of the cylinder. At the top these steam ports open into the inclosed space *A, B, C, D*, which represents the steam chest. The valve proper is represented by *V*, which is operated by the rod *R* passing out through a suitable orifice in the forward end of the steam chest. The steam from the boiler is admitted into the space above the valve. It will be observed that in the position shown the valve exactly covers the ports *S* and *S<sub>1</sub>*, and steam from the steam chest cannot enter the cylinder, nor can any steam contained in the

FIG. 6.

cylinder escape. If the valve is moved either to the right or left of the position shown, both ports are immediately uncovered. If the movement be towards the right, port *S<sub>1</sub>* is opened to the live-steam space above valve *V* and port *S* is opened to the exhaust space *E* beneath the valve *V*. A reverse movement of the valve opens port *S* to the live-steam space and port *S<sub>1</sub>* to the exhaust space. The movement of the valve from "centre" to the right and back again to "centre" accomplishes the right-hand stroke of the piston; its movement from "centre" to the left and back again to "centre" accomplishes the left-hand stroke of the piston. These alternate right and left movements of the valve are accomplished by means of the rod *R* and an eccentric. (See ECCENTRIC.) When the valve is at "centre" the axis of the eccentric is at right angles to the flywheel crank, providing the valve is constructed, as shown, to cover exactly the steam ports, which is the construction for nonexpansive working of the steam. This is the simplest form of slide valve. To provide for the expansive working of the steam, its use as a compression cushion and other desirable variations in admission and exhaust, the construction of the valve and the position of the eccentric have to be modified in various ways, an analysis of which is a matter of considerable mechanical intricacy.

The train of mechanism by which the opening and closing movements of the valves are effected is called the *valve gear*. This varies in construction and operation. The precise character of the gear adopted in any case is determined partly by the form of valve and partly by the nature of the general problem presented for solution. In some cases it is merely required that a fairly good steam distribution shall be secured; in other instances a good method of expansion must be obtained; in still other cases the system must be capable of adjustment with a view to wise regulation of speed, and in all

locomotive and marine engines easy and prompt reversal of the direction of motion is required. Of these the link motion invented by Howe in 1843, and first used on Stephenson's engines,

FIG. 7.

is perhaps the most familiar, it being the gear very generally used, either as originally designed or in some modified form, on locomotives and marine engines. Fig. 7 shows the Howe link, or, as it is more commonly called, the Stephenson reversing link valve gear. The two eccentrics  $E$  and  $E_1$  are set on the crank shaft  $S$  nearly at right angles to the crank  $C$ . These eccentrics carry two rods  $r$  and  $r_1$  diverging from each other at a slight angle and with their forward ends connected by the slotted, curved link  $L$ . The valve stem  $V$  has a block or pin which connects it to the link by means of a sliding fit in the slot. If the link be lifted so that the rod  $r$  lies nearly in line with  $V$ , then the valve receives its motion merely as if driven directly by the single eccentric  $E$ ; if the link be lowered so that rod  $r_1$  lies nearly in line with  $V$ , then the valve acts practically as if driven by the single eccentric  $E_1$ . Now, eccentric  $E_1$  being set for forward motion of the engine and eccentric  $E$  being set for backward motion, it will be seen that the movement of the link gives a ready means for reversing the engine. It does more than this, however, since by putting the link in intermediate positions between full forward and full backward gear the cut-off of the valve can be adjusted for expansive working of the steam. The train of levers  $v, w, x, y$ , and  $z$  in Fig. 7 shows the means of operating this link in an ordinary locomotive engine.

The governor of a steam engine is a device whose function is to regulate the energy developed in accordance with the load propelled. If the admission and pressure of the steam be constant, the speed will vary as the load varies; with a light load the speed will be high and with a heavy load it will be slow. These fluctuations in speed are always undesirable and may easily become dangerous. Governors act to regulate the energy in two ways, first by cutting off steam from the boiler as the speed increases, which amounts to a reduction in boiler pressure in the cylinder, and second by reducing the quantity of steam admitted into the cylinder. The first are called *throttling governors* and the

FIG. 8.

second are called *cut-off governors*. Governors are also classified according to their method of action and according to their form. The most common form of governor is the fly-ball or pendulum governor, which may operate either by throttling or by cut-off action. The diagram (Fig. 8) shows a form of pendulum governor. The stem or shaft,  $S$ , is given rotary motion by means of a belt embracing the pulley,  $P$ . Keyed to the top of the shaft is the plate  $a$ , carrying, by means of the arms  $b$  and  $b_1$ , the heavy balls  $c$  and  $c_1$ , and hung to the arms  $b$  and  $b_1$  are the arms  $d$  and  $d_1$  which connect with the plate  $e$ , which is free to slide up and down the shaft  $S$ . The balls and their connecting arms revolve with the shaft, and because of the familiar law of centrifugal force they tend to fly apart as the speed of rotation increases and to come closer together as this speed decreases. As the balls fly apart, through increased speed, they lift the plate  $e$ , and this operates the train of levers  $x, y$ , and  $z$  in such a way as either to shut off steam from the boiler or from the cylinders. That is, as the speed increases the energy is decreased, and conversely as the speed decreases the energy is increased. In this way the energy is proportioned to the load at every instant, the exactness with which this proportion is maintained depending upon the sensitiveness of the governor.

The *transmission mechanism* of a steam engine consists of the piston rod, the crosshead, and the connecting rod. The duty of the *piston rod* is to convey the energy developed by the piston outside of the cylinder so that it may be transmitted to the crank shaft or flywheel. At its inner end the piston rod is attached rigidly to the piston at its centre and at its outer end it is rigidly attached to the crosshead. The rod passes out of the cylinder through an orifice in its front end, this orifice being so constructed that it is steam-tight. It is due largely to the fact that a circular orifice is more easily made steam-tight than any other form that the piston rod is universally cylindrical in form. The *crosshead* is the connecting link which permits the rectilinear motion of the piston rod to be transformed into the swaying motion of the connecting rod. The manner in which it accomplishes this is clearly shown by Fig. 9, which is a sec-

FIG. 9. SECTION OF CROSSHEAD.

tion through a familiar make of crosshead. The piston rod coming from the right is rigidly attached to the crosshead by a threaded connection, while the connecting rod is connected by means of a horizontal pin, so that it can swing up and down. The top and bottom of the crosshead are planed smooth and fit a groove or track in the upper and lower guides. These guides are a part of the engine frame, and serve to prevent any vibration of the outer end of the piston rod due to the swaying motion of the connecting rod. The connecting rod is commonly a rectangular or cylindrical bar having at each end a circular bearing, one to embrace the crosshead pin and

the other to embrace the crank pin. Fig. 10 shows the construction described. The articles CRANK and FLYWHEEL describe the construction and functions of these parts of the engine's mechanism, and they will not be mentioned further. In concluding this section reference may be made to Fig. 11 as showing in a very plain

FIG. 10. CONNECTING ROD (TOP AND SIDE VIEWS).

manner the character and relation of the several structural details which have been described individually. In this engraving the different parts are designated by letters as follows: The engine frame, *A*; the cylinder, *B*; the piston rod, *C*; the crosshead, *D*; the connecting rod, *E*; the crank, *F*; the flywheel, *G*; and the governor, *H*.

The first practical use of importance to which steam engines were put was the pumping of water, and the *pumping engine* still remains one of the principal forms of the steam engine. (See PUMPS AND PUMPING MACHINERY.) The modern form of *mill engine* is the horizontal direct-acting flywheel engine, in which the power is taken from the flywheel and transmitted to

which can be used for dynamo driving or other high-speed work, is shown by Fig. 11. A third type of stationary engine is the *hoisting engine* which in its smaller sizes combines a vertical steam boiler and a duplex horizontal or vertical engine in one machine. Such engines do not have a flywheel, but connect directly with a

crank shaft which drives the drum upon which the hoisting rope is wound. Hoisting engines of larger size have separate boilers and often operate as many as eight separate drums. The largest sizes of hoisting engines are those used in raising ore from

deep mine shafts. These mine hoists have capacities of from 2000 to 5000 horse power. Like the smaller sizes, they are either duplex vertical or duplex horizontal engines. A duplex engine consists of a right-hand and a left-hand engine, both of which couple to the same crank shaft. They are to be distinguished from cross-compound engines, which have a similar appearance structurally, by the important fact that each half of the machine is distinct from the other half so far as the use of the steam is concerned. In direct-acting mine hoists the drum or drums are mounted directly on the crank shaft; in general hoists the crank shaft drives a separate drum shaft by means of

FIG. 11. SMALL HIGH-SPEED HORIZONTAL ENGINE.

shafting by means of belts. (See BELT; POWER, TRANSMISSION OF.) For mill engines of large size present practice favors compound engines; simple engines are used when the unit of power which is required is small. A horizontal simple engine of comparatively small size,

gearing. A fourth form of stationary engine is the *rolling-mill engine*, used for driving the trains of rolls in rolling mills. (See ROLLING MILL.) This is usually a horizontal simple engine of large size and especially sturdy construction. The largest stationary steam engines now

used in any form are those employed for driving the generators of electric-power plants. The present limit of size in a single unit has been set at 10,000 horse power, which will have a low-pressure cylinder in the multiple expansion system of 110 inches diameter and six-foot stroke, or two low-pressure cylinders of about 84 inches diameter. These will often be arranged to have their exhaust steam drive low-pressure condensing steam turbines (q.v.). Modern engines are also operated where possible with superheated steam; i.e., steam carrying a temperature in excess of that due to its pressure, so as to diminish losses due to condensation in the process of expansion. Very notable economies have been secured in a combined design of engine and boiler, made in one unit, and known as the Locomobile arrangement. The steam is superheated by passing it in a coil of piping in the currents of hot gases from the furnace, and the short connections reduce losses between boiler and engine which are present in less compact arrangements. A design of engine cylinder has been advanced, in which the flow of the steam masses into the cylinder on admission and out of it upon exhaust is maintained with minimum changes of direction with their attendant losses. Such designs are called Uni-flow Engines. A sixth important form of steam engine is the steam-driven air compressor described in the article AIR COMPRESSOR.

Engines other than stationary fall into one of two great classes, viz., locomotive engines for railways and marine engines for ship propulsion. The *traction engine* is essentially a locomotive engine designed to run on common roads, and the *portable engine* is practically a stationary engine and boiler plant of small size mounted on wheels so that it may be hauled from place to place. The growth and construction of the *locomotive engine* are described in the article LOCOMOTIVE. *Marine engines* fall into two separate classes. For paddle-wheel boats the beam engine and the inclined engine are universally employed. For screw-propelled vessels the inverted vertical direct-acting engine is almost universal. (See SHIP AND SHIPPING, *Power Navigation*.) For a discussion of the theory of steam engines and heat engines in general, see STEAM; THERMODYNAMICS. For descriptions of special applications of steam engines, see VULVING MACHINES; FIRE ENGINE; MOTOR VEHICLE.

**STEAM ENGINEERING, BUREAU OF.** One of the bureaus of the United States Department of the Navy. It was established by Act of Congress of July 5, 1862, and Benjamin F. Isherwood, engineer in chief of the navy, became its first chief. It has charge of all matters con-

nected with the propelling and other machinery of naval vessels except such as may be specifically assigned to the bureaus of Ordnance and Construction and Repair. The propelling machinery (including boilers) is either designed by officers attached to the Bureau of Steam Engineering, or the design is passed upon and approved by the bureau before the construction or purchase is authorized. The chief of the bureau, who is also engineer in chief of the navy, is selected by the President from the line (i.e., executive) officers of the navy and has the rank of rear admiral while serving in this capacity. See ENGINEER, NAVAL; NAVY, DEPARTMENT OF THE.

**STEAMER DUCK, LOGGERHEAD, or RACE-HORSE.** A very large duck (*Tachyeres cinereus*), numerous about the southern extremity of South America, so called on account of its peculiarity of rowing itself along the surface of the water at great speed. This is said to be due to the remarkable fact that this bird loses its power of flight when it reaches maturity.

**STEAM FITTING.** The trade and business of fitting and setting the pipes, connections, valves, and fixtures required in a building for its heating or its steam machinery. It forms a distinct branch of the trades connected both with steam machinery and with building, though sometimes allied with the similar operations of gas fitting.

**STEAM HAMMER.** See HAMMER.

**STEAM HEATING.** See HEATING AND VENTILATION.

**STEAM NAVIGATION.** The earliest suggestion of steam navigation is believed to have come from Roger Bacon, and from the thirteenth century until the end of the eighteenth various schemes were proposed, the more important and significant of which are outlined under SHIPBUILDING and SHIPS AND SHIPPING. Among the notable work which led to the practical development of the steamboat was that of John Fitch (q.v.) in America, Patrick Miller (q.v.) in Great Britain, and others, chief among whom was Robert Fulton (q.v.), who in 1807 made a successful trip in the *Clermont* from New York to Albany, while in Great Britain Henry Bell (q.v.) completed the steamboat *Comet* early in 1812, this being the first steam passenger vessel built in Europe. It sailed regularly between Glasgow and Greenock, the port at which it was built. To Bell, who built other boats in 1815, is due the inauguration of steam navigation in British waters. In America, Fulton was followed by John and Robert L. Stevens, the latter employing in the steamship *Phoenix* feathering paddle wheels, and by 1830 there were 86 steamers on the Hudson River and in Long Island Sound, in addition to a large number in service on the Great Lakes and in western waters. As discussed under MERCHANT MARINE (q.v.) transatlantic steam navigation was inaugurated with the voyage of the American steamship *Savannah*; while two British vessels, the *Great Western*—a paddle-wheel steamer of 1340 tons, 450 horse power, with wheels 28 feet in diameter and 10 feet in breadth of face—and the *Sirius*, sailing in 1838, marked the beginning of regular transoceanic service.

By 1850 the steam tonnage of the United Kingdom had amounted to 168,474 tons, which increased as follows by decades: 1870, 1,112,934; 1880, 2,703,468; 1890, 5,042,517; 1900, 7,207,610; 1910, 10,442,719; 1915, 19,235,705.

VERTICAL STEAM ENGINES DIRECT CONNECTED TO ELECTRIC GENERATORS  
1. 6,000 Horse-power Poppet Valve Westinghouse Cross-compound Engine.  
2. 5,000 Horse-power Westinghouse-Corliss Cross-compound Engine.

In the United States the steam tonnage was as follows: 1830, 74,472; 1840, 202,339; 1850, 525,947; 1860, 867,937; 1870, 1,075,095; 1880, 1,211,558; 1890, 1,859,088; 1900, 2,657,797; 1910, 4,900,361; 1915, 5,943,810. See UNITED STATES, *Shipping*.

In the development of steam navigation the design, construction, and operation of boilers and machinery, so as to secure ever-increasing efficiency and economy, was ever the object. The screw propeller (q.v.), first used with success on the United States steamer *Princeton* about 1841, began to figure as a rival of the paddle wheel as a mode of propulsion. By 1843 nearly 30 vessels were fitted with screws, and in 1845 the American screw steamship *Alacachussets* sailed for Liverpool. The screw propeller at this early date could operate with greater efficiency, and with less space for machinery there was more room for cargo. By 1850 the screw propeller was firmly established on all except shallow and inland waters, and by 1870 its triumph for deep-sea ships was complete.

In Fulton's early experiments on the Seine the water-tube boiler was employed, and Col. John Stevens, in a small steamboat completed in 1804, also used a water-tube boiler which developed later into the sectional steam boiler. Soon the return-tubular boiler was evolved, and better construction was secured, so that greater pressure could be withstood and the operation of the engine rendered more efficient. The water-tube boiler (see *BOILER* and *SHIPBUILDING*) is now one of the most approved types, although its supremacy has been disputed by the fire-tube boiler now more commonly found on steamships.

In the navigation of steam vessels, in addition to the proper operation of the steamship, the economy of the voyage became of increasing importance. As consumption of coal was the largest single expense, economy must be secured not only in design and construction of the ma-

young men for positions as officers in the merchant marine is an important matter, as no longer is it possible to secure properly qualified men from those forming the ordinary run of a working crew. Accordingly school ships or a system of cadet officers are maintained in most important maritime countries. See *BOILER*; *NAVIGATION*; *PADDLE WHEEL*; *SCREW PROPELLER*; and similar titles.

**STEAM PUMP.** See *PUMPS* AND *PUMPING MACHINERY*.

**STEAMSHIP.** See *MERCHANT MARINE*; *SHIP* AND *SHIPPING*.

**STEAM SHOVEL.** A modified form of dredge adapted for excavating material on dry land, as in railway or canal construction. The steam shovel was invented in 1840 by an American named Otis, but it did not come into general use until about 1865. As will be seen from the accompanying outline drawing, the steam shovel consists essentially of a strong frame mounted on wheels to form a base to which the working parts are attached. The large majority of steam shovels are mounted on cars which run on temporary track, but smaller sizes are in use where ordinary wide wheels are employed. The digging mechanism of a steam shovel consists of a boom hinged to a mast or support at the front end of the car, and a dipper handle and dipper carried by the boom. The operating machinery consists of a main engine, which hoists the dipper and swings the crane, and of a thrusting mechanism for forcing the dipper into the earth. The operation begins with the dipper at the position shown by the dotted lines in the illustration. The engineman begins to hoist and thus swing the dipper upward along a curved path; at the same time the crane by means of the thrusting mechanism forces the dipper into the earth so that a layer is scooped off the face of the bank and falls into the dipper. The depth of the cut is so regulated by the crane man that the dipper is just filled when at its topmost position. The dipper is then hauled back and the crane is swung so as to carry the dipper over the car set alongside the shovel, or over a spoil

SECTION SHOWING MECHANISM OF STEAM SHOVEL.

chinery, but also in the operation of the vessel; therefore the navigation of a steamship so that it would be remunerative to the owners, in addition to making safe and speedy voyages, required careful attention. The master of a modern steam vessel, while not usually a practical engineer, must have a moderate and accurate knowledge of steam engineering and at the same time be as good a navigator, both theoretically and practically, as was required in the old clipper-ship days. The training of

bank, and the latch is pulled, setting free the swinging bottom of the dipper, which falls open and empties the contents of the dipper. In actual operation these several movements are combined to a greater or less extent, and are accomplished by various devices. The various parts of the shovel, body, mast, boom, and dipper handles are constructed either of wood or steel, the latter material being most generally used for the heavier types of shovels. The dipper is always made of steel or iron plates, and

its size or capacity varies from one to six cubic yards, but capacities of 1, 1½, 2, and 2½ yards are the ones most common. For digging blasted rock the front edge or lip of the dipper has steel teeth. The excavating capacity of steam shovels varies from 2400 cubic yards of sand to 600 cubic yards of loose rock per 10 hours, with a 2½ cubic-yard dipper, while one large steam shovel weighing 310 tons, with a 75-foot boom and a six cubic-yard dipper, had a capacity of 5800 cubic yards of material in eight hours.

The steam shovel found extensive application in the excavation of the Panama Canal, and is used with high efficiency in the removal of iron ore in the open mines of the Lake Superior region or for stripping the overburden of the shallow coal seams of Kansas and other Mid-western States. For information as to developments in steam-shovel design and operation the current files of the engineering press should be consulted as well as the technical reports of such works as the Panama Canal. The catalogues and other printed matter of the manufacturers of this class of machinery contain much information.

**STEAM TURBINE.** A form of prime motor in which the kinetic energy of expanding steam acts upon a wheel provided with vanes so as to cause rotation. The ordinary method of using steam to obtain power is to admit it into a closed cylinder, where it acts upon a movable piston. (See STEAM; STEAM ENGINE.) In this case work is performed by the static expansive force of the steam pressing against the piston; in the case of the steam turbine the work is developed by the kinetic energy of the particles of steam which are given a high velocity by reason of the steam expanding from one pressure to a lower pressure. In the mōlpile (q.v.), or "Hero's steam engine," invented by Hero of Alexandria (q.v.), we have the germ of the steam turbine. The next steam turbine was invented by Branca in 1629 and consisted simply of a jet of steam impinging upon the vanes of a paddle wheel

perfect them, because of the possibilities and the remarkable advances made in the reciprocating engine. Dr. De Laval, of Sweden, was the first to make a practical application of the steam turbine, in 1883, by attaching it to his cream separator. Mr. (later Sir) C. A. Parsons, of England, built his first turbine in 1884. These two notable inventors gave a new impetus to

ACTION OF STEAM ON BLADES OF PARSONS'S TURBINE.

steam-turbine building, and many other forms have since been brought out. The first Parsons turbine developed 10 horse power at 18,000 revolutions per minute and proved entirely practical. This turbine consists of several successive turbine wheels, or rows of blades, on one drum or shaft within a concentric case having interior blades; the moving vanes or blades on the shaft are in circumferential rows projecting outwardly from the shaft and nearly touching the case, and the fixed blades on the casing are in similar rows, projecting inwardly from the case and nearly touching the spindle or shaft. This construction constitutes what practically amounts to a series of turbine wheels on one shaft, each one complete in itself, like a parallel flow or Jonval water turbine, through which the steam is forced to pass. The passageway in each successive turbine is also slightly larger than that in its predecessor, to allow for the increasing bulk of the elastic steam as it exerts its force on each turbine successively and expands with a consequent reduction of pressure. The steam in passing through the successive turbines transmits to each a rotative force, partly by impulse and partly by reaction, so that the Parsons

turbine involves the germinal principles of both the Branca turbine and Hero's engine. As the steam leaves any set of revolving blades, it is caught by the guide blades which so reverse its direction of motion that it will impinge properly on the next set of revolving blades. The notable feature of the Parsons turbine is the "compounding" of the steam, or its expansion in successive stages. The steam enters the first turbine at practically boiler pressure and passes from this to a second turbine, or set of turbines, of larger diameter, and from the second to third turbine still larger in diameter. There is a drop in pressure

SECTION OF PARSONS'S STEAM TURBINE.

and blowing it around. Branca's device was the first impulse steam turbine. In 1784 Wolfgang de Kempelen was granted a patent for a reaction turbine and, in the same year, James Watt patented a steam turbine. In 1843 Pilbrow patented a steam turbine working on the same principle as the one later brought out by De Laval. None of these was of actual commercial value, nor was any vigorous attempt made to

at each stage but an increase in velocity, both of which are allowed for by the increase in diameter. The end thrust due to the pressure of the steam on the blades is balanced by having a series of disks at the end of the shaft where steam is admitted, equal in diameter to the successive turbine steps and connected to them by steam passages, as shown in the illustration. The disks are separated by a

labyrinth packing. The revolving portion of the turbine is called the "rotor."

The De Laval turbine is a highly improved form of Branca's impulse turbine. Its rotor consists of a single wheel carrying suitably formed buckets and upon these steam from one or more nozzles impinges, the nozzles being at the side of the wheel and the buckets of such

ACTION OF STEAM IN DE LAVAL'S TURBINE.

SECTION OF NOZZLE OF DE LAVAL'S STEAM TURBINE.

shape as to take advantage of both the impulse and the reaction. In this turbine the expansion of the steam takes place in the nozzle, hence the necessity for having this of the proper form. The outer edge of the buckets is shrouded by a steel ring which prevents the centrifugal escape of the steam. These turbines, especially in the larger sizes, are equipped with several nozzles. As the velocity of the steam issuing from the nozzle exceeds 2500 feet per second, they are essentially of very high speed, the smaller sizes running at 30,000 revolutions per minute and the larger sizes at 10,000 revolutions per minute. A gear and pinion are used to reduce the speed to reasonable working velocities.

In the Curtis turbine, the rotor consists of a number of blade wheels set between stationary rings of guide blades, as in the Parsons, but differs from the latter in that the steam is admitted to the first turbine by a series of nozzles. The steam is expanded nearly to the exhaust pressure in the nozzles, so that few revolving wheels are required, and regulation is obtained by closing one or more nozzles. The shaft of the Curtis turbine is usually vertical and a special step bearing is provided to support the weight and the end thrust due to the steam pressure.

ACTION OF STEAM BLADES OF CURTIS'S TURBINE.

The end of the shaft rests on a film of oil that is under pressure so that the rotor turns almost without friction.

A turbine which is similar in design to the Pelton water wheel (q.v.) is called the Riedler-Stumpf turbine. It has buckets on the periphery of the rotor and a jet of steam from a rectangular nozzle impinges on these. As the steam leaves the buckets, it enters a passage in the casing by which it is led back to the rim of the

rotor on which it acts a second time. These machines are built with horizontal or with vertical shafts. An impulse turbine which uses stage expansion is the Rateau, invented by Professor Rateau, of France.

The usual velocity of the tips of the rotating blades of the several makes of turbines is as follows: Parsons, from 100 to 150 feet per second at the high-pressure end and 300 to 350 feet per second at the low-pressure end; Curtis, about 420 feet per second; Rateau, 350 to 400 feet per second; and in the De Laval and Riedler-Stumpf turbines, peripheral velocities exceeding 1000 feet per second are used.

The commercial use of the steam turbine is at present restricted to a limited number of lines. It is peculiarly adapted to driving electric generators, because of the high speed of rotation, convenience, compactness, and ease of regulation, and it is extensively used for this purpose. The rotor and its attached generator can be brought

CURTIS TURBINE OPERATING DYNAMO.

up to speed without the resistance of the load. The turbine does not work well for slow speeds nor for heavy resistances to be slowly started from rest. Many of the large power stations have been equipped with turbine-driven generators, and turbines can be economically applied to utilize the energy in steam exhausted from large reciprocating engines in such plants. The steam turbine is also very desirable for propelling ships because of its simplicity, lightness, compactness, and almost entire absence of vibration. Its disadvantages are the high rotative speed, delicate adjustments required, gyroscopic action, and lack of reversibility. When a screw propeller is run at the high speed developed by a steam turbine, it has a tendency to form a hollow, or cavity, in the water. This tendency is decreased as the speed of the ship increases, so that the turbine is better adapted for fast than

for slow vessels. The Parsons turbine was first used on the *Turbinia* as an experiment, and on a trial trip in 1897 this vessel made a speed of 34½ knots per hour. This wonderful performance induced the British Admiralty to build two torpedo destroyers, the *Viper* and the *Cobra*, the former making on her trial trip a speed of 36.58 knots. Since that time the marine turbine has been quite generally adopted for both naval and fast passenger vessels. An extra turbine is fitted to the propeller shaft, for driving the ship backward, and is run in a vacuum when the ship is going ahead. The small diameter of the propellers used with turbines permits the use of three, or even four, propellers. The greatest development of the steam turbine has been in the central electric station. Units of 10,000 kilowatt capacity before referred to have been succeeded by 20,000 and in 1915 by a 35,000 kilowatt-capacity machine for use in Philadelphia. The largest reciprocating unit yet found practical has 10,000 kilowatt capacity.

**Gas Turbines.** Many attempts have been made to build a turbine using as a motive power the gases obtained by burning or exploding a charge similar to that used in an internal-combustion engine. Such a turbine would use the energy of the fuel as directly as possible, and should be very efficient. Practically all the forms of turbines which are used with steam have been tried for gas turbines and proved unsuccessful. The gases are extremely hot and cause very rapid deterioration of the machine and do not seem to give up their heat energy in passing through the turbine. A small gas turbine, similar to the De Laval steam turbine, run at 19,000 revolutions per minute, developed three-brake horse power, but an expenditure of four horse power was required to compress the air for combustion; hence there was a loss of one horse power.

The large steam turbines are far more economical than the small ones and, when of more than 1000 horse power, are usually more economical than reciprocating engines. The economy is greatly increased by superheating the steam, and a very high vacuum, or a very low back pressure, must be maintained for the exhaust. There is no way of applying an indicator to the steam turbine so that the power delivered by the shaft, i.e., the brake horse power, is the standard for comparison. In turbines using nozzles, the shape of these has a great influence on the efficiency of the turbine.

**STEARIC** (stê-är'ik) **ACID** (from Gk. *stéar*, *stear*, tallow),  $C_{17}H_{35}COOH$ . One of the solid fatty acids. It exists as a glyceride (stearin) in most fats, and is especially abundant in the more solid kinds, such as mutton suet. The

stearic acid of commerce is a mixture of stearic and palmitic acids. Pure stearic acid may readily be separated from this by dissolving in hot alcohol and precipitating with a hot alcoholic solution of magnesium acetate, the precipitate being practically pure stearate of magnesium; in this reaction, one part, by weight, of magnesium acetate should be employed for every four parts of commercial stearic acid treated. Magnesium stearate thus obtained is decomposed by boiling with hydrochloric acid, and the stearic acid set free is further purified by recrystallization from alcohol. Pure stearic acid is a colorless crystalline substance having neither taste nor odor; it melts at 69.2° C. (157° F.), is insoluble in water, on which it floats, but dissolves in alcohol and ether, its solution reddening litmus. It may be distilled under diminished pressure. The only stearates soluble in water are stearates of the alkalies, whose solutions are frothy and form a lather, but on the addition of an excess of water separate into an acid salt, deposited in silky crystalline plates, and the free alkali, or more probably a basic salt, which remains in solution. (See SOAP.) The stearates of the alkalies are soluble also in alcohol. Chloride of sodium (common salt) has the property of separating alkaline stearates from their aqueous solution. Free stearic acid has been found in decomposing pus and in the caseous deposits of tuberculosis. In adipocere and in feces stearic acid occurs in the form of its calcium salt; in blood, chyle, and in serous fluids, in the form of sodium salts. See CANDLE; FATS; OIL; SOAP.

**STEARIN** (from Gk. *stéar*, *stear*, tallow), or **TRISTEARIN**,  $C_3H_5(C_{17}H_{35}COO)_3$ . One of the chief constituents of fats. It is considerably harder than palmitin (q.v.) and less soluble than both palmitin and olein, the other characteristic constituents of natural fats. Stearin may be obtained in a tolerably pure state from mutton suet by repeated crystallization from ether. The only way to obtain it chemically pure is by synthesis: first, anhydrous glycerin is heated with an equal weight of stearic acid, the product being a compound called monostearin; the monostearin, freed from the excess of glycerin, is then heated with a further excess of stearic acid, and the product, tristearin, is carefully freed from the excess of stearic acid. Like palmitin and certain other triglycerides, it presents a remarkable peculiarity in liquefying: it melts first if heated to 55° C.; on further heating it resolidifies and melts again when 72° C. is reached. Stearin for commercial purposes is prepared on a large scale from beef suet, lard, cottonseed oil, etc., by chilling the rendered product to 50°–60° F. (10°–15° C.); holding the mass for some time to allow for graining and then pressing carefully in small quantities in cotton bags. The liquid portion squeezed out is sold as oleo-oil and used in the manufacture of butterine. The oleostearin press cake is blended with olein from various sources and marketed as compound lard. Since the hydrogenation of oils has become an important part of the fat industry, a number of synthetic stearin compounds have appeared on the market.

**STEARNS**, **FREDERIC PIKE** (1851– ). An American hydraulic engineer, born at Calais, Me. He was employed in the city surveyor's office, Boston, in 1869–72; was identified with the construction and maintenance of the Boston water supply in 1872–80 and of the main drain-

age works in 1880-86; and served as chief engineer of the Massachusetts State Board of Health from 1886 to 1895, and of the Massachusetts Metropolitan Water Works from 1895 to 1907. Stearns was a consulting engineer to the Charles River Basin Commission in 1903-10 and to the New York Board of Water Supply after 1905, and a member of the board of consulting engineers for the Panama Canal in 1905-06. He was a member of boards that made reports on water supply for Baltimore in 1908-09, and for Winnipeg in 1913. In 1906 he was president of the American Society of Civil Engineers.

**STEARNS, WILLIAM AUGUSTUS** (1805-76). An American clergyman and educator, born at Bedford, Mass. He was educated at Harvard and at Andover, and was ordained in the Congregational ministry in 1831. In 1854 he became president of Amherst College. His publications include *Discourses and Addresses* (1855), and *A Plea for the Nation* (1876).

**STEATITE.** See SOAPSTONE.

**STEBING, THOMAS ROSCOE REDE** (1835- ). An English naturalist. He was born in London and was educated at King's College, London, becoming a fellow of Worcester College, Oxford. In 1858-84 he was engaged in teaching, and thereafter devoted himself to literary and scientific pursuits. An important report was made by him on the Amphipoda of the Challenger expedition. He received a gold medal from the Linnean Society in 1908. He made a special study of crustacea, and besides contributing largely to reviews wrote: *Essays on Darwinism* (1871); *The Naturalist of Cumbria, a True Story, Being the Life of David Robertson by his Friend* (1891); *A History of Crustacea* (1893); *Amphipoda Gammaridea of Das Tierreich* (1906); *Australian Amphipoda* (1910); *Marine Investigations in South Africa* (6 parts, 1900-12); *Cumacea of Das Tierreich* (1913); *Marine Investigations in South Africa* (1910-15).

**STEBBINS, GEORGE COLES** (1846- ). An American evangelistic singer. He was born at East Carlton, Orleans Co., N. Y., and studied music at Rochester, N. Y., Chicago, and Boston. He began his musical career in Chicago in 1869, and after directing Church music in Boston for two years took up evangelistic work under D. L. Moody in 1876. With Ira D. Sankey and James McGranahan he was joint author of many gospel hymns and selections for male chorus, male quartet, etc., and alone he prepared *The Northfield Hymnal* (1904).

**STEBNITSKY, stëb-nit'skî.** See LIESKOV, NIKOLAI SEMIONOVITCH.

**STECCHETTI, stë-kët'të, LORENZO.** See GUERRINI, OLINDO.

**STEDMAN, CHARLES** (1753-1812). An English military historian, born at Philadelphia. He was educated at William and Mary College and studied law. At the outbreak of the Revolutionary War he adhered to the crown. He served with the British at Lexington and Bunker Hill, later became commissary to the army of Sir William Howe, and later was with Cornwallis in the South. In 1783 he settled in England. He published a *History of the Origin, Progress, and Termination of the American War* (2 vols., 1794), which remains the best contemporary account of the Revolution from a British standpoint, and is of value for its military maps. It called forth from Sir Henry Clinton a reply: *Some Observations upon Mr. Stedman's History* (1794).

**STEDMAN, EDMUND CLARENCE** (1833-1908). An American poet, critic, and essayist, born at Hartford, Conn., and educated at Yale. In 1852 he entered journalism as editor of the Norwich (Conn.) *Tribune* and the following year he became editor of the Winsted (Conn.) *Herald*, on which he remained till 1855. He then went to New York and in 1859-61 was on the staff of the New York *Tribune*. At the outbreak of the Civil War he was sent to the front by the New York *World* as war correspondent, and there continued till 1863. As opportunity offered, he studied law and was for a time private secretary to Attorney-General Bates at Washington. In 1864 he was interested in constructing and financing the Union Pacific Railroad. From 1865 till 1900 he was a member of the New York Stock Exchange (a *History* of which he published in 1905-06, with A. N. Easton). He delivered the first Turnbull lectures on poetry at Johns Hopkins (repeated at Columbia and the University of Pennsylvania and was one of the original members of the American Academy of Arts and Letters. His chief volumes of verse are: *Poems, Lyrical and Idyllic* (1860); *Alice of Monmouth: An Idyll of the Great War* (1864); *The Blameless Prince* (1869); *Hawthorne and Other Poems* (1877); *Lyrics and Idylls* (1879); and *Poems Now First Collected* (1897). His critical works, *The Victorian Poets* (1875), *The Poets of America* (1885), *The Nature and Elements of Poetry* (1892), were supplemented by *A Victorian Anthology* (1895) and *An American Anthology* (1900). In 1911 appeared *Genius and Other Essays*. Stedman edited, with Ellen M. Hutchinson, *A Library of American Literature* (11 vols., 1888-90); and, with George E. Woodberry, the *Works of Edgar Allan Poe* (10 vols., 1895). After the death of Lowell, Stedman had perhaps the leading place among American poets and critics. Consult Stedman and Gould, *Life and Letters of Edmund Clarence Stedman* (2 vols., New York, 1910); also William Winter, *Old Friends* (ib., 1909).

**STEDMAN, ELIZABETH CLEMENTINE** (Mrs. WILLIAM BURNET KINNEY) (1810-89). An American writer, a sister of William E. Dodge and the mother of Edmund Clarence Stedman (qq.v.). She was born in New York City and was married first to Edmund B. Stedman (died 1835), a Hartford merchant, and in 1841 to William Burnet Kinney (q.v.). She was contributor to the *Knickerbocker* and to *Blackwood's*. During a 14-years' stay in Europe she was a friend of the Brownings. She published *Felicita, a Metrical Romance* (1855); *Poems* (1867); and *Bianca Capello, a Tragedy* (1873).

**STEED, H. WICKHAM** (1871- ). An English journalist and author. He was educated at Sudbury grammar school and at the universities of Jena, Berlin, and Paris. He was acting correspondent of the London *Times* at Berlin in 1896, and correspondent of the same journal at Rome in 1897-1902 and at Vienna in 1902-13. In 1914 he was appointed its foreign editor. He published: *The Socialist and Labour Movement in England, Germany, and France* (1894); *The Hapsburg Monarchy* (1913; 2d ed., 1914; French ed., 1914).

**STEEDMAN, CHARLES** (1811-90). An American naval officer, born at Charleston, S. C. He was appointed a midshipman in the navy in 1828, and served in the Mexican War at Vera Cruz and at Tampico. From 1847 to 1855 he was attached to the United States Naval Observ-

atory at Washington, attaining the rank of commander in 1855; in 1859 he commanded the *Dolphin* in the Paraguay expedition. He was loyal to the Union during the Civil War, taking part in DuPont's attack and capture of Port Royal, and in the capture of the Savannah forts. In October, 1862, he captured Confederate batteries at the mouth of the St. John's River, Fla. In 1865 he commanded the Mediterranean squadron, and in 1866 was made a commodore. He commanded the Boston Navy Yard from 1869 to 1872, became a rear admiral in 1871, and was retired in 1873.

**STEEDMAN, JAMES BARRETT** (1818-83). An American soldier, born in Northumberland Co., Pa. In 1837 he settled in Ohio. In 1856-60 he was printer to Congress. He led the Fourth Ohio Volunteers at the battle of Philippi, became a brigadier general, and at Perryville brought up his troops just in time to fill a gap in the Federal battle line. At Chickamauga he led the vanguard of Granger's reserve corps to Thomas's aid on the second day. He served under General Sherman during the Atlanta campaign and then rejoined Thomas at Nashville. He resigned from the service in 1866 with the rank of major general of volunteers. During Johnson's administration he was collector of internal revenue at New Orleans, and in 1879 he was elected to the Ohio State Senate.

**STEEL.** See IRON AND STEEL; METALLOGRAPHY.

**STEEL, FLORA ANNIE (WEBSTER)** (1847- ). An English novelist, born at Harrow. In 1867 she married and went to India, where she lived till 1889. She was for some time inspectress for the government and aided schools in the Punjab. While in India she published, in conjunction with Lieutenant Colonel Richard Temple, a collection of Punjab folk tales, under the title *Wide Awake Stories* (1884). After her return to England she wrote novels and short stories illustrative of Anglo-Indian life. Among her writings are: *Miss Stuart's Legacy* (1893); *Tales from the Punjab* (1894); *On the Face of the Waters* (1896); *Voices in the Night* (1900); *The Hosts of the Lord* (1900); *In the Guardianship of God* (1903); *Book of Mortals: A Record of the Good Deeds and Qualities of the Lower Animals* (1906); *King Errant* (1912); *The Mercy of the Lord* (1914).

**STEEL CONSTRUCTION.** See BRIDGE; STEEL SKELETON CONSTRUCTION; TRUSS.

**STEELE**, štä'le. A town in the District of Essen, Prussia, 4 miles east of Essen, on the Ruhr River. In the town are sandstone quarries, coal mines, gristmills, brickkilns, distilleries, breweries, gas works, and water works. Pop., 1900, 12,243; 1910, 14,487.

**STEELE**, stēl, ANNE (1717-78). An English hymn writer, the daughter of a lay Baptist preacher living at Broughton in Hampshire. Her life mainly passed quietly in her native shire. In 1760 appeared her devotional *Poems*, reissued with additions, and a memoir by Dr. Caleb Evans (3 vols., Bristol, 1780). Many of her hymns are in common use. Consult her *Hymns, Psalms, and Poems*, edited with memoir by J. Sheppard (London, 1863).

**STEELE, DANIEL** (1824-1914). An American Methodist Episcopal theologian, the father of Wilbur F. Steele. He was born at Windham, N. Y., and graduated from Wesleyan University in 1848. In 1850 he entered the ministry, joining the New England Conference of his church,

and afterward held various pastorates. He was professor in Genesee College, Lima, N. Y., from 1862 to 1871, and in 1872 the first president of Syracuse University. In 1884-92 he held different chairs in Boston University School of Theology. He contributed to the Whedon series of Commentaries, and published *Love Enthroned* (1875); *Milestone Papers* (1878); *Half Hours with St. Paul* (1895); *The Gospel of the Comforter* (1897); *Jesus Exultant* (1899); *A Substitute for Holiness, or Antinomianism Revealed* (1899); *Half Hours with St. John's Epistles* (1901); *Steele's Answers* (1912).

**STEELE, JOEL DORMAN** (1836-86). An American educator, born at Lima, N. Y., and educated at Genesee College. He was severely wounded at the battle of Seven Pines. Afterward he was principal of the Newark, N. Y., High School in 1862-66, and of the Elmira Academy in 1866-72. In 1866 he published a popular text book entitled *Fourteen Weeks in Chemistry*. Its success led to a series of books, intended for terms of fourteen weeks: *Astronomy* (1868), *Natural Philosophy* (1869), *Geology* (1870), *Human Physiology* (1873), and *Zoology* (1875). With his wife, Esther B. Steele, he wrote a successful series of school histories known, from the publisher's name, as *Barnes' Brief Histories*. He bequeathed \$50,000 to Syracuse University to found the Steele chair of theistical science.

**STEELE, SIR RICHARD** (1672-1729). An English essayist, playwright, and politician, born in Dublin. In 1684 he was sent to the Charterhouse School, where he formed a memorable friendship with Addison. In 1690 he was enrolled at Christ Church, Oxford, but he passed to Merton College (1691). In 1694 he left Oxford without a degree, and enlisted in the Life Guards. An elegy which he wrote on the death of Queen Mary (December, 1694), wisely dedicated to Lord Cutts, Colonel of the Coldstream Guards, led eventually to a captaincy (1702) in the regiment. "Finding the military life exposed to much irregularity," Steele wrote *The Christian Hero* (1701), a moral treatise for his own guidance. It was not taken seriously by his associates, and seems to have had little effect on its volatile author. He now wrote three comedies: *The Funeral* (1701); *The Lying Lover* (1704); and *The Tender Husband* (1703). Though rather too deliberate in their moral purpose, they contain much delightful wit. After some vain searches, it was said, for the philosopher's stone, he married (1705) a Mrs. Stretch, who owned an encumbered estate in Barbados. She died about a year after the marriage. In 1706 Steele became gentleman waiter to Prince George; in 1707 he was appointed gazetteer, and seems to have left the army. The two positions brought him £400 a year. He now secretly married Miss Mary Scurlock, of Llangunnor, in Wales, who figures as Prue in his curious letters. He took a house in Bury Street, and lived far beyond his means. The death of Prince George in 1708 put an end to his place at court, and three years later he lost his gazetteership. But he was appointed commissioner of stamps in 1710, a post with £300 a year. Meanwhile (April 12, 1709) had appeared the *Tatler*, a tri-weekly containing sketches and short essays on manners, written under the pseudonym of Isaac Bickerstaff. The periodical came to an end on Jan. 2, 1711, and was succeeded on March 1 by the more famous *Spectator*. Though the plan of these papers was Steele's, Addison had contrib-

uted to the *Tatler*, and Addison now became the more important figure. When the *Spectator* suspended publication on Dec. 6, 1712, Steele had written 236 papers and Addison 274. The *Guardian*, started March 17, 1713, was followed by several other short-lived periodicals, of which the most noteworthy is the *Englishman*. In these later undertakings Steele, a strong Whig, involved himself in political controversy, and was handled without mercy by Swift. He resigned his commissionership of stamps and entered Parliament, but he was expelled (March, 1714) for seditious libel contained in *The Crisis*, a pamphlet in favor of the Hanoverian succession. On the accession of George I Steele was again elected to Parliament (1715). He also secured the patent of Drury Lane Theatre (worth £1000 a year), for which he wrote his last comedy, *The Conscious Lover* (produced 1722). Broken in health, he passed his last years at Carmarthen, in Wales, where he died, and was buried there in St. Peter's Church.

Steele was improvident, generous, lighthearted. As a poet he won no place. His political pamphlets interest, but do not convince. His comedies are still read for wit and gaiety in special scenes. As an essayist he has often been compared with Addison. The latter was a stylist. Steele composed off-hand with less attention to form. But he preceded Addison and thus became the father of the essay and sketch dealing with contemporary manners, which by Fielding was transformed into the novel. See ADDISON, JOSEPH.

Consult the excellent biographies of Steele by Aitken (London, 1889) and by Dobson, in "English Worthies" (ib., 1886); Thackeray, *English Humourists* (ib., 1853; new ed., New York, 1911); *The Spectator* (London, 1898); *The Tatler* (ib., 1899); and *Plays* ("Mermaid" series, ib., 1893), all admirably edited by G. A. Aitken.

**STEELE, SAMUEL BENFIELD** (1849- ). A Canadian soldier, born at Purbrook, Ontario, and educated at the British American Commercial College, Toronto. He studied at the Royal Military School there, served during the Fenian Raid in 1866, and with Colonel (afterward Field Marshal Viscount) Wolseley (q.v.) in the Red River expedition in 1870. He joined the Royal Northwest Mounted Police in 1873, becoming inspector (1878), superintendent (1885), and later commissioner of police. In the forces employed in the suppression of the second rebellion under Louis Riel (q.v.) in 1885, Steele commanded a body of cavalry and scouts. He commanded the Royal Northwest Mounted Police during the rush of miners to the Klondike in 1898 and during the organization of the Yukon Territory. On the outbreak of the South African War (q.v.) he was put in command of Strathcona's Horse, served with distinction through the war, and was promoted colonel; he returned to Canada in 1906, and administered the tenth and thirteenth military districts (1907-10). On the outbreak of the European War in 1914, Steele rendered assistance in organizing the Canadian troops in Manitoba. In December, 1914, he was promoted brigadier general, with rank of major general, and was appointed inspector general for western Canada.

**STEELE, WILBUR FLETCHER** (1851- ). An American Methodist Episcopal theologian, son of Daniel Steele. He was born at Leominster, Mass. He graduated from Syracuse Uni-

versity (1872) and from Boston University School of Theology (1874), and studied at Berlin and Oxford. He entered the ministry in 1874. From 1881 to 1888 he was principal of Bennett Seminary in Greensboro, N. C.; from 1892 to 1899 was professor of biblical exegesis and acting dean of the Iliff School of Theology, Denver, and thereafter he was professor of biblical science in Denver University. While in North Carolina he secured the passage of the Savings Bank Law of the State.

**STEEL ENGRAVING.** See ENGRAVING.

**STEELHEAD** (from the color and hardness of the head), or **HARDHEAD**. The large sea trout or salmon trout of the Pacific Slope (*Salmo gairdneri*). It is found in coastwise streams from Santa Barbara Co., Cal., northward nearly to Alaska. It reaches a length of 30 inches. See SALMON.

**STEEL SHAPES.** Structural steel produced by a rolling mill in certain fixed shapes such as angles, I bars, tees, bulbs, etc. These sections are limited only by the fact that they must in each case be of uniform section throughout the length of the piece, and the fact that the roller grooves cannot be wider at the bottom than the top. The more common standard shapes are plates, flats, squares, rounds, half-rounds, angles, channels, I beams, Z bars, T bars, trough shapes,

STRUCTURAL STEEL SHAPES.

rails, and bulbs. In structural work these direct shapes are riveted together to form the various compound shapes used for columns for buildings, bridge members, etc. For further information consult the various engineers' pocketbooks and the handbooks of Carnegie Steel Company, and other manufactures. See BEAM; ROLLING MILL.

**STEEL SKELETON CONSTRUCTION.** In the words of municipal building codes, "A form of building construction wherein all external and internal loads and stresses are transmitted to the foundations by a rigidly connected framework of metal or reinforced concrete. The inclosing walls are supported by girders at each story."

**Development.** The employment of steel skeleton construction in the erection of tall buildings is due partly to the natural outcome of conditions imposed upon owners of property lying within the congested sections of large cities and partly to the introduction of new materials and devices. Neglecting the æsthetic considerations, the height of buildings has always been largely controlled by practical considerations of cost and utility, and until about 1870 these limited the height of buildings to five or six stories. Rapid increase in real-estate

tate values made it unprofitable to keep low buildings on valuable ground, as high rents would have to be charged in order to derive a fair return from the investment, so that owners were obliged to erect taller buildings to provide more room and obtain more rent.

The first result of the increase in the height of buildings was the invention of passenger elevators (see ELEVATOR), for tenants would not climb stairs above five or perhaps six stories. Elevators were employed in commercial buildings for the first time in 1868. Their gradual development and improvement in speed made vertical travel easy, and the erection of eight,

other incombustible materials, with floors in which wooden beams were not used. All columns, girders, and stairs also must be non-inflammable. (See FIREPROOF CONSTRUCTION.) This gave great impetus to the manufacture of structural iron and steel.

A new difficulty here presented itself. When buildings were erected over 10 stories in height, the outer walls and piers had to be made so thick at the base, in order to support safely the weight of the dead load of walls and floors and loads imposed thereon, that the valuable ground space occupied by them caused great loss of income on a narrow lot little more

FIG. 1. FLOOR PLANS OF TYPICAL SKELETON CAGE.

nine, or 10 story buildings became possible, and the problem of making real estate profitable was thus temporarily solved. Later, these 10-story buildings, in which the cheapest offices rented for \$2 per square foot of floor space, ceased to yield sufficient revenue in large cities owing to rapid rise in property values, so the building height had to be increased to 12 and 14 stories. It was soon discovered that these tall buildings, constructed with timber in the floors, stairs, and elevator wells, could not be controlled in case of fire. About 1880 many large cities made laws requiring buildings exceeding a stated number of feet in height (generally 85) to be fireproof, i.e., constructed with walls of brick, stone, iron, or

than an entrance hallway would be left between side walls on the lower floors. It became necessary to make the piers thinner, and various devices were employed to reduce their size. First (about 1888), columns were built in to receive the ends of the beams and girders and thus relieve the piers of floor loads. Finally it was discovered, in 1890, that the pier thickness could be still further reduced by relieving the piers of the weight of the walls; supporting the four walls on girders set between the wall columns at every floor level. This led to the modern method of construction known as *Steel Skeleton Construction*. It consists of a complete and well-connected framework of steel capable of carrying not only the floors and the roof, but

the outside walls and every other part of the building, and constructed with sufficient wind bracing to secure its independent safety under all conditions of loading and exposure.

The modern building constructed with a steel skeleton frame is quite a different structure from the old building with thick bearing walls. In the latter beams and columns were an adjunct to masonry work, but in the former the relation is reversed. The masonry walls are not needed for strength; they are divided into panels one story in height, and supported by the steel frame. As the walls carry no load, being merely a veneer or outside covering for the steel frame, commonly called "curtain walls," the different municipal codes permitted a reduction in their thickness. The saving in floor space resulting from the use of curtain walls may be seen from the following comparison. In a 12-story building, when the walls carry the floor loads they must be of the following thickness: 12th and 11th story, 16 inches; 10th and 9th, 20 inches; 8th and 7th, 24 inches; 6th and 5th, 28 inches; 4th and 3d, 32 inches; 2d and 1st, 36 inches. When curtain walls are employed, supported on the steel cage, they must be of the following thickness: 12th, 11th, 10th, 9th, 8th, and 7th story, 12 inches; 6th, 5th, 4th, 3d, 2d, and 1st story, 16 inches. This is a saving of over 3 feet in the width of a building. In a higher building the percentage saved is greater; this is one of the factors that has made the erection of 20-story buildings possible. If the Woolworth Building in New York City, the tallest commercial building in the world, had been erected in the old way, with bearing walls, they would have been required to be 10 feet, 4 inches thick. They are 3 feet, 8 inches thick.

**Materials.** It is not definitely known when and how iron was first used in the construction of buildings. Cast-iron columns and lintels have been in use for many years. The first wrought-iron beams and girders, which were of European manufacture, were imported into the United States about 1840, being used in connection with wooden beams. The first wrought-iron beams made in America were rolled at Trenton, N. J., in 1853, and the first steel beams were manufactured by Carnegie as late as 1885. Cooper Union in New York City, constructed about 1860, was the earliest structure in which iron beams were used throughout in the floor construction. Now buildings are entirely of steel, with riveted-steel columns and girders and rolled-steel beams, although cast iron is still used to some extent for columns and bases. Wrought iron has been entirely superseded by steel, which is not only stronger but cheaper, the manufacture of wrought-iron structural shapes having been abandoned in 1893. Continued improvements in the manufacture of steel have lowered the cost of production from about 20 cents per pound to one and one-half cents, the price in 1916, and, with the introduction of cheap structural steel, skeleton construction has come rapidly into use.

**Advantages.** The dimensions of the external piers cease to control the height of the building, which is now limited by the possibility of securing adequate foundations and by a consideration of the amount of floor space which could be devoted without too great a loss to a system of elevators of sufficient capacity to afford speedy access to all parts of the building. At the present writing 40-story buildings are not

uncommon, rising to a height of 600 or 700 feet above the curb. The advantages that resulted in the very rapid introduction of steel skeleton construction were not only the opportunity afforded for greatly reducing the size of the piers, but the enormous facilities afforded for rapid construction, the steel frame being erected at the rate of one story every three or four days. Other advantages are the comparatively small amount of materials used, the proportionally small load upon the foundations, and the fact that, as the walls are supported at each story directly on the frame, the masonry can be built at any story independently of the masonry below it, as shown in the accompanying Plate.

**Fabrication of Frame at Mill.** All the members of a steel skeleton frame are prepared at the mill and shipped to the site ready for assembling. Rolled beams are used for floors, and the columns and girders are built up of plates, angles, channels, and other rolled sections (Fig. 4). These are cut to exact lengths at the mills and then either punched or drilled for the rivet and bolt holes required for assembling the different sections of a built-up member and for connecting the different members at the building. Drilled holes are superior to punched holes, as they can be accurately located and do not weaken or injure the material, but they are more expensive to make and are therefore confined to the connecting ends of members which are to be joined at the site and where a perfect alignment of rivet holes is necessary. After having been punched, the sections are assembled, the rivet holes being drilled or reamed out wherever the alignment is not perfect, and finally riveted together. The rivets are of mild steel usually  $\frac{3}{4}$  inch,  $\frac{7}{8}$  inch, or 1 inch in diameter and are made with one head forged, the other being formed by the riveting machine. The rivet is first raised to a red heat, after which it is placed in the hole passing through the different sections to be joined. The machines used for riveting, operated usually by compressed air or hydraulic power, consist of two large arms, one of which holds the head of the rivet firmly against the member, and the other pressing in the opposite direction forces the sections closely together, while at the same time a ram moving in the direction of the axis of the rivet forces the hot metal to fill the hole, and forges the other head on the projecting end of the shank. This is known as "shop riveting" to distinguish it from "field riveting" which is done by hand at the building. As machine riveting is stronger and more economical than hand riveting, as much of it as possible is done at the shop and only the connection rivets are driven in the field.

Because of the danger of fracturing a casting under the blows of a punch and riveting machine, holes in cast-iron members must be drilled and the connections made by means of bolts. A bolted connection can never be made as stiff or as rigid as a riveted one, hence this is one of the reasons for not using cast iron in skeleton frame construction.

Prior to assembling, all steel sections are cleaned from rust, scale, and dirt, thoroughly dried, and then given one coat of linseed oil, metallic paint, or some other protective coating to preserve the metal from rust. After erection the entire frame is then given two or three additional coats. The members are now shipped to the building for erection.

**Bases.** If a heavily loaded column were to be placed directly upon a wall or pier of masonry, the weight would be distributed over such a small area that there would be danger

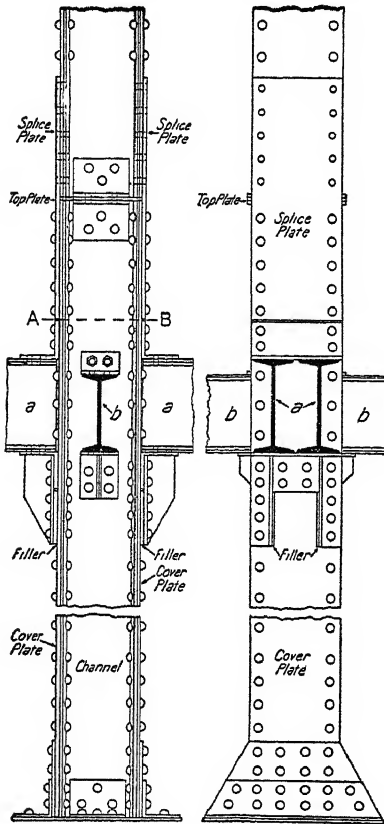

FIG. 2. BUILT-UP STEEL COLUMN.

of crushing the wall or pier. To prevent this it is necessary to place a bearing plate or base between the column and the masonry which distributes the weight over a larger area. Bases may be of cast iron, as shown in Fig. 4, or of steel, as shown in Fig. 2. Cast-iron bases, known as ribbed bases, consist of two flange plates, one supporting the column and the other resting on the masonry, connected by a core, or web, having vertical braces or ribs carried from the upper flange to the corners of the lower flange and

FIG. 3. BUILT-UP STEEL COLUMNS—SECTIONS.  
(See Fig. 2.)

to all sides, in order to stiffen the lower flange and prevent it from shearing or bending. These are generally used with masonry foundations. When the foundations consist of grillage beams (see FOUNDATION), the bases are generally

of steel (Fig. 2), being composed of plates and angles riveted to the shell of the column.

**Columns.** Both cast-iron and steel columns are used in skeleton frames. The most economical form of cross section for a cast-iron column is a hollow circle. This form is generally used for interior columns, but for exterior columns it is not so desirable, because it cannot be bonded into the walls so readily, nor does it present the same facilities for the design of the beam and girder connections, as some of the other forms of cross sections do. The next column in economy of cross section is the hollow square. It is generally used for wall columns, being easier to bond into the masonry than a circular section. The H-shape column ranks third in regard to economy of cross section. It is particularly well adapted for wall columns in skeleton construction because when built into brick walls the masonry fills all voids, the projecting flanges tie and anchor the walls to the frame, and, if placed perpendicular to the length of the wall, only the outside edges are near the outer face. Moreover, lugs and brackets for beam and girder connections can be cast upon such columns better than upon circular columns, especially for wide and heavy girders, and, finally, the column connections do not require projecting rims or flanges, which are often in the way on circular columns. As before mentioned, because of the impossibility of making riveted connections with cast-iron columns, they should not be used in skeleton frames subject to lateral vibration.

Steel or built-up columns are composed of standard rolled sections such as channels, plates, and angles riveted together, the various combinations being almost unlimited. Arranged in the order of their simplicity of construction, i.e., the number of rows of rivets they contain, they rank as follows in point of economy: I beam and Bethlehem H columns, no rivets; plate columns, composed of four angles riveted to a central web, two rows of rivets; channel columns (Fig. 2), composed of two channels riveted to side or flange plates, four rows; and box columns, composed of four plates and four angles riveted together with eight rows of rivets. There are other considerations, however, than economy of construction, which sometimes govern the selection of a column. Some of these are (a) the cost and availability of the material. In this respect I beams, channels, plates, and angles are the most economical sections. Patented sections, such as the Bethlehem, as a rule are not so economical. (b) The amount of labor required to assemble the column in the shop and to make the beam and girder connections at the building. In this respect the Bethlehem column probably leads. (c) The distribution of the material in the column so as to give the maximum strength with the least area of cross section. From this standpoint the channel and box columns are superior. (d) The facility with which connections may be made between the column and the beams and girders which it supports. In this respect, also, sections of an open construction such as the Bethlehem and plate and angle are superior to a closed section such as the channel and box column. Other minor considerations are the facility with which the thickness of the metal in the different sections composing the column can be reduced in order to meet the reduced loads of the upper floors, and, finally, the facility with which the

column can be fireproofed. (See FIREPROOFING.) Steel columns are always connected by means of splice plates and angles, as shown in Fig. 2.

**Beams and Floor Construction.** The floor construction of a skeleton building consists of a series of arches or slabs of concrete or terra cotta (see FIREPROOF CONSTRUCTION, Figs. 1-5) laid between steel I beams. The spacing of the beams depends upon the kind of arch used, but it may be said to average 5 feet for terra cotta and somewhat more for concrete. The arrangement of the floor beams is determined more or less by the size of the building, the floor loads to be carried, and the purpose for which the building is to be used. Generally the floor area is divided into a number of units about 15 by 20 feet in size and as nearly uniform as possible, as shown in Fig. 1. On lots 30 feet and less in width, no interior columns are used, and the floor beams rest upon transverse girders set between the wall columns, which are about 15 feet on centres. Beams 10 and 12 inches in depth are most frequently used, 8 inches being the minimum and 15 inches the maximum. In order to counteract the horizontal thrust exerted by the floor arches the beams are tied across from end to end by lines of tie rods, as shown in Fig. 1. Channels are frequently placed against the wall to receive the end of the arch sprung from the last beam, there being no corresponding arch on the other side and consequently no necessity for any flange. They are also employed in framing around openings, such as those for elevator and stair wells. Their general use, however, is not to be recommended, as they are a very difficult section to fireproof. Typical connections between beams and columns are shown in Fig. 4.

**Girders.** Girders are the members placed between the columns to support the ends of the floor beams. They may be single or double beam girders or built-up or riveted girders. Riveted girders are built up of plates and angles. They are known as plate girders when they have a single web, and box girders when they have two or more webs. Beam girders have been rolled to a depth of 36 inches, but from an economical standpoint a built-up girder is usually preferable where the span requires a greater depth than 20 inches. The reason for this is that the number and thickness of the flange plates used in a built-up girder may be varied at different parts of it in proportion to the stresses which come upon those parts. Whereas in a rolled beam the thickness of the webs and of the flanges is necessarily unvarying throughout, and if therefore these are thick enough to withstand the greater stresses, they are much too thick in those portions where the smaller ones occur, and consequently considerable material is wasted. Cantilever girders, as shown in Fig. 4, are sometimes necessary in tall and narrow skeleton buildings, to distribute the weight evenly over the footings, where building on the lot lines confines the offsets of the footing to one side. As such buildings are usually designed, the wall columns are placed 4, or at the most 8, inches from the outside face of the wall. On interior lots where the offsets in the footings can be made on one side only, most of the weight is brought on the extreme outer edge of the footing instead of being uniformly distributed, and the wall has a tendency to settle outwards. To prevent

this tendency to settle unequally, the wall columns are supported on cantilever girders the shoe or base of which may be placed directly over the centre of the footing—thus insuring an equal distribution of the load. The canti-

FIG. 4. FRAMING SECTION OF SKELETON CAGE.  
Showing cantilever girders.

levers are usually balanced, as shown in Fig. 4. Beam and girder connections are also shown in Fig. 4.

**Wind Bracing.** Buildings are always subject to lateral strains from the force of the wind, and, when these are great, they must be provided for, just as those produced by vertical loads. Until the advent of the skyscraper little attention was paid to that fact and there had been little occasion for it. The old buildings constructed of solid masonry walls braced by permanent partitions were not more than 10 stories high, and the strength and dead weight of the walls were sufficient to resist any overturning forces. In skeleton buildings their height is so great in comparison with their width, and they have been so deprived of the lateral

stability due to solid walls and partitions, that some provision against wind effect is necessary. For buildings under 100 feet in height, provided the height does not exceed four times the average width of the base, no provision is necessary. For buildings not exceeding 120 feet in height, and in which the least width is two-thirds the height, sufficient rigidity may be obtained by using continuous column splices (Fig. 2), making the columns in two-story lengths, alternate columns breaking joints on alternate floors, making the girders as deep as practicable, and riveting the webs as well as both flanges to the columns by means of angles or brackets. Exposed buildings in which the height exceeds four times the width, or which are more than 120 feet high, should have some definite form of wind bracing. There is the greatest diversity of practice in regard to bracing, largely on account of peculiar conditions of every building. The height, width, shape, and exposure of the structure, as well as the character of the inclosing walls, determine the amount of wind pressure to be resisted, while the details of the construction and the planning of the various floors will decide upon the type of bracing to be used. There are three distinct systems of wind bracing: first, sway bracing; second, knee bracing; and, third, portal-arch bracing.

In the sway-brace system several rows of columns are braced by means of diagonal rods placed between the floor levels, forming a vertical truss from cellar to roof. The columns become the upper and lower chords of the truss, and the floor beams the struts; after having been designed for static loads the columns and beams would then have to be designed for the additional stresses of the truss. The sway-bracing system is undoubtedly the cheapest and best system of wind bracing, when the division of the building by partitions will admit of its use. Partitions have to be placed wherever these trusses are, and it frequently happens that partitions are not wanted in just those particular places. The best-planned building

Fig. 5. PORTAL TYPE OF WIND BRACING—HALF PLAN.

leaves each floor one great loft to be subdivided by light interchangeable partitions to suit the tenant's wishes.

In the second system of wind bracing (shown in Fig. 4 and also in the accompanying Plate) the frame is stiffened by means of triangular braces called "knees" or "gussets" riveted to the columns and girders at all floor levels. Wall columns are braced longitudinally as well as transversely. This system of bracing possesses a great advantage over the first, inasmuch

that it requires no special provisions in planning. It is seldom necessary to make these knees more than 4 feet in depth, so their projection below the girders may be concealed by coves or brackets. The disadvantage of this system is that it is not so economical as the first, how-

Fig. 6. PORTAL TYPE OF WIND BRACING—DETAIL.

cause it produces heavy bending moments in both the columns and girders, and also on account of the increased amount of labor necessary to make the connections at the building.

The third system of wind bracing is the portal-arch system (Figs. 5-7), which is used in the place of sway rods, where conditions as to corridors, doors, etc., prohibit the crossing of such spaces. This consists in riveting a steel arch to the columns and girders at the weak parts of the building, the arches being placed between hall columns wherever possible so as not to interfere with the arrangement of the partitions. This system is not so economical as sway bracing, but it is generally considered more effective and cheaper than the knee-brace system, because it produces practically no bending moment in the columns. The knee-brace system, however, seems generally to be preferred.

**Disadvantages of Skeleton Construction.** There are several serious objections to the modern system of steel skeleton construction. Among them are the danger of corrosion and the difficulty of protecting the metal frame from fire, as the safety of the structure depends upon the preservation of the frame. Most steel frames are built permanently into the walls with no provision for their preservation excepting that afforded by paint and other protective coating and the 4 or 8 inches of masonry through which heat and moisture can readily penetrate.

The dangers incurred in this form of construction are corrosion from exposure to the

weather, from leakage from gas, water, and other pipes; electrolysis; and expansion caused by exterior conflagrations.

**Conclusion.** In addition to these structural disadvantages, high buildings are a menace to life and health and they cause congestion of thoroughfares. That they are a menace to life has been proved over and over again by

Fig. 7. PORTAL TYPE OF WIND BRACING—SECTION.

the many disastrous fires that have taken place, notably that on Washington Place, New York City. The building itself was damaged hardly at all, yet 140 occupants lost their lives in a vain effort to escape from the burning building. It is unquestionable that the freedom to erect skyscrapers results in the cutting off of light and air, and thereby has a damaging effect upon the health of the population. Narrow streets are turned into cañons, and dark rooms by the thousand have been created, and in these human beings are compelled to work under artificial light.

All these considerations have resulted in the passage of laws limiting the height of buildings in Washington, Baltimore, Boston, and Chicago, and if social or economic conditions in the future do not soon lead to a reduction in the height of buildings in other cities, they also will be forced to follow the example of those above.

**Bibliography.** The *Engineering News* (New York, weekly), *Architecture* (ib., monthly), and architectural magazines carry many articles on skeleton construction. Among the books which may be consulted are: Wm. H. Birkmore, *Skeleton Construction in Buildings and the Planning and Construction of High Office Buildings* (New York, 1898); Henry Jackson Burt, *Steel Construction* (Chicago, 1914); handbooks of the Bethlehem, Carnegie, and Cambria steel companies; J. K. Freitag, *Architectural Engineering*

(New York, 1907); Kidder, *Architect's and Engineer's Pocket Book* (ib., 1916); M. S. Ketchum, *Steel Mill Buildings* (ib., 1908). See FIREPROOF CONSTRUCTION; FOUNDATION.

**STEELTON.** A town in Algoma District, Ontario, Canada, on the Canadian Pacific and the Algoma Central and Hudson Bay railways (Map: Ontario, R 14). It has manufactures. Pop., 1911, 3936.

**STEELTON.** A borough in Dauphin Co., Pa., 3 miles southeast of Harrisburg, on the Pennsylvania and the Philadelphia and Reading railroads (Map: Pennsylvania, H 7). It has a public library. It is known for its steel interests, the extensive works of the Pennsylvania Steel Company being here. Other establishments are brickyards, a flouring mill, and machine shops. Pop., 1900, 12,086; 1910, 14,246; 1915 (U. S. est.), 15,337; 1920, 13,428.

**STEEL WOOL.** An abrading material used as a substitute for sand, glass, or emery paper for abrading or coarsely polishing wood or metal work. It is composed of sharp-edged threads of steel, which curl up like wool or excelsior.

**STEELYARD.** See BALANCE.

**STEEN**, stān, JAN (c.1626-79). One of the foremost Dutch genre painters. He was born at Leyden, where he entered the university in 1646, and two years later helped to found the painters' guild. He is said to have studied at Utrecht with Nicolas Knupfer and then at The Hague with Jan van Goyen, whose daughter he married in 1649; but neither master exercised much influence on his art. From 1649 to 1654 he lived at The Hague; then he leased a brewery at Delft for seven years. In 1661-69 he resided at Haarlem, and from then until his death at Leyden, where he obtained a license for a tavern in 1672. His frequent change of residence was due mainly to financial straits, which prompted him also to keep a tavern. The view which represents him as dissolute and dissipated is exaggerated, for during his short life he painted more works than any other genre master. Unlike others who confined themselves to a single phase of Dutch life, Steen depicted every phase, with never-failing though somewhat coarse humor, sometimes ironical but always good-natured. He painted a few religious and historical subjects and some also of most excellent technique representing high life; but he usually depicts the lower and middle classes: village surgeons, artisans, beggars; scenes of child life, for which he has unusual sympathy, particularly when he paints his own family; festivals, domestic life, tavern and love scenes. Some were repeated, such as the "Doctor's Visit," of which he painted 47 versions (Amsterdam, The Hague, Leipzig, Munich, St. Petersburg, etc.); "A Merry Company" (Amsterdam, The Hague, Buckingham Palace, National Gallery, London, St. Petersburg), and "Bad Company" (Louvre, Berlin, etc.). Some of his early subjects show the influence of Frans Hals; but his best reproductions belong, for the most part, to his Haarlem period. His works are particularly numerous at Amsterdam, which has the well-known "Eve of St. Nicholas" (a favorite subject), "The Rustic Wedding," several family scenes, and many others; at The Hague are "The Menagerie," "The Painter's Family," "The Oyster Party," etc.; others are at St. Petersburg, Berlin, Munich, Vienna, Cassel ("Twelfth Night"), Brunswick ("The Marriage Contract"), the Louvre, Buckingham Palace, the National

Gallery, London, and in many English private collections. He is represented also in some American collections—three examples are in the Metropolitan Museum, New York. His art is characterized by amazing power of invention, skillful composition, good color and lighting, but the drawing in some of his paintings is sketchy and superficial. These were probably "pot boilers," necessitated by his financial condition. In his work the story-telling element is always in evidence, often to the detriment of artistic excellence. Consult: *Masters in Art*, vol. vi (Boston, 1905), containing an exhaustive bibliography; Hofstede de Groot, *Catalogue of Dutch Painters*, vol. i (London, 1908); Wilhelm Bode, *Great Masters of Dutch and Flemish Painting* (New York, 1909).

**STEEN**, stân, JOHANNES WILHELM CHRISTIAN (1827–1906). A Norwegian educator and statesman, born in Christiania. Educated at Tromsø and Christiania, he was for years a teacher and rector of schools. He entered politics as an advocate of liberalism and nationalism and almost continuously from 1859 to 1900 was a member of the Storting, where by reason of his conspicuous ability and learning he soon became a leader, President of the Odelsting and President of the Storting. When Johan Sverdrup became head of the government (1884), Steen was the liberal party's recognized leader. In 1891 he was called upon to form a new ministry, in which he became Minister of State, but the consular question caused its retirement (1893). In 1898 he formed his second ministry, which was succeeded by that of Blehr (1902).

**STEENKERKE**, stân'kêr-ke, or **STEENKERKEN**. A village in the Province of Hainault, Belgium, on the Senne, 19 miles southwest of Brussels. It is noted for the disastrous defeat of the Dutch and English troops under William of Orange, who here attacked the French army commanded by Marshal Luxembourg, Aug. 3, 1692.

**STEENSTRUP**, stân'strup, JOHANNES CHRISTOFFER H. R. (1844– ). A Danish historian and literary scholar, born at Sorø, son of J. J. S. Steenstrup. He was educated at Copenhagen University, where he became professor in 1882. His most important works include: *Normannerne* (4 vols., 1876–82); *Danske og Norske Riger paa de britiske Oer i Dannevoeldens Tidsalder* (1879–82); *Tore Folkeviser fra Middelalderen* (1891; Eng. trans. by E. G. Cox, *The Mediæval Popular Ballad*, 1914); *Danmarks Riges Historie* (1896–1907), with Erslev and others. Steenstrup came to be considered the most versatile Danish historian of his time.

**STEENSTRUP**, JOHANNES JAPETUS SMITH (1813–97). A Danish scientist, born in Thy and educated in Copenhagen. His *Geognostisk-geologisk Undersøgelse af Skovmoserne Vidnesdam og Lilleløse* (1841) became the classical work on peat bogs, and his *Om Forplantning gennem vekslende Generationsrækker i lavere Dyreformer* (1842) established the alternation of generations in the hydroids, especially in trematode worms. Steenstrup was professor of zoölogy at Copenhagen University from 1845 to 1885. He studied the shell mounds discovered by Worsaae, concluded that they dated from the Stone age, and gave to them the name *kjøkkenmøddinger*, or kitchen middens (q.v.). No other Danish scientist has had so wide a range—zoölogy, geology, archaeology. He was the father of J. C. H. R. Steenstrup.

**STEENSTRUP**, KNUD JOHANNES VOGELIUS (1842–1913). A Danish geologist, distinguished especially for his scientific explorations in Greenland. From 1894 he was a member of the Royal Greenland Commission. Between the years 1871 and 1899 he made nine voyages to West Greenland to study the geology of Godthaab, Ivigtut, Uminak, Frederikshaab, etc. Apart from his many valuable memoirs on geological subjects, the most interesting of his publications is a work on the old Scandinavian ruins in the district of Julianehaab (1885). He received many honors from scientific societies.

**STEEPLECHASING**. Racing over a course selected by reason of the obstacles, such as fences, hedges, hurdles, and ditches. It is popularly supposed to have originated in the hilarious spirit of excited fox hunters, taking a bee line from the point where they were to a distant village church steeple. The Grand National Steeplechase of Liverpool, established in 1839, is the great event of the steeplechase year in England. There are many valuable stakes in America contested during the race meetings.

**STEER**, PAUL WILSON (1869– ). An English landscape, figure, and portrait painter. He was born at Birkenhead and studied at the Gloucester School of Art and at the Beaux-Arts under Cabanel, but was most influenced by Manet. His landscapes and figure subjects are treated in an original and spontaneous manner, with fine color harmonies and sunlight effects. Good examples of his work, which is to be found in various public collections in England, Ireland, and Australia, include: "The Golden Valley" (1903); "Richmond Castle, Yorkshire" (1903, Metropolitan Museum, New York); "Chepstow Castle (1905) and "The Music Room" (1906), both in the Tate Gallery, London; "At the Window" (1909); "Corfe Castle," and his own portrait in the Uffizi, Florence.

**STEERING**. That branch of practical navigation which involves the actual control of the direction of a moving vessel. Steering usually involves the manipulation of the helm, or rudder, tiller, and necessary adjuncts, as described under **HELM**. In addition the effect of sails, paddle wheels, screws, etc., must be considered, and sea, currents, winds, and other conditions taken into account, these varying from time to time, and different types of vessels requiring different methods. A twin-screw steamer, e.g., will steer differently from one with a single screw, having a greater power of manœuvring. The steering of a vessel depends upon the course followed. Consult Knight, *Modern Seamanship* (3d ed., New York, 1903). See **NAVIGATION**; **RULES OF THE ROAD**; **SAILINGS**.

**STEERING ENGINE**. See **MACHINERY**; **SHIPBUILDING**.

**STEERSMAN**. See **HELM**.

**STEEVENS**, GEORGE (1736–1800). An English Shakespeare commentator, born at Poplar. He was educated at Eton and at King's College, Cambridge, but left the university without a degree (1756). Inheriting a small fortune from his father, a director of the East India Company, he was able to give his time to the study of Shakespeare. He reprinted 20 plays from the quartos (4 vols., 1766), edited, with frequent advice from Dr. Johnson, an edition of Shakespeare (1773), which was revised by Isaac Reed (q.v.) (1785), and, in conjunction with Reed, brought out a new edition (15 vols., 1793).

**STEEVENS, GEORGE WARRINGTON** (1869-1900). An English journalist, born at Sydenham and educated at the City of London School and at Balliol College, Oxford. In 1893 he joined the editorial staff of the *Pall Mall Gazette*. In 1897 he became a special correspondent of the *Daily Mail*, visiting in succession the United States, Greece, Egypt, India, Rennes (the scene of the trial of Dreyfus), and South Africa. His letters to the *Daily Mail* were republished under the titles *The Land of the Dollar* (1897), *With the Conquering Turk* (1897), *Egypt in 1898* (1898), *With Kitchener to Khartum* (1898), *In India* (1899), *The Tragedy of Dreyfus* (1899), and *From Cape Town to Ladysmith* (1900). The last volume, left incomplete, was edited by Vernon Blackburn. Before his connection with the *Daily Mail* he had published *Naval Policy* (1896) and the clever *Monologues of the Dead* (1896). He died of enteric fever at Ladysmith, then (1900) besieged by the Boers. He was the most famous war correspondent of his time. Consult the memoir in vol. i (1900) of the *Memorial Edition* of Stevens's writings, edited by Street and Blackburn.

**STEFAN-BOLTZMANN** (stă'fän-bólts'mán) **LAW.** See RADIATION.

**STEFÁNSSON, stă'fäns-sön, VILHJÁLMUR** (1879- ). An Arctic explorer of Icelandic descent, born at Gimli, Manitoba, Canada. Educated in the universities of North Dakota and of Iowa (A.B., 1903), he studied anthropology in the graduate school of Harvard University, and for two years was an instructor there. In 1904 and 1905 he made archaeological researches in Iceland. He wintered (1906-07) with the Eskimo of Mackenzie Delta, returning alone across country via the Porcupine and Yukon rivers. With Dr. R. M. Anderson he undertook (1908-12), under the auspices of the American Museum of Natural History, New York, the ethnological survey of the Central Arctic coasts of the shores of North America. By journeys of nearly 1000 miles Stefánsson explored the coasts of Coronation Gulf and the adjacent regions, discovering tribes unknown to whites—the so-called blond Eskimo of Victoria Land. For the Government of Canada he took command of an expedition (1913-16) to explore the regions west of Parry Archipelago. His main ship, the *Karluk*, was beset and sank, part of her crew perishing. (See POLAR RESEARCH.) Absent at the time from the *Karluk*, he resumed his explorations by sledge over the Arctic Ocean, leaving Collinson Point, Alaska, in April, 1914, with a supporting sledge that turned back 75 miles offshore. With two men and six dogs he journeyed over the moving ice pack for 96 days, living largely by his rifle on polar game. Stefánsson located considerable parts of the continental shelf north of Alaska and west of Banks Land. After reaching Banks Land, he subsisted on land game until autumn, when his party reached the *Mary Sachs*, one of his ships which had reached southwestern Banks Land. By a spring sledge journey, in 1915, he discovered new land north of Prince Patrick Island, near the 78th degree of north latitude, and extending west from 116 degrees west longitude. This coast was skirted for about 100 miles, the land being mountainous and rugged, its western terminus not reached. The exploration of the land later occupied Stefánsson's energies. The more important of his writings

are: *My Life with the Eskimo* (1912); *Stefánsson-Anderson Expedition, 1909-12, Preliminary Ethnological Report* (Anthropological Papers, American Museum of Natural History, New York, 1914).

**STEFFANI, stă-fü'né, AGOSTINO, ABBATE** (1655-1730). An Italian composer and statesman, born at Castelfranco, Venetia. He studied music in Venice and under Ercole Bernabei (c.1620-87) in Munich, where he became organist in 1675 and director of the Elector's chamber music in 1681. He took holy orders (1680), was appointed court kapellmeister at Hanover (1688), and brought out his Italian operas with great splendor in the garden of Schloss Herrenhausen. He is remembered for his numerous chamber duets, set to Italian texts, which are models. His compositions are preserved in manuscript in the royal library, London; of the few that appeared in print, may be mentioned: *Psalmodia Vespertina*, for eight voices (1674); *Sonate da camera a due violini, alto e continuo* (1679); *Duetti da camera a soprano e contralto* (1683); and *Janus Quadrifons*, motets with basso continuo for three voices. In 1710 he resigned his post in favor of Handel, and was made Privy Councillor by the Elector Palatine and Bishop in partibus of Spizza, Dalmatia, by the Pope.

**STEFFENS, stéf'enz, (JOSEPH) LINCOLN** (1866- ). An American author and editor, born at San Francisco, Cal. He graduated at the University of California in 1889, studied sociology in Germany and France, and was on the staffs of the *New York Evening Post* (1892-98) and the *Commercial Advertiser* (1898-1902). He was managing editor of *McClure's Magazine* in 1902-06, and in 1906-11 was associate editor of the *American* and *Everybody's* magazines. He became widely known for the "muck-raking" type of article, intended as an exposure of corrupt political and economic conditions. His writings include: *The Shame of the Cities* (1904); *The Struggle for Self-Government* (1906); *Upbuilders* (1909); *The Least of These* (1910).

**STEGANOPODES, stég'a-nöp'ô-déz** (Neo-Lat. nom. pl., from Gk. στεγανόπους, *steganopous*, web-footed). A group of birds within the Ciconiiformes, characterized by having all four toes "totipalmate," or connected by a common web, also a more or less developed gular pouch. The skull is desmognathous and the wing is aquitocubital. The neck is without apteria; the tongue is rudimentary. The Steganopodes are cosmopolitan, aquatic piscivorous birds of large size. About 60 species are known, of which half are cormorants (q.v.).

**STEGOCEPHALIA** (Neo-Lat. nom. pl., from Gk. στέγειν, *stégein*, to cover + κεφαλή, *kephalē*, head). The name proposed by Cope to designate a well-defined order of fossil amphibia, found in strata from the Lower Carboniferous to the Upper Trias. They are distinguished from other amphibians by a dermal armor of overlapping bony scales which usually protects the ventral, and in some cases the dorsal surface. The group is important as representing the earliest and most primitive tetrapoda or four-footed vertebrates adapted to at least partial land-living habits, and breathing by means of lungs. The majority of stegocephalians are salamander-like or lizard-like in form, with a long tail, flattened head, and two pairs of limbs. The presence of gills in the young and grooves for

sensory mucous canals on the skull bones of some forms proves an aquatic habit. A carnivorous diet is indicated by the conical pointed teeth.

The dermal armor, the most distinctive feature of the group, consists chiefly of bony scales,

SKULL OF A STEGOCEPHALIAN.

1, plates of roof of skull (*Capitosaurus*); 2, palatal view (*Cyclostosaurus*).

arranged in regular rows on the ventral surface, but scattered or wanting on other portions of the body. Three large plates, one median and two paired, on the pectoral region, represent the interclavicle and the clavicles. The skull, of flattened triangular form, is characterized by a solid roof of paired plates of dermal bone, and the cranial roof is always pierced by five openings—the paired nares and orbits, and the median opening for the pineal body, which may have served as a light-perceiving organ. The teeth are simple hollow cones in the smaller Paleozoic genera, but in many of the later types the dentine and cement exhibit a system of extremely complicated folds—hence the name Labyrinthodontia often applied to these forms. The vertebral column presents widely divergent conditions in different types, as regards the nature and degree of ossification of the centra. As a rule the Paleozoic genera have the notochord largely persistent, the vertebral column thus remaining permanently in the larval condition, while the large Triassic labyrinthodonts have well-developed centra. The limbs are known for but few forms, and in these they do not differ remarkably from those of modern urodeles. The hind foot is always pentadactyl, but in the fore-foot (except in *Keratropeton*, *Melanerpeton*, and

LABYRINTHODONT TOOTH-STRUCTURE.

Cross section of labyrinthodont tooth, showing the folded structure.

ten applied to these forms. The vertebral column presents widely divergent conditions in different types, as regards the nature and degree of ossification of the centra. As a rule the Paleozoic genera have the notochord largely persistent, the vertebral column thus remaining permanently in the larval condition, while the large Triassic labyrinthodonts have well-developed centra. The limbs are known for but few forms, and in these they do not differ remarkably from those of modern urodeles. The hind foot is always pentadactyl, but in the fore-foot (except in *Keratropeton*, *Melanerpeton*, and

STEGOCEPHALIAN TEETH.

a few related forms) the number is reduced to four, the fifth or outer digit probably being the one lacking. In any attempt to trace the phylogenetic relationships of vertebrate classes the

Stegocephalia are of the greatest importance, since it is in this group only, with its solid skull roof, that we find on the one hand a close approximation to the Paleozoic bony fishes, and on the other to the most generalized Permian reptiles, the *Cotylosauria*. See REPTILE.

The classification is as follows: A.—Suborder Leptospondyli. Small animals, usually salamandriform, occurring in the Carboniferous and Permian. The suborder is divided into three families: (1) Branchiosauridæ; (2) Microsauridæ; (3) Aistopodidæ, the serpent-like footless forms. *Dolichosoma*, which attained a length of three feet, and *Ophiderpeton* are the best-known forms.

B.—Suborder Ganocephala or Temnospondyli. The most familiar type is *Archegosaurus decheni* from the Lower Permian of Germany, a species which attained a length of four feet. *Cricotus* and *Eryops*, from the North American Permian, measure 4 to 6 feet.

C.—Suborder Labyrinthodontia or Stereospondyli. The true labyrinthodonts are clearly differentiated by the form of the teeth, which have the dentine infolded in a more or less com-

LIMB GIRDLES IN STEGOCEPHALIA.

1, pectoral arch; 2, pelvic arch of *Discosaurus*.

plicated manner, and by the vertebrae, which are completely ossified, with biconcave centra sometimes perforated for the passage of the constricted notochord. The maximum development of the group is attained in the Trias, chiefly of Europe. The genera *Labyrinthodon*, *Capitosaurus*, *Trematosaurus*, and *Mastodonsaurus*, from the European Trias, are all enormous animals, the last named, with a skull four feet in length, being the largest amphibian known. Consult: Woodward, *Vertebrate Palaeontology* (London, 1898); K. A. von Zittel, *Text-book of Palaeontology*, Eng. trans. by C. R. Eastman (New York, 1903); H. R. Knipe, *Evolution in the Past* (London, 1912).

**STEGOSAURUS** (Neo-Lat., from Gk. *στειν*, *stegēin*, to cover + *σαῦρος*, *sauros*, lizard). A Jurassic dinosaur of most peculiar appearance. Fossil skeletons are found in Wyoming and Colorado. It was from 25 to 30 feet long, had a very small head, highly arched back, short fore and long hind legs, and heavy long tail. The great bulk of the hinder part of the body depended for its nervous control upon a ganglion in the neural cavity of the sacrum, and this ganglion was of a size several times greater than the brain in the head, which latter is by comparison very small. Consult C. W. Gilmore, *Osteology of the Armored Dinosauria* (Washington, 1914). See DINOSAURIA.

**STEIER**, sht'ēr. A town of Upper Austria. See STEYR.

**STEIN**, stin, SIB (MARK) AUREL (1862–). A British Orientalist and archaeologist, born at Budapest, Hungary. He studied at Vienna and Tübingen, and at Oxford and London. In 1888 he was appointed registrar of the Punjab University and principal of the Oriental College at Lahore, India, and in 1899 principal of the Calcutta Madrasah. In 1900 he was deputed

by the Indian government to conduct archaeological explorations in Chinese Turkestan. The first results of his discoveries are published in his *Preliminary Report* (1901). On his return from Turkestan he became inspector of education in the Punjab. From 1906 to 1908 he was engaged in archaeological explorations in Central Asia and west China, for which he received the Royal Geographical Society's gold medal in 1909. In 1909 he was transferred to the Archaeological Department of India. He was created K. C. I. E. in 1912 and received honorary degrees from Oxford and Cambridge. Among the more important of his publications are a critical edition of Kāhāna's *Rājataranginī, or Sanskrit Chronicle of the Kings of Kashmir* (Bombay, 1892), together with an English translation and commentary on the same (2 vols., 1900); *The Sand-buried Cities of Khotan* (1903); *Ancient Khotan* (2 vols., 1907), a report of his explorations; *Ruins of Desert Cathay* (2 vols., 1912), a narrative of his expedition.

**STEIN**, shtin, CHARLOTTE VON (1742-1827). A celebrated court lady to the Duchess Amalia of Saxe-Weimar, wife of the court equerry. She was an intimate friend of Goethe from 1775 to the time of his Italian journey (1786), by which he won emancipation from his love for her. To her he addressed the *Briefe aus der Schweiz* (1779), which are among the classics of travel, and a multitude of love letters, first published in 1848, and best edited in the Weimar edition of his *Works* (1886). Her letters to Goethe are supposed to have been destroyed. After Goethe's union with Christiane Vulpius there was an estrangement between him and Frau von Stein, gradually overcome later on. Consult: Höfer, *Goethe und Charlotte von Stein* (Stuttgart, 1878); Düntzer, *Charlotte von Stein* (ib., 1874); Erich Schmidt, *Charakteristiken*, vol. i (2d ed., Berlin, 1902); W. Bode, *Charlotte von Stein* (ib., 1910).

**STEIN**, HEINRICH FRIEDRICH KARL, BARON VON (1757-1831). A Prussian statesman. He belonged to an old Franconian family, and was born at Nassau. He studied at Göttingen, entered the Prussian civil service, and in 1781 was at the head of the Department of Mines for Westphalia. In 1786 he visited England and made a study of its institutions, utilizing his experiences in his guidance of Prussian affairs. In October, 1804, he entered the Prussian ministry as chief of imposts, manufactures, and commerce. He introduced reforms in his department, particularly by abolishing restrictions on internal trade; but was hampered in his endeavors by the spirit of Prussian conservatism. In 1807 he was dismissed from office by the King for his refusal to accept the post of Minister of Foreign Affairs under the existing system of government, but the Peace of Tilsit opened the eyes of the sovereign to the wisdom of Stein's policy, and he was recalled, with the approbation of Napoleon, who had as yet no idea of the ability and patriotism of the Minister. Seeing that, from a military point of view, Prussia was powerless, he set about developing her internal resources by a series of reforms, the principal of which were the abolition of serfdom, with indemnification to territorial lords; subjection of the nobles to manorial imposts; promotion in the state service by merit alone; and the establishment of a modern municipal system. While he was paving the way for German unity, the Prussian army was being reorganized by

Scharnhorst and Gneisenau (qq.v.). As the result of a letter criticizing Napoleon's policy, which came to the knowledge of the French Emperor, Stein was obliged to resign (Nov. 24, 1808), and retired to Austria. In danger of being surrendered by Austria to Napoleon, Stein was summoned in 1812 to Russia by the Emperor Alexander, and counseled as to the coalition of the German states against Napoleon. After the battle of Leipzig, in 1813, Stein became head of the council for the administration of the reconquered German countries, as well as of the territory which France had annexed west of the Rhine. He was a leader in all the military diplomacy of that stirring time up to the congresses of Vienna and Aix-la-Chapelle. After his retirement from political life he devoted himself to the promotion of German science and art and formed the society for the study of early German history whose publications are celebrated as the *Monumenta Germaniae Historica*. He died at Kappenberg (Westphalia) June 29, 1831. Consult: Seeley, *Life and Times of Stein* (London, 1879); Pertz, *Leben des Freiherrn von Stein* (1885).

**STEIN**, LORENZ VON (1815-90). A German political scientist, born at Eckernförde, in Schleswig. He studied law and philosophy at Kiel and Jena; became a professor in Kiel in 1846; and from 1855 till 1885 was professor of political science at Vienna. He published important works on economics and theory of government: *Geschichte des französischen Strafrechts* (1846-48); *System der Staatswissenschaft* (1852-56); *Lehrbuch der Volkswirtschaft* (1858; 3d ed., 1887); *Lehrbuch der Finanzwissenschaft* (1860; 5th ed., 1885-86); *Verwaltungslehre* (1865-84); *Die Frau auf dem Gebiet der Nationalökonomie* (1875; 6th ed., 1886).

**STEINAMANGER**, shtī'nā-māng-ēr (Hung. *Szombathely*). The capital of the County of Eisenburg (Vas), Hungary, 68 miles south of Pressburg (Map: Hungary, E 3). It has a beautiful modern cathedral, a fine county building, and a theological seminary. Important state railway workshops are located here, two factories for agricultural machinery and steam flour mills. Steinamanger is on the site of the Roman *Sabaria*, and has ruins of a triumphal arch, amphitheatre, and aqueduct in the vicinity, with many remains in the local museum. Pop., 1900, 24,751; 1910, 30,947.

**STEINBACH**, ERWIN VON. See ERWIN VON STEINBACH.

**STEINBOK**, stīn'bōk (Ger., stone-goat), or **STEINBUCK**, stīn'būk. 1. The European ibex (q.v.). 2. In South Africa, by transference, the Dutch name (also "steenbok") for the small antelopes of the genus *Nanotragus*, specifically the widespread *Nanotragus campestris*, which abounds in open or thinly wooded and hilly places from the Cape to the Zambezi River. It is of an indeterminate reddish hue, about 24 inches tall, long-necked, with short, erect, forward-curving ringed horns, is exceedingly swift and active, and skillful in hiding. Other species of the genus are the oribi, grysbok, and royal antelope (qq.v.), with still others in Zanzibar and Abyssinia. Consult Zoological Society of London, *Proceedings* (London, 1900).

**STEINDORFF**, shtīn'dōrf, GEORGE (1861- ). A German Egyptologist, born at Dessau. He was educated in the Gymnasium in his native town and later (1881-84) in the universities of Berlin and Göttingen. In 1885 he be-

came an assistant in the Berlin Museum, and five years later was appointed privatdocent in the University of Berlin. In 1893 he was called to Leipzig and in 1904 became regular professor of Egyptology and director of the Egyptian collection. From 1899 to 1912 he was actively engaged in work in Egypt. His publications are numerous. Among them may be cited: *Koptische Grammatik* (2d ed., 1904); *Das Kunstgewerbe in Alten Aegypte* (1898); *Die Blütezeit den Pharaonreichs* (1900); *Das Grab des Ti* (1913).

**STEINER**, stin'ēr, BERNARD CHRISTIAN (1867- ). An American librarian and political scientist, born at Guilford, Conn., and graduated from Yale in 1888. From Johns Hopkins he received the Ph.D. degree in 1891. He was appointed librarian of the Enoch Pratt Free Library at Baltimore in 1892; was an associate in history at Johns Hopkins from 1894 to 1911; and later was dean and professor of constitutional and of public law at the Baltimore Law School. Among his publications are: *Education in Connecticut* (1893); *Education in Maryland* (1894); *Citizenship and Suffrage in Maryland* (1895); *Institutions and Civil Government of Maryland* (1899).

**STEINER**, shtin'ēr, JAKOB (1796-1863). A Swiss mathematician, born at Utzenstorf, near Solothurn. He studied at Heidelberg, gave private instruction in Berlin, and in 1834 was made assistant professor in the university and member of the Academy of Sciences. Steiner's chief work is the *Systematische Entwicklung der Abhängigkeit geometrischer Gestalten* (1832; in the Ostwald Classics, 1896). He also wrote *Die geometrischen Konstruktionen ausgeführt mittels der geraden Linie und eines festen Kreises* (1833; in the Ostwald Classics, 1895). His *Vorlesungen über synthetische Geometrie* (3d ed., 1887) and his *Gesammelte Werke* (1881-82) appeared posthumously. Consult Graf, *Der Mathematiker Jakob Steiner von Utzenstorf* (Bern, 1897).

**STEINHAEUER**, stin'hau-ēr, HENRY BIRD (1804-85). A Canadian clergyman and missionary. He was born, of full-blooded Chipewewa Indian parents, in the Ramah Indian settlement at Lake Simcoe, Ontario, and was named for a member of a German family who adopted and educated him. About 1840 he went to the Canadian Northwest with Rev. James Evans, a Methodist missionary, and settled at Norway House, where he remained for 15 years as an interpreter and assisting Evans in his invention of the Cree syllabic characters. He was ordained a Methodist minister in 1853, when he removed to Whitefish Lake and established the Methodist mission there. He translated almost the whole of the Old Testament, and the greater part of the New Testament, into the Cree language.

**STEINHEIL**, shtin'hil, KARL AUGUST (1801-70). A German physicist and astronomer, born at Rappoltsweiler, Alsace. He studied law at the University of Erlangen, and astronomy at Göttingen and Königsberg. He became professor of physics and mathematics in the University of Munich; later entered the Austrian government service, organized and perfected the telegraph system in that country, and brought about the Austrian-German Telegraph Association; performed a similar service for Switzerland; and in 1852 returned to Munich. In 1854 he founded an establishment for making superior optical and astronomical instruments, where the

great telescopes of the observatories of Upsala, Mannheim, Leipzig, Utrecht, etc., were made, and where he began the making of the photograph objectives since known by his name.

Steinheil devised an electromagnetic telegraph, in 1836 constructed the first printing telegraph, and in 1838 discovered the possibility of leading back the current through the ground. He invented the electrical clock, constructed an excellent pyroscope, and made the first daguerreotype picture in Germany. He also established the laws of electrotypy, and constructed several optical instruments. Consult Marggraff, *Karl August Steinheil und sein Wirken* (Munich, 1888).

**STEINHEIL**, MARGUERITE (1869- ). A French woman, the protagonist in a bewildering *cause célèbre*. Of a family of rich manufacturers of Beaucourt, she married the artist, Adolphe Steinheil; went with him to Paris; made a place for herself in the society of the French capital; and drew about her distinguished people in the worlds of art, letters, and politics. Her own circumstantial accounts of her intimacy with President Faure have not been generally regarded as above suspicion. She was, however, connected, at least by gossip, with the mystery attending the President's sudden death. Subsequently she became the centre of a ghastly tragedy—the murder of her husband and her mother, Mme. Japy, on the night of May 30-31, 1908. She was accused of the crime but, after a dramatic trial, was acquitted. To her friends she was the "Tragic Widow," the scapegoat of a situation involving political complications in which people of high position at home and exalted personages abroad were scandalously entangled. To her enemies she was an audacious and wanton adventuress, the "Black Panther" of a hostile press. After her acquittal, Mme. Steinheil lived quietly in England, where she wrote *My Memoirs* (New York, 1912), a book of varied and extraordinary interest, at once autobiography and *apologia*. Despite the trial and the *Memoirs*, the reason for the perpetration of the crime of which she was accused, and the identity of the perpetrators of it remained a mystery.

**STEINITZ**, shtin'its, WILHELM (1836-1900). A German chess master, born in Prague, Bohemia, and educated at the Vienna Institute of Technology. In 1866 he defeated Anderssen in a contest for the world's championship. At the London tournament of 1872 he won every game, and in 1873, at Vienna, he secured the Kaiserpreis of 2000 florins. After defeating Blackburne in England, he withdrew from active tournament play, but the increasing success of Zukertort, whom he had defeated in 1872, forced him back into the field. At a tournament in London (1883) Zukertort defeated him for first place, but at a second match in 1886 Steinitz won from his great rival with 10 to 5 games won and 5 drawn. He defended his title in 1889 at Havana against Tchigorin, but lost the championship in 1894 to Lasker, who again defeated him in 1897. Steinitz was the first to see the value of a steady development of position with an accumulation of minute advantages over the more dashing and open game. After 1883 he lived in the United States, and (1885-91) was editor of the *International Chess Magazine*. He published *Book of the Sixth Chess Congress of 1889* and *The Modern Chess Instructor* (1889).

**STEINLE**, shtin'le, EDUARD VON (1810-86). A German historical painter. He was born in Vienna, the son of an engraver, and studied there at the academy and under Kupelwieser. From 1828 to 1834 he worked in Rome under the influence of Veit and Overbeck. Having been commissioned to decorate the castle chapel at Rheineck he settled at Frankfurt in 1843, and in 1850 was appointed professor at the Städels Institute. Steinle's religious paintings are executed in the manner of the Nazarenes (see *PRE-RAPHAELITES*) and, while distinguished by finished grace and beauty of line, contain nothing original. The most important are the frescoes in the cathedral at Cologne (1843-46); in St. Mary's at Aix-la-Chapelle, in St. Ägidius at Münster, in Strassburg Cathedral (1877-80), and in Frankfurt Cathedral, where he designed and in part executed the entire decoration (1880-85). He also painted many religious canvases, particularly Madonnas. But Steinle is most attractive in his paintings inspired by fairy tales and other imaginative subjects, in which he reveals a refined sense of color and much poetic fancy; such as "The Warder" (1858) and "Loreley" (both in the Schack Gallery, Munich). Notable also are his cycles in water colors and sepia, such as the "Legend of St. Euphrosyne," Brentano's "Fairy Tale of the Rhine" and "Parsifal" (Pinakothek, Munich). Consult: Steinle's *Briefwechsel* (Freiburg, 1897) and Steinle's *Gesammt Werk* (Munich, 1910), both edited by A. M. von Steinle; also the monographs by Wurzbach (Vienna, 1879), Valentin (Leipzig, 1887), and Popp (Mainz, 1906).

**STEINLEN**, stän'län', THÉOPHILE ALEXANDRE (1859-1923). A French draftsman, illustrator, lithographer, and painter. He was born in Lausanne, Switzerland, and was mainly self-taught. About 1872 he went to Paris, and first made a name with his humorous and original drawings for the *Chat Noir*, and other periodicals. He also became widely known as one of the creators and greatest masters of poster design, cats being his favorite subject. Famous examples of his posters are "Pure Sterilized Milk of the Vingeanne"; "Exposition at the Bodinière"; and "Yvette Guilbert." A more sombre side of his art found expression in admirable lithographs, many of which appeared in the anarchist journal *La Feuille*, in etchings, dry points, and sketches of Parisian life of the lower classes, and in his illustrations for Anatole France's *Crainquebille*, Jean Richepin's *Chanson des gueux* (1910), Descarve's *Barabbas* (1913), and other works. In all of these Steinlen reveals himself as a personality of great social as well as artistic significance. He is a master of rapid methods of expression and a draftsman of great suppleness and remarkable accuracy. Consult the complete illustrated catalogue of his works by Crauzat (Paris, 1913), and *Steinlen and his Art* (London, 1911).

**STEINMANN**, shtin'män, GUSTAV (1856-). A German geologist and paleontologist. He was born at Brunswick, and was educated there and at Munich. In 1877 he became an assistant at the Geological-Paleontological Institute of Strassburg, where he was privatdocent in 1880-85. He served as professor at Jena in 1885-86 and at Freiberg from 1886 to 1906, and thenceforth was professor and director of the Geological-Paleontological Institute at Bonn. He made three great journeys of investigation

to South America in 1882-84, in 1903-04, and in 1908, besides his travels in Europe. In addition to contributions to scientific publications, Steinmann wrote: *Elemente der Paläontologie* (1890), with L. Döderlein; *Geologischer Führer der Umgebung von Freiberg* (1890), with F. Gräff; *Paläontologie und Abstammungslehre am Ende des 19. Jahrhunderts* (1899); *Ueber die Ausbildung der naturwissenschaftlichen Lehrer an den Mittelschulen* (1899); *Einführung in die Paläontologie* (1903; 2d ed., 1907); *Die geologischen Grundlagen der Abstammungslehre* (1908).

**STEINMETZ**, stin'mets, CHARLES PROTEUS (1865-1923). An American electrical engineer. He was born at Breslau, Germany, where he was educated, studying also at Zurich, Switzerland, in 1888-89. In 1893 he became consulting engineer for the General Electric Company, and after 1902 was also professor of electrical engineering at Union University. He served as president of the American Institute of Electrical Engineers in 1901-02. A Socialist, in 1915 he was chosen president of the Schenectady Common Council. Steinmetz published: *Theory and Calculation of Alternating Current Phenomena* (1897; 4th ed., 1908); *Theoretical Elements of Electrical Engineering* (1901; 4th ed., 1915); *Theory and Calculation of Transient Electric Phenomena and Oscillations* (1909; 2d ed., 1911); *General Lectures on Electrical Engineering* (1908; 4th ed., 1910); *Radiation, Light, and Illumination* (1909; 2d ed., 1911); *Electric Discharges, Waves, and Impulses* (1911); *Engineering Mathematics* (1911; 2d ed., 1915).

**STEINMETZ**, shtin'mets, KARL FRIEDRICH VON (1796-1877). A Prussian field marshal, born at Eisenach. He fought in the wars against Napoleon, and against Denmark in 1848; became lieutenant general in 1858, and in the campaign against Austria of 1866 won great distinction as commander in chief of the Fifth Army Corps, by his victories at Nachod, Skalitz, and Schweinschädel. At the beginning of the Franco-German War he was made commander in chief of the First Army. Owing to self-confidence, he engaged in disputes with other commanders and the general staff. At Gravelotte (q.v.), he was deprived of his command because he almost caused a disaster by refusing to clear the way for Prince Frederick Charles, who he thought was trying to gain fame and glory at his expense. In September, 1870, Steinmetz was appointed Governor-General of Posen and Silesia, and in April, 1871, he was made general field marshal.

**STEINSCHNEIDER**, shtin'shn'dër, MORITZ (1816-1907). A German bibliographer and Orientalist, born at Prossnitz, Moravia. He studied at Prague, Vienna, Leipzig, and Berlin, and taught at Prague and after 1845 at Berlin, where from 1869 to 1890 he was principal of the school for Jewish girls. The most important of his publications are *Catalogus Librorum Hebræorum in Bibliotheca Bodleiana* (1852-60). *Catalogus Codicum Hebræorum Bibliothecæ Academicæ Lugduno-Batavæ* (1858), and lists of the Hebrew manuscripts in the Royal Library of Munich (1875; 2d ed., 1895); in the Hamburg Library (1878); and in the Berlin Royal Library (1878-97). He wrote *Hebräische Uebersetzungen des Mittelalters* (1859-64, 69-81): an article in Ersch and Gruber's *Encyclopädie*, translated by Spottiswoode as *Jewish Literature from the Eighth to the Eighteenth Centuries* (1857); *Arabische Uebersetzungen aus*

dem Griechischen (1891-96); *Die arabische Literatur der Juden* (1902); *Europäische Uebersetzungen aus dem Arabischen bis Mitte des siebzehnten Jahrhunderts* (1905); *Geschichtsliteratur der Juden in Druckwerken und Handschriften*, part i (1905). Consult the *Festschrift zum 80. Geburtstag M. Steinschneiders* (Leipzig, 1896).

**STEINTHAL**, shtin'täl, HEYMANN (1823-99). A German philosopher and philologist, born at Gröbzig, in Anhalt, and educated at Berlin, where he became privatdocent in 1850 and assistant professor in 1863. After 1872 he lectured on the philosophy and history of religion at the school of Judaism in Berlin. He was an admirer of Wilhelm von Humboldt (q.v.), on whose methods he wrote a number of works. With Lazarus he edited from 1860 to 1890 the *Zeitschrift für Völker-Psychologie und Sprachwissenschaft*, and his works include: *Der Ursprung der Sprache* (1851; 4th ed., 1888); *Die Entwicklung der Schrift* (1852); *Geschichte der Sprachwissenschaft bei den Griechen und Römern* (1863; 2d ed., 2 vols., 1889-91); *Die Mande-Negersprachen, psychologisch und phonetisch betrachtet* (1867); *Abriß der Sprachwissenschaft* (1871, 2d ed., 2 vols., 1881-93); *Allegemeine Ethik* (1885); *Zu Bibel und Religions-Philosophie* (1890-95). In 1906 a volume of posthumous essays, entitled *Ueber Juden und Judentum*, was edited and published by Karppeles. Consult Achelis, *Heymann Steintal* (Hamburg, 1898), and the memorial article by his widow, "Wie Steintal und Lazarus Brüder werden," in the *Jahrbuch für jüdische Geschichte und Literatur* (1900).

**STEINWAY**, stin'wä, HEINRICH ENGELHARD (1797-1871). A German-American piano manufacturer, originally named Steinweg, born at Wolfshagen, Harz Mountains. He began to manufacture guitars and zithers in Brunswick, and finally undertook the making of pianofortes. In 1850 he went to New York City with his four sons—Charles, Henry, William, and Albert—leaving the German business to his oldest son, Theodor. In 1853 they established the firm of Steinway & Sons. See **PIANOFOETE**.

**STEINWICK**. See **STEENWIJCK**.

**STEJNEGER**, stî'ne-gër, LEONHARD (1851-). An American naturalist. He was born in Bergen, Norway, and graduated at the University of Christiania in 1871. Ten years later he came to America. In 1889 he became curator of reptiles at the United States National Museum in Washington and in 1911 head curator of biology. He prepared the greater part of the fourth volume of the *Standard Natural History, Birds* (1885); *Poisonous Snakes of North America* (1893); *Report of the Rookeries of the Commander Islands* (1897); *The Asiatic Fur Seal Islands and Fur Seal Industry* (1898); *The Herpetology of Porto Rico* (1904); *The Herpetology of Japan* (1907); *The Origin of the So-called Atlantic Animals and Plants of Western Norway* (1907).

**STELE** (Neo-Lat., from Lat. *stela*, from Gk. στήλη, *stêlē*, post). In vascular plants the central cylinder of the stem or root in which the vascular cylinder appears. It is invested by the cortex.

**STELLA**. 1. The name applied by Sir Philip Sidney in his sonnets, entitled *Astrophel and Stella*, to Penelope Doveaux, Lady Rich. 2. The name given by Jonathan Swift (q.v.) to Esther Johnson.

**STELLARTON**, stêl'ar-ton. A town in Pictou County, Nova Scotia, Canada, on East River, and on the Intercolonial Railway, 2 miles from New Glasgow (Map: Nova Scotia, H 5). It is the centre of a coal-mining and industrial district. Pop., 1901, 2335; 1911, 3910.

**STELLENBOSCH**, stêl'en-bôs. A town of the Cape Province, South Africa, 31 miles by rail east of Cape Town (Map: Cape of Good Hope, D 9). After Cape Town it is the oldest settlement of the colony, having been founded by Huguenot refugees about 1681. It is the headquarters of the Dutch Reformed church in South Africa and possesses its theological seminary. Victoria College is the nucleus of a South African Dutch university, and the town also contains a school of mines, an agricultural college, a school of music, and other educational institutions. Pop., 1911, 10,764 (5346 whites).

**STEL/LITE**. See **COBALT**.

**STELVIO** (stêl'vê-ô) **PASS** (Ger. *Stilfser Joch*). A lofty Alpine pass leading across the Ortler group of Tyrolean Alps on the boundary between Tirol and Italy, 68 miles southwest of Innsbruck (Map: Italy, C 1). The carriage road passing through it is the highest in Europe, being 9055 feet above the level of the sea. It forms part of the great road extending between Milan and Innsbruck, and was completed by the Austrian government in 1820-24, at an expense of \$1,500,000.

**STELZLE**, stêlts'le, CHARLES (1869-). An American Presbyterian minister and sociologist, born in New York City. He worked as a machinist and studied industrial problems in 1885-94, and held pastorates in Minneapolis and New York until 1903. He was then for 10 years superintendent of the department of church and labor of the Presbyterian church and also of the department of immigration in 1908-10. In 1910 he organized the Labor Temple, New York, of which he was superintendent until 1912. In 1915 he became connected with the National Anti-Saloon League. Stelzle with J. E. McAfee (q.v.) and others were leaders in the attempt to bring about readjustments in the church to meet modern economic conditions. His writings include: *The Workingman and Social Problems* (1903); *Christianity's Storm Centre, a Study of the Modern City* (2d ed, 1907); *Principles of Successful Church Advertising* (1908); *The Church and Labor* (1910); *American Social and Religious Conditions* (1912); *The Call of the New Day to the Old Church* (1915).

**STEM** (AS. *stemn*, OHG. *stam*, Ger. *Stamm*, stem; connected with OIr. *tamon*, stem, and ultimately with Eng. *stand*). In general, stems of plants are axes distinguished from roots by bearing leaves or leaflike organs. Although there are stemlike structures among the thallophytes and bryophytes, it is only among vascular plants (pteridophytes and spermatophytes) that real stems appear.

Stems may be variously classified. By duration, they are annual or perennial; by structure, herbaceous or woody; by direction, erect, decumbent, prostrate, climbing, etc. Perhaps one of the most important classifications is upon the basis of character of foliage organs produced, as follows: *Foliage-bearing stems*, which generally give style to the whole plant body, are the most conspicuous, since they display green leaves, and are necessarily aerial. As a consequence, they are inclined to branch, and the leaf-bearing joints are well separated. *Scale-bearing stems*,

which bear the comparatively small and colorless (not green) leaflike bodies (scales), may be subterranean or aerial, and the joints may be so near together that the scales overlap, as in the aerial scale bud of shrubs and trees, or the subterranean budlike structures called bulbs,

FIG. 1. UNDERGROUND STEM OF SOLOMON'S SEAL.

whose scales and stem become gorged with reserve food. Other prominent subterranean types are tubers (potato), comparatively short, thick stems, with much reduced and not overlapping scales, and the more slender rootstocks and rhizomes (Fig. 1). *Stems bearing flower parts* are very much modified, and constitute the so-called flowers of angiosperms (q.v.). The most essential classification of stems is on the basis of their anatomical structure (see below). (For structural details of stems, see HISTOLOGY; MORPHOLOGY OF PLANTS.) Certain broad outlines must be presented here as a basis of the most fundamental classification. At the tip of the stem there is a single apical cell (some pteridophytes) or a group of apical cells, which by their power of continuous division increase the stem in length and give rise to all the tissues. Just behind this growing tip the three great regions begin to be defined (Fig. 2). On the outside is a layer of cells (dermatogen) that gives rise to the epidermis. In perennial stems that increase in diameter the epidermis is sloughed off on the older parts, and the region beneath develops a cork tissue of greater or less thickness, which constitutes the bulk of the bark (q.v.). Within the dermatogen is a zone consisting of several layers of cells (periblem) that gives rise to

FIG. 2. LONGITUDINAL SECTION THROUGH APEX OF STEM. Showing dermatogen (*d*), periblem (*p*), and between them the periblem.

the cortex. Within the periblem is a central solid cylinder of cells (plerome) that gives rise to the stele, characterized by developing the vascular or woody bundles. The arrangement and character of the woody bundles developed in the stele determine the three general and most fundamental types of vascular stems. In the

dicotyledon and conifer types (Fig. 3) the woody bundles are arranged in a hollow cylinder surrounding a central pith. Around the woody tissue of perennial stems there is developed a

FIG. 3. CROSS SECTION OF A DICOTYLEDONOUS STEM. Showing pith, three growth rings, and cortex.

layer of actively dividing cells, the cambium, that adds a new outer zone of woody tissue each growing season, in cross section giving the appearance of concentric annual rings. This power of increasing in diameter is one of the prominent features of these stems. In the monocotyledon type (Fig. 4) the woody bundles are scattered irregularly through the stele, as in the corn-stalk and palm, so that there is no defined central pith region. Such stems show no annual

FIG. 4. CROSS AND LONGITUDINAL SECTION OF CORN STEM. Showing the monocotyledonous structure.

increase in diameter. In the pteridophyte type usually a single large woody bundle of peculiar structure appears in the stele, in such a way that there can be no annual increase in diameter.

The primary function of the stem is to develop foliage leaves and display them to the air and sunlight, and also to act as a great conducting region between the root system and the leaves. (See CONDUCTION.) Subsidiary functions are vegetative propagation (as in horizontal ground stems); the storage of foods (as in bulbs and tubers); and the manufacture of foods, as in leafless stems, such as *Equisetum* and the cacti.

Among the external factors which influence stem development, light and moisture are perhaps most important. In general, light is thought to retard stem development, as seen when stems grown in full light are compared with those grown in weak light and in the case of tubers. In some cases, however, as in the cacti, light has been found to favor stem development. Experiments seem to show that much of the so-called influence of light is due to a moisture influence.

**STEM GIRDLER.** A horn-tail fly (*Phyllocolus flaviventris*) which with its ovipositor girdles the twigs of currant bushes and deposits an egg below the cut. The resulting larva bores downward into the pith, which it devours, with the adjacent woody portion of the stem. In the autumn it spins its cocoon in the burrow, transforms to a pupa in the following spring, and shortly after emerges. An allied species (*Phyllocolus integer*) works similarly in willows. See WILLOW INSECTS.

**STEMMING.** The material employed for confining a charge of explosive in a bore hole. The process or operation of forcing the stemming into place and compacting it is styled tamping or ramming. In guns, wads are used as stemming. In blasting various plastic or pulverulent materials, which, being mobile, can by tamping be forced to take the form of the bore hole, are used. It is important, and in coal and bitumen mining essential, that no combustible material such as coal dust shall be used as stemming. The most satisfactory of all materials for this purpose is moist fire clay. Properly tamped stemming, by enabling an explosive to develop its maximum energy under the conditions of its explosion, promotes safety and economy in mining and quarrying. Recent precise investigations show that the use of the most efficient stemming materials may increase the useful energy of a shot in blasting 93 per cent, while the use of the least efficient material may increase that energy 60 per cent. This increase is the more certain if a "Renfort" or "Booster" be employed in firing the charge. Consult Munroe and Hall, "A Primer on Explosives for Coal Miners," *Bulletin 17, Bureau of Mines* (Washington, 1911); Snelling and Hall, "The Effect of Stemming on the Efficiency of Explosives," *Tech. Paper 17, Bureau of Mines* (ib., 1912); Munroe and Hall, "A Primer on Explosives for Metal Miners and Quarrymen," *Bulletin 80, Bureau of Mines* (ib., 1915).

**STENDAL**, štēn'däl. A town in the Province of Saxony, Prussia, on the Uchte, 36 miles north-northeast of Magdeburg (Map: Germany, D 2). It has a fifteenth-century late Gothic cathedral restored in 1893. There are railway repair shops, and factories for iron furniture, cloth, gilt cornices, agricultural implements, and sugar. Stendal, founded in the twelfth century, was the capital of the Altmark of Brandenburg. Pop., 1900, 22,081; 1910, 27,263.

**STENDHAL**, stān'hām. The name assumed by MARIE HENRI BEYLE (1783-1842), a French novelist remarkable for keen analysis of character. Though never popular, Stendhal has been much read and admired by Flaubert and the Naturalistic school, and by the later psychologic novelist Bourget. Stendhal was born at Grenoble. At seventeen he entered the service of Bonaparte. After Napoleon's downfall he resided in Italy. In 1821 he was expelled by the Austrians and returned to Paris. In 1831 he

became French Consul General at Civitavecchia. In the age of Chateaubriand Stendhal sympathized with Voltaire. In the day of the Romantic carnival he was practicing the restless dissection of character that marks the work of Taine and Bourget. Hardly one of his books could have paid the expense of printing, and of his now admired essay on love (*De l'amour*) it is said that 17 copies were sold in 11 years. Nisard, literary historian of his time, does not name him. To-day he takes his place among the "great French writers." His works are collected in 24 volumes (five posthumous). They begin with a book of Italian travel and an essay *De la peinture en Italie* (1817); *De l'amour* follows in 1822, with a striking essay on *Racine et Shakespeare*, participating much in the contention of the Romanticists. His novels were *Armance* (1827), *Le rouge et le noir* (1831), *La chartreuse de Parme* (1839). Here he analyzes the forms of restlessness into which the fall of Napoleon had thrown a generation trained to a life filled with emotion. The novels are realistic studies of social types, but types of energy and passion. His great creation is Julien Sorel, the criminal hero of *Le rouge et le noir*, whose career, founded on fact, is a breviary of hypocrisy, though the Fabrice of *La chartreuse de Parme* is hardly inferior. Skillful in the dissection of motive, Stendhal's novels are inferior in style to his posthumously published *Vie de Napoléon* (1876).

**Bibliography.** C. A. Sainte-Beuve, *Causeries du lundi*, vol. ix (Paris, 1857-62; Eng. trans. by E. J. Trechmann, New York, 1909-11); A. A. Paton, *Henry Beyle, Otherwise de Stendhal: A Critical and Biographical Study* (London, 1874); Paul Bourget, *Essais de psychologie contemporaine* (5th ed., Paris, 1889); Arthur Chuquet, *Stendhal-Beyle* (2d ed., ib., 1902); Adolphe Paupe, *Histoire des œuvres de Stendhal* (ib., 1906); Edouard Rod, *Stendhal, in Les grands écrivains français* (3d ed., ib., 1911); H. B. Samuel, *Modernities* (London, 1913); Henri Cordier, *Bibliographie stendhalienne* (Paris, 1914); Adolphe Paupe, *La vie littéraire de Stendhal* (ib., 1914).

**STENGEL**, štēng'el, HERMANN G. L., BARON VON (1837- ). A German statesman, born at Speyer and educated at Munich. He held various minor offices in the Bavarian administrative service from 1862 to 1876, when he became Minister of Finance. He became adviser to the Auditing Department in 1879, councillor to the Bavarian Minister of Finance in 1881, and plenipotentiary of Bavaria and Saxe-Meiningen to the Bundesrat in 1884. In 1894 he was promoted to Ministerial-Director. From 1903 to 1908 Stengel was Secretary of the Imperial Treasury and plenipotentiary of Prussia to the Bundesrat. With the Stengel Law of 1904 he began the important financial reforms of his administration. He wrote *Die Grundentlastung in Bayern* (1872) and *Die Börsensteuer* (1881).

**STENHAMMAR**, stān'hām-mār, WILHELM (1871- ). A Swedish composer and pianist, born at Stockholm. At the conservatory of his native city he studied under Andersson and Sjögren, and then went to Berlin for further study under H. Barth (1892-93). In 1898 he became conductor of the Philharmonic Society of Stockholm, and two years later second conductor of the Royal Opera. He grew to be one of the most prominent of modern Swedish masters, distinguished for vigor of thematic in-

vention and masterly employment of folk melodies. His works include the operas *Tirfing* (1898) and *Das Fest auf Solhaug* (1899), the choral works with orchestra *Prinssan och Svennen* and *Snofried*; an overture, *Excelsior*; a Symphony in F; a concerto for piano in B flat minor; string quartets; piano pieces; songs.

**STEN'NIS**, THE STANDING STONES OF. A name applied to two circles of stone pillars on two headlands in the Loch of Stennis, Scotland.

**STENO**, stā'nō, NICHOLAS. See STENSEN, NIELS.

**STEN'OCAR'DIA**. See ANGINA PECTORIS.

**STENOGRAPHY**. See SHORTHAND.

**STENOTYPE**. See SHORTHAND.

**STENSEN**, stān'sēn, NIELS, or (Latinized) STENO, NICHOLAS (1638-86). A Danish anatomist, physiologist, and geologist; also a bishop. He was born and educated as a Protestant at Copenhagen, but in 1667 accepted Roman Catholicism. In 1660-63 he lived at Amsterdam and Leyden, in 1666 became head of a hospital in Florence and physician to the Grand Duke of Tuscany, and the year 1669 he spent in Paris. From 1672 to 1674 he was again in Copenhagen. In anatomy he discovered the excretory duct (Steno's duct) of the parotid gland (1661) and the muscular nature of the heart; in physiology he criticized the errors of his contemporaries, especially the theories of Thomas Willis (q.v.); further, he emphasized the mechanical nature of the muscles; in geology he wrote on geological formations and on fossils. In 1675 he became a priest and gave up his scientific studies. After 1677, as vicar apostolic, he labored zealously among the northern missions. Among his theological works was *Prüfung der Reformatoren* (1678). Consult his *Life* by Plenkens (Freiburg, 1844) and *Jørgensen* (Copenhagen, 1884).

**STENTOR** (Lat., from Gk. Στέντωρ). In Homer's *Iliad*, a Grecian herald in the Trojan War. His voice was as loud as that of fifty other men together. His name is preserved in the adjective "stentorian."

**STENTOR**. A species of monkey. See HOWLER.

**STENZLER**, stēnts'lēr, ADOLF FRIEDRICH (1807-87). A German Orientalist, born at Wolgast and educated at Greifswald, Berlin, Paris, and London. In 1833 he became professor at Breslau, where also until 1872 he was assistant librarian. He edited, with Latin versions, the *Raghuvamça* (1832) and the *Kumāra Sambhava* (1838) of Kalidasa; with German translations, Yājñavalkya's *Book of Laws* (1849) and *Indische Hausregeln* (4 vols., 1864-78; containing the *Açvalāyana* and the *Pāraskara*); as well as a useful *Elementarbuch der Sanskritsprache* (1868; 7th ed. by Pischel, 1902).

**STEPHAN**, shtē'fān, HEINRICH VON (1831-97). A German administrator. He was born at Stolp in Pomerania, entered the Prussian postal service in 1848, and was rapidly promoted until in 1875 he became Postmaster-General of the German Empire, having under his control the telegraph lines as well as the mails. In 1877 he assumed charge of the national printing offices. He introduced many internal reforms, invented the postal card, and brought about the formation of the Postal Union. He published *Geschichte der preussischen Post* (1859) and *Das heutige Aegypten* (1872).

**STEPHANITE**, stēf'an-it (named in honor of Archduke Stephan). A mineral silver sul-

phantimonite which crystallizes in the orthorhombic system. It has a metallic lustre and is iron black in color. It occurs in veins with other silver ores, especially in Freiberg, Bohemia, in Hungary, Mexico, Peru, and in the United States at the Comstock lode in Nevada and at various localities in Idaho.

**STEPHANUS**, or ÉTIENNE, à'tyēn'. A famous French family of printers and scholars.—HENRICUS (c.1460-1520), the founder of the establishment with which the family is identified, set up a press in Paris in 1501. His publications, about 120 in number, of which only one was in French, were mostly scientific.—His second son, ROBERTUS (1503-59), had a good classical training and on his father's death carried on the business. In 1531 his *Thesaurus Linguae Latinae* began to appear, and in 1539 he was appointed royal printer to Francis I. In 1551, after the King's death, he was forced to leave Paris for Geneva, where in the same year he published the Greek New Testament, with his verse divisions, which are still in use. His various editions of the Bible, in Hebrew, Greek, Latin, and French, several works of the Genevan reformers, a *Dictionnaire français-latin* (1539-40 and 1549), French and Latin grammars, and a work on pedagogy, the first book from his press (1526), are the more important titles in a list of nearly 400, all of which are marked by wonderful typographical clearness and accuracy.—His son HENRICUS the Younger (1528-98), after three years in his father's establishment in Geneva, in 1554 became independent. From his extensive travels he brought back valuable collections of classical manuscripts. But his scholarly enthusiasm in launching the editions of Plato (1578), and the *Thesaurus Linguae Graecae* (1572), which were so long the source of all Greek lexicons, outran his business prudence. The great printing house was nearly ruined, and his later works were printed by others. Thirty first editions of Greek authors constitute a claim to renown second only to that won by the *Thesaurus*.—His son PAULUS (1566-c.1627) succeeded him, edited Euripides (1602) and Sophocles (1603), and in 1602, implicated in the Escalade (see GENEVA), had to leave Geneva.—His eldest son, ANTONIUS (1592-1674), momentarily renewed the glories of the house of Paris, but eventually died in the Hôtel Dieu, old, blind, and poor. Consult Renouard, *Annales de l'imprimerie des Etienne* (2d ed., Paris, 1843), and Feugère, *Essai sur la vie et les œuvres de Henri Etienne* (ib., 1853). For Robert's work in connection with the Greek New Testament consult Scrivener, *Introduction to the Textual Criticism of the New Testament* (3d ed., London, 1883).

**STEPHEN**, stē'ven. The first Christian martyr. He was chosen first among the seven deacons whose selection is related in Acts vi, and the account of his martyrdom is in the following chapter. His execution does not seem to have had the sanction of the Roman authorities and therefore was illegal. The authenticity of the speech in chapter vii has been questioned, but, on the whole, there does not seem to be valid reason for doubting that the account is trustworthy. St. Stephen's Festival is celebrated in the Roman Catholic and Anglican churches on December 26. His relics were believed to have been discovered at Jerusalem in 415, and a minor festival on August 3 commemorates this event. Consult the commentaries

on Acts vi and vii; also A. C. McGiffert, *The Apostolic Age* (New York, 1897); and for the discovery of the relics, Lagrange, *Saint Etienne et son sanctuaire à Jérusalem* (Paris, 1894).

**STEPHEN.** The name of nine popes. Some lists of popes enumerate 10 Stephens. The confusion arises from the fact that another of the name was elected immediately before Stephen II, but died four days after, before he had received episcopal consecration, and is therefore not properly called Pope.—**STEPHEN I, SAINT, Pope 254–257.** The chief interest of his pontificate lies in the controversy over the validity of baptism by heretics, in which Stephen declared, in opposition to Cyprianus (q.v.), that baptism, no matter by whom administered, was valid if the proper matter and form were employed. (See **HERETIC BAPTISM.**)—**STEPHEN II, Pope 752–757.** During his pontificate occurred the Donation of Pepin (q.v.). Consult Schnüren, *Die Entstehung des Kirchenstaates* (Cologne, 1894), and L. M. O. Duchesne, *The Beginning of the Temporal Sovereignty of the Popes* (London, 1908).—**STEPHEN III, Pope 768–772,** a Sicilian by birth. He held a synod at the Lateran in 769, supported by the sons of Pepin, at which an attempt was made to exclude secular influence in papal elections, and a decree passed against the Eastern Iconoclasts.—**STEPHEN IV, Pope 816–817.** He was closely allied with the Emperor Louis the Pious, whom he crowned at Rheims.—**STEPHEN V, Pope 885–891.**—**STEPHEN VI, Pope 896–897.** The most striking event of his pontificate is characteristic of the darkness of the times. Urged on by the faction to whom he owed his elevation, Stephen had the body of his predecessor Formosus disinterred, and after the formality of a trial and condemnation stripped of its sacerdotal robes and thrown into the Tiber. Stephen himself was soon imprisoned by a popular uprising and died in prison. Consult H. K. Mann, *Lives of the Popes*, vol. iv (London, 1910).—**STEPHEN VII, Pope 929–931,** during the period when Theodora and Marozia held sway in Rome.—**STEPHEN VIII, Pope 939–942,** while Marozia's son Alberic II held the temporal power and restricted the Pope to purely spiritual functions. He was able, however, by threats of excommunication to reduce to obedience the rebellious vassals of Louis IV of France.—**STEPHEN IX, Pope 1057–58,** Frederick by baptism, son of Gozelon, Duke of Lorraine. He was made a cardinal and chancellor of the Roman church by his cousin, Leo IX. As Pope he followed his German predecessors in zeal for reform, but died in less than a year. Consult Will, *Die Anfänge der Restauration der Kirche im 11. Jahrhundert* (Marburg, 1864), and H. K. Mann, *Lives of the Popes*, vol. vi (London, 1910).

**STEPHEN** (c.1097–1154). King of England from 1135 to 1154. He was the third son of Stephen, Count of Blois and Chartres, by Adela, daughter of William the Conqueror, and was thus the nephew of Henry I of England. He was brought over to England at an early age and became a favorite with his uncle, who bestowed on him large estates and obtained for him in marriage the hand of Matilda, heiress of Count Eustace of Boulogne. Henry's only son having died in 1120, the King sought to secure the crown for his daughter Matilda, widow of Henry V of the Holy Roman Empire, and Stephen was among the first of the great barons to take the oath of fealty to Matilda. Nevertheless, on the death of Henry I in 1135,

Stephen hastened from Normandy to England, seized the royal treasure, and was crowned King at Christmastide. Revolts in the south and west occurred in 1136, and though these were speedily suppressed, they broke out anew in the following year. In 1138 David I of Scotland invaded England in support of the claims of his niece Matilda, but he was badly beaten in the battle of Northallerton (q.v.). Robert, Earl of Gloucester, half brother of Matilda, also rose in rebellion, but was for the time defeated. Stephen, however, foolishly entered into conflict with the Church, whose cause was espoused by his own brother, Henry of Winchester, the papal legate. While the quarrel was in progress, Matilda and Robert of Gloucester landed in England, towards the end of 1139, and began a civil war which lasted for 14 years and plunged England into utter misery. The nobles took advantage of the civil strife to make themselves virtually independent, and their castles, which Stephen had unwisely permitted them to build up, became mere robber strongholds and places of terror for the unhappy peasantry. In 1141 Stephen was taken prisoner at the battle of Lincoln and was deposed by a Church council, Matilda being chosen Queen. She soon alienated her supporters by her harsh government, and Stephen, who had been released in exchange for Robert of Gloucester, was declared the lawful King by a second Church council and was crowned on Christmas Day. In 1148 Matilda left England; Robert of Gloucester was now dead, and the struggle was henceforth carried on by Henry, the son of Matilda and Geoffrey Plantagenet, Count of Anjou, who in 1151 succeeded his father and later by his marriage to Eleanor of Aquitaine, the divorced wife of Louis VII of France, became one of the richest princes in Europe. Stephen's son, Eustace, died in 1153, and in November of the same year Stephen and Henry concluded the Treaty of Wallingford, by which the former remained King, while the succession was vested in Henry. Stephen died Oct. 25, 1154. Consult: Kate Norgate, *England under the Angevin Kings*, vol. i (London, 1887); T. H. Round, *Geoffrey de Mandeville* (ib., 1892); William Stubbs, *Constitutional History*, vol. i (6th ed., Oxford, 1897); id., *The Early Plantagenets* (5th ed., London, 1903).

**STEPHEN, GEORGE.** See **MOUNT STEPHEN, BARON.**

**STEPHEN, HENRY JOHN** (1787–1864). An English jurist, brother of Sir James Stephen. He was born at St. Christopher's, West Indies, studied for a time at St. John's College, Cambridge, and in 1815 was called to the bar. His legal treatises have given him a permanent place among English jurists. In 1824 appeared his *Treatise on the Principles of Pleading in Civil Actions* (9th ed., 1867), which is a model of form and clearness, and was styled by Kent "the best book that was ever written in explanation of the science." He also published a *Summary of the Criminal Law at its Present State* (1834) and *New Commentaries on the Laws of England* (4 vols., 1841–45; 15th ed., 1908).

**STEPHEN, SIR JAMES** (1789–1859). An English historian and official, born in London and educated at Cambridge. From 1836 to 1847 he was Undersecretary of State for the Colonies and so influential in that capacity as to be popularly dubbed "Mr. Oversecretary Stephen." In 1847 he was made a K.C.B. and Privy Coun-

cilor. It was he who in 1833 prepared the bill abolishing the slave trade. From 1849 to 1859 he was professor of modern history at Cambridge, and from 1855 to 1857 professor also at East India College, Haileybury. He was the brother of Henry John Stephen and the father of Sir James Fitzjames Stephen and of Sir Leslie Stephen (qq.v.). His writings include: *Essays in Ecclesiastical Biography* (1849; new ed., with memoir, 1907), his chief work; *Lectures on the History of France* (2 vols., 1852); and *Desultory and Systematic Reading* (1853).

**STEPHEN, SIR JAMES FITZJAMES** (1829-94). An eminent English jurist and writer on legal subjects, born in London, the son of Sir James Stephen and the brother of Sir Leslie Stephen. He was educated at Trinity College, Cambridge, and was admitted to the bar at the Inner Temple in 1854. He was recorder of Newark-on-Trent in 1859-69, and was legal member of the Legislative Council of the Governor-General of India in 1869-72, doing much to consolidate, abbreviate, and simplify the Indian law of crimes and of evidence, it being due to his efforts that the Indian Evidence Act was passed in 1872. He returned to England in 1872 and employed his time until 1875 in the work of codifying the law of evidence and criminal law of England. He was appointed professor of common law to the Inns of Court in 1875, and in 1879 was appointed a judge of the Queen's Bench Division of the High Court, which position he held until 1891, when he was disabled by nervous trouble resulting in insanity. His greatest work was his *History of the Criminal Law of England* (1883). It is the best work upon the subject for the period it covers, although marked by a certain bias due to his peculiar temperament. His *Digest of the Law of Evidence* (1876) is widely used in England and the United States. He also published: *Essays of a Barrister* (1862); *Liberty, Equality, and Fraternity* (1873); *Digest of the Criminal Law* (1877); *A View of the Criminal Law in England* (1863). Consult Leslie Stephen, *Life of Sir James Fitzjames Stephen* (London, 1895).

**STEPHEN, JAMES KENNETH** (1859-92). An English verse writer, son of Sir James Fitzjames Stephen, born in London. He graduated from King's College, Cambridge, in 1882; in 1884 was called to the bar at the Inner Temple; and in 1888 was appointed clerk of assize for the South Wales Circuit. Two years later he resigned to return to Cambridge as tutor. In the meantime he had contributed to the *St. James's Gazette* and had conducted (1888) a weekly journal called the *Reflector*. The year before his death Stephen published two slender volumes of light verse, *Lapsus Calami* and *Quo, Musa, Tendis?* which met with instant success. In the verse of his day there was nothing cleverer than some of the parodies, as those on Browning, Wordsworth, Clough, Whitman, and especially Kipling. Other poems reveal him a keen critic of contemporary life. A collected edition of his poems appeared in 1896. Consult A. C. Benson, *The Leaves of the Tree* (New York, 1911).

**STEPHEN, KATHERINE** (1856-1924). An English educator. She was the eldest daughter of Sir James Fitzjames Stephen (q.v.), and was educated at a private school at Brighton and at Bedford College, London. She was librarian of Newnham College, Cambridge, 1887-1910, vice principal, 1892-1911, and in the latter year was appointed principal. From 1903

she was chairman of the Cambridge Training College for Women. She published *French History for English Children* (1899) and *Three Sixteenth-Century Sketches* (1904).

**STEPHEN, SIR LESLIE** (1832-1904). An English biographer and critic, son of Sir James Stephen and brother of Sir James Fitzjames Stephen (qq.v.). He was born in London, Nov. 28, 1832, and was educated at Eton, at King's College, London, and at Trinity Hall, Cambridge, where he graduated in 1854 (M.A., 1857) and where he remained as fellow and tutor until 1864. He had taken orders in the English church, but his reading gradually bred clear-cut convictions which caused him to leave it. In 1864 he went to London and engaged in literary work, writing much for leading periodicals. In 1865 he published *Sketches from Cambridge*, reprinted from the *Pall Mall Gazette*, and in 1871 became editor of the *Cornhill Magazine*, the reputation of which he maintained by securing such contributors as Stevenson, Hardy, and Henry James. He resigned this post in 1882 to undertake the editorship of the *Dictionary of National Biography*, which, though ill health forced him to hand the management over to Sidney Lee (q.v.) in 1891, will always be a monument to his scholarship and judgment. He wrote nearly 400 of the articles himself, including Addison, Burns, Byron, Carlyle, Coleridge, Dickens, George Eliot, Fielding, Gibbon, Hume, Johnson, Milton, Pope, Scott, Swift, Thackeray, and Wordsworth. Practically all his work on the *Dictionary* was excellent, but his type of mind and literary method achieved happier results, perhaps, with the eighteenth-century subjects. His first wife, a daughter of W. M. Thackeray, died in 1875, and three years later he married Julia Prinsep, widow of Herbert Duckworth. For a year (1883) he held the Clark lectureship in English literature at Cambridge. In addition to biography and literature Stephen showed a keen interest in philosophy and ethics. In this field he was utilitarian and fortified his position with an irony, a subtlety of thought, and a trenchantly critical method that won him high regard among literary men and scholars at the expense, perhaps, of popularity. He was an agnostic, and scorned the Broad Church party as a halfway house where intellectual lucidity could not comfortably dwell. Leslie Stephen died in London, Feb. 22, 1904. His works include: *Hours in a Library* (three series, 1874-76-79), able and impartial criticisms about which there plays a delightful humor; *The History of English Thought in the Eighteenth Century* (1876; new ed., 1902); *Essays on Free-thinking and Plain Speaking* (1879); *The Science of Ethics* (1882), widely used as a textbook; *Life of Henry Fawcett* (1885); *An Agnostic's Apology* (1893); *Life of Sir James Fitzjames Stephen* (1895), his brother; *Social Rights and Duties* (1896); *Studies of a Biographer* (1898); *The English Utilitarians* (1900); *English Literature and Society in the Eighteenth Century* (1904); and, in the "English Men of Letters Series," lives of Johnson, Swift, Pope, Hobbes, and George Eliot. Stephen was knighted in 1902. In 1907 appeared, in 10 volumes, his *Collected Essays*. Consult F. W. Maitland, *Life and Letters of Leslie Stephen* (New York, 1906), an admirable biography, and *Dictionary of National Biography*, second supplement, vol. iii (ib., 1912).

**STEPHEN BÁTHORY.** See BÁTHORY

**STEPHEN DUSHAN**, dō'shān (c.1308-55). Czar of Serbia from 1331 to 1355. Profiting by the disorders in the Byzantine Empire, he took possession of a large part of Macedonia and of northern Greece. He extended his sway over most of Albania, Bulgaria acknowledged his overlordship, and he defied Louis the Great of Hungary. Stephen was great as ruler, soldier, and lawgiver. In 1346 he had himself crowned Emperor (Czar) of the Servians and Greeks. In 1349 an independent patriarchate was instituted for Serbia. Under Stephen there was for a brief period a great Slavic realm in south-eastern Europe. Speedy disruption followed his death. He is a national hero to the Servians.

**STEPHEN FORMATION.** The name given by Walcott to beds of limestone and shale found at Mount Stephen in British Columbia. The rocks are particularly notable for the variety and remarkable preservation of their fossils, which belong to the very remote period of Middle Cambrian time. Over 90 genera have been recognized, mostly crustaceans, and among them the ancestral forms of the trilobites. They also include representatives of medusæ, holothurians, and brachiopods, of which the structures are shown to the minutest details. Among some of the notable forms are Marrella, Molania, Naraolia, Notostraca, and Ottoia (qq.v.). Consult Walcott, "Cambrian Geology and Paleontology," in *Smithsonian Museum Collections*, vol. liii, no. 1, and vol. lvii, nos. 2, 6, 12 (Washington, 1908, 1912).

**STEPHEN-LIÉGEARD**, stē'fān'-lyā'zhār', FRANÇOIS EMILE (1830- ). A French poet, born at Dijon. He became a lawyer and held governmental positions. His work, reminiscent of Lamartine, was crowned seven times by the Floral Academy of Toulouse and three times by the French Academy. He was decorated by various foreign governments and was made an Officer of the Legion of Honor. He wrote: *Les abeilles d'or* (1850); *Le verger d'Isaure* (1870); *Une visite aux monts maudits* (1872); *Livingstone* (1876), a poem; *Les grands cœurs* (1882); *Au caprice de la plume* (1884); *La côte d'azur* (1887); *Rêves et combats* (1892); *Les saisons et les mois* (1899); *Pages françaises* (1902); *Les Boers* (1902); *Aimer* (1906); *Brins de laurier* (1909).

**STEPHENS**, stē'venz, ALEXANDER HAMILTON (1812-83). An American statesman and Vice President of the Confederate States, born in Taliaferro Co., Ga., Feb. 11, 1812. His boyhood was one of toil, with occasional attendance at "old-field" schools. A society for the education of young men for the Presbyterian ministry became interested in him and provided him with the means for education. He graduated first in his class in 1832 from Franklin College, now the State University. He taught school awhile, and after three months' study of law without a tutor was admitted to the bar at Crawfordville, his county town, at the age of 22. At 24 he was elected to the State Legislature, and after five years there was sent as a Representative to Congress. He remained from 1843 until he voluntarily retired in 1859. Here he advocated the annexation of Texas, but opposed the war with Mexico. He ardently supported the Compromise Measures of 1850 and advocated the passage of the Kansas-Nebraska Bill of 1854.

In 1861 he became Vice President of the Confederate States and remained so while that government lasted, though not wholly in accord with its policy. He headed the Confederate Commission that met President Lincoln and Secretary Seward at Hampton Roads in February, 1865, to confer upon terms of peace. (See HAMPTON ROADS CONFERENCE.) After the fall of the Confederacy he was imprisoned in Fort Warren, Boston harbor, for six months in 1865. Elected to the United States Senate in 1866, he was refused a seat and did not reënter official public life until 1873, when he became a member of the House of Representatives, from which he again voluntarily retired in 1882. In the fall of that year he was elected Governor of Georgia and died in the executive mansion, Atlanta, March 4, 1883, leaving a creditable record as statesman, orator, and writer.

Stephens was independent of party. Until 1855, though he had not been in accord with the Whig party, he generally acted with it because he preferred its policy to that of the Democrats. Later he acted with the Democrats, opposed the Know-Nothing party, and supported Douglas for the presidency in 1860. While he rejected as fallacious and inconsistent the doctrine of nullification, he believed in the right of secession, but was opposed to that policy in 1861. Though devoted to the Union, he, however, believed his ultimate allegiance due to his State; and on secession he went with the State. Besides editing the *Atlanta Daily Sun* from 1871 to 1873, he published: *A Constitutional View of the War between the States* (2 vols., 1868-70)—perhaps the ablest statement of the South's position in regard to the doctrines of State sovereignty and secession; *The Reviewers Reviewed* (a reply to his critics); and *A School History of the United States* (1872). Consult: Cleveland, *Alexander H. Stephens in Public and Private, with Letters and Speeches* (Philadelphia, 1866); Johnston and Browne, *Life of Alexander H. Stephens* (ib., 1878; new ed., 1883); W. P. Trent, *Southern Statesmen of the Old Régime* (New York, 1897); Lewis Pendleton, *Alexander H. Stephens* (Philadelphia, 1908).

**STEPHENS**, H(ENRY) MORSE (1857-1919). An American historian, born in Edinburgh, Scotland. He graduated at Balliol College, Oxford, in 1880, became a staff lecturer on history to the Oxford Extension Delegacy in 1891, and in 1892 was chosen lecturer on Indian history at Cambridge University. He was professor of modern European history at Cornell University from 1894 to 1902, when he became professor of history and director of university extension at the University of California. In 1915 he was president of the American Historical Association. His writings include: *History of the French Revolution* (2 vols., 1886-92); *Portugal* (1891), in the "Story of the Nations Series"; *Albuquerque and the Early Portuguese Settlements in India* (1891); *Revolutionary Europe, 1789-1815* (1897; 7th ed., 1907), in the "Periods of European History Series"; *Modern European History, 1600-1890* (1899). He also edited *Principal Speeches of the Statesmen and Orators of the French Revolution* (1891) and, in collaboration with G. B. Adams, *Select Documents of English Constitutional History* (1901).

**STEPHENS**, JAMES (1825-1901). An Irish agitator and Fenian leader, born in Kilkenny. After participating in the Young Ireland rising

of 1848, he fled to Paris. In 1853 he instituted the foundation of the Irish Republican Brotherhood, commonly known as the Fenian Society (q.v.). His system depended on complete preparation of the people. A favorable opportunity was to be awaited when England should be embroiled abroad. By 1863, in point of view of numbers and revenue raised, the organization had assumed formidable proportions, but from that time dates its decline. The rising in the autumn of 1865 was an ill-timed affair delayed from the preceding spring, and the leaders were arrested. Stephens escaped from Dublin Castle, sacrificing his lieutenants, and proceeded to the United States, devoting his energies to pacifying and uniting the branch of the society there, but in 1867 he was formally deposed.

**STEPHENS, JAMES** (?- ). An Irish poet and novelist. While a poor boy and without education he wandered all over Ireland, nearly starved in Belfast, and finally after learning typewriting and stenography became a clerk in a solicitor's office at Dublin. His first volume of verse, *Insurrections* (1909), attracted widespread favorable notice because of its original qualities, and enabled the author to give more attention to literary work. A second volume of poetry, *The Hill of Vision*, appeared in 1912. In the latter year he published also two novels, *The Charwoman's Daughter* (American edition under the title *Mary, Mary*) and *The Crock of Gold*. His subsequent writings include: *Here Are Ladies* (1913); *The Demi-Gods* (1914); *The Rocky Road to Dublin* (1915), verse; *Songs from the Clay* (1915).

**STEPHENS, JOHN LLOYD** (1805-52). An American traveler and author, born at Shrewsbury, N. J. He graduated at Columbia in 1822, from 1825 until 1833 practiced law in New York City, and then traveled for two years in southern and eastern Europe and in Palestine and Egypt, writing letters for the *American Monthly Magazine*. Later he published *Incidents of Travel in Egypt, Arabia Petraea, and the Holy Land* (2 vols., 1837; 10th ed., 1848) and *Incidents of Travel in Greece, Turkey, Russia, and Poland* (2 vols., 1838; 7th ed., 1847-53). In 1839 he was sent by President Van Buren on an unsuccessful mission to Central America. On his return he published *Incidents of Travel in Central America, Chiapas, and Yucatan* (2 vols., 1841; 12th ed., 1852). He again went to Central America in 1841 and made further explorations, the results of which appeared in *Incidents of Travel in Yucatan* (2 vols., 1843). Both works were widely read at the time in America and England and attracted attention to the archaeological remains in Yucatan. In 1849 Stephens became interested in the plan for building a railroad across the Isthmus of Panama, and was made vice president and afterward president of the company that was formed for that purpose.

**STEPHENS, WILLIAM** (1671-1753). An English colonial governor, born at Bowcombe, Isle of Wight. He graduated at King's College, Cambridge, and was admitted to the Middle Temple. About 1736 he went to South Carolina to survey a barony and met General Oglethorpe. He removed to Georgia in 1737 and became secretary of the trustees. In 1741 he became president of Savannah, one of the two counties into which the colony was divided, and in 1743 was made president of the colony. He was requested to resign on account of his age in 1750, and

gave up his office in April, 1751. He published *Journal of the Proceedings in Georgia, Beginning Oct. 20, 1737* (3 vols., 1742; reprint, 1906). One volume was printed separately as *State of the Province* (1742). His life was written by his son Thomas, under the title *The Castle Builder* (2d ed., 1759).

**STEPHENSON**, sté'ven-son. A town, including the villages of Daggett and Stephenson, in Menominee Co., Mich., 22 miles north of Menominee, on the Chicago and Northwestern Railroad (Map: Michigan, B 3). There are flour and lumber mills here, and extensive sugar-beet fields. Some dairy products are shipped. Pop., 1900, 3006; 1910, 2913.

**STEPHENSON, GEORGE** (1781-1848). An English engineer and inventor and the "founder of railways." He was born June 9, 1781, at Wylam, near Newcastle, where his father was fireman at a colliery. After a boyhood spent in farm work he became assistant to his father and was steadily advanced. He got some education by attending night school while working as fireman and brakeman, and in addition to his regular duties undertook the cleaning and repairing of clocks. He became acquainted with William Fairbairn (q.v.) at this time and the two were in frequent conference. After serving as engineer at various collieries and other establishments he was made engine-wright of the Killingworth High Pit, having by this time gained a thorough practical knowledge of the operation and construction of engines and pumping machinery. Devoting his leisure to scientific pursuits, he invented a miner's safety lamp (q.v.) known as the "Geordie" (1815), and there resulted a controversy over the priority of the invention, as a similar idea had been successfully worked out by Sir Humphry Davy (q.v.). His attention was meanwhile turned to the experiments of Blackett and Hedley with locomotives, then in progress at Wylam, and he induced the owners of the Killingworth Colliery to undertake the construction of a locomotive. (See LOCOMOTIVE.) In 1821 he became chief engineer of the Stockton and Darlington Railway (see RAILWAYS), and in 1824 he was appointed engineer of the Liverpool and Manchester Railway. In 1825 the Stockton and Darlington road was opened, and was the first regularly operated in the world where locomotives were employed to haul freight and passengers. In 1829 his *Rocket* won in the celebrated competitive trial of locomotives on the Liverpool and Manchester Railway, and in 1830 the line was formally opened. Subsequent improvements were made in the locomotive and Stephenson became chief or consulting engineer to nearly all of the railway projects that were soon set on foot. His success in this field made it possible for him to become interested also in the development of coal mines. Stephenson visited the Continent in 1846, where he was received with unusual honors. He was the first president of the Institution of Mechanical Engineers, which he founded in 1847, but was never a candidate for political honors. In the latter part of his life he devoted himself to farming at his country place at Tapton House, Chesterfield, where he died, Aug. 12, 1848. By his successful development of the locomotive and of the railway Stephenson ranks as one of the foremost mechanical engineers of the nineteenth century. Not only was his influence felt in the purely mechanical and engineering difficulties to

be overcome, but also in the conservative organization and prosecution of the railway enterprises of his time.—His nephew, **GEORGE ROBERT STEPHENSON** (1819–1905), built railways in England, New Zealand, and Denmark, and in 1876–77 was president of the Institution of Civil Engineers. For George Stephenson's son, see **STEPHENSON, ROBERT**. Consult Samuel Smiles, *Life of George Stephenson and of his Son Robert* (London, 1857); id., *Lives of the Engineers* (new ed., ib., 1904). See **LOCOMOTIVE**; **RAILWAYS**.

**STEPHENSON, JOHN** (1797–1842). A Canadian physician. He was born in Montreal, was educated by the Sulpicians in that city, went to Edinburgh, and received his medical degree there in 1820. Returning to Montreal in 1821, he was the first to organize medical education in Canada by establishing lectures in 1822 at the Montreal General Hospital. The McGill University medical faculty originated from these lectures, and Stephenson was its first registrar. He was the first professor to be appointed in anatomy, surgery, and physiology, and he held all three professorships at the same time.

**STEPHENSON, ROBERT** (1803–59). A British civil engineer. He was the only son of George Stephenson (q.v.) and was born at Willington Quay, near Newcastle. He was educated at Newcastle and received practical engineering experience at the Killingworth Colliery and with his father in railway surveying and the construction of locomotives, being, in the meanwhile, a student for six months at Edinburgh University. After managing his father's locomotive factory in Newcastle for a few months he went to South America on account of ill health (1824) and engaged in mining. Coming back to England in 1827, he returned to the locomotive works and supervised the construction of the *Rocket* (see **LOCOMOTIVE**), incorporating in its mechanism many original and serviceable ideas, and assisted his father in other work. In 1833 he became the engineer of the London and Birmingham Railway, one of the first in which great engineering difficulties were encountered in the construction, but which was completed in 1838. The firm of Robert Stephenson & Co. by this time had become the leading engine builders of the world, and a standard type of locomotive was evolved which was subsequently enlarged and improved. Robert Stephenson was interested in every department of railway construction, and particularly in the design of bridges, where he achieved the highest reputation. Among the bridges he designed were the high-level bridge over the Tyne at Newcastle, the Victoria Bridge at Berwick, the famous Britannia Tubular Bridge across Menai Strait, the Conway Bridge, and the Victoria Bridge over the St. Lawrence. (See **BRIDGE**.) In 1847 Stephenson was elected to Parliament from Whitby as a Conservative, and in 1856 became president of the Institution of Civil Engineers. For bibliography, see **STEPHENSON, GEORGE**; also consult Jeafferson and Pole, *The Life of Robert Stephenson* (London, 1864). See **BRIDGE**; **LOCOMOTIVE**; **RAILWAYS**; **STEAM ENGINE**.

**STEPHENSON, THOMAS BOWMAN** (1839–1912). An English Wesleyan clergyman, born at Newcastle, and educated at the University of London. He entered the ministry of the Wesleyan Methodist church in 1860 and was elected to the Legal Hundred in 1888. In 1891 he was

president of the Conference. Of the National Childrens' Home and Orphanage, London, which he had founded in 1873, he was principal until his death. He was a member of the London School Board from 1873 to 1876 and was warden of the Wesley Deaconess Order and founder of the Wesley Deaconess Institute. Stephenson published: *Words of a Year* (1892); *The People's Order of Divine Service* (1901); *William Arthur, a Brief Biography* (1907).

**STEPNEY, GEORGE** (1663–1707). An English minor poet and diplomatist, who, after his education at Westminster school and at Cambridge, entered the diplomatic service. Some of his correspondence is in J. M. Kemble, *State Papers* (London, 1857). For his poetry, see Chalmers's *English Poets*, vol. viii. Consult R. Harrison, *Notices of the Stepney Family* (London, 1870).

**STEPNIAK**, styĕp-nyĕk' (pseudonym of KRAVCHINSKY), SERGEI MIKHAILOVITCH (1852–95). A Russian revolutionary exile and writer, born in southern Russia. He graduated at the St. Petersburg School of Artillery and entered the Forestry Institute at St. Petersburg. In 1872 he joined a Nihilist circle and engaged in spreading revolutionary ideas among the factory workmen in the capital. He was arrested in 1874 but escaped and thenceforth led the life of an outlaw. He engaged in conspiracies in Italy, took an active part at Geneva in the publication of *The Commune*, and in 1878 smuggled into Russia a press and type for illegal publications. When the revolutionists resolved upon the death of General Mezentsev, chief of the gendarmes, Stepniak, chosen by lot for the purpose, stabbed him on Aug. 16, 1878, and somewhat later, in justification of the act, published *Life for Life*. During the years 1879–83 he lived in Switzerland and Italy, where appeared his famous *Underground Russia* (1882). In 1884 Stepniak settled in London. In 1885 appeared his *Russia Under the Tsars*, followed by *The Russian Storm Cloud* (1886), *Russian Peasantry*, *Andrei Kozhukhov* (1889, translated as *The Career of a Nihilist*), *The Little Cottage on the Volga* and *King Stork and King Log* (1895). He edited *Free Russia* (founded in 1890), the monthly organ of the English Society of Friends of Russian Freedom. He died in London in an accident at a railway station. His works were collected and published at St. Petersburg in 1907.

**STEPPE**, stĕp (Russ. *stepi*, waste, heath, steppe). The name given to the undulating plains of southeastern Europe and northern Asia which correspond in general to the prairies and pampas of America, but are marked by some peculiarities due to their elevation and dry climate. The steppes are covered with grass in the rainy season or early summer and afford pasturage to great herds of cattle, sheep, and horses, and are largely occupied, where not brought under cultivation, by nomadic tribes of Tatars. See **GRASSLANDS**; **PRAIRIE**.

**STEPPE MURRAIN**. See **CATTLE PLAGUE**.

**STEP RATE INSURANCE**. See **LIFE INSURANCE**.

**STERE**, stĕr (Fr. *stère*, from Gk. *στερεός*, *stereos*, solid). Another name for a cubic meter established by the Law of 18 Germinal an III (April 7, 1795). The name was continued after the formal adoption of the metric system, being used for wood, especially firewood. See **METRIC SYSTEM**.

**STEREOCHEMISTRY.** A branch of chemistry dealing with those cases of isomerism that cannot be explained by the doctrine of the linking of atoms, and explaining those cases on the assumption that the combining forces of an atom act in certain definite directions in space. Isomerism (i.e., the existence of compounds having the same qualitative and quantitative composition and the same molecular weight, yet differing more or less in their properties) and the doctrine of the linking of atoms (the structural theory) have been discussed in the article CARBON COMPOUNDS, which should be read in connection with the present sketch.

**Optical Isomerism.** Most of the cases not explained by the doctrine of the linking of atoms are presented by compounds identical in all their physical properties except the power of rotating the plane of polarized light. It is well known that this power is possessed by a number of crystalline substances in the solid state, and that every such substance (e.g., quartz) can be obtained in two enantiomorphous crystalline forms, rotating the plane of polarized light through equal angles but in opposite directions. But when melted or dissolved, such substances usually lose that power completely, which shows that their optical property is peculiar, not to their nature, but to the particular crystalline form which they assume in the solid state. These are not the substances that stereochemistry has to deal with; such substances, inasmuch as they lose their difference of optical rotatory power with their crystalline form and are therefore identical in the liquid, gaseous, or dissolved state, cannot be considered as different chemical individuals, and hence cannot form the subject of a theory of chemical compounds. Cases of optical isomerism proper are presented by substances retaining or acquiring their difference of optical rotatory power in the liquid, gaseous, or dissolved state.

In 1874 Le Bel and Van't Hoff discovered, independently and almost simultaneously, that all optically active compounds, and only optically active compounds, contain one or more asymmetric carbon atoms, i.e., carbon atoms directly linked to four atoms or groups of atoms different from one another. The following formulas, containing asymmetric carbon atoms (denoted by an italic *C*), represent optically active compounds:

On the contrary, formulas like that of propionic acid,

which contains no asymmetric carbon atom (i.e., no atom combined with four different atoms

or groups), have in no case been found to represent optically active compounds. The relation between the optic rotatory power and the asymmetric carbon atom must therefore form the cornerstone of any explanation of optical isomerism that might be advanced.

Altogether three different explanations suggest themselves as possible: (1) the assumption that the four valencies of the carbon atom are unequal and that cases of isomerism may result from different distributions of the four atoms or groups combined with the carbon atom, among its different valencies; (2) the assumption that the atoms or groups combined with the carbon atom are in constant motion around it and that the molecules of optically different compounds may be made up of the same atoms or groups in different motions around the carbon atom; and (3) the assumption that the molecules of different compounds may be made up of the same atoms or groups, similarly linked to the carbon atom, but differently arranged in space around it. The first of these assumptions compels us to recognize the possible existence of isomers that are positively known to be impossible. For instance, if the assumption were correct, two different nitromethanes would be possible; yet a systematic experimental investigation carried out by Henry showed that nitromethane can exist in one form only. The second of the above assumptions is apparently incapable of either purely theoretical development or systematic correlation with facts, and must therefore be abandoned. The third assumption, viz., that the difference between optical isomers is due to differences in the configuration of the atoms in their molecules, presents itself, therefore, as the only possible explanation. Furthermore, even this explanation must first of all discard the hypothesis of the arrangement of atoms in a plane. Indeed, were the plane graphical formulas, as we ordinarily write them, true to reality, then, e.g., two methylene chlorides would be possible, the configurations of whose atoms would be represented by the following formulas:

Yet only one methylene chloride is possible. If the valencies of the carbon atom were assumed to be distributed, in the plane, not exactly at equal angles, but, let us say, as in the following symbol

then the number of theoretically possible yet really nonexisting isomers would be even greater.

Considerations of this nature led Van't Hoff to the conclusion that if optical isomerism is to be explained, it is necessary to assume that the four valencies of the carbon atom are evenly distributed around it in space. This is the fundamental hypothesis of stereochemistry. In agreement with this hypothesis one may imagine that the asymmetric carbon atom is situated at the centre of a regular tetrahedron, and the four different atoms or groups held by it are situated at the four corners of the tetrahedron. The application of the stereochemical hypothe-

sis to the study of isomerism is very difficult to explain or to grasp without the use of models. A crude but sufficient form of model may be readily made in a few minutes from pasteboard, by cutting out four equal equilateral triangles and fastening them together to form a regular tetrahedron, by means of strips of gummed paper. Small slips of paper of different colors may be used to represent the four different atoms or groups and may be fastened to the corners by means of pins. With the aid of two such models it is easy to demonstrate the following cases: (1) with three slips of paper of one color and one of another color, only one arrangement is possible, which corresponds, e.g., to the fact that only one nitromethane,  $\text{CH}_3(\text{NO}_2)$ , can be obtained. (2) With two slips of paper of one color and two of another color, again only one arrangement is possible, which corresponds, e.g., to the fact that only one methylene chloride,  $\text{CH}_2\text{Cl}_2$ , can be obtained. (3) With two slips of paper of one color, one slip of another color, and one of a third color, again only one arrangement is possible, which corresponds, e.g., to the fact that only one propionic acid,  $\text{CH}_3(\text{CH}_2)(\text{COOH})$ , can be obtained. (4) With four slips of different colors two different arrangements are possible, which corresponds to the fact that only molecules containing an asymmetric carbon atom, i.e., one linked to four different atoms or groups, can be different in spite of being made up of the same atoms linked together in the same manner. The two models will, in this case, be like an object and its image in a mirror: the object being right-handed, its reflected image will be left-handed, and vice versa. Thus the models will illustrate the difference between the two optically active lactic acids, malic acids, or mandelic acids (see above); or, in general, any pair of optical isomers whose molecules contain one asymmetric carbon atom. As an instructive example it may be demonstrated, by means of the models, why only one acetic acid,  $\text{CH}_3(\text{COOH})$ , is possible; why only one monochloroacetic acid,  $\text{CH}_2(\text{Cl})(\text{COOH})$ , is possible; why only one dichloroacetic acid,  $\text{CHCl}_2(\text{COOH})$ , is possible; why only one trichloroacetic acid,  $\text{CCl}_3(\text{COOH})$ , is possible; why two optically isomeric chlorobromoacetic acids,  $\text{C}(\text{H})(\text{Cl})(\text{Br})(\text{COOH})$ , are possible; and why two optically isomeric chlorobromofluoroacetic acids,  $\text{C}(\text{Cl})(\text{Br})(\text{F})(\text{COOH})$ , are possible.

The work of later years showed that while the presence of an asymmetric carbon atom is always sufficient to cause asymmetry of the molecule as a whole and therefore isomerism, molecular asymmetry (and hence also optical isomerism) may occur in some cases in which asymmetric carbon atoms are absent. This principle is well illustrated by the inosites (q.v.). However, a beginner may be advised to adhere to the doctrine of the asymmetric carbon atom in the form in which its youthful creator, Van't Hoff, originally formulated it.

As already pointed out above, optical isomers possess precisely the same physical properties and differ only with regard to the direction in which they rotate the plane of polarized light. Their behavior towards chemical reagents is likewise identically the same, except if the reagents themselves are optically active—i.e., made up of unsymmetrical molecules. In general, a pair of optical isomers will appear identically similar unless exposed to an agency,

whether physical (like polarized light) or chemical (an optically active reagent), that is itself unsymmetrical. From this point of view it is clear that since, in general, the separation of mixed substances can only be effected (chemically) by reagents towards which the given substances behave differently—the separation of mixed optical isomers can only be effected by either some purely mechanical means or by reagents that are themselves unsymmetrical. It may be remarked that all reactions by which compounds with asymmetric carbon atoms may be produced from compounds containing no such atoms cause the simultaneous production of both optical isomers in precisely equal quantities; so that a separation is required whenever optically active compounds are to be prepared artificially (in nature either one or the other of a pair of optical isomers is usually found isolated). Three methods have thus far been found for effecting the separation. First, it is possible in many cases and under certain conditions of temperature, to separate the isomers mechanically. In all such cases the two isomers are found to form enantiomorphous crystals. Below, or sometimes above, the point of temperature at which this takes place, the two isomers usually crystallize together, forming a double compound, the so-called "racemic" modification of the given compound. The racemic modification is optically inactive because its two components tend to rotate the plane of polarized light to the same extent in opposite directions. The second method of separating optical isomers is applicable only to acids and bases. If a mixture of two optically isomeric acids is treated with an optically active base, two salts result differing more or less considerably in solubility, and therefore capable of being separated by fractional crystallization. The result is similar when a mixture of two optically active isomeric bases is treated with an optically active acid. Finally, the third method is based on the fact that certain processes of fermentation often destroy one of the optical isomers much more rapidly than the other. Thus, levo-glucose may be prepared by subjecting to fermentation its mixture with dextro-glucose, the latter alone being affected by the fermentation. It has been assumed by some that the living organisms (e.g., *Penicillium glaucum*) causing fermentation are capable of discriminating, by a sort of instinct, between the isomers, and, while feeding on one, reject the other. But the lifeless enzymes (q.v.) obtained from ferments have been shown to exercise the same action as the ferments themselves; and hence the peculiar action of the latter may be confidently ascribed to the stereochemical properties of their enzymes.

Passing now to the consideration of compounds whose molecules contain more than one asymmetric carbon atom, the most important case to be mentioned is that of tartaric acid  $(\text{COOH})\text{C}(\text{H})(\text{OH})\cdot\text{C}(\text{H})(\text{OH})(\text{COOH})$ , with two asymmetric carbons in its molecule. By the use of models like those mentioned above, it is easy to convince one's self that three different arrangements are possible: (1) a right-handed arrangement of the groups around either of the asymmetric carbons; (2) a left-handed arrangement of the groups around either of the asymmetric carbons; (3) a right-handed arrangement around one, and a left-handed arrangement around the other asymmetric carbon. Corresponding to these are the well-known dextro-

rotatory, levo-rotatory, and inactive (mesotartaric) modifications of the acid, the last named being inactive because one-half of its molecule rotates the plane of polarized light to the same extent in one direction as the other half does in the opposite direction. Besides these there is the racemic modification (racemic acid), which is a double compound of the dextro-rotatory and levo-rotatory tartaric acids (q.v.). The compounds containing more than two asymmetric carbon atoms include the sugars (q.v.)—an important class of compounds whose theory could not have been developed, and many of which would certainly not have been discovered without the concepts of stereochemistry.

**Geometrical Isomerism.** It may be seen from the preceding paragraphs that the fundamental hypothesis of stereochemistry, viz., that the valencies of a carbon atom act symmetrically around it in space, while indispensable for correlating optical isomers, also throws additional light on the phenomena of chemical isomerism proper. Take, e.g., again the case of methylene chloride,  $\text{CH}_2\text{Cl}_2$ . Were optical isomerism unknown and the stereochemical hypothesis non-existent, the question as to why only one modification of this compound is possible would be answered by pointing out that the four carbon valencies are identical and that, hydrogen and chlorine atoms being univalent, only one mode of linking the atoms is possible. If it were further asked, "But how do we know that two methylene chlorides might not exist, in whose molecules the atoms are linked similarly, but arranged differently?"—chemists would answer: "Of course, such a state of things is not inconceivable; only in all the innumerable cases thus far discovered, the doctrine of the linking of atoms is sufficient, the number of known isomeric compounds never exceeding the number of possible modes of linking; and so we deem it unnecessary to enter into speculations as to the arrangement of atoms in space." From the standpoint of stereochemistry the answer is thorough: only one methylene chloride is possible, (1) because the four valencies of carbon are identical; (2) because only one mode of linking the atoms is possible; (3) because only one arrangement of the atoms in space is possible, as may be readily demonstrated by the use of tetrahedron models.

It is, therefore, clear that stereochemistry not only explains, and hence permits of foreseeing all possible cases of optical isomerism, but also explains thoroughly why more cases of chemical isomerism than are explained and foretold by the doctrine of the linking of atoms are not possible. But stereochemistry has still another important application. Its fundamental hypothesis applied to the so-called "unsaturated" compounds (see CARBON COMPOUNDS) leads to a clear explanation of cases of isomerism which, again, cannot be explained by the doctrine of atomic linking alone. In the simplest class of unsaturated compounds one carbon atom is united by two valencies to another carbon atom. Using the stereochemical concept of the carbon tetrahedron, this means that two carbon tetrahedra have an edge in common, the four atomic groups held by the two carbons being situated at the four free corners of the tetrahedra. Take, e.g., the case of two carbon atoms united by a double bond and holding two hydrogen atoms and two carboxyl ( $\text{COOH}$ ) groups. In this case the doctrine of the linking of atoms recog-

nizes the possibility of two isomeric modifications, as shown by:

and

Stereochemical doctrine recognizes further that with the second of these modes of linking two different arrangements in space are possible, as may be seen from the accompanying diagram,

and better still by the use of models. As a matter of fact, three unsaturated acids  $\text{C}_2(\text{H}_2)(\text{COOH})_2$  are known, viz., methylene malonic acid characterized by the first of the above modes of linking, and two acids—maleic and fumaric—both characterized by the second mode of atomic linking, and differentiated from each other by the different configuration of their atoms. Optical activity is of course out of question, because none of the molecules under consideration is unsymmetrical. But corresponding to the difference in configuration are certain differences in the chemical behavior of maleic and fumaric acids, although the close relationship between the two is indicated by the great readiness with which they are transformed into each other. The most important difference between the two consists in the fact that maleic acid forms an anhydride, its two carboxyl groups losing the elements of water and becoming joined together, thus:

Fumaric acid, on the contrary, has no anhydride of its own. This indicates that in maleic acid the two carboxyl groups must be nearer together than in fumaric acid, and therefore the first of the above two stereochemical formulas is assigned to maleic, the second to fumaric acid. (See FUMARIC AND MALEIC ACIDS.) The oxidation of fumaric and maleic acids with aqueous potassium permanganate has furnished striking proof of the correctness of this assignment of formulae. But this matter cannot be taken up here.

As to compounds with triple bonds in their molecules (see CARBON COMPOUNDS), the verdict of stereochemistry is that no more isomers are possible than can be foreseen by the doctrine of atomic linking. This, too, may be best demonstrated by means of models.

**History.** The optical rotary power of a substance in the noncrystalline state (sugar in solution) was first observed by Biot in 1815. The optically isomeric tartaric acids were thoroughly investigated by Pasteur, who in 1860 discovered the three classic methods of separating such isomers (see above). Ten years later Wislicenus studied the isomeric lactic acids, and in a memoir published in 1871 expressed the view that the doctrine of atomic linking was no longer sufficient for the purposes of organic chemistry. Wislicenus's remark attracted the attention of Van't Hoff, who advanced the stereo-chemical theory of optical isomerism in 1874. Meanwhile Le Bel, in Paris, had undertaken to continue the work of Pasteur, and soon independently arrived at the same conclusions as Van't Hoff. Remarkably enough, Le Bel's and Van't Hoff's memoirs appeared within one month. The theory of geometrical isomerism was worked out by Van't Hoff about 1878. At present stereochemistry forms quite an extensive science, and its theories, to which no exception has yet been found in the case of carbon compounds, are being gradually extended also to the compounds of nitrogen, selenium, tin, and other elements, and especially, by Werner, to complex inorganic compounds.

Consult also the works on theoretical and organic chemistry recommended in the article CHEMISTRY. See CHEMISTRY; CARBON COMPOUNDS; LACTIC ACID; TARTARIC ACID; FUMARIC AND MALEIC ACIDS; SUGARS; INOSITE; VALENCY.

**STEREOCHROMY**, stér'è-òk'rò-mī (from Gk. *στερεός*, *stereos*, solid + *χρῶμα*, *chrōma*, color). A process of wall-painting, invented in 1896 by Prof. J. N. von Fuchs, of Munich, and first practiced by the painter Joseph Schlottbauer. Upon a thin coating of mortar forming a part of the wall, mineral water colors were applied, thus admitting of any part of the picture being retouched, as in the case of oil paintings. A coating of liquid glass was then added to protect it from the effects of the atmosphere. Experience has shown, however, that the surface of the painting cracks, and the process is no longer employed.

**STEREOPTICON.** See PROJECTION APPARATUS.

**STEREORNITHES**, stér'è-òr'nī-théz (Neo-Lat. nom. pl., from Gk. *στερεός*, *stereos*, solid + *ὄρνις*, *ornis*, bird). A group of extinct ratite birds of gigantic size whose remains are found in the Miocene strata of Patagonia. The propriety of this name as indicative of a distinct group has been criticized, and it is believed that, on the contrary, many of the species are not ratite at all, but carinate, one, at least, having been determined to be a vulture. The most conspicuous genus is *Phororhacos*. Consult Alfred Newton, *Dictionary of Birds* (New York, 1893-96). See BIRD, FOSSIL.

**STEREOSCOPE** (from Gk. *στερεός*, *stereos*, solid + *σκοπεῖν*, *skopein*, to view). An optical instrument that enables one to see the pictures of objects not merely as plane representations, but with an appearance of solidity, and in relief. When a person looks at a solid body with both eyes the pictures formed on the retinas are not alike, as the right eye is able to see more of the right side of the object and the left eye more of the left side. When these two impressions are blended the object is seen with an appearance of depth or relief. The first stereoscope was devised in 1838 by Wheatstone (q.v.) and consisted of two plane mirrors at an angle of 90° and two similar clamps or supports for holding the picture. The face of the observer was placed close to the meeting point of the two mirrors and the light from each picture was reflected into the eye by the adjacent mirror. The pictures for use in this instrument were drawn as they would appear to each eye separately, and consequently were reflected to the eyes as they would actually be seen. The apparatus was successful so long as the pictures were confined to representations of geometrical objects of three dimensions, which could be constructed readily, but the reproduction of more complex objects, such as natural scenery, was beyond the skill of the artists, and it did not occur to the inventor to use photography, then being developed. Sir David Brewster in 1849 constructed a lenticular stereoscope in which lenses were substituted for Wheatstone's reflectors, and he was able to obtain also a magnified image. He divided a double convex lens transversely into halves, which were placed in front of the two pictures with their thin edges adjacent, so that the rays would be deviated by such an amount that they would apparently originate in a common point between the two pictures, the lens acting as a prism which always bends the rays around its base. Thus the two pictures, which are placed directly in front of the two lenses at a distance equivalent to the principal focus, are united into one image. The growth of photography and the ease of reproduction for the stereoscope soon made the instrument popular; the open form used in the United States was devised by Dr. Oliver Wendell Holmes, the poet. Brewster also invented a form of photographic camera with two lenses to take stereoscopic pictures. Instead of two lenses, which in modern stereoscopic cameras are generally of the rapid rectilinear type, the position of the camera can be shifted, but the results are not as good as those obtained with two similar lenses mounted on a camera with a vertical partition which enables two pictures to be taken on the same plate. The lenses, generally speaking, should be about 2½ inches apart, though a slight increase does not make any great difference, the relief becoming more prominent. Too great a difference exaggerates the picture. In printing, the negative reverses conditions, and prints must be interchanged, as pictures taken on the right-hand side must always be seen with the right eye.

The opera glass furnishes a familiar instance of the application of the binocular principle, and in the more modern double-tube telescopes and field glasses, particularly those with reflecting prisms and of high power designed for military operations, great success has been attained in securing the stereoscopic effect with considerable magnifying power. Furthermore the stereo-

scopic principle is applied with success in many modern range finders. In the binocular microscope (see MICROSCOPE) the same idea is applied, while in the stereomicrometer it is possible to measure small distances. Consult: Brewster, *The Stereoscope* (Leipzig, 1856); Helmholtz, *Physiologische Optik* (ib., 1856-66); Le Conte, *Sight* (New York, 1881); Müller-Pouillet, *Lehrbuch der Physik* (11th ed., Brunswick, 1914); C. Pulfrich, *Stereoskopisches Sehen und Messen (mit Literaturverzeichnis)* (Jena, 1911); M. v. Rohr, "Abhandlungen zur Geschichte des Stereoskops," in Ostwald, *Klassiker der exakten Wissenschaften*, vol. clxviii (Leipzig, 1908); A. Keller, "Das Stereoscop und seine wichtigsten Anwendungen in der modernen Wissenschaft," in *Himmel und Erde*, vol. xxvi (Leipzig, 1914). See RANGE FINDER.

**STEREOTOMY** (from Gk. *στερεός*, *stereos*, solid + *τομή*, *tomē*, a cutting). A special branch of descriptive geometry (q.v.) which treats of its applications to the making of exact patterns for the various forms of wood and stone required for stairs, stair rails, vaults, arches, etc. See STONE WORK.

**STEREOTROPISM**. See TROPISM.

**STEREOTYPING**. See PRINTING.

**STERILITY** (from Lat. *sterilis*, barren). Barrenness, infecundity. In a woman, sterility consists of an incapacity for conception; in a man, of the inability to procreate the species. The causes of sterility in a woman are as follows: (1) Causes preventing the entrance of semen into the uterus, including absence of the uterus or vagina, imperforate hymen, vaginismus, atresia vaginae, occlusion of cervical canal, conical shape of cervix, cervical endometritis, polypi or fibroids, displacements, very small os internum or externum. (2) Causes preventing the production of a healthy ovule, including chronic ovaritis, cystic disease of both ovaries, cellulitis or peritonitis, absence of ovaries. (3) Causes preventing passage of ovule into uterus, including stricture or obliteration of Fallopian tubes, absence of Fallopian tubes, detachments and displacements of Fallopian tubes. (4) Causes destroying the vitality of semen or preventing fixation of impregnated ovum, including corporeal or cervical endometritis, membranous dysmenorrhœa, menorrhagia or metrorrhagia, abnormal growths, areolar hyperplasia.

Sterility in man is *organic* when there is anatomical derangement of the apparatus; *atonic* when erections are wanting or feeble; *anæsthetic* when there is a diminution of sensitiveness in the nerves supplying the male organ; or *psychic* when mental conditions (as of fright, repulsion, etc.) inhibit the genital centre in the spinal cord. The determination of which partner in marriage is sterile is of great importance. In many countries obloquy and derision attach to the wife who fails to bear children, and her legal status is impaired. The woman is much less often to blame than has been supposed. See HYBRIDITY.

**STERILIZATION**. See BACTERIA.

**STERILIZATION** (from Lat. *sterilis*, barren). Sterilization, with reference to the human race, is a term applied to an operation performed for the purpose of depriving a member of either sex of the power to reproduce. The most common operations now employed are: (a) in the male, *vasectomy*, sometimes known as "Rentoul's operation"—the removal of a small portion of each sperm duct; and (b) in the fe-

male, *salpingotomy*—the removal of a small portion of each Fallopian tube. These methods avoid certain harmful effects, physical or mental, which often follow other forms of sterilization—forms which are more correctly termed asexualization.

Three motives appear to have prompted sterilization of individuals in the United States, first eugenic, second punitive, third therapeutic. Discussion at the present time centres chiefly upon: (a) the advisability of compulsory sterilization as a method of practical eugenics, and (b) the legal limitations which should be placed upon compulsory sterilization wherever adopted. As a method of practical eugenics sterilization is advocated to prevent the procreation of habitual criminals, idiots, feeble-minded, insane, diseased, and degenerate persons. In a large number of instances, it is argued, criminality, insanity, feeble-mindedness, and degeneracy are the result of hereditary characteristics. When such is the case the advocates of sterilization hold it to be the duty of the State to prevent persons possessing these characteristics from handing them down to later generations. The more conservative advocates of sterilization desire its application, at first, only in the most patently degenerate cases where the operation is often of direct therapeutic as well as eugenic value. They urge segregation as an alternative. The custodial care of defectives at present, however, is wholly inadequate and it is a tenable hypothesis that sterilization would prove a more practicable means of attaining the desired end.

Various States of the Union have passed experimental sterilization laws and under these somewhat less than 1000 operations had been performed prior to 1914. The first sterilization law was passed by Indiana, March 9, 1907. Washington, California, Connecticut, Nevada, Iowa, New Jersey, New York, North Dakota, Michigan, Kansas, and Wisconsin have also enacted important sterilization measures. Bills on this subject have been introduced from time to time into the legislatures of Illinois, Minnesota, New Hampshire, Ohio, Oregon, Pennsylvania, and Virginia. In Oregon the bill was passed by the Legislature and approved by the Governor, but was repealed by referendum. In Indiana and California a number of operations have been performed, but in several other States no action under the law has been taken. Commenting on laws actually on the statute books, H. H. Laughlin, Secretary of the Eugenics Record Office, remarks: "All of the existing statutes, with the possible exception of the Kansas statute, have totally inadequate provisions for safeguarding the rights of the individuals designated for sterilization; no hearing is provided; no easy method of appeal may be had by persons whose sterilization has been decided upon." Nevertheless he thinks that most of the existing statutes have some elements of virtue, and are at least an attempt to bring legislation into line with scientific advance. Consult: Havelock Ellis, "The Sterilization of the Unfit," in the *Eugenics Review*, vol. 1 (London, 1909); H. H. Laughlin, "The Legal, Legislative, and Administrative Aspects of Sterilization," in *Eugenics Record Office Bulletin* No. 10 B. (Cold Spring Harbor, N. Y., 1914). See EUGENICS; HEREDITY; MENTAL DEFECTIVES; Segregation.

**STERILIZED FOOD**. Food subjected to an agent (usually heat) capable of destroying germs of fermentation or disease which may

be present. The articles of diet which are not usually prepared by heat before ingestion, and which are capable of conveying disease, are fresh fruits, some vegetables, water, and milk. Water and milk are very likely to act as carriers of pathogenic microorganisms. Water may be rendered sterile by boiling or by distillation. It is then best kept for use in sterile bottles, sealed, and maintained at a low temperature. Ice may be the means of carrying disease, since many bacteria, although retarded in their growth, are not killed by freezing.

Milk is the food around which the question of sterilization centres, because it is the sole nourishment of infants and is filled with bacteria, particularly in summer. Although sterile when from the breast of the suckling mother or udder of the healthy cow, milk is almost a perfect culture medium for many varieties of bacteria, pathogenic and nonpathogenic, which increase with great rapidity. It may become contaminated during the interval between milking and ingestion in various ways. Unclean material may be introduced into the milk from the udders or the milker's hands. Impure water used as an adulterant or for cleansing containers may be a means of contamination. Exposure to the air is sufficient to introduce, through dust, many different forms of bacteria.

Diseases most likely to be propagated through milk are typhoid fever, tuberculosis, especially the glandular and intestinal types, scarlet fever, cholera, suppuration, diphtheria, septic sore throat, and especially the summer diarrhoea of children. Besides producing their specific diseases, bacteria produce elements in milk capable of giving rise to ptomaine poisoning (q.v.). The addition of nonpoisonous antiseptic substances has been proposed. But it has been found that with such drugs as salicylic acid and boric acid quantities too large to be wholesome must be employed. Formalin has been extensively used of late years to keep milk sweet and aseptic; but the addition of preservative agents is no longer looked upon with favor. Cold is a very imperfect means of sterilization.

Milk is usually sterilized by boiling or by exposure to superheated steam. Germs existing in this fluid can be absolutely destroyed only by heating to 212° F., or higher on two or three successive occasions. The ordinary method of sterilizing milk is to place it in sealed jars or bottles containing sufficient for one feeding, which are then subjected to the action of steam. It is then cooled rapidly, kept sealed, and placed on ice. Exposure to such high temperatures alters the character of milk materially, both as to digestibility and nutritive qualities; it is therefore rendered unfit for use except as a makeshift in very hot weather and in cases of infantile summer diarrhoea. Prolonged use of sterilized milk for children dependent solely upon it for nutriment has resulted in symptoms of scurvy. To obviate this difficulty milk is often subjected to a process known as pasteurization. (See PASTEURIZER.) Pasteurization has been shown to be sufficient to kill the microorganisms most commonly found in milk, and in particular those giving rise to diarrhoeal diseases, which are very vulnerable to heat. Spores, however, are not destroyed. The tubercle bacillus is more resistant. Pasteurized milk will keep two or three days at ordinary temperatures or several days on ice, and its taste, digestibility, and nutritive value are believed to be unchanged.

See ADULTERATION; FOOD; MILK, and bibliography thereto appended.

**STERLING.** An epithet generally applied to the coinage of Great Britain. Charlemagne had a *livre esterlin* or true pound which superseded earlier systems of coinage and weights. In this a pound of 12 ounces became the money weight. The older *silver* or scruple of 24 wheat-corns being superseded by the penny of 32 wheat-corns, the term "sterling" seems to have been applied to the latter, in consequence of its being in use among the Riparian or Austrasian Franks, sometimes called the *Esterlings*. In England the word "sterling" retaining the ancient French meaning of "true" came in the course of time to be associated with the fineness of the gold coin of the realm, as pounds sterling, and especially to indicate the fineness of the silver. The superiority of the English silver, maintained by laws requiring its assay at government mints, was generally acknowledged over Europe; and hence the adjective "sterling" has become a synonym for "pure" or "genuine."

**STERLING, stér'ling.** A city and the county seat of Logan Co., Colo., 128 miles northeast of Denver, on the Union Pacific and the Chicago, Burlington, and Quincy railroads (Map: Colorado, F 1). It carries on an important trade in beets, alfalfa seed, cattle, and sheep, and has a sugar factory. Pop., 1900, 998; 1910, 3044.

**STERLING.** A city in Whiteside Co., Ill., 110 miles west of Chicago, on Rock River, the Hennepin Canal, and on the Chicago and Northwestern and the Chicago, Burlington, and Quincy railroads (Map: Illinois, E 2). The principal manufactures are hardware, agricultural implements, funeral cars, ambulances, gasoline engines, wire fence, canned goods, paper, and foundry and machine-shop products. There are a public library and a hospital. Sterling adopted the commission form of government in 1915. Pop., 1900, 6309; 1910, 7467.

**STERLING, JOHN** (1806-44). An author of Irish parentage, born on the island of Bute. He was educated at Glasgow and at Cambridge. He went to London and began writing for the *Athenaeum*. Owing to ill health, he passed two years in the West Indies (1830-32). Returning to England, he took orders and served eight months as a curate. In 1838 the Sterling Club was instituted and named after him. It included Lord Houghton, Carlyle, and Tennyson. Among his writings are: *Arthur Coningsby* (1833); *Poems* (1839); *The Election* (1841), a poem; *Strafford* (1843), a drama. Sterling, a man of many friends, cut down with consumption in the prime of life, has been immortalized by Carlyle in a *Life* (London, 1851; new ed., Oxford, 1909). Consult *Essays and Tales*, with a memoir by J. C. Hare (London, 1848).

**STERN, stérn, ADOLF** (1835-1907). A German literary historian and poet, born in Leipzig. He studied at the universities of Leipzig and Jena, and in 1868 was appointed professor of the history of literature in the Polytechnikum of Dresden. His publications include the compilation *Fünfzig Jahre deutscher Dichtung* (1871); two collections of essays, *Aus dem achtzehnten Jahrhundert* (1874), *Geschichte der neuern Litteratur* (7 vols., 1882-85); *Grundriss der allgemeinen Literaturgeschichte* (4th ed., 1906); and editions of Hauff, Herder, and Körner, Sr. Among his literary works may be mentioned: *Gedichte* (1860; 4th ed., 1900); *Die*

Wiedertauffer (1866), stories; the novels *Die letzten Humanisten* (1880), *Camœns* (1887), and *Die Ausgestossenen* (1911), a fragment. His selected works appeared in eight volumes (Leipzig, 1908). Stern's real name was Adolf Ernst. Consult Adolf Bartels, *A. Stern, der Dichter und Litterarhistoriker* (Dresden, 1905).

**STERN, DANIEL.** See AGOULT, COMTESSE D'.

**STERN, L. WILLIAM** (1871- ). A German psychologist. He was born in Berlin and studied in the university there under Ebbinghaus and Stumpf. In 1897 he became a lecturer at Breslau, where he was associate professor and director of the psychological seminary after 1907. His publications include: *Die Analogie im volkstümlichen Denken* (1893); *Psychologie der Veränderungsauffassung* (1898); *Ueber Psychologie der individuellen Differenzen* (1900); *Die psychologische Arbeit des 19. Jahrhundert* (1900); *Zur Psychologie der Aussage* (1902); *Die Aussage als geistige Leistung und als Verhorsprodukt* (1903); *Helen Keller* (1905); *Person und Sache* (1906); *Monograph über die seelische Entwicklung des Kindes* (2 vols., 1907-08), with his wife, Clara Stern; *Die differentielle Psychologie in ihrem methodischen Grundlagen* (1911); *Die psychologischen Methoden der Intelligenzprüfung* (1912; Eng. trans. by G. M. Whipple as *The Psychological Method of Testing Intelligence*, 1914); *Physiologie der frühen Kindheit bis zum sechsten Lebensjahre* (1914).

**STERNBERG, stěrn'běrk.** A town in Moravia, Austria, 12 miles north-northeast of Olmütz (Map: Austria, E 2). It is the chief seat of the Moravian cotton and linen industry, and there is a large tobacco factory. Pop., 1910, 14,585.

**STERNBERG, CONSTANTIN VON** (1852-1924). A Russian-American pianist and composer, born at St. Petersburg. In 1871 he became conductor of the Court Opera at Strelitz, in 1875 director of the music school, and court pianist at Schwerin. He settled in the United States in 1885, becoming director of the College of Music at Atlanta, Ga. In 1890 he became the head of the Sternberg School of Music in Philadelphia. His compositions include some admirable pianoforte music.

**STERNBERG, stěrn'běrg, GEORGE MILLER** (1838-1915). An American army surgeon. Born at Hartwick Seminary, Otsego Co., N. Y., he graduated from the College of Physicians and Surgeons, New York, in 1860, and entered the medical corps of the United States army the following year as assistant surgeon. He rose until he was appointed, in 1893, brigadier general and surgeon general of the army, retiring in 1902. He saw active service in the Civil War with the Army of the Potomac and in the Spanish-American War as commander of the medical service. He also helped suppress cholera and yellow-fever epidemics, being secretary of the Havana Yellow Fever Commission in 1879. In 1898 he was president of the American Medical Association. Sternberg was much interested in bacteriology, to which he made important contributions, such as his discovery (1881), independently of Pasteur (q.v.), of the diplococcus of pneumonia, and the results of his researches in disinfection. He contributed many valuable papers to medical literature. Among his works are: *Photomicrographs* (1879); *Photomicrographs and How to Make Them* (1883); *Malaria and Malarial Diseases* (1884); *Disinfection and Individual Prophylaxis*

*against Infectious Diseases* (1886; Ger. and Sp. trans.); *Immunity* (1895); *A Text Book of Bacteriology* (1896; 2d ed., 1901); *Infection and Immunity* (1903); *Sanitary Lessons of the War and Other Papers* (1912).

**STERNE, CARUS.** See KRAUSE, E. L.

**STERNE, LAURENCE** (1713-68). A humorist, born at Clonmel in Ireland. Carried about in the regiment in which his father was an officer, he saw many phases of life in Ireland and England. From 10 to 18 he was at school at Halifax in Yorkshire. Later he went to Jesus College, Cambridge, receiving his degree in 1736. He was ordained two years later, probably with a view to the family living of Sutton, near York, which was immediately given him, followed in 1741 by the prebend in York Minster. In 1743 the living of Stillington, carrying another prebendal stall in the cathedral, was given him. He passed 20 years in his Yorkshire home, preaching curious sermons and reading Cervantes, Rabelais, and old romances. He found himself suddenly famous when the first two volumes of his *Tristram Shandy* appeared at York at the end of 1759, and were announced as published Jan. 1, 1760. He went up to London, became the lion of the moment, and published a collection of sermons. In 1760 he was presented to the living of Coxwold. There he went on with *Tristram*, publishing the ninth and last volume in 1767. During these years he spent much time in London and traveled on the Continent. The outcome of his tour in the autumn of 1765 was *A Sentimental Journey through France and Italy* (1768). Less than a month after its publication Sterne died in a London lodging. In 1775 appeared *Letters to his Intimate Friends*, with the fragment of an autobiography, edited by his daughter; *Letters from Yorick to Eliza* (i.e., Mrs. Elizabeth Draper); and *Twelve Letters to his Friends*, letters iv-ix being of doubtful authenticity.

Sterne's work reached a wide popularity at once, and had a following in England, France, and Germany for years. His sentimentality, the deliberate self-conscious indulgence in feelings of pathos, became the fashion of the day. His work is curiously subjective, dependent upon the moods and whims of the moment; and he has a formless, easy-going style, admirably representing his thought. His characters are remarkable for their genuine human quality, remote as they live from the interests of the ordinary people of the time, and belong to the small class of positive creations in literature.

Thackeray, in *English Humourists of the Eighteenth Century* (London, 1853; new ed., New York, 1911); Percy Fitzgerald, *Life of Laurence Sterne* (London, 1864; 2d ed., ib., 1896); Paul Stapfer, *Laurence Sterne, sa personne et ses ouvrages* (2d ed., Paris, 1882); H. D. Traill, *Laurence Sterne, "English Men of Letters"* (London, 1882); Texte, *Rousseau et le cosmopolitisme littéraire au XVIIIème siècle* (Paris, 1895); H. W. Thayer, *Laurence Sterne in Germany* (New York, 1905); P. E. More, *Shelburne Essays* (3d series, ib., 1905); W. L. Cross, *Life and Times of Sterne* (ib., 1909); W. S. Sichel, *Sterne: A Study* (ib., 1910); L. S. Benjamin, *Life and Letters* (2 vols., ib., 1912). His works, first collected in 1779, were edited, with newly discovered letters, by J. P. Browne (London, 1873). A less complete edition was edited by G. Saintsbury (ib., 1894).

**STERNE, SIMON** (1839-1901). An Ameri-

can economist and lawyer, born in Philadelphia. He studied at Heidelberg and at the University of Pennsylvania (LL.B., 1859), and was admitted to the New York bar in 1860. Beside serving as counsel for corporate interests, he was active in social and political reform movements, edited the *Commercial Advertiser* in 1867, and in 1870 was secretary of the Committee of 70 that overthrew the Tweed Ring. He served on various commissions, State and national, relating to problems of government and public utilities. His publications include: *On Representative Government and Personal Representation* (1871); *Constitutional History and Political Development of the United States* (1882; 4th rev. ed., 1888); *Railways in the United States* (1912), posthumously collected papers.

**STERNEGG, KARL THEODOR VON INAMA.** See INAMA-STERNEGG, K. T. VON.

**STERNER, ALBERT EDWARD** (1863– ). An American painter, lithographer, and illustrator. He was born in London and studied at Birmingham, and in Paris under Boulanger, Lefebvre, and Gérôme. In 1881 he came to America, settling in New York in 1885. Possessed of great versatility, he used all mediums with equal success, his red chalk and other drawings displaying dashing technique and facility of execution. Good examples are: "Amour Mort," a lithograph; "La Surprise," a series of red-chalk portraits including Mrs. Catherine Gardner Boyer (1912); "Portrait of my Son" and "In the Studio," both oil paintings. He became an Associate of the National Academy of Design, and instructor at the Art Students' League and in the New York School of Applied Design.

**STERNUM** (Neo-Lat., from Gk. *στέρνον*, breastbone), or **BREASTBONE**. A narrow flat bone in the median line of the chest in front, giving attachment to the first seven ribs through the costal cartilages and thus closing anteriorly the thoracic cavity. In the adult it consists of three parts, the upper or manubrium, the middle or gladiolus, and the inferior or ensiform. A sternum is not present in fishes, batrachians, or serpents, but it does occur in all warm-blooded vertebrates and reaches its highest development in the flying birds, where a heavy ridge or keel furnishes attachment for the powerful muscles of the wings. In the tortoise it is represented by the lower shell or plastron. See **SKELETON**.

**STERNUTATORIES.** See **ERRHINES**.

**STERRETT, JOHN ROBERT STILINGTON** (1851–1914). An American classical scholar, born at Rockbridge Baths, Va. He was educated at the University of Virginia and in Europe. Later he engaged in important archaeological expeditions in Asia Minor, the results of which were published in the papers of the American School at Athens under the titles *Wolf Expedition to Asia Minor* (1885), *Epigraphical Journey in Asia Minor* (1888), and also in *Leaflets from the Notebook of a Traveling Archaeologist* (Texas, 1889). After holding professorships of Greek at Miami University and the University of Texas, he was called in 1892 to a similar position at Amherst College; in 1901 he became head of the department of Greek in Cornell University. In 1896–97 he was professor in the American School of Classical Studies at Athens. His writings, besides those mentioned, include: *Qua in re Hymni Homericici quinque maiores inter se differunt* (1881); *Inscriptions of Assos; Inscriptions of Tralles* (1885); *The Torch-Race*

(1902); school edition of part of the *Iliad* (1907); *A Call of Contemporary Society for Research in Asia Minor and Syria* (1911). Sterrett had begun also a translation of Strabo (q.v.) for the Loeb Classical Library.

**STERRY, JOSEPH ASHBY.** See **ASHBY-STERRY, JOSEPH**.

**STESICHORUS**, stê-sîk'ô-rûs (Lat., from Gk. *Στησίχορος*) (c.640–555 B.C.). A famous Greek lyric poet, born in the Locrian Matarus in Italy, but considered a Himeræan, since he spent the greater part of his life in Himera, Sicily. It is reported that he was at first the friend of Phalaris, the tyrant of Agrigentum, but that later, recognizing the cruel character of that tyrant, he warned his fellow citizens against his schemes by telling them the fable of the horse that, as the result of his efforts to avenge himself on the stag that had intruded upon its pasture, became subject to man. The Himeræans did not listen, and he was compelled to flee to Catania, where he died. The Himeræans, however, in later times honored him with a statue, which was seen by Cicero; his figure was also stamped on their coins. A famous story relates that Stesichorus was struck with blindness because of his attack on Helen, but recovered his sight after he had published a recantation in which he declared it was only the shade of Helen, not Helen herself, that went to Troy.

In his hands the religious hymn was somewhat secularized. The content also was epic, although the form continued to be that which had been established for melic verse. He treated in his *Destruction of Troy* the story of Æneas' wanderings, which thereafter was established in literary tradition. He also employed folk tales and was the forerunner of the Greek romance in that he established in Greek literature the impersonal love poem, and he was the first to give literary treatment to the Sicilian story of Daphnis, later handled by Theocritus and other bucolic poets. His dialect was a combination of epic with Doric. He also contributed to the development of the strophic and epodic structure of lyric poetry. His poems were written in strophe, antistrophe, and epode, and this arrangement became the norm for lyric poetry, which was thereafter changed only in minor details. The fragments are published by Bergk, *Poeta Lyrici Græci* (Leipzig, 4th ed., 1882; reprinted, 1914). Consult: Welcker, *Stesichorus' Kleine Schriften* (Bonn, 1884); G. S. Farnell, *Greek Lyric Poetry* (London, 1891); Rizzo, *Questioni Stesichoree* (Messina, 1895); H. W. Smyth, *Greek Melic Poets* (London, 1900); W. C. Wright, *A Short History of Greek Literature* (New York, 1907); Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. i, part i (6th ed., Munich, 1912).

**STETHOSCOPE** (from Gk. *στήθος*, stêthos, breast + *σκοπεῖν*, *scopein*, to view). An instrument for examining the heart and lungs through their sounds. In its simplest form, invented by Laennec (q.v.), the stethoscope consists of a tube of wood, from 10 to 12 inches long, with a flanging end to be placed on the chest to receive the sound, an open canal to conduct it, and a broad flat earpiece at the other end for apposition to the ear and excluding extraneous sounds. (See Fig. B.) An improvement upon this is the binaural stethoscope, introduced by Dr. Camman, of New York, in the form of a binaural or double instrument having an earpiece for each of the

ears and flexible rubber tubes connecting them with the chest piece. (See Fig. A.) A still finer instrument is the phonendoscope (q.v.), which conveys sounds with greater minuteness

STETHOSCOPE.

A, stethoscope with ear tubes; B, older form.

and intensity. See AUSCULTATION; RESPIRATORY SOUNDS.

**STETSON, AUGUSTA E(MMA)**, (née SIMMONS) (?- ). An American Christian Science leader, born at Waldoboro, Me. She studied at the Blish School of Oratory in Boston, and in 1884 received the degree of Doctor of Christian Science (C.S.D.) from the Metaphysical College. She then began Christian Science healing in Boston, and in 1885 led the service on alternate Sundays at Chickering Hall. The next year she was sent by Mrs. Eddy to New York City, where she organized the First Church of Christ, Scientist, in 1887. She was appointed pastor of that church (1888) and in 1895 was made first reader when the title of pastor was changed in all Christian Science churches. For a time she was also principal of the New York City Christian Science Institute (chartered 1891). Mrs. Stetson raised more than \$1,250,000 to rebuild a structure for the use of the First Church, and in 1903 it was dedicated free of debt. In 1909 she was excommunicated by the Mother Church at Boston, on charges of insubordination and of false teaching. She published: *Poems* (1901; 2d ed., 1910); *Reminiscences, Sermons, and Correspondence* (1913); *Vital Issues in Christian Science* (1914).

**STETSON, FRANCIS LYNDE** (1846-1920). An American lawyer. He was born at Keeseville, N. Y., and graduated at Williams College in 1867, afterward taking a law course in Columbia University. He was admitted to the bar in 1869 and practiced in New York City. He devoted attention chiefly to corporation and railway law, becoming eminent in those lines. He became general counsel of the United States Steel Corporation, the International Mercantile Marine Company, the Northern Pacific Railway, the Southern Railway, and the United

States Rubber Company; also director in several railway companies and other corporations.

**STETSON UNIVERSITY.** See JOHN B. STETSON UNIVERSITY.

**STETTIN**, shtët-tën'. The capital of the Province of Pomerania, Prussia. The city is situated on both banks of the Oder, 17 miles south of the Stettiner Haff, an inlet of the Baltic, and 83 miles by rail northeast of Berlin (Map: Germany, F 2). The district on the right bank of the river comprises the former suburbs of Lastadie and Silberwiese. The main part of the city is on the left bank of the river; the site is hilly, and consequently the streets are uneven, but the houses are well built. The extensive fortifications were demolished in 1874. The castle, dating from 1577, formerly occupied by the dukes of Pomerania, is now a government building. The Königs-Thor and the Berlinger Thor, remains of the old fortifications, are interesting sandstone gates built by Frederick William I. St. James is an imposing thirteenth-century church, restored in 1897; St. Peter and St. Paul is the oldest church in Pomerania, restored in 1816-17; and the fine Roman Catholic church (1890) is noteworthy.

Stettin is the most important manufacturing city in Pomerania. Its principal industrial establishment is the Vulcan shipbuilding yard, employing over 8000 men and covering 70 acres. The clothing industry ranks second in importance only to shipbuilding, and employs over 10,000 men, women, and children. There are numerous large factories of chemicals and cement, locomotives, anchors, bicycles and sewing machines, soap and candles, sugar, paper, glass, etc. A new harbor on the east bank of the Oder was opened in 1900; its area is 150 acres, and its quays have a length of over 14,000 feet. This, together with the deepening of the Oder to the Stettiner Haff (1903), enabling large vessels, which formerly stopped at Swinemünde, to reach the city, has made Stettin the fourth port of Germany. It has direct steamship communication with New York, London, and other foreign cities. The chief exports are grain, spirits, lumber, sugar, chemicals, and cement; the imports, iron, petroleum, wine, groceries, and coal. Pop., 1890, 116,228; 1900, including annexed suburbs, 210,680; 1910, 236,113.

Stettin is of Slavic origin. It first came into notice in the twelfth century. As a member of the Hanseatic League it became a flourishing commercial town. It belonged to Sweden from 1648 until 1720, when it passed to Prussia. It was held by France from 1806 to 1813. Consult W. H. Meyer, *Stettin in alter und neuer Zeit* (Stettin, 1887).

**STEUBEN**, stü'bën; Ger. pron. shtoi'bën, FRIEDRICH WILHELM VON, BARON (1730-94). A German-American soldier, born at Magdeburg, Prussia. He was educated at the Jesuit colleges of Neisse and Breslau, and at the age of 14 served as a volunteer under his father at the siege of Prague (q.v.). In 1747 he was appointed cadet of infantry, and in 1758, after promotions, became an adjutant general with the rank of captain. He fought with distinction in the Seven Years' War, at its end becoming grand marshal of the Prince of Hohen-zollern-Hechingen, in which position he remained until about 1774. In 1777 Saint-Germain, the French Minister of War, induced him to go to America, and he arrived at Portsmouth, N. H., in the beginning of 1778. He immediately offered his services as a volunteer to Congress and

was directed to join the army at Valley Forge. This he did Feb. 23, 1778, and in May, 1778, he was appointed instructor general of the Continental army with the rank of major general. He devoted himself to the task of reorganizing the army on the European model, drilling untrained soldiers and introducing system. He increased the general efficiency of the army, contributing greatly to the success of ensuing campaigns. At Monmouth he rendered valuable service, and in 1780 he was sent with a separate command to cooperate with General Greene in Virginia, where he opposed the marauding expedition of Benedict Arnold, and finally took an active part in the siege of Yorktown. In 1780 he prepared a manual for the army which came into general use. After the war he received grants of land from several States, and finally Congress voted him a tardy pension of \$2400. For several years he lived in New York City and then removed to the tract of land (Steuben Township) granted to him by New York, where he lived in a log cabin (near the site of the present Utica) until his death, Nov. 28, 1794. A monument to Baron Steuben was unveiled at Utica, N. Y., Aug. 3, 1914. Friedrich Kapp has written the most trustworthy biography (New York, 1859).

**STEUBENVILLE**, stū'ben-vīl. A city and the county seat of Jefferson Co., Ohio, 43 miles west by south of Pittsburgh, Pa., on the Ohio River and on the Pennsylvania, the Wheeling and Lake Erie, and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads (Map: Ohio, J 5). It is favorably situated for commerce and industry. Noteworthy features are the Carnegie Library, city hall, courthouse, Gill and Ohio Valley hospitals, Stanton Park, and the Y. M. C. A. building. The surrounding region has coal deposits, natural gas, and petroleum wells. There are manufactures of iron and steel, glassware, chimneys and electric-light bulbs, paper, foundry and machine-shop products. The water works are owned and operated by the municipality. Pop., 1900, 14,349; 1910, 22,391; 1915 (U. S. est.), 26,631; 1920, 28,508. A fort named in honor of Baron Steuben was erected here in 1787. Consult Howe, *Historical Collections of Ohio* (Columbus, 1890-91).

**STEUNENBURG**, stōi'nēn-būrg, FRANK (1861-1905). An American governor, born at Keokuk, Iowa. Moving to Caldwell, Idaho, in 1887, he engaged in newspaper work, was chosen to the State Legislature in 1890, and, having been elected on the Populist ticket, served as Governor of Idaho from Jan. 1, 1897, to Dec. 31, 1900. His handling of the miners' strike which occurred in his administration aroused great hostility among the miners, and led to his assassination by Harry Orchard (q.v.) in 1905. See also HAYWOOD, WILLIAM D., and IDAHO, *History*.

**STEVAERTS**, stā'vārts. See PALAMEDESZ.

**STEVENS, ABEL** (1815-97). A Methodist Episcopal clerical writer. He was born at Philadelphia and entered the New England conference (1834). He was editor of *Zion's Herald* (Boston, 1840-60), of the *National Magazine* (New York, 1852), of the *Christian Advocate* (ib., 1856-60), corresponding editor of the *Methodist* (ib., 1860-74). He was the author of *Memorials of the Introduction of Methodism into the Eastern States* (1852), *Memorials of the Early Progress of Methodism in the Eastern States* (2d series, 1854), *The History of the Re-*

*ligious Movement of the Eighteenth Century Called Methodism* (3 vols., 1858-61), *History of the Methodist Episcopal Church in the United States of America* (4 vols., 1864-67), *Supplementary History* (1899), *Madame De Stael: A Study of her Life and Times* (2 vols., 1880), *Christian Work and Consolation* (1882).

**STEVENS, ALFRED** (1828-1906). An eminent Belgian genre painter. His father had been an officer in the service of William I of the Netherlands. He was born at Brussels, studied there under Navez, and in Paris with Roqueplan and at the Ecole des Beaux-Arts under Ingres. He first exhibited in Brussels, but in 1849 settled at Paris, where he spent the remainder of his life, a notable figure. Among his works are the "Discouragement of the Artist" and "Love of Gold" (1853); "Masquerade on Ash Wednesday" (1853, Marseilles Museum); "Consolation" (1857, Ravené Gallery, Berlin); "The Lady in Pink," "The Japanese Robe," "Preparing for the Ball," "The Morning Call," and "Ready for the Fancy Ball" (all in the Metropolitan Museum, New York). His most characteristic subjects depict interiors of modern houses as background for the figures of women and children of fashionable life. He revels in painting Oriental furniture and rich stuffs, securing remarkable effects of texture and rich, scintillating color. He is master of an impeccable technique and an amazing perfection of finish, but errs sometimes in overcrowded detail and lack of unity in composition. His management of tone and light is scientific, yet admirable. He was the painter par excellence of women, endowing them with the quality of charm, to which is added a reserve of expression and a refinement and grace not shown by the ultramoderns in his genre. Stevens received many prizes, medals, and various foreign orders and was an Officer of the Legion of Honor. In 1911 an interesting exhibition of his work was held in New York. He published *Impressions on Painting* (Eng. trans., New York, 1886). Consult Camille Lemonnier, *Alfred Stevens* (Brussels, 1906).

**STEVENS, ALFRED GEORGE** (1818-75). An English sculptor. He was born at Blandford in Dorset, the son of a house painter, and received his artistic training, chiefly under Thorvaldsen, during a nine years' stay in Italy. Returning to England in 1842 he was employed as a teacher and as a designer of metal articles. He is celebrated for his designs for articles of daily use, executed in exquisite classical taste, as well as for more ambitious efforts like the vases decorating the railing in front of the British Museum, and the lions on the posts, since placed in the Museum; the mantelpiece in the dining room of Dorchester House, Park Lane; and the mosaics designed to fill the spandrels under the dome of St. Paul's. His greatest achievement, however, is the Duke of Wellington monument in St. Paul's Cathedral, probably the finest work of its kind in England. From 1856 his life was devoted to its accomplishment, although he did not live to see it placed in its final position. The monument is marked by vigorous and original execution, and by great dignity and unity of design. The two powerful groups of "Truth Tearing Out the Tongue of Falsehood" and "Valor Triumphant Over Cowardice," which decorate the canopy above the edifice are comparable to the best work done in sculpture. He was almost unrecognized and little appreciated by the British public. Al-

though his training was classical, his work is strikingly free from the mannered classicism of his day, and he was unquestionably the greatest sculptor of the period in England. Consult H. Stannus, *Alfred Stevens and his Work* (London, 1891).

**STEVENS, BENJAMIN FRANKLIN** (1833-1902). An American bibliographer, born at Barnet, Vt. He joined his brother Henry in London in 1860, for many years had charge of the Chiswick Press, acted as agent for American libraries, and United States dispatch agent. For over 30 years he and his agents searched the archives of England, France, Holland, and Spain for papers relating to America. His publications include: *American Manuscripts in European Archives* (1887); *Campaign in Virginia in 1781* (1888); *Facsimiles of Manuscripts in European Archives Relating to America, 1773-83* (25 vols., 1889-98); *Gen. Sir William Howe's Orderly Book at Charlestown, Boston, and Halifax* (1890); *Columbus, his Own Book of Privileges, 1502* (1893); *Introduction to Calendar of American Papers in the Earl of Dartmouth's Collection* (1895).

**STEVENS, EBENEZER** (1751-1823). An American soldier, born in Boston, Mass. He enlisted as a lieutenant in a Rhode Island artillery regiment in May, 1775, and by successive promotions rose to the rank of lieutenant-colonel in April, 1778, serving in the expedition against Quebec (1775), and commanding the artillery at Ticonderoga, at Freeman's Farm, and, for a time, at Yorktown. He was one of the founders of the Society of the Cincinnati, became prominent as a merchant in New York, and was made a major general of militia.

**STEVENS, EDWARD** (1745-1820). An American soldier. He was born in Culpeper Co., Va., became colonel of Virginia militia early in 1775, was in command at the skirmish at Great Bridge (Dec. 9, 1775), saved part of Washington's army from capture at Brandywine (Sept. 11, 1777), served with gallantry and marked ability at Germantown, Camden, and Guilford Court House, and became a brigadier general of militia in 1779.

**STEVENS, EDWIN AUGUSTUS** (1795-1868). An American capitalist, railroad organizer, and shipbuilder, born at Hoboken, N. J. With his brothers J. C. Stevens and Robert L. Stevens (q.v.) he succeeded to the large shipping and railroad interests of their father, John Stevens (q.v.), and became one of the most prominent railroad organizers in the United States. J. C. and E. A. Stevens assisted their brother in the design and construction of a high-speed, iron-hulled, seagoing ironclad of 6000 tons and 15½ knots (estimated) speed. This vessel was authorized by Congress and her keel was laid in 1854, but she was never completed. She is commonly, but erroneously, called the *Stevens Floating Battery*. After the death of Robert, the work was directed by E. A. Stevens. About 1863 the United States government relinquished its claim on the vessel. Mr. Stevens continued its construction until his death in 1868, and in his will he left \$1,000,000 for its completion, directing that it should be given, when finished, to the State of New Jersey. The bequest was expended without achieving its object; and, pursuant to subsequent litigation instituted by the heirs of the Stevens estate, the uncompleted ship was sold for old iron in 1880. Another vessel built by E. A. Stevens, the *Naugatuck*,

was accepted by the Federal government and was used during the Civil War. He founded the Stevens Institute of Technology (q.v.).

**STEVENS, FRANK LINCOLN** (1871- ). An American plant pathologist, born near Syracuse, N. Y. He was educated at Hobart and Rutgers colleges, at Ohio State University, at the University of Chicago (Ph.D., 1900), and at Bonn and Halle. He was professor of botany and vegetable pathology in 1902-12 at the North Carolina College of Agriculture and Mechanical Arts, and for some years was biologist of the North Carolina Agriculture Experiment Station. In 1912-14 he was dean of the College of Agriculture and Mechanical Arts in the University of Porto Rico, and thenceforth held the chair of plant pathology at the University of Illinois. In 1910 he served as president of the American Phytopathological Society. He is coauthor of *The Hill Readers* (1906); *Practical Arithmetic* (1909); *Diseases of Economic Plants* (1910); *The Fungi which Cause Plant Disease* (1913).

**STEVENS, GEORGE BARKER** (1854-1906). An American theologian, born at Spencer, Tioga Co., N. Y. He graduated at the University of Rochester in 1877 and at Yale Divinity School in 1880. He was pastor of the First Congregational Church in Buffalo (1880-82) and of the First Presbyterian Church in Watertown, N. Y. (1882-85), and then, after a year's study at Jena, became professor of New Testament criticism and interpretation at Yale; in 1895 he was transferred to the chair of systematic theology. He wrote *The Pauline Theology* (1892); *The Johannine Theology* (1894); *A Short Commentary on Galatians* (1894); *The Messages of Paul* (1900; new ed., 1912); *The Messages of the Apostles* (1900; 2d ed., 1911); *The Teaching of Jesus* (1901; 2d ed., 1909); *The Christian Doctrine of Salvation* (1905).

**STEVENS, HENRY** (1819-86). An American bibliographer, born at Barnet, Vt. He graduated at Yale in 1843 and studied law at Harvard. He visited England in search of Americana in 1845, and remained there, acting as purchasing agent for the British Museum and for many libraries, public and private, among which was the Lenox Library of New York, whose collection of Americana he formed. He published bibliographical catalogues and pamphlets, prized for their minute accuracy, and made a collection of Franklin documents which was purchased by the United States government. Of his numerous publications the more noteworthy are: *Catalogue Raisonné of English Bibles* (1854); *Catalogue of American Books in the Library of the British Museum* (1857); *Bibliotheca Americana* (1861); *Bibliotheca Historica* (1870); *Historical Collections* (1881-86); *Who Spoils our New English Books* (1885); *Recollections of James Lenox* (1886).

**STEVENS, ISAAC INGALLS** (1818-62). An American soldier and administrator, born at North Andover, Mass., and graduated at West Point in 1839. He joined General Scott's army in Mexico as adjutant of engineers in 1847, and was in its important engagements. In 1849 he became assistant in charge of the United States Coast Survey office at Washington, but resigned from the army in 1852 to accept the governorship of Washington Territory. In 1855 the Washington Indians revolted. Stevens at once suppressed the insurrection, and arrested Chief Justice Lander, who had issued writs of habeas

corpus for Indian prisoners. On the outbreak of the Civil War he was commissioned colonel of the Seventy-ninth New York Volunteers, and later was promoted to the rank of brigadier general. He took part at Stone River and Secessionville. On July 4, 1862, he was promoted to the rank of major general, and during August took part in the campaign in northern Virginia, fighting at the second battle of Bull Run and at Chantilly. At the latter, while leading a charge, he was killed, Sept. 1, 1862. He published *Campaigns of the Rio Grande and Mexico* (1851).

**STEVENS, JOHN** (1749-1838). An American inventor, engineer, and steamboat builder. He was born in New York City, and in 1768 graduated at King's (now Columbia) College. He then studied law, and in 1771 was admitted to the bar. In 1790 he petitioned Congress for legislation for the protection of American inventors, and through his efforts a bill was passed which laid the foundations for the present patent system of the country. In 1788 he began experiments as to the motive power of steam, and in 1792 took out two patents for marine engines under the new law. Subsequently, with Nicholas Roosevelt and Robert R. Livingston, he built a steamboat, and sought from the New York State Legislature the exclusive right of navigation of the Hudson River, but his boat, completed in 1801, failed to fulfill the speed conditions imposed, and Livingston later became associated with Fulton in his successful attempt. In 1804 he built a twin-screw steamship, and in 1807, with his son R. L., built the paddle-wheeled steamboat *Phoenix*, which was in successful operation only a few days after Fulton's *Clermont*. The *Phoenix* was shut out by the monopoly of Fulton and Livingston, but was operated for six years on the Delaware River, to reach which the *Phoenix* sailed around from New York City, being thus the first steamship to navigate the ocean successfully. In October, 1811, he established the first steam ferry in the world (Hoboken to New York City). He invented many improvements in boat and engine construction, and designed in 1812 a circular ironclad floating battery for harbor defense. In 1826 he constructed a locomotive model of his own, which he exhibited in operation in Hoboken—said to have been the first locomotive ever to run on a track in America. See ARMOR PLATE.

**STEVENS, JOHN AUSTIN** (1795-1874). An American banker and financier, born in New York City. He graduated at Yale in 1813 and in 1818 became a partner in the extensive mercantile business of his father, Ebenezer Stevens, in New York City. During the Civil War he was one of the principal financial advisers of the government, and his greatest public service was rendered as chairman of the famous "treasury notes committee" of New York, Boston, and Philadelphia bankers, which played a prominent part in placing the first 7-30 and later war loans.

**STEVENS, JOHN AUSTIN** (1827-1910). An American author, born in New York City. He graduated at Harvard in 1846; was secretary to the New York Chamber of Commerce from 1862 to 1868; and later was for some years librarian of the New York Historical Society. He founded the Society of the Sons of the Revolution and the Loyal League. In 1877 he established the *Magazine of American History*, of

which he was the editor until 1883. His publications include: *The Valley of the Rio Grande* (1864); *Colonial Records of the New York Chamber of Commerce* (1867); *The Expedition of Lafayette against Arnold* (1878); *Life of Albert Gallatin* (1884), in the "American Statesmen Series"; *New York City in the Nineteenth Century* (1901).

**STEVENS, JOHN F.** (1853- ). An American civil and railroad engineer and executive. He was born at West Gardiner, Me., and after a course of technical training was assistant engineer of the city of Minneapolis (1874-76). Thereafter till 1880 he was connected, as an engineer, with various railways. He then saw service with the Great Northern, being its general manager in 1902-03, and with the Chicago, Rock Island, and Pacific Railway, of which he was second vice president in 1904-05. From his activity as a railway engineer Stevens was called in 1905 to be chief engineer of the Panama Canal (q.v.), and he was largely responsible for the plans which were followed in the construction of that waterway. He resigned April 1, 1907. In February-March of that year he was also chairman of the Isthmian Canal Commission. Subsequently he was vice president of the New York, New Haven, and Hartford Railroad in charge of operation until 1909, and president of several railways in the Northwest in 1909-11.

**STEVENS, JOHN LEAVITT** (1820-95). An American journalist and diplomat, born at Mount Vernon, Me. In 1855 he became associate editor of the *Kennebec (Me.) Journal*, and in 1857 chief editor of the paper. He was an advocate of the Republican party, which he helped to organize in Maine. He was Minister Resident to Uruguay and Paraguay in 1870-73, to Sweden and Norway in 1877-83, and to the Hawaiian Islands, his title being changed to Minister Plenipotentiary in 1890, after a year at this last post. Upon the outbreak of a revolution against the royal government in 1893 and the establishment of a provisional government (see HAWAIIAN ISLANDS, *History*) Stevens established a protectorate over the islands. This action was disavowed by the Secretary of State of the United States, and subsequently Stevens was recalled; but he was exonerated by the Senate. His publications include a scholarly *History of Gustavus Adolphus* (1884) and *Picturesque Hawaii* (1894).

**STEVENS, LILLIAN M. N.** (1844-1914). An American temperance worker, born at Dover, Me. She was educated at Foxcroft Academy, taught school for a time, and was married to Michael Stevens of Portland, Me., in 1867. In 1874 she assisted in organizing the Maine Woman's Christian Temperance Union, of which she was treasurer in 1874-77 and thenceforth president until her death. She was vice president of the National W. C. T. U. in 1894-98, and after the death of Miss Frances Willard (q.v.) in the latter year was its president until her own death. Mrs. Stevens was a lady manager of the Chicago Exposition in 1892-93, and served as Maine representative on the National Conference of Charities and Correction for many years. In 1911 she received the honorary degree of A.M. from Bates College. Selections from her addresses were published in 1914.

**STEVENS, PHINEAS** (1707-56). A colonial soldier in America, born at Sudbury, Mass. About 1711 he removed with his father to Rutland, N. H. (now in Vermont), and in 1723 was

a captive for a time among the Abnaki Indians on the St. Francis River. He was one of the pioneer settlers of "Township No. 4" (now Charlestown, N. H.), and in April, 1747, during King George's War, as commandant of the fort there, repelled the attack of 400 French and Indians under Niverville. He was twice (1749 and 1752) sent to Canada to negotiate an exchange of prisoners. The journal kept by him during his first trip to Canada is printed in the *New Hampshire Historical Collections*, vol. v, and that kept during his second trip is printed in *Travels in the American Colonies*, edited by N. D. Mereness (New York, 1916).

**STEVENS, ROBERT LIVINGSTON** (1787-1856). An American inventor and marine engineer, son of John Stevens (q.v.), born in Hoboken, N. J. He applied the wave line to shipbuilding, invented a percussion shell (the rights to which were bought by the government), was one of the first to use anthracite coal in steam navigation, and introduced many improvements in the construction of steamships and marine engines. In 1842 he was commissioned by the government to build the first ironclad warship ever constructed, generally known as the *Stevens Floating Battery*, but he died without completing it. See **STEVENS, EDWIN AUGUSTUS**.

**STEVENS, THADDEUS** (1792-1868). An American statesman and congressional leader, born at Danville, Vt., April 4, 1792. He graduated at Dartmouth College in 1814; taught school in York, Pa., and studied law; began to practice in Gettysburg, and removed to Lancaster, Pa., in 1842. In 1833 he served in the State Legislature, and was an early advocate of negro suffrage. Stevens affiliated with the Anti-Masonic party (see **ANTI-MASONS**), and was active at its Baltimore convention in 1831; but from the time of his election to the Legislature he acted with the Whigs. His career in the Legislature was varied, but indicative of his energy and ability; he conquered the "machine" in his own party, and in December, 1849, took his seat in Congress. During two terms there he opposed not only the Fugitive Slave Law, but also every form of concession to the South. He took a leading part in the formation of the Republican party in Pennsylvania. After an interval of six years devoted to the practice of law he returned to Congress in 1859, and from then until his death was the recognized leader of the House of Representatives, being chairman of the Committee on Ways and Means throughout the war, and later chairman of what was then the equally important Committee on Reconstruction. He was regarded as the most radical antislavery advocate in Congress, and was the most powerful opponent of the presidential plan of reconstruction. Stevens was one of the authors of the so-called Wade-Davis Reconstruction Bill of 1865 and reported the Reconstruction Act of 1867 from the committee of which he was chairman. (See **RECONSTRUCTION**.) He was chairman of the House committee in charge of the impeachment of President Johnson (q.v.). He died at Washington, Aug. 11, 1868. Consult E. B. Callender, *Thaddeus Stevens* (Boston, 1882), and S. W. McCall, *Thaddeus Stevens*, in "American Statesmen Series" (ib., 1909). See also Woodburn, *Thaddeus Stevens* (Indianapolis, 1913).

**STEVENS, WALTER LE CONTE** (1847- ). An American physicist. He was born in Gordon

Co., Ga., graduated from the University of South Carolina in 1868, and later studied at Strassburg, Berlin, and Zurich. After teaching for several years in the South he was an instructor at Cooper Institute, New York, and professor successively at Packer Institute, Rensselaer Polytechnic Institute, and Washington and Lee University (from 1898). Stevens made special researches in physiological optics and acoustics. He revised Steele's *Physics* (1886), and contributed to works of reference and to scientific journals.

**STEVENS, WILLIAM ARNOLD** (1839-1910). An American philologist and Baptist theologian, born at Granville, Ohio. He graduated from Denison University in 1862 and then studied at the Rochester Theological Seminary, and later at Harvard, Leipzig, and Berlin. From 1877 until his death he was professor of New Testament interpretation at the Rochester Theological Seminary. His publications include: *Select Orations by Lysias* (1876); *Commentary on the Epistles to the Thessalonians* (1887); *Outline Handbook of the Life of Christ* (1892), with E. D. W. Burton; *A Harmony of the Gospels for Historical Study* (1894; 3d ed., 1905), also with Burton; *Life of the Apostle Paul* (1894).

**STEVENS INSTITUTE OF TECHNOLOGY**. An engineering school founded in 1870, in Hoboken, N. J., by Edwin A. Stevens, who bequeathed to it a block of land and \$650,000. The school was opened for instruction in 1871, with Henry Morton as first president. The courses include training in applied mathematics, theory of machine construction, mechanical drawing and designing, shop practice in experimental mechanics, physics, chemistry, and applied electricity. English branches and modern languages are also taught. Admission to the institute is by examination only. The only degree conferred is that of Mechanical Engineer. In 1915 the endowment was \$1,425,000; the annual income about \$190,000. The ground and buildings were valued at \$500,000 with a total estimated value of \$2,600,000 for the property under the control of the institute. There were in 1915-16 453 students with 37 instructors. In the academic department there were 238 students with 13 instructors. The library contained about 11,000 volumes. Alexander C. Humphreys became president in 1901.

**STEVENSON, ADLAI EWING** (1835-1914). An American politician, Vice President of the United States in 1893-97. He was born in Christian Co., Ky., educated at Centre College, Danville, Ky., but removed with his parents to Bloomington, Ill., before graduating. At Bloomington he studied law and in 1857 was admitted to the bar. He was a master in chancery (1860-64), became prominent in Democratic local politics, and was a member of the 44th Congress (1875-77), and of the 46th Congress (1879-81). As First Assistant Postmaster-General during Cleveland's first administration he antagonized civil-service reformers by his sweeping removals. In 1892 he was in the Illinois delegation to the Democratic Convention by which he was nominated for Vice President on the Cleveland ticket, which was elected. In 1897 he was appointed by President McKinley a member of the bimetallic commission sent to Europe. In 1900 he was again the candidate of the Democratic party for Vice President and in 1908 the Democratic candidate for Governor of Illinois.

**STEVENSON, EDWARD LUTHER** (1860- ). An American cartographer and historian, born at Rozetta, Ill. He graduated from Franklin (Indiana) College and then studied at Johns Hopkins, Jena, Halle, and Heidelberg (Ph.D., 1891). He was professor of history at Rutgers College from 1891 to 1910, when he was appointed secretary of the Hispanic Society of America. In 1913 he was decorated Knight of the Royal Order of Isabella the Catholic of Spain, in recognition of his achievements in cartography, a subject on which he became the leading American authority. His publications include: *Maps Illustrating the Early Exploration and Discovery of America, 1502-1530* (1903-06); *The Marine World Chart of Nicolo de Canerio Januensis* (1908); *Early Spanish Cartography of the New World* (1909); *Atlas of Portolan Charts* (1911); *Willem Janszoon Blaeu, 1571-1638* (1914); *Portolan Atlas Joan Martines en Messina ano 1582* (1915).

**STEVENSON, JOHN JAMES** (1841-1924). An American geologist, born in New York City. He graduated in 1863 at New York University, where, after two years (1869-71) as professor of chemistry at West Virginia University, he served as professor of geology until 1909. In 1873-74 and 1878-80 he was geologist on the United States Geological Survey. He also served on the Pennsylvania Geological Survey in 1875-78 and in 1881-82. He was president of the Geological Society of America in 1898. His publications include: *The Geology of a Portion of Colorado Explored and Surveyed in 1873* (1875); *Report of Progress in the Greene and Washington District of the Bituminous Coal Fields of Western Pennsylvania* (1876); *Report upon Geological Examinations in Southern Colorado and Northern New Mexico during 1878 and 1879* (1881); *Origin of the Pennsylvania Anthracite* (1893); *Carboniferous of the Appalachian Basin* (1903-07); *Formation of Coal Beds* (1911-13); and many other contributions of permanent importance.

**STEVENSON, JOSEPH** (1806-95). A Scottish historian and antiquary, born at Berwick-upon-Tweed. In 1834 he became a subcommissioner of the public records, London. He was ordained a priest in the Church of England (1839), but his studies in the Reformation period of English history led him to the Roman Catholic church (1863). In 1877 he entered the Society of Jesus. At the suggestion of Stevenson, the English government began in 1857 the valuable *Chronicles and Memorials of Great Britain and Ireland*, otherwise known as the *Rolls Series*. The government also sent him to Rome in 1872 to make an exhaustive examination of the Vatican archives. The 13 volumes of his manuscript still remain unpublished in the Public Record Office. Stevenson edited nearly 50 works for the leading learned societies, among the most important of which are eight volumes of *The Church Historians of England* (1853-56), and the *History of Mary Stewart* by her secretary Claude Nau (1883).

**STEVENSON, J (OSSEPH) ROSS** (1866- ). An American Presbyterian minister and educator, born at Ligonier, Pa. He graduated from Washington and Jefferson College in 1886 and from McCormick Theological Seminary in 1889, and studied at the University of Berlin in 1889-90. After a Western pastorate he was adjunct professor (1894-97) and professor (1897-1902) of ecclesiastical history at McCormick. He was

minister of the Fifth Avenue Presbyterian Church, New York, in 1902-09, and of the Brown Memorial Church, Baltimore, in 1909-14. In the latter year he succeeded F. L. Patton as president of Princeton Theological Seminary. In 1915 he was elected moderator of the General Assembly of his church.

**STEVENSON, MATILDA COXE** (née EVANS) (1855-1915). An American ethnologist, born at San Augustine, Tex. In 1872 she was married to James Stevenson, an ethnologist (died 1888), with whom she spent 13 years in explorations of the Rocky Mountain region. After 1889 she was on the staff of the Bureau of American Ethnology of the Smithsonian Institution. Mrs. Stevenson explored the cave, cliff, and mesa ruins of New Mexico, studied all the Pueblo tribes of that State, and in 1904-10 made a special study of the Taos and Tewa Indians. She was the author of *Zuñi and the Zuñians* (1881); *Religious Life of the Zuñi Child* (1887); *The Sia, Zuñi Scalp Ceremonials* (1890); *Zuñi Ancestral Gods and Masks* (1898); *The Zuñi Indians: Their Mythology, Esoteric Fraternities, and Ceremonies* (1904).

**STEVENSON, ROBERT** (1772-1850). A Scottish engineer, born at Glasgow. He was educated at Anderson's College, Glasgow, and at Edinburgh University, and his progress in the study of engineering was so rapid that in 1791 he was intrusted with the erection of a lighthouse on Little Cumbrac. During 47 years' service as engineer and inspector of lighthouses, he planned and constructed 23 lighthouses round the Scottish coasts, with the catoptric illumination, and his invention of intermittent and flashing lights. The most remarkable of these structures was that on the Bell Rock (q.v.). The enterprise was unprecedented in lighthouse engineering, for Bell Rock was washed except by lowest ebb tides. Stevenson was the author of four volumes of professional printed reports, a large work on *The Bell Rock Lighthouse* (Edinburgh, 1824), and articles in important reference works.

His sons ALAN (1807-65), DAVID (1815-86), and THOMAS (1818-87) were also noted lighthouse engineers, and writers in the field of their specialty. Thomas was the father of Robert Louis Stevenson. Consult David Stevenson, *Life of Robert Stevenson* (Edinburgh, 1878). See LIGHTHOUSE.

**STEVENSON, ROBERT ALAN MOWBRAY** (1847-1900). An English art critic, a cousin of Robert Louis Stevenson. He was born in Edinburgh, graduated with the master's degree from Sidney Sussex College, Cambridge, and studied art in the Edinburgh School of Art and in Paris and Antwerp, but never practiced painting extensively. From 1889 to 1893 he was professor of fine arts at University College, Liverpool, and from 1893 art critic on the *Pall Mall Gazette*. He was one of the most gifted and just of English critics. His sympathies were with the Impressionist school, but his judgment was impartial, and he possessed a keen analytical mind and an effective style. His works include: *Engraving* (1886), from the French of Delaborde; *Peter Paul Rubens* (1898); *The Art of Velazquez* (1895); *Velazquez* (1899); and an *Essay on Raeburn* (1900).

**STEVENSON, ROBERT LOUIS** (properly ROBERT LEWIS BALFOUR) (1850-94). A Scottish romancer, essayist, and poet, born in Edinburgh, Nov. 13, 1850, the only son of Thomas

Stevenson, a distinguished lighthouse engineer. After education at various schools and under private tutors, he entered Edinburgh University in 1867, intending to become an engineer. On this profession he turned his back in 1871, and, after partially recovering from an illness in which nervous exhaustion and pulmonary symptoms were combined, prepared for the bar, to which he was called in 1875. He had already written several essays and tales and some verse, chiefly with a view of, in his own forcible phrase, "playing the sedulous ape" to the great masters. His bent to a literary career was encouraged by the friendship of Edmund Gosse, Andrew Lang, and Sidney Colvin, whom he met in London. A canoeing trip in Belgium and France and a walking tour in the Cévennes furnished material for *An Inland Voyage* (1878) and *Travels with a Donkey* (1879), sketches in which he gave full proof of his exquisite literary art. Without attracting much attention, he was contributing to the *Cornhill Magazine* and *Temple Bar* short stories, and some of his best essays afterward collected under the titles of *Virginibus Puerisque* (1881) and *Familiar Studies of Men and Books* (1882). To this period also belong the fantastic *New Arabian Nights* (1882), first published between 1876 and 1878. In 1876 he had met, in an artistic colony near Paris, Mrs. Osbourne, an American lady, afterward to be his wife. In 1879, hearing from California that she was seriously ill, he made up his mind to go there. His resources were so limited that he made the long journey in an emigrant ship and train, noting his experiences and publishing them in *The Amateur Emigrant* (first printed entire in Edinburgh edition, see below), and *Across the Plains* (1892). He spent somewhat more than a year in California, often in very delicate health, and in 1880 married Mrs. Osbourne. The next few years were spent in various health resorts—Davos, the Riviera, Bournemouth, and in America in the Adirondacks, where he was a member of Dr. Trudeau's (q.v.) colony at Saranac Lake. Often under the most discouraging conditions, but with that brave cheerfulness which marked his character, he worked incessantly, and for years his life seemed to hang by a thread. Success first came to him with the publication in 1882 of *Treasure Island*, a tale of pure adventure. *Dr. Jekyll and Mr. Hyde* (1886), a striking ethical parable under the guise of fiction, attracted thoughtful people. In the same year appeared *Kidnapped*, which, with the *Master of Ballantrae* (1889), offered vivid pictures of past Scottish life. In 1888 he was in San Francisco, still in quest of health, from which city he sailed with his family on a voyage to the South Seas. Pleased with the scenery and the people of Samoa, he made a home for himself there in 1890 and acquired a position of influence among the natives. After a long struggle against tuberculosis, he died, by rupture of a blood vessel in the brain, Dec. 3, 1894, and was buried on the peak of Mount Vaea, above Vailima, his Samoan home. He left several manuscripts, among which were two romances, *Weir of Hermiston* (1896) and *St. Ives* (completed by Quiller-Couch, 1897). The former, which no writer was bold enough to touch, is generally considered, even in its unfinished state, Stevenson's masterpiece. Other works deserving special mention are: *The Silverado Squatters* (1883); *Prince Otto* (1885),

a dainty romantic tale; three books in collaboration with his stepson, Lloyd Osbourne, *The Wrong Box* (1888), *The Wrecker* (1892), and *The Ebb Tide* (1894); a volume of exquisite verse, *Underwoods* (1887); *A Child's Garden of Verses* (1885); *The Merry Men and Other Tales* (1886), a volume of short stories in which his mastery over the grim and terrible best shows itself: "Mémorial of Fleeming Jenkin" (prefixed to *Papers of Fleeming Jenkin*, 1887); *Island Nights' Entertainments* (1893); *Catrina* (1893), the sequel to *Kidnapped*. Stevenson's delightful *Letters* (4 vols., New York) were edited by Sidney Colvin in 1911.

In both fiction and essays Stevenson displays an exquisite and finished style; his work is that of a true artist in words, and his example stimulated many younger artists of the day to more or less conscious imitation. His influence was also great in regard to the subject matter of fiction. At a time when the novel had forgotten to tell a story and was running into minute philosophical analysis, Stevenson came forward with adventure as purely romantic as Scott's, though in structure, in method of description and narrative, and in brilliancy of style he marks the great technical advance since the days of the *Waverley Novels*. But it was not only the many delightful qualities of his written work which made Stevenson the best-loved writer of his time; even more, perhaps, he was endeared to countless readers by the frank revelation of a most engaging personality, which shines through all his works—of a serene undaunted cheerfulness, gained not by shutting his eyes to the pathos and the difficulty of human conditions, but by a brave rising to the height of their demands.

The most nearly completed collection of his works is the sumptuous Edinburgh edition (27 vols.) edited by Sidney Colvin (1894-98); two volumes of charming letters arranged by the same editor, with much biographical matter, appeared in 1899, and the *Vailima Letters*, written from Samoa in 1895. Consult also the biographies by his cousin Graham Balfour, his authorized biographer (2 vols., New York, 1901; abridged ed., 1 vol., with additions, ib., 1915); M. M. Black (Edinburgh, 1898), and L. C. Cornford (ib., 1899); also E. B. Simpson (1906); id., *Stevenson's Edinburgh Days* (London, 1898); Fraser, *In Stevenson's Samoa* (ib., 1895); Osbourne and Strong, *Memoirs of Vailima* (ib., 1903); and critical studies by Walter Raleigh (ib., 1895); Henry James, in *Partial Portraits* (ib., 1888); J. J. Chapman, in *Emerson and Other Essays* (New York, 1896). Among later books, criticism or biography, or both, should be mentioned: H. B. Baildon, *R. L. Stevenson: A Life Study* (New York, 1901); G. K. Chesterton, *Varied Types* (ib., 1903); A. H. Japp, *R. L. Stevenson: A Record, an Estimate, and a Memorial* (ib., 1905); *Stevensoniana* (ed. J. A. Hammerton, Edinburgh, 1910), consisting of anecdotes and appreciations by friends and critics of R. L. S.; E. B. Simpson, *Stevenson Originals* (New York, 1912); F. Watt, *R. L. S.* (ib., 1913); R. L. B. Stevenson, *R. L. Stevenson* (London, 1913), treating of the man and his work; F. Swinner-ton, *R. L. Stevenson: A Critical Study* (New York, 1914); Mrs. R. L. Stevenson, *The Cruise of the Janet Nichol among the South Sea Islands* (ib., 1914); Sir A. W. Pinero, *Robert Louis Stevenson as a Dramatist* (ib., 1914);

Henry James, in *Notes on Novelists* (ib., 1914); W. A. Raleigh, *Stevenson* (ib., 1915); Clayton Hamilton, *On the Trail of Stevenson* (Garden City, N. Y., 1915); also W. F. Pridaux, *Bibliography of R. L. Stevenson* (London, 1903).

**STEVENSON**, SARA YORKE (MRS. CORNELIUS STEVENSON) (1847-1921). An American archaeologist, born in Paris, France. She was educated in Paris at the Cours Rémy and the Institut Descauriat, and resided in Mexico in 1862-67. Of the department of archaeology in the University of Pennsylvania, with which she had been prominently connected for many years, she became president in 1904. She was also secretary of the American Exploration Society in 1897 and of the Pennsylvania branch of the Archaeological Institute of America in 1899-1903; and in 1893 was vice president of the jury on ethnology at Chicago. For the purpose of archaeological investigations she visited Rome and Egypt. After 1908 Mrs. Stevenson served as assistant curator of the Pennsylvania Museum. In 1909 she was president of the Pennsylvania Equal Suffrage Society. Besides papers and articles on archaeology, she wrote *Maximilian in Mexico* (1899) and she became literary editor of the Philadelphia *Public Ledger*.

**STEVENS POINT**. A city and the county seat of Portage Co., Wis., 155 miles by rail northwest of Milwaukee, on the Wisconsin and Plover rivers, and on the Minneapolis, St. Paul, and Sault Ste. Marie, and the Grand Bay and Western railroads (Map: Wisconsin, D 4). It is the seat of a State normal school, and has a Polish convent and a public library. The city has some mineral wealth and there is excellent water power. There are saw mills, paper mills, foundries, and manufactories of sashes and doors, furniture (including tables and desks), engines, boxes, etc. The manufacture of artificial flies for fishing and self-rocking cradles are important industries. Pop., 1900, 3524; 1910, 8692; 1920, 11,371.

**STEVIN**, stā'vin, SIMON. See STEVINUS.

**STEVINUS**, stā-vē'nus, SIMON (1548-1620). A Dutch mathematician, born at Bruges. He became a favorite of Prince Maurice of Orange, who made him a quartermaster general. Skilled in mechanics and geometry, he proved the law of equilibrium on an inclined plane, distinguished stable from unstable equilibrium, demonstrated the resolution of forces, and showed that the downward pressure of liquids was independent of the shape of the containing vessel. He is chiefly remembered, however, for his introduction of decimal fractions into common use by publishing in 1586 a small pamphlet, which was soon translated into French as *La Disme enseignant facilement expédier par Nombres Entiers sans rompre tous Comptes se rencontrans aux Affaires des Hommes*. Consult M. Cantor, *Vorlesungen über Geschichte der Mathematik* (2d ed., Leipzig, 1900).

**STEWART** (AS. *stigeard*, *stūweard*, from *stig*, pen for cattle, *sty* + *weard*, guard), LORD HIGH. The first of the great offices of state in England. Although of ancient origin, it owes its eminence to John of Gaunt (1340-99). It was hereditary in various lines until the accession of Henry IV (1399), when it was merged with the crown, and has since been in abeyance except when temporarily revived from time to time under the great seal *pro hac vice*. It is now revived only on the occasion of a coronation, or the trial of a peer by the House of Lords

for treason or felony, when the Steward presides. When the proceedings are at an end, the Lord Steward terminates his commission by breaking his wand of office. See LORD HIGH STEWARD.

**STEWART OF THE CHILTERN HUNDREDS**. See CHILTERN HUNDREDS, STEWARD OF THE.

**STEWART**, stū'ert. A Scotch and English royal family. See STUART.

**STEWART**, ALEXANDER TURNER (1803-76). An Irish-American merchant, born at Lisburn, near Belfast, Ireland, of Scotch parentage. He entered Trinity College, Dublin, with the intention of studying for the ministry, but left before graduating and in 1823 emigrated to America. Settling in New York City, he taught school for two years, and in 1825, having fallen heir to a small legacy from some Irish relatives, he established himself in the dry-goods business. In 1848 he built a store at Broadway and Chambers Street, which at the time was the largest dry-goods store in the world. In 1862 he removed his retail business to a new store, erected at a cost of \$2,750,000, at Broadway and Ninth and Tenth streets, retaining his old store for wholesale trade. At the time of his death the business of A. T. Stewart and Company comprised branches and agencies in the principal cities of Europe, and several mills and factories in the United States.

**STEWART**, ALVAN (1790-1849). An American abolitionist, born at South Granville, Washington Co., N. Y. After teaching in the Royal School of the seigniory of St. Armand, Canada, in 1811-12, and practicing law at Utica, N. Y., he devoted himself chiefly to advocating temperance and the abolition of slavery. In 1835 he called together in Utica an antislavery convention that was dispersed by mob violence. According to William Godell, Stewart was the first to insist "on the necessity of forming a distinct political party to promote the abolition of slavery." When such a party was formed, he was its candidate for Governor, but was, of course, defeated. Years before Lincoln made his famous "house divided against itself" speech, or Seward his "irrepressible conflict" speech, Stewart declared that "these States must necessarily be in eternal conflict until liberty conquers slavery or slavery overturns the liberty of all." A collection of his speeches, with a slight memoir, was published by his son-in-law, Luther R. Marsh (New York, 1860).

**STEWART**, BALFOUR (1828-87). A British physicist and meteorologist. He was born at Edinburgh, and was educated at St. Andrews University and Edinburgh University. After a brief career in business in 1856 he became connected with Kew Observatory, later (1859) being appointed its director. He was appointed professor of natural philosophy in Owens College, Manchester, in 1870, where he served until his death. Stewart's researches in radiant heat procured for him in 1868 the Rumford medal of the Royal Society. He also devoted himself to the study of terrestrial magnetism and meteorological problems, particularly those connected with solar radiation. He was also a devout churchman and was a member of a committee appointed to promote the interchange of views of scientific men of orthodox religious opinions. In *The Unseen Universe* (1876), a popular work written by Stewart in conjunction with Prof. P. G. Tait, an attempt

was made to combine theological doctrines with the scientific ideas then current to demonstrate the existence of the soul and of a transcendental universe. Stewart was prominently identified with the Society for Psychical Research. He published an *Elementary Treatise on Heat* (1866; 6th ed., rev., 1895); *Lessons in Elementary Physics* (1871); *Physics* (1872); *The Conservation of Energy* (1875; 9th ed., 1900); and *Lessons in Practical Physics*, with W. H. Gee (vol. i, 1885; vol. ii, 1887).

**STEWART, CHARLES** (1778-1869). An American naval officer, born in Philadelphia, Pa. At 13 he shipped on a merchant vessel as cabin boy, and later rose to be captain of an Indiaman. In 1798 he entered the United States navy as fourth lieutenant of the frigate *United States*, serving until 1800, after which he had command of different schooners. He captured the French vessel *Deux Amis*, and a few days later the schooner *Diane*. While on this cruise he took the British privateer *Louisa Bridger* by a night action, but on discovering her nationality made reparations. In 1804, in command of the *Siren*, he joined the Mediterranean squadron. He then returned to the United States in command of the *Constellation*, and 1806 was promoted to be captain. Afterward he was for a time in the merchant service, but reentered the navy, and in the War of 1812 aided Commodore Bainbridge in persuading the administration to send the United States warships to sea instead of keeping them in New York Harbor. In 1813 he was transferred to the *Constitution*, which on Feb. 20, 1815, captured two British war vessels, the *Cyane*, 34 guns, and the *Levant*, 18 guns. Later he was surprised by a British squadron and the *Levant* was recaptured. He commanded the Mediterranean squadron from 1817 to 1820, after which he was sent to the Pacific station. He commanded the home squadron in 1842-43, and became commandant of the Philadelphia Navy Yard. In 1862 he was promoted to the rank of rear admiral. During the last 17 years of his service he was senior officer of the navy.

**STEWART, DAVID, DUKE OF ROTHESAY** and **EARL OF CARRICK**. See **ROTHESAY**.

**STEWART, SIR DONALD MARTIN** (1824-1900). A British field marshal. He was born near Forres, Elginshire; completed his education at Aberdeen University, and in 1840 joined the Bengal army. He fought on the frontier; served with distinction during the Indian Mutiny at Delhi and Lucknow; commanded the Bengal troops in the Abyssinian War in 1867-68; and was chief commissioner at Andaman and Nicobar (1869-74). During the Afghan War in 1878 he commanded the Kandahar field force, and in 1880 on his march from Kandahar to Kabul won the battles of Ahmed Khel and Urzu. As commander in chief in northern Afghanistan he sent Sir Frederick Roberts on his march from Kabul to Kandahar, while he withdrew with the remainder of the army through the Khyber Pass. Consult C. R. Elsmie, *Field-Marshal Sir Donald Stewart* (London, 1903).

**STEWART, DUGALD** (1753-1828). A Scottish philosopher, born in Edinburgh. He studied at the University of Edinburgh from 1765 to 1769. In 1771 he went to Glasgow, where he stayed only one session, partly to attend the lectures of Thomas Reid. In 1772 he was called to teach the mathematical classes

in the University of Edinburgh; in 1775 he was elected joint professor, and acted in that capacity till 1785, when he was appointed professor of moral philosophy, and continued in the active duties of the chair for 25 years. In 1792 appeared his first volume of the *Elements of the Philosophy of the Human Mind*. In 1793 he published his *Outlines of Moral Philosophy*. In 1806, on the accession of the Whig party to power, he received a sinecure office worth £300 a year. In 1810 Stewart gave up his active teaching work and retired to Kinneil House, Linlithgowshire, which the Duke of Hamilton placed at his service. In the same year he published his *Philosophical Essays*; in 1814 the second, and in 1827 the third volume of the *Elements*; and in 1828 *Philosophy of the Active and Moral Powers*. He died in Edinburgh, June 11, 1828.

The philosophy of Stewart was the following up of the reaction against the skeptical results that Berkeley and Hume drew from the principles of Locke. Both Reid and Stewart professed the Baconian empirical method, but considered that these processes of investigation could establish certain ultimate truths of a higher certainty than themselves. His collected works were edited by Sir W. Hamilton, in 11 vols. (Edinburgh, 1854-59), to which Professor Veitch contributed a biography.

**STEWART, GEORGE** (1848-1906). A Canadian journalist and author. He was born in New York City, but was taken to Ontario in 1851 by his parents, who lived in that province, mostly in London, until 1859 and then removed to St. John, N. B. He was for a few years a druggist, but relinquished that occupation for journalism. At a comparatively early age he founded *Stewart's Literary Quarterly Magazine*, an excellent periodical, but after five years it was discontinued. He was afterward connected editorially with St. John newspapers, then was editor in chief of Rose-Belford's *Canadian Monthly*, Toronto; but in 1879 he removed to the city of Quebec where until 1896 he edited the *Daily Chronicle*. Stewart contributed to various British, American, and Canadian reviews and works of reference and was made a member of several Canadian and foreign literary societies. His publications include: *The Story of the Great Fire in St. John, N. B.* (1877); *Evenings in a Library* (1878); *Canada under the Administration of the Earl of Dufferin* (1878); *Emerson, the Thinker* (1879); *Alcott, The Concord Mystic* (1880); "Frontenac and His Times," in Justin Winsor's *Narrative and Critical History of America*, vol. iv (1885); *Essays from Reviews* (1892-93).

**STEWART, GEORGE BLACK** (1854- ). An American Presbyterian theologian, born at Columbus, Ohio. He graduated from Princeton in 1876, attended McCormick Theological Seminary, and graduated from Auburn Seminary in 1879. Ordained to the Presbyterian ministry, he was pastor at Auburn, N. Y., in 1878-84, and at Harrisburg, Pa., in 1884-99. Thenceforth he was president of Auburn Seminary and professor of practical theology there. He founded and for five years was president of the Pennsylvania Chautauqua. Besides editing the *Auburn Seminary Record* and writing for the religious press, he published *Life of Jesus for Juniors* (1896) and *A Study of the Life of Jesus* (1907).

**STEWART, HENRY**. See **DARNLEY, LORD**.

**STEWART, SIR HERBERT** (1843-85). A British soldier, born at Sparsholt, Hampshire. Entering the army in 1863, he served in India until 1873. In 1878 he went to South Africa, where he participated in the Zulu War in 1879, and was captured by the Boers at Majuba in 1881. In the following year he was made assistant adjutant general of the cavalry in Egypt. He participated in the victory of Tel el Kebir (1882), and took possession of Cairo in the same year, and for his services in the Suakin campaign was made K.C.B. in 1884. In 1884-85 he took part in the expedition for the relief of Gordon at Khartum, repulsed the Arabs in the battle of Abu Klea, but three days later was mortally wounded. He was promoted to major general before he died.

**STEWART, JAMES** (1846-1906). A Canadian physician. He was born at Osgoode, Russell County, Ontario, and graduated in medicine at McGill University in 1869. He was professor of materia medica and therapeutics in McGill University in 1883-91; was appointed registrar of the faculty in 1884; was professor of clinical medicine in 1891-93; and in 1893 took the combined chair of medicine and clinical medicine, being professor of the former subject at the time of his death. He was elected president of the Association of American Physicians in 1903, and was coeditor of the *Montreal Medical Journal*. He made noteworthy contributions to medical literature on neurology.

**STEWART, JOHN ALEXANDER** (1846- ). A British moralist. He was born in Wigtownshire, Scotland, and was educated at Edinburgh University and Lincoln College, Oxford, where he won the Newdigate prize for English verse in 1868. He was appointed White's professor of moral philosophy in the University of Oxford in 1886. He published: *The English MSS. of the Nicomachean Ethics* (1882); *Notes on the Nicomachean Ethics* (1892); *The Myths of Plato* (1905); *Plato's Doctrine of Ideas* (1909). He contributed to important reference works.

**STEWART, JULIUS** (1855-1919). An American figure and genre painter. He was born in Philadelphia, and studied under Gérôme and Madrazo in Paris, where he made his home. He painted many charming studies of nudes in the open air. His pictures of the life of the American colony in Paris, such as "The Hunt Ball" (Essex Club, Newark, N. J.) and "Five O'clock Tea," are French in method and elegance, but thoroughly American in spirit. He was made an Officer of the Legion of Honor in 1901, and received gold medals at Berlin in 1891 and 1895, and in Munich in 1897 and 1901.

**STEWART, MATTHEW, EARL OF LENNOX** (1616-71). A Regent of Scotland, born in Dumbarton Castle, the son of John, third Earl of Lennox. After negotiations with Henry VIII of England which resulted in treason to his own country, he married Henry's niece, Lady Margaret Douglas, and engaged in fruitless expeditions in attempting to bring Scotland under the control of England. When Mary Stuart came to the Scottish throne, Lennox returned to his native country, was reinstated in his forfeited estates, and arranged the marriage between Mary and his eldest son, Henry, Lord Darnley (q.v.). After his son's murder he took part in the seizure and imprisonment of Mary in Lochleven Castle, and was provisionally appointed Regent on behalf of his infant grandson, afterward James VI. He was appointed

lieutenant general of the kingdom and confirmed in the regency after the assassination of Murray, in 1570; he gallantly defeated the Queen's supporters, capturing the castles of Doune and Dumbarton; and convened a parliament at Leith which was adjourned to be held later at Stirling. On his journey to the latter town he was mortally wounded in a skirmish with some of the Queen's partisans.

**STEWART, ROBERT, second MARQUIS OF LONDONDERRY**, best known as **VISCOUNT CASTLEREAGH** (1769-1822). An eminent English statesman. He was the eldest surviving son of Robert, first Marquis of Londonderry, and was educated at St. John's College, Cambridge. He entered the Irish Parliament in 1790, became Viscount Castlereagh (1796), and Chief Secretary for Ireland (1798). In suppressing the rebellion of that year he was energetic. In helping to bring about Parliamentary union with England he made use of money in corrupting opponents. Castlereagh entered the Imperial Parliament, and in 1805-06 was Secretary of State for the War and Colonial departments. Resigning on Pitt's death in 1806, he resumed the office of War Minister next year, and organized the disastrous Walcheren expedition (1809). Canning (q.v.), then Foreign Secretary, bitterly attacked Castlereagh for this. The result was that both resigned, and a duel took place, Sept. 21, 1809, in which Canning was wounded. After the assassination of Perceval in 1812, Castlereagh became Foreign Secretary, a post which he held during the achievements of the Duke of Wellington. His personal influence and his untiring exertions kept together the coalition against Napoleon. He represented England at the Congress of Vienna in 1814-15, at the Treaty of Paris in 1815, and at the Congress of Aix-la-Chapelle in 1818. His foreign policy was favorable to the principles of the "Holy Alliance" abroad and he recommended despotic measures at home. As the leader of the Liverpool government in the Lower House, he carried the suspension of the Habeas Corpus Act in 1817. The "Six Acts" of 1819 made him extremely unpopular. The retirement of Canning from the ministry (1820) threw the whole weight of business on Castlereagh. By the death of his father in 1821 he became Marquis of Londonderry. The great toil and responsibility of his office deranged his mind, and he died by suicide at North Cray Place, Kent, Aug. 12, 1822. Consult his *Memoirs and Correspondence* (12 vols., London, 1848-53) and Arthur Hassall, *Viscount Castlereagh* (ib., 1908).

**STEWART, SIR THOMAS GRAINGER** (1837-1900). A British physician. He was born and educated in Edinburgh (M.D., 1858) and settled there after postgraduate work in Berlin, Prague, and Vienna. In 1876 he was elected professor of the practice of physic at Edinburgh University. Six years later he was appointed physician in ordinary to the Queen in Scotland, and he was knighted in 1894. In 1898 he was president of the British Medical Association. Stewart excelled in practice as well as in lecturing, and contributed to general as well as to medical literature. Among his works are: *A Practical Treatise on Bright's Disease of the Kidneys* (1868; 2d ed., 1871); *An Introduction to the Study of the Diseases of the Nervous System* (1884); *Clinical Lectures on Important Symptoms* (1884, 1888, and 1894); and *The Good Regent: a Chronicle Play* (1898).

# STICKLEBACKS

1

2

4

3

5

1. COAST STICKLEBACK (*Apeltes quadracus*).
2. EUROPEAN STICKLEBACK (*Gasterosteus aculeatus*).
3. SALMON-KILLER (*Gasterosteus cataphractus*).

4. NEST OF EUROPEAN STICKLEBACK (*Gasterosteus aculeatus*).
5. SEA-ADDER (*Spinachia spinachia*) and its eggs hidden among the seaweed.

**STEWART, WILLIAM RHINELANDER** (1852-). An American humanitarian, born in New York City. He graduated from the Columbia Law School in 1873 and practiced law for a time, but gained other interests and in 1903 became president of the Rhinelander Real Estate Company. In 1892 he was appointed a commissioner on the New York State Board of Charities, of which he was also president from 1894 to 1900 and after 1904. In 1898 he was president of the 25th National Conference of Charities and Correction. Two years later he organized a similar State Conference, of which he was president in 1903, and in 1910 a New York City Conference. He was the originator in 1889 and treasurer of the committee that erected the Washington Arch in Washington Square, New York, and in 1894 was a member of the Committee of Seventy that fought Tammany Hall. He published *The Philanthropic Work of Josephine Shaw Lowell* (1911).

**STEWART ISLAND.** See NEW ZEALAND.

**STEYN, stin, MARTINUS THEUNIS** (1857-1916). A South African statesman, the last President of the Orange Free State. He was born at Winbury, Orange Free State, was educated at Grey College, Bloemfontein, and in Holland, after which he studied law at the Inner Temple, London, and was called to the bar in 1882. Returning to South Africa, he became state attorney in 1889; was elevated to the bench, the same year, as second puisne judge; and in 1893 was appointed first puisne judge. In 1896 he was chosen by universal suffrage President of the Republic. His policy was to draw the two Boer states closer together, and the defensive alliance agreed upon by the Orange Free State and the Transvaal in 1897 had his hearty support. In 1899 he represented his state in the conference at Bloemfontein with Sir Alfred Milner (q.v.) and President Kruger (q.v.) in an attempt to adjust the difficulties existing between the British and the Boers. Upon the failure of negotiations and the breaking out of hostilities he called out the Free State troops to act in coöperation with those of the Transvaal. In May, 1900, after the British had annexed the Orange Free State by proclamation, he issued a counter proclamation reasserting the state's independence. After Kruger's departure he became the virtual head of the Boer forces. He took part in the peace conference that led to a cessation of hostilities in 1902 and later was a prominent advocate of Boer interests in the Orange River Colony under British rule.

**STEYNE, stin, LORD.** A clever and wicked old nobleman in Thackeray's *Vanity Fair*, who is involved in a scandal with Becky Sharp.

**STEYR, shtir, or STEIER.** A town of Upper Austria, at the confluence of the Steyr and the Enns, 90 miles west by south of Vienna (Map: Austria, D 2). Its principal structures are the Gothic church (1443) and the palace of Count Lamberg (tenth century). It is an important centre of the Austrian iron and steel industry. There is here a large government rifle factory; other manufactures are cutlery, leather, paper, woollens, hosiery, etc. Pop., 1900, 17,592; 1910, 17,451.

**STHENEBŒA, sthën'ë-bë'ä, or STHENOBŒA, sthën'ô-bë'ä.** See BELLEPHON.

**STHENELUS.** See HERCULES.

**STYB/NITE** (from Neo-Lat. *stibium*, from Gk. *στίβι*, *stibi*, *στίβις*, *stimmis*, sulphuret of an-

timony, probably from Egypt. *stm*, *stibium*). A mineral trisulphide of antimony crystallized in the orthorhombic system. It has a metallic lustre, and is steel-gray to lead-gray in color. It occurs with quartz, in beds or veins, in granite or gneiss, often with other antimony minerals and metallic sulphides. Stibnite is an important ore of antimony, and was used by the ancients for coloring the hair, eyebrows, etc.

**STICHARION, sti-kä'ri-on.** See COSTUME, ECCLESIASTICAL.

**STICK/LEBACK'** (so called from the sharp spines on its back). A general name for the small active fresh-water hemibranch spiny-rayed fishes of the family Gastrolestidae, interesting because of their nest-building. They are natives of northern America, Europe, and Asia. There are a dozen or so species, none exceeding 6 inches long. The body is slender and more or less compressed, without scales, but usually mailed with plates. The anterior dorsal fin is replaced by several strong, widely separated spines. The ventral fin consists of a strong spine and one or two rudimentary rays. The typical form is the common European stickleback or burnstickle (*Gasterosteus aculeatus*), represented in eastern North America by the very similar or identical *Gasterosteus bispinosus*. It is four inches long, is olivaceous and dotted on the back, and has three dorsal spines. In the spring the male of this species builds upon the bottom of the stream a nest composed of bits of straw, sticks, leaves of plants, and sand, glued together by a secretion produced by a special gland. This secretion is drawn out into a silklike thread by which the materials are woven together as the fish trails it after him. The completed shape is like that of a hand muff, smooth inside, with openings in the direction of the current. When the house is completed the male induces a female to enter and deposit her eggs, a process lasting a few minutes. The female then leaves by one of the openings and the male enters by the other to deposit milt over the eggs. Other females enter, until the nest contains layers of eggs and milt. These the male guards until the young are hatched and able to shift for themselves. Sticklebacks are remarkably voracious and extremely destructive to the young fry of fishes. Consult authorities cited under AQUARIUM and FISH. See the accompanying Plate of STICKLEBACKS.

**STICK-TIGHT.** See HOUND'S-TONGUE.

**STIEGLITZ, stëg'lits, JULIUS OSCAR** (1867-). An American chemist, born in Hoboken, N. J. He graduated from the Realgymnasium in Karlsruhe, Germany, in 1886 and from the University of Berlin (Ph.D.) in 1889. After coming to the United States, he studied at Clark University, from which he received the honorary degree of Sc.D. in 1909. Called to the University of Chicago, he rose from docent (1892-93) to be professor (1905), director of analytical chemistry (1909), and in 1912 became director of the university laboratories. In 1909 he was Hitchcock lecturer at the University of California, and in 1911 was elected to membership in the National Academy of Sciences. He published numerous papers on molecular rearrangements, imido ethers, carbamid bases, and similar subjects, and is author of *The Elements of Qualitative Chemical Analysis* (2 vols., 1911-12).

**STIELER, shtë'lër, ADOLF** (1775-1836). A German cartographer, born at Gotha, and edu-

cated in law at Jena and Göttingen. He was employed in the government service at Gotha. His principal cartographic work, establishing a remarkable standard of accuracy and completeness, is *Der Handatlas* (1817-23; 9th ed., 1914). He published other similar works.

**STIELER, KARL** (1842-85). A Bavarian dialect poet and author, born in Munich, son of the preceding. After studying law in his native city he undertook extensive travels, which he described in letters to the *Allgemeine Zeitung*. Afterward he became state archivist in Munich. His poems, written in the dialect of Upper Bavaria and overflowing with fresh, delicious humor, appeared in the following collections: *Bergbleameln* (1865), *Weil's mi freut* (1876), *Habt's a Schneid'?* (1877), and others, all of which met with great favor, as did also his High German poems *Hochlandslieder* (1879), *Neue Hochlandslieder* (1883), and *Wanderzeit* (1882). Posthumously were published *Ein Winteridyll* (30th ed., 1908), *Kulturbilder aus Bayern* (2d ed., 1895), *Natur- und Lebensbilder aus den Alpen* (1890), *Aus Fremde und Heimat* (1886), and *Durch Krieg zum Frieden* (1895). For his biography, consult Heigel (Bamberg, 1891); A. Dreyer, *K. Stieler* (Stuttgart, 1905).

**STIER, shtēr, RUDOLF EWALD** (1800-62). A German Lutheran divine, born at Fraustadt, Posen. After studying law and theology at Halle, Berlin, and Wittenberg, he was appointed professor in the Missionary Institute at Basel in 1824. He then became pastor at Frankleben in 1829 and at Wichlinghausen in 1838, and was superintendent at Schkeuditz after 1850 and at Eisleben after 1859. Besides publishing an edition of Luther's Catechism and a translation of the Bible, he published *Die Reden der Apostel* (2 vols., 1824-30; Eng. trans., 1869); the important mystical commentary *Reden des Herrn* (3 vols., 1843; 3d ed., 7 vols., 1870-74; Eng. trans., 3 vols., 1869); *Die Reden der Engel in der heiligen Schrift* (1862). Consult J. P. Lacroix, *Life of Rudolf Stier* (New York, 1874).

**STIFFNECK.** See WRYNECK.

**STIFTER, shtift'ēr, ADALBERT** (1805-68). An Austrian poet, novelist, and painter, born at Oberplan, Bohemia. He studied law at the University of Vienna, but gave the preference to history, philosophy, and natural science, took up teaching, and in 1850 was appointed superintendent of public schools in Upper Austria. His idyls and novelettes, collected under the title *Studien* (1844-51; 17th ed., 1901), rank with the best prose writings of his time, and from their first appearance evoked unstinted admiration. Their purely idyllic character, utterly alien to all worldly problems and tendencies, the masterly details in the author's original conceptions and descriptions of nature, constituted so grateful a contrast to the current belletristic productions as to atone for the merely accessory rôle assigned to the human element. The *Studien* were followed by *Bunte Steine* (1852; 10th ed., 1897); and the novels *Der Nachsommer* (1857; 3d ed., 1877) and *Witiko* (1865-67). His letters, with biography, were published by Aprent (1869). An edition of his complete works appeared in Prague (1901 et seq.). A critical edition by A. Sauer, F. Hüller, J. Radler, et al., began appearing in 1904. Consult: Kuh, *Zwei Dichter Oesterreichs* (Pressburg, 1872); the biographies by Markus (Vienna, 1877), Pröll (Prague, 1891), and Stoessel (Berlin, 1902); A. Sauer, *Stifter als*

*Stilkünstler* (Prague, 1902); W. Kosch, *A. Stifter und die Romantik* (ib., 1905).

**STIGMA** (from Gk. *στίγμα*, *stigma*, mark, brand, puncture). In anatomy, a spot or mark on the skin or a small cicatrix; in botany, a special tissue for the reception of pollen; in entomology, the spiracle of an insect. To the psychiatrist a stigma is an anatomical or functional deviation from the normal in a degenerate person. Certain stigmata are so constant and so frequent that they have been accepted as indices of degeneration by teachers, physicians, and officers in prisons and asylums. Besides idiots, insane persons, and certain criminals, the feeble-minded and the markedly eccentric are classed as degenerates. (See DEGENERACY.) The stigmata of degeneration are anatomical, physiological, or psychical; i.e., they are deviations in form and shape, in function and faculty, from the normal.

**Anatomical Stigmata** comprise irregularity in formation of the skull cap or of the face; deformity of the palate; irregularity of the teeth; anomaly of tongue, lips, or nose; spots on the iris, crossed eyes, and other ocular changes; absence of pigment in iris, hair, and skin (see ALBINO); anomaly of the ears; shortening or lengthening of part of a limb, reduction or increase in the normal number of fingers; deformity of the thorax, dwarfing, giantism, the occurrence of feminine configuration in a male or of masculinity in a female; anomalies of the skin, including abnormal growth of hair or absence of proper hair, etc.

The most frequently and easily observed anatomical stigmata are the irregular ears and teeth. The principal ear types are the Darwin ear, marked by a tubercle; the Morel ear, a large smooth organ with thin edges; the Stahl ears, with various anomalies of the helix and crura (see EAR); and the Blainville type, in which the ears are not mates. Dental and palatal anomalies are very frequent, the degenerate's hard palate being dome-shaped, hip-roofed, or flat-roofed, provided with a Gothic arch, or a horseshoe arch, or asymmetrical. Frederick Peterson (q.v.) considers the deformed palate one of the chief anatomical stigmata of degeneration. Talbot found 43 per cent of abnormal palates among 1605 feeble-minded persons. Charon found 82 per cent of abnormal palates in idiots and feeble-minded folk, 76 per cent in epileptics, 80 per cent in cases of general insanity, 70 per cent in hysterical insane, 35 per cent in cases of general paralysis, and 10 per cent in apparently normal people.

**Physiological Stigmata**, to follow Peterson's classification, include (1) anomalies of the motor function, such as delay in learning to walk, tremors, epilepsy; (2) anomalies of sensory function, such as deaf-mutism, migraine, blindness, defects in sight; (3) anomalies in speech, such as stammering, mutism; (4) anomalies of genito-urinary function; (5) anomalies of instinct or appetite, such as desire for liquor or drugs; (6) diminished resistance to external influences and to diseases; (7) delayed development of puberty.

**Psychical Stigmata** include feeble-mindedness, imbecility, idiocy, insanity, eccentricity, certain moral delinquency and sexual perversion. Consult: Morel, *Traité des dégénérescences* (Paris, 1857); Max Nordau, *Degeneration* (Eng. trans., New York, 1895); Peterson, "The Stigmata of Degeneration," in *State Hospitals Bul-*

*letin* (Utica, N. Y., July, 1896). See EUGENICS; HEREDITY, and bibliographies there given.

**STIGMARIA** (Neo-Lat., from Gk. *στίγμα*, mark). The generic name given to fossilized plant remains with pitted surfaces, found in the coal measures. They were first thought to represent a distinct species of plant, but they are now known to be the roots of *Sigillaria* and other trees that lived in carboniferous times.

**STIGMATIZATION** (from Gk. *στυγματίσειν*, *stigmatizein*, to mark). The name applied to the impression on certain individuals of the stigmata or marks similar to the wounds made in the body of Christ during his torture. These stigmata comprise not only the wounds of the hands and feet and of the side received in the crucifixion, but also those impressed by the crown of thorns and by the scourging. In some cases the stigmata have been only subjectively felt and could not be seen by others. The first and most remarkable example of stigmatization is that of St. Francis of Assisi (q.v.). In his case these mysterious markings are said to have persisted for three years, until his death, and to have been seen by St. Bonaventure and by several popes, and closely observed by multitudes after his death.

Since St. Francis's time there have been many such cases. Dr. Imbert-Gourbeyre in 1894 was able to collect 321 examples, in every century since the thirteenth, in every European country and in every station in life. While the great majority were religious, mostly Dominicans or Franciscans, many were not and some 20 were in the married state. Twenty-nine cases were listed during the nineteenth century. The most noteworthy of these are Anna Katherine Emmerich (died 1824) and Louise Lateau (1850-83) of Bois d'Haine, Belgium. This last case attracted great attention and provoked public discussion, in which the Salpêtrière school of neurology took the position that stigmatization is only a neurotic phenomenon in hysterical individuals. Dr. Lefebvre, an eminent physician, professor of medicine at the University of Louvain, after a prolonged investigation of Louise Lateau's case, pronounced it miraculous. On the other hand, Theodor Schwann, the distinguished biologist, also a professor at Louvain and himself a Catholic, refused after careful examination to admit the preternatural character of the phenomena. In the *Comptes Rendus* of the Society of Biology of Paris for July 11, 1885, there is a report of a case in which bleeding through the unbroken skin was produced by hypnotic suggestion.

**Bibliography.** Lefebvre, *Louise Lateau* (Louvain, 1870); A. Imbert-Gourbeyre, *Les stigmatisés* (Paris, 1873); Bourneville, *Louise Lateau* (ib., 1875); id., *Le science et le miracle* (ib., 1878); Richer, *Etudes cliniques sur l'hystéro-épilepsie ou grande hystérie* (ib., 1881); J. **STIGMONOSE.** See CARNATION.

**STIKINE** (sti-kén') **INDIANS.** See TLINKIT.

**STIKINE RIVER.** The largest and most important stream of southeastern Alaska, where

it debouches at Wrangell. Its principal course lies in British Columbia, and it has for years been the principal route between the interior of that country and the Pacific Ocean (Map: Alaska, O 7). There is a summer steamer service as far as Telegraph Creek, 170 miles from the mouth.

**STIL'BITE.** A mineral, one of the commonest of the zeolites (q.v.). It occurs in sheaf-like aggregates in basaltic rocks, granites, and gneisses.

**STILES**, stilz, CHARLES WARDELL (1867- ). An American zoölogist and pathologist. He was born at Spring Valley, N. Y., and was educated at Wesleyan University and abroad, especially in Germany and France. From 1892 to 1906 he was professor of medical zoölogy at Georgetown University, and he became zoölogist and later consulting zoölogist to the Bureau of Animal Industry, and in 1902 professor of zoölogy in the Public Health Service. As secretary of the International Commission on Zoological Nomenclature he prepared, with Albert Hassall, the *Index Catalogue of Medical Zoölogy* (1902-14). Stiles paid especial attention to the hookworm disease and discovered that the parasite of the American infection was a new species, which he called *Uncinaria americana* and later *Necator americanus*. He was a prolific writer. Many honorary degrees were conferred on him.

**STILES**, EZRA (1725-95). An American clergyman and college president, born at North Haven, Conn. He graduated at Yale in 1746, was tutor there from 1749 to 1755, was ordained by the Congregational church in 1749, and preached for a time to the Stockbridge Indians. Transient religious doubts induced him to abandon the ministry and study law (1752); and he was admitted to the bar in 1752, and practiced in New Haven in 1753-55. Returning to the ministry in 1756, he was pastor of the Second Church in Newport, R. I., in 1756-77, and during this period spent a large part of his time in literary and scientific studies, learning several European and Oriental languages and carrying on an extensive correspondence with learned men in many parts of the world. In 1777-78 he was pastor of the North Church, Portsmouth, N. H., and in 1778 became the president of Yale, which position he held until his death. He also occupied the chair of ecclesiastical history from 1780 to 1795. Both during and preceding the Revolution he was an ardent patriot. He published *An Account of the Settlement of Bristol, R. I.* (1785) and a rambling, diffuse *History of Three of the Judges of King Charles I* (1794). His *Literary Diary* (45 vols.), edited by F. B. Dexter, was published in 1901. For his grandson and great-grandson see GANNETT, EZRA STILES, and GANNETT, WILLIAM CHANNING. Consult Abiel Holmes, *Life* (Boston, 1798), and J. L. Kingsley in Jared Sparks, editor, *American Biography* (new ed., New York, 1902).

**STILETTO FLY.** A small, slender predatory fly of the family Therevidæ, frequently of varied color and closely resembling one of the robber flies (Asiliidæ). It does not catch its prey on the wing as do the robber flies, but lies in wait upon leaves and bushes and even upon the ground, springing on weaker insects as they approach. The larvæ are very long and slender, and live in rotten wood and in rich earth, and seem to feed upon both decaying animal and vegetable matter.

**STILICHO**, stil'ī-kō, FLAVIUS (?-408 A.D.). A Roman general and statesman. He was the son of a Vandal who served as an officer in the Roman army under Valens, Emperor of the East (364-378). He himself followed a military career, earning the special recognition of the Emperor Theodosius (379-395), who, in 383, sent him at the head of an embassy to the court of the Persian King Sapor III. Here by skillful diplomacy he at once arranged a very advantageous peace. On his return to Constantinople at the end of 384 he married Serena, the Emperor's niece, and received the titles of *comes stabuli sacri* and *comes domesticorum*. During the next decade he attained the grade of commander in chief (*magister militum*) of the army in Thrace (385) and directed the campaign in Britain against the Picts, Scots, and Saxons (386). The same year he was battling with his Emperor against the barbarians on the banks of the Hebrus. In 392 he was successful in campaigns against the Bastarnæ, Goths, Alani, and Huns, but was prevented from gaining greater glory by the jealousy of the Consul Rufinus, who exercised a great influence over the Emperor. In 394, however, he received a greater honor; for Theodosius made his son Honorius *Augustus*, giving him the sovereignty of Italy, Spain, Gaul, and Africa, and appointed Stilicho and Serena guardians of Honorius. Thus Stilicho found himself on a footing with his hated rival Rufinus, for he became the real ruler of the West, with headquarters at Rome, as the young Honorius was wholly indifferent to the cares of state. While Theodosius lived, Stilicho and Rufinus were forced to maintain a semblance of peace, but when he died, in 395, their rivalry broke out openly. Stilicho had a stronger personality and a close connection with the Imperial family, for his daughter Maria was betrothed to his ward, the Emperor Honorius. After successful campaigns on the Rhine he marched to the East, nominally to drive back the Goths and the Huns, whom Rufinus had persuaded to invade the Empire, but really to overthrow Rufinus, and by connivance with these same Goths Stilicho procured his assassination at the close of 395. He was now the virtual master of the Empire, for Honorius and Arcadius, the joint emperors, were puppets in his hands; but Stilicho never aspired to the throne, remaining as yet loyal to the worthless son of his old patron. His attention, indeed, was now wholly occupied with the formidable invasion of the Goth Alaric (q.v.), who had forced his way into the Peloponnesus with a great army, and was abetted by Arcadius from jealousy of Stilicho. Alaric was almost caught in a trap, but escaped northward, where he held his own for six years. At the end of 402 the contest was fought out. Alaric had invaded northern Italy, and the cowardly Honorius fled from Mediolanum (Milan) to Ravenna. Stilicho gathered all available troops from the western provinces and made a stand. He was blockaded in Milan, but early in 403 he broke the blockade and won a victory over Alaric at Pollentia, near Turin, and another at Verona. Alaric withdrew from Italy, but retained his power at the court of Arcadius. In 406 a new invasion threatened. A countless horde of Germans and Celts was led down from the north by their chief, Radagaisus, who occupied the heights of Fæsulæ, above Florence, where Stilicho, by a brilliant movement, hemmed him in and forced him to surrender. Radagaisus was

treacherously put to death and his followers were sold into slavery. This was the last great achievement of Stilicho. His downfall was due to his ambition to see his own son Eucherius on the throne of Rome; and in this he might have succeeded but for the wily Olympius, who warned Honorius of Stilicho's designs. Honorius now for the first time showed signs of energy. He aroused the soldiers by a clever speech and won over many partisans of Stilicho, who, deserted by his friends, met death by assassination at Ravenna in 408. Consult Thomas Hodgkin, *Italy and her Invaders*, vols. i-ii (Oxford, 1880), and Pasquale Villari, *The Barbarian Invasions of Italy*, vol. i, English translation by Linda Villari (New York, 1902).

**STILL**, ANDREW TAYLOR (1828-1917). An American osteopath. He was born at Jonesboro, Lee Co., Va., and served as a surgeon and major of the Twenty-first Kansas Volunteers during the Civil War. Still was the founder of osteopathy (q.v.), the practice of which he began in 1874, and after 1892 was president of the American School of Osteopathy at Kirksville, Mo. His writings include: *Autobiography of A. T. Still* (1897; rev. ed., 1908); *Philosophy and Mechanical Principles of Osteopathy* (1902); *Osteopathy, Practice and Research* (1910).

**STILL**, JOHN. See GAMMER GURTON'S NEEDLE.

**STILLBIRTH**. See ABORTION.

**STILLÉ**, stil'la, ALFRED (1813-1900). An American physician. Born in Philadelphia, he was educated at Yale and at the University of Pennsylvania (M.D., 1836). He settled in practice in his native city, but spent parts of 1841 and 1851 in Paris and Vienna. From 1854 to 1859 he was professor of medicine at the Pennsylvania Medical College and from 1864 to 1884 at the University of Pennsylvania. Stillé was one of the first in America to distinguish between typhus and typhoid fever. His observations in this connection he made during a typhus epidemic in Philadelphia in 1836 and reported in 1838. He acquired a great reputation as a practitioner, teacher, and writer, and was the first secretary, and in 1867 the president, of the American Medical Association. Among his numerous works are: *Medical Education in the United States* (1846); *Elements of General Pathology* (1848); *Therapeutics and Materia Medica* (1860; 4th ed., 1874); *Epidemic Meningitis* (1867); *Cholera* (1885). He edited with A. Maish the *National Dispensatory* (1879).

**STILL-HUNTING**. This method of hunting is similar to stalking (essentially an English term) in that each involves approaching an animal by stealth; but the two differ in that the still-hunter, either tracking or lying in wait for his quarry, usually in thick cover, often does not see it until near enough to shoot, whereas the stalker, generally hunting in the open, detects his game sometimes at a great distance, and then endeavors to keep out of sight until within range. American big-game animals most frequently taken by still-hunting include the smaller deer, moose, caribou, elk, and bears. Those that are usually stalked are sheep and goats, in their mountain fastnesses, elk and bears when found in thinly timbered country, and the caribou when they are feeding on the great barrens. Both forms of hunting, to be reasonably successful, demand patience, much knowledge of the animal's habits, good eyesight and hearing, physical endurance, especially in

the pursuit of the mountain animals, and ability to shoot accurately and quickly with a rifle.

In this necessarily brief treatment of the subject it is impossible more than to suggest a few general rules which should guide the still-hunter; and the discussion may well apply chiefly to the common white-tailed deer, since that species is the most widely distributed of American animals pursued in this way. The two legitimate methods of still-hunting this wary, alert, and intelligent creature are by lying in wait in frequented localities, or by deliberately tracking it to within shooting distance. Though the first-named method demands much patience and often skillful manœuvring, and is entirely sportsmanlike, the literal pursuit of the animal by tracking it through the forest involves much more of expert woodcraft, and is fascinating sport for the hunter.

Some hunters become remarkably expert in following a deer's trail under even most unfavorable conditions, as, e.g., when the animal moves through a dense forest over a thick carpet of fallen foliage, in which they pick out the trail by noting freshly overturned leaves or the small hoofprints on the leaves themselves. Tracking on the snow is a simple matter as to following the trail; but the keen hunter should be able quickly and accurately to read many things from a trail so plainly marked, such as the sex and sometimes the approximate age of the deer; whether the animal suspects that it is being pursued or is feeding quietly; its speed, and whether it is moving steadily or stopping frequently, etc. It is absolutely essential to follow a deer, or any other big-game animal, upwind, as the slightest air current from the hunter will carry for a long distance to the animal's extraordinarily sensitive nose the scent of a human being, a warning almost certain to result in the deer's instant and precipitate flight. It is best also, when possible, to follow a trail with the sun at one's back.

The hunter must also bear in mind constantly the fact that a deer's hearing and eyesight are exceedingly keen, and that it is always on the alert for unusual sounds or movements in the forest. He must therefore move with the utmost caution, and avoid striking branches or breaking twigs by stepping upon them or otherwise, as the snapping of a twig is likely to put a deer to instant flight. A movement of any kind if detected is also very likely to produce the same result, though under such conditions a deer, if he has not seen the hunter plainly, may stop after taking a few jumps and look back to satisfy its curiosity. Another singular habit of a deer, of which the hunter should always be ready to take advantage, is that of stopping to look back upon reaching the brow of a hill. It may also be noted that a deer in full flight which will take him past the hunter is likely entirely to overlook him if he stands still as the animal approaches.

Once within range, if it is possible to do so with safety, the hunter should wait until the deer shows its full broadside, and then should shoot carefully at the point of the foreshoulder. That shot, if correctly placed, is not only fatal, but is likely to break both forelegs, with the result that the animal cannot run far; whereas it is well established that a sturdy buck shot cleanly through the heart may, unless the great arteries or veins are cut, run several hundred yards or more before he falls. Some hunters suppose

it to be a sure sign that a deer has not been hit if it runs away with its great white tail held aloft in the usual manner; this is by no means invariably true, though it is probably always a sign the animal has been hit if it runs with tail down. In either event the hunter should at once search carefully for blood spots, following the trail for a hundred yards at least; but on finding such signs he should abandon the pursuit (unless the trail is likely to be obliterated by rain or snow) for at least half an hour, for a badly wounded deer, if not pursued, will soon lie down and die, or become so weak from loss of blood that he will not be able to escape when the hunter approaches.

Still-hunting the moose involves much the same tactics, but demands even more care, especially about the wind; for this remarkable animal has not only the largest, but apparently the most efficient, nose in the woods. Moreover, where it has been hunted, if only to a very limited extent, it becomes even more watchful and suspicious of everything than its smaller relatives, which it equals, if it does not exceed, in intelligence. (For hunting the moose by calling, see HUNTING BIG GAME.) Caribou are stalked with comparatively little difficulty, if the hunter has any cover at all, and takes advantage of the wind; and their habit of pursuing an almost perfectly straight line when they are feeding often makes it possible for the hunter to get ahead of them by a détour and await their approach. Bull elk, during the rutting season, are very likely to betray their whereabouts by their persistent and defiant challenging (bugling), and bears, especially the grizzly and big brown species, are often seen at great distances on thinly timbered mountainsides.

Consult: T. S. Van Dyke, *The Still Hunter* (New York, 1904), the standard work on still-hunting deer; J. Brunner, *Tracks and Tracking* (ib., 1909); Theodore Roosevelt, *The Wilderness Hunter* (ib., 1909); also bibliography under HUNTING.

**STILLING**, shtil'ing, BENEDIKT (1810-79). A German anatomist and surgeon. He was born at Kirchhain (Hesse), studied medicine at the University of Marburg (M.D., 1832), and was district surgeon in Cassel until 1840. He afterward practiced privately. Stilling traveled much. He is well known through his studies on the brain and the nervous system, having been the founder of the theory of the vasomotor nervous system—*Physiologische, pathologische, und medizinische praktische, Untersuchungen über die Spinal Irritation* (1840); and after his first visit to Paris he introduced ovariectomy into Germany (1837), using his own method, the extraperitoneal one, etc. Four of his writings received the prize of the Academy of Medicine at Paris. His best-known works are *Untersuchungen über die Funktionen des Rückenmarks und der Nerven* (1843, 1859); *Untersuchungen über den Bau des kleinen Gehirns des Menschen* (1864-67, 1878); *Ueber die Medulla oblongata* (1843).

**STILLING**, JOHANN HEINRICH JUNG. See JUNG-STILLING, J. H.

**STILLINGFLEET**, EDWARD (1635-99). An Anglican prelate, born at Cranborne, Dorsetshire. He received his education at Cambridge. In 1659 he published the *Origines Sacrae, or Rational Account of the Christian Faith, as to the Truth and Divine Authority of the Scriptures*, a work which made his reputation, and is still

esteemed as a masterly treatise, though much of it is superseded by modern scholarship. In 1664 appeared his *Rational Account of the Grounds of the Protestant Religion*, a defense of the Church of England from the charge of schism in its separation from Rome, which was received with great favor, and led to his appointment as preacher at the Rolls Chapel. In 1670 he became canon of St. Paul's Cathedral, and in 1673 was made dean. After the Revolution of 1688 he received the appointment to the Bishopric of Worcester. Stillingfleet's chief works, besides those mentioned, were the *Origines Britannicæ*, or *Antiquities of the British Churches* and *The Doctrines and Practices of the Church of Rome Truly Represented* (1686; 3d ed., 1851), a standard work. His complete works were published in six volumes (London, 1710, with life by Richard Bentley, supplementary vol., 1735).

**STILLINGIA**, stil-lin'jî-â (Neo-Lat., named in honor of Stillingfleet, English botanist). A genus of plants belonging to the family Euphorbiaceæ. The species are mostly trees or shrubs of tropical Asia and America, and of the islands of Bourbon and Mauritius. One species, *Stillingia sylvatica*, queen's delight or yaw shrub, a perennial herb 2 to 3 feet high, is found from Virginia to Kansas and south to the Gulf. The root of this plant has been variously used in medicine. *Stillingia sebifera* or *Sapium sebiferum*, the tallow tree of China, from the fruit of which the Chinese obtain tallow, and which was introduced into the East and the West Indies, has a trunk and branches like the cherry and foliage like the black poplar.

**STILL LIFE** (still, i.e., dead). A branch of painting devoted to the representation of lifeless objects, such as dead game, fish, household utensils, vases, plate glasses, and the like; taken to include also fruits and flowers. Still-life painting is concerned purely with pictorial effects like the charm of color and treatment of light and shadow. It was practiced by the Greeks of the best period, and further developed during the Alexandrian period, as may be seen in the surviving Pompeian frescoes and Roman mosaics. During the Renaissance it was in abeyance, except as an accessory to figure painting. The early Netherlanders from Jan van Eyck down, and Germans, like Dürer and Holbein, excelled especially in this variety. But still-life painting did not develop independently in the Netherlands until the seventeenth century, its golden age—Holland was its special home. Until about 1650 the local schools are plainly discernible: Haarlem, with its breakfast scenes, rich or frugal, and goldsmith's plate; Leyden, the university city, with books, writing materials, and musical instruments; The Hague, with the products of the fish markets; Utrecht, with fruits and flowers. The most eminent masters were Jan de Heem of Utrecht, Willem Kalf of Amsterdam, and Abraham van Beyeren of The Hague. Others were Snyder, Seghers, and Johannes Fyt in Flanders; Claesz, Heda, Van Aelst, Dou, Rembrandt (occasionally), Weenix, Van Huysum, and Rachel Ruysch in Holland. The greatest still-life painter of the eighteenth century was Chardin in France. During the nineteenth century this genre was practiced occasionally by many of the great artists (Delacroix, Courbet, Manet, Cézanne), and as a specialty by Desgoffe, Philippe Rousseau, Antoine Vollon, the greatest of the century, and many others like Ribot, Roybet, and Bonvin. In the United

States, W. M. Chase, celebrated for his fish, came to be known as the most brilliant painter of still life. Well known also are Emil Carlsen and Wilton Lockwood, the latter for his flowers.

**STILLMAN**, SAMUEL (1738-1807). An American clergyman. He was born in Philadelphia, Pa., removed to Charleston, S. C., in 1748, was ordained as a Baptist minister in 1759, and preached first at James Island (S. C.), then at Bordentown (N. J.), and finally at Boston. He was one of the incorporators of Brown University (1764). Among his published sermons are *A Sermon on the Repeal of the Stamp Act* (1766), *Election Sermon* (1779), *Masonic Discourse* (1785), and a *Sermon Occasioned by the Death of George Washington* (1799).

**STILLMAN**, THOMAS BLISS (1852-1915). An American chemist, born in Plainfield, N. J. He graduated from Rutgers College in 1873, receiving the degree of M.S. in 1876. During 1876-79 he studied analytical chemistry in the laboratory of Fresenius in Wiesbaden, and in 1879 began practice as an analytical chemist in New York. At Stevens Institute, where in 1883 he received the degree of Ph.D., he was appointed professor of analytical chemistry (1886) and in 1902 he was given the chair of engineering chemistry and was made head of the chemical department. In 1909 he retired, but continued active as a consulting chemist, and from 1911 until his death was city chemist of Jersey City and Bayonne, N. J. He published *Engineering Chemistry: A Manual of Quantitative Chemical Analysis for Students, Chemists, and Engineers* (1897) and *Examination of Lubricating Oils* (1914).

**STILLMAN**, WILLIAM JAMES (1828-1901). An American journalist, landscape painter, and author. He was born in Schenectady, N. Y., and after graduating at Union College in 1848 took up landscape painting under Frederick Church. In 1849 he studied in England, where he was influenced by the Pre-Raphaelites, becoming acquainted with Turner, whose work he admired, and with Ruskin. From 1851 to 1859 he exhibited at the National Academy, of which he was elected an associate in 1854. In 1852 he was commissioned by Louis Kossuth to go to Hungary to carry away the crown jewels which Kossuth had hidden during the Revolution. He continued to practice painting until 1855, when he took up journalism, devoting himself to political and artistic subjects. Stillman was United States Consul at Rome (1861-65), and in Crete (1865-69). From 1883 to 1885 he was art critic of the *Evening Post*, and from 1875 to 1885 correspondent on political affairs for the *London Times*. He lived in Italy from 1878 to 1898, after which he retired to Surrey, England, where he died. His writings include: *The Cretan Insurrection of 1866-68* (1874); *On the Track of Ulysses* (1888); *Union of Italy, 1815-1895* (1898; new ed., with epilogue by G. M. Trevelyan, 1909); *Francesco Crispi* (1899). Consult his *Autobiography of a Journalist* (2 vols., Boston, 1901), full of interesting reminiscences.

**STILLWATER**. A city and the county seat of Washington Co., Minn., 18 miles north-east of St. Paul, on the St. Croix River and Lake, and on the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, and the Northern Pacific railroads (Map: Minnesota, E 5). It has a situation of great natural beauty at the foot of the celebrated dalles of St. Croix, cliffs which extend for 30 miles above the city. Still-

water has the Minnesota State prison, a public library, a United States government building, a fine city hall, Stillwater City Hospital, and St. Joseph's and St. Mary's convents. The city has extensive lumber interests, breweries, foundries and machine shops, grain elevators, a brickyard, and manufactories of wagons, boats, farm implements, boots and shoes, boxes, etc. The commission form of government was adopted in 1915. Pop., 1900, 12,318; 1910, 10,198.

**STILLWATER, BATTLE OF.** See SARATOGA, BATTLES OF.

**STILLWELL, LEWIS BUCKLEY** (1863- ). An American electrical engineer. He was born at Scranton, Pa., and studied at Wesleyan and Lehigh universities in 1882-85. After 1886 he was engaged in practice as a consulting electrical engineer at New York City. He served as chief engineer of the Westinghouse Electric and Manufacturing Company in 1891-97, and as electrical director of the Niagara Falls Power Company in 1891-1900, and of the Rapid Transit Subway Construction Company in 1900-08. He was also consulting electrical engineer to the Manhattan Railway Company in 1900-04 and afterward to the Hudson Companies. In 1909-10 he was president of the American Institute of Electrical Engineers.

**STILLO, LUCIUS ÆLIUS PRÆCONINUS** (called also Philologus). A celebrated Roman grammarian. He was learned in both Greek and Latin and was an instructor of Cicero in rhetoric and of M. Terentius Varro in grammar. His sympathy with the aristocratic party led him to accompany Quintus Metellus Numidicus into exile at Rhodes in 100 B.C. His works include commentaries on the *Ænemerita*, or Songs of the Sali, and the *Twelve Tables*, and a volume entitled *De Proloquitis*. Consult J. E. Sandys, *A History of Classical Scholarship*, vol. i (2d ed., Cambridge, 1906).

**STILT** (Swed. *stylta*, OHG. *stelza*, Ger. *Stelze*, stilt, crutch). A large, handsome, long-shanked shore bird of the genus *Himantopus*, related to the avocets. The common Old World species (*Himantopus himantopus*) is widely distributed. The American species (*Himantopus mexicanus*) is common to both continents; and others are known in other parts of the world along seacoasts. They frequent muddy flats in small flocks, and walk with long, measured steps, seeking for food among the reeds, and catching small fishes in the pools and shallows. See Plate of BEACH BIRDS.

**STILT BUG.** A plant bug of the family Berytidae, which includes very slender species with long, thin legs in which the thighs are thickened at the tip. Only six species are known to occur in the United States.

**STIMSON, FREDERIC JESUP** (1855- ). An American lawyer and author, born at Dedham, Mass. He graduated at Harvard in 1876 and at the Harvard Law School in 1878, and began practice in Boston. In 1884-85 he was Assistant Attorney-General of Massachusetts, and in 1898-1902 general counsel to the United States Industrial Commission. In 1903 he became professor of comparative legislation at Harvard, and in 1914 was appointed first ambassador of the United States to Argentina. He is best known as the author of law books, including *American Statute Law* (2 vols., 1886); *Stimson's Law Glossary* (1890); *Labor in its Relation to Law* (1894); *Handbook to the Labor Law of the United States* (1896); *Uniform State*

*Legislation* (1896); *The American Constitution* (1908); *Popular Law-Making* (1911). Under the pen name of "J. S. of Dale" he wrote novels and short stories (*Guerndale*, 1882, was his first novel), and later under his own name.

**STIMSON, HENRY LEWIS** (1867- ). An American lawyer and cabinet officer, born in New York City. He was educated at Yale (A.B., 1888), Harvard (A.M., 1889), and Harvard Law School. Admitted to the bar in 1891, he became a member of the law firm of Root and Clarke in 1893, of Root, Howard, Winthrop, and Stimson in 1897, and of Winthrop and Stimson in 1901. In 1906-09 he was United States Attorney for the Southern District of New York. Stimson was unsuccessful as Republican candidate for Governor of New York in 1910. In 1911-13 he served as Secretary of War in the cabinet of President Taft. In 1915 he was a delegate to the New York State Constitutional Convention.

**STIMULANTS** (from Lat. *stimulare*, to urge, prick, from *stimulus*, goad, incitement; connected with Gk. *στίζω*, *stizein*, to pierce, Skt. *tij*, to be sharp, OHG. *stehhan*, Ger. *stechen*, Eng. *stick*). Agents which increase temporarily the functional activity of the organism as a whole or of the various organs of the body. These may be cardiac, respiratory, nervous, hepatic, renal, gastric, etc., depending on the organ or system affected. Stimulants embrace a wide range of therapeutic agents, but popularly the term is applied to those acting especially on the circulatory, respiratory, and nervous systems. Alcohol is the most generally employed, in the form of whisky, brandy, or wines. The various preparations of ammonia, inhaled or given as the aromatic spirit of ammonia, are very serviceable diffusible stimulants. Ether may be taken as an inhalation, a hypodermic injection, or in solution by the mouth, and acts rapidly. Among the many other general stimulants may be mentioned camphor, strychnine, lavender, ginger, peppermint oil, and the other essential oils. This class of remedies is useful in fainting, hysteria, shock, etc.

**STIMULUS** (from Lat. *stimulus*, goad, incitement). A mechanical, molecular, chemical, or ethereal change in the conditions external to a plant cell or to the plant body, which produces a change (reaction) in the cell, a particular organ, or the whole plant. Mechanical stimuli, due to the mass movement of the external agents, are contact, pressure, traction, friction, torsion, etc. (See MOVEMENT; TENDRIL; THIGMOTROPISM.) In the absence of knowledge as to its nature, gravity may be included in this group, since it depends upon the mass of the body acting (the earth), although it is not in itself mechanical. (See GEOTROPISM.) Molecular stimuli depend upon molecular movements. Osmotic pressure has been proved capable of acting as a stimulus. The reactions of organisms to solutions of varying concentration are interpreted as due not to the chemical nature but to the physical character, viz., the amount of osmotic pressure. (See OSMOSIS.) Chemical stimuli depend not upon the mass, but upon the chemical composition of the body acting. They are, therefore, almost as various as chemical compounds, although many substances are nearly or quite inert. The most common acting upon plants are water, organic acids, mineral salts and other solutes in the water. (See CHEMOTROPISM.) Ethereal stimuli are propagated in the ether, light, and heat. (See HELIOTROPISM; THER-

MOTROPISM.) Here also may be included electricity, whose action in nature is little understood. See IRRITABILITY; PSYCHOLOGY; PSYCHOLOGICAL APPARATUS.

**STINDE**, stin'de, JULIUS (1841-1905). A German humorist. He studied and practiced manufacturing chemistry, became editor of a Hamburg trade journal, contributed to periodicals, and was gradually drawn wholly to literature, wherein he won popularity by *Buchholzens in Italien* (1883), *Die Familie Buchholz* (1884, translated), a second part of this (1886), *Frau Buchholz im Orient* (1888), *Frau Wilhelmine Buchholz' Memoiren* (1895), and *Hotel Buchholz, Ausstellungserlebnisse* (1896). His other writing, dramatic and otherwise, is of slight worth, but in the *Buchholz* series the lower middle class of Berlin is depicted with a fresh, genial, healthy humor. Consult R. M. Meyer, *Die Ahnen der Familie Buchholz in Gestalten und Problemen* (Berlin, 1905).

**STING** (from AS. *stingan*, to push out). An organ possessed by various kinds of animals, by which they not only inflict a mechanical wound in their prey, but also insert into it an irritant or poison. Stinging or netting cells (see NEMATOCYST) occur in all the Coelenterata except ctenophores, in some turbellarian worms, and on the cerata of the nudibranch *Eolis*. The sting of scorpions (q.v.) is in the tail. The poison, secreted by a gland, exudes through small openings into the wound, and is powerful enough to cause death in the small natural prey. Among insects, several forms are provided with a sting. This organ, of especial use as a means of defense to the so-called aculeate Hymenoptera, a group which includes the bees, wasps, and many ants, and to the Mutillidæ or cow ants or velvet ants, is simply a modified ovipositor connected with a poison gland. The sting of a bee consists of three distinct pieces: two barbed needles and one gougelike piece, the director; the needles move up and down on the director, controlled by muscles attached to their bases. In the anterior part of the director there is a slight projection on the needle which catches a bit of the poison in the chamber and carries it to the wound. The director itself is composed of a united pair of stylets, and without the director is a third pair of stylets which are thick and hairy. (See INSECT, *Poisonous Insects*.) The poison is secreted by glands which pour this into the chamber. The poison of the bee is said to be secreted by two glands, one producing an acid and the other an alkaline fluid. Merely acid poison glands are said by some investigators to be present in those wasps which only stupefy the prey they store up for nourishment of their young.

**STINGFISH.** See WEEVER.

**STING'RAY**, or **STINGAREE**, stin'gà-rè'. A ray (q.v.) of the family Dasyatide, characterized by the usual possession of a long whiplike tail, bearing near its base one or more long, strong, sharp spines retroversely serrated. When broken off the spine is replaced by the coming forward of one of a succession growing behind it. The family includes about fifty species, inhabitants of the warmer seas, some species occurring in the fresh waters of Northern South America, some of which are 10 or 12 feet in length. They are generally much dreaded because of the ugly wound they are capable of inflicting with the spine or sting. The sting is not poisonous, as is frequently supposed, although the mucous secre-

tions of the skin may be responsible for the serious inflammations frequent in the wounds. See DEVILFISH; also RAY and accompanying Plate.

TAIL OF A STINGRAY.

a, enlarged view of the base of the tail of a stingray, having several spines; b, a single spine, barbed on both sides.

**STINKBUG.** Any one of the heteropterous insects of the family Pentatomidæ, many of which are protected from their natural enemies by a nauseous and persistent odor, which remains upon berries over which these bugs may have walked. The family is large; 5000 species have been described, of which 500 are found in the United States. They are broad, flat insects with five-jointed antennæ, are usually green, gray, or brown, though some have a brilliant combination of black and red or yellow and black. They vary in habit, some species being exclusively carnivorous and others exclusively plant feeders, while others seem to feed indifferently upon the juices of plants or upon other insects. See SOLDIER BUG.

A STINKBUG.

**STINK DAMP.** See COAL, *Mining*.

**STINKHORN.** See FUNGI.

**STINKING GOOSEFOOT.** See CHENOPODIUM.

**STINKING SMUT.** See BUNT.

**STINKPOT.** See MUSK TORTOISE.

**STINKWEED.** See STRAMONIUM.

**STINKWOOD.** See OREODAPHNE.

**STINNES**, HUGO. See SUPPLEMENT.

**STINT** (from AS. *styntan*, to make blunt, short, from *stunt*, dull, stupid). One of the small sandpipers (q.v.) of the genus *Tringa* or *Pisobia*. The American stint (*Tringa* or *Pisobia minutilla*) is the smallest of the sandpipers, less than 6 inches long, breeds only in the Arctic regions, and is common throughout North America during the migrations. The plumage in summer is variegated bright bay, blackish, ashy and whitish above, whitish beneath; in winter the color is simply ashy above, whitish beneath. The little and Temminchi stints (*Erolia minuta* and *E. temminchii*) are European and Asiatic species, nesting in the far north of Siberia. For their interesting habits consult M. D. Haviland, *A Summer on the Yenesei* (New York, 1915).

**STI'PA.** See FEATHER GRASS.

**STIPENDS, CLERICAL** (Lat. *stipendium*,

tax, from *stips*, gift + *pendere*, to weigh out). A general designation of the means of support provided for the clergy. There have developed in Western civilization five general methods of providing clerical support: (1) voluntary offerings, (2) tithes, (3) endowments, (4) state aid, and (5) contracts. No country shows any one method prevailing to the exclusion of the others. Tithes (q.v.) were ordained in the Hebrew law, and the system continued in Christian times. State aid is of two kinds, direct and indirect; the latter is of the greater antiquity. When the political power under the Emperor Constantine came to the support of the Christian religion one of the first results of the coöperation of the state was the legal capacity given churches in a corporate character to receive gifts *inter vivos* and by bequest, and to hold the same in perpetuity. This was an indirect method of state aid. Direct state support has been developed since the Reformation. It is now in operation in those European states of Roman Catholic allegiance which entered into a treaty—the concordat—with the see of Rome for the support of the clergy. Such treaties came about as a return for the sequestration of the older ecclesiastical endowments in land. Spain, Portugal, and Austria give such direct support. The Protestant German and Scandinavian states furnish a like support to the Protestant ministry. Russia supports the hierarchy of the orthodox church. A similar system prevails in the Central and South American states for the Roman Catholic clergy. The fifth method, that of contracts, is essentially American. It consists of a contract between a church (in the Protestant denominations) and its minister for the payment of a definite sum for his support, and then a series of contracts between the church and its attendants for the rental of pews and sittings. As a reaction from this method has developed what is known as the free-church movement, which seeks to abolish rentals and to substitute voluntary contributions. Most churches combine pew rentals with voluntary contributions.

**STIPPLE** (from Dutch *stippeln*, to speckle, from *stippen*, to dot, prick, from *stip*, point, dot), or **STRIPPLING**. In engraving, a process of working by dots instead of lines. In dotted prints (*Schrotblätter, manière criblée*) the dots showed white on a black ground. In *opus mallei*, punches were driven into the plate with a hammer. Stippling was intermingled with line engraving (q.v.), but as an art in itself it resulted in prints produced altogether, or mainly, by dots. In the simplest form of stipple the plate is covered with an etching ground (see **ETCHING**) and the design is executed with a point, but complicated roulettes were also used. It was an art of delicacy, softness, and gentle charm rather than of strong effects. Francesco Bartolozzi (q.v.) and Caroline Watson were among its most noted exponents. Stipple or stippling is also used in water color, particularly in miniature painting. The application of color in dots is especially adapted to minuteness and delicacy of execution.

**STIPULATION** (Lat. *stipulatio*, bargain, *stipulare*, to bargain, covenant). In law, a material clause or provision in a contract. The term is also sometimes applied to an agreement between attorneys as to some matter of practice. In admiralty practice it is a bond or undertaking filed with the court by one of the parties to an action or proceeding. A libellant must

file a stipulation for costs. When a vessel is attached under a libel the owner must file a stipulation for value to obtain release. See **BOND**.

**STIRLING**, stēr'ling. A river port and capital of Stirlingshire, Scotland, on the Forth, 35 miles northwest of Edinburgh (Map: Scotland, E 3). Rich agricultural, mining, and manufacturing districts near by are the basis of its prosperity. Situated at the head of navigation of the Forth, Stirling, strongly fortified by nature, was the key to the Highlands. It owes its origin to the strong natural fortress of Castle Hill, crowned by the venerable castle, commanding a view of great beauty. From this hill north and east to the plain extends the oldest part of the town. Stirling Bridge, which existed in 1571, was until recent years the only one by which wheeled carriages could cross the Forth. Noteworthy are the East and West churches—the former erected by James IV about 1494—and Mar's Work, an incomplete and richly ornamented structure, built in 1572. Ropes, malt, leather, soap, and mineral oils are manufactured. Vessels of 150 tons can reach the port of Stirling, but its river trade has decreased since the advent of railroads. Stirling (formerly Stryvelyne or Estrivelin) is one of the most ancient and historically important towns of Scotland. Alexander I died in the castle in 1124. Near by the battle of Stirling was fought in 1297. (See WALLACE, WILLIAM.) The town was taken by Edward I, after a siege of three months, in 1304. In the vicinity, at Bannockburn (q.v.), the famous battle of that name was fought in 1314. The castle was the birthplace of James II and of James V. James III built the Parliament House in the castle, and improved and embellished the fortress. James V built the palace, the walls of which are profusely covered with grotesque ornamentation. In the older part of the castle is the Douglas Room, in which William, Earl of Douglas, was assassinated by James II. In 1651, after the battle of Dunbar, the castle was taken by Monk; and it withstood a siege by the Highlanders in 1745. Pop., 1901, 18,403; 1911, 21,205. Consult *History of the Chapel Royal of Stirling*, published by the Grampian Club (Stirling, 1882), and *Charters of Stirling* (ib., 1884).

**STIRLING**, EARL OF (1726–83). See ALEXANDER, WILLIAM.

**STIRLING**, JAMES (1692–1770). A mathematician, born at Garden, Stirlingshire, Scotland. He was educated at Glasgow University and Balliol College, Oxford. He was expelled from Oxford (1715) on account of his relations with the Jacobites, and went to Venice, where he took up the study of mathematics. It was during his residence in Venice that he wrote his work *Lineæ Tertii Ordinis Newtonianæ* (1717), and his paper *Methodus Differentialis Newtoniana Illustrata*, which was communicated to the Royal Society through Newton (*Philosophical Transactions*, 30: 1050). Stirling returned to London in 1725 and devoted himself to the teaching of mathematics, enjoying the friendship of Newton and corresponding with many of the noted mathematicians of the day. His greatest contribution to mathematics was his *Methodus Differentialis, sive Tractatus de Summatione et Interpolatione Serierum Infinitarum* (1730; 2d ed., 1764; Eng. trans., 1749).

**STIRLING**, JAMES HUTCHINSON (1820–1909). A Scottish philosopher, born in Glasgow. He studied at Glasgow University and then prac

ticed medicine for some years, but later traveled and devoted himself to the study of philosophy, especially German philosophy. His first book, *The Secret of Hegel* (2 vols., 1865; new ed., rev., 1898), was of much importance, as were later ones, in advancing idealistic thinking. A translation of Schwegler's *History of Philosophy* (1867; frequently republished) was followed by *As Regards Protoplasm* (1869); *Lectures on the Philosophy of Law* (1873); *Text-Book to Kant* (1881); *Philosophy and Theology* (1890), the first Gifford lectures at Edinburgh; *Darwinianism: Workmen and Work* (1894); *What is Thought?* (1900); *The Categories* (1903; 2d ed., 1907). Consult A. H. Stirling, *James Hutchinson Stirling* (London, 1912), with preface by Lord Haldane.

**STIRLING, JOHN WILLIAM** (1859- ). A Canadian physician. He was born at Halifax, graduated in medicine at Edinburgh University in 1884, and studied afterward in Vienna, Berlin, and London, giving special attention to the eye and ear. He practiced in Montreal as an ophthalmological and aural surgeon, was appointed professor of ophthalmology in the University of Bishop's College, Lennoxville, and in 1906 became professor of ophthalmology in McGill University. He was appointed oculist and aurist to the Montreal General Hospital, and in 1909 was a delegate to the International Ophthalmological Congress, Naples.

**STIRLING, YATES** (1843- ). An American naval officer, born in Baltimore. He graduated from the United States Naval Academy in 1863, served on the *Shenandoah* in the North Atlantic Blockading Squadron in 1863-65, and participated in both attacks on Fort Fisher. Subsequently he was promoted through the various grades to commander in 1880, captain in 1894, and rear admiral in 1902. He commanded the *Newark* in 1895-96 and the *Lancaster* in 1896-97; served as a member of the Lighthouse Board from 1898 to 1900; and was commandant of the Naval Station at San Juan, P. R., in 1900-02, and of the Navy Yard at Puget Sound, Wash., in 1902-03. Stationed with the Asiatic Fleet, he commanded the Philippine Squadron in 1903-04 and the Cruiser Squadron in 1904, and in 1904-05 was commander in chief of the fleet. He was retired in the latter year.

**STIRLING-MAXWELL, CAROLINE E. S. NORTON, LADY.** See **NORTON**.

**STIRLING-MAXWELL, SIR WILLIAM** (1818-78). A Scottish author, born near Glasgow. He bore the name of Stirling until 1865, when by the death of Sir John Maxwell, his maternal uncle, he succeeded to a baronetcy and affixed the name of Maxwell. He graduated at Cambridge in 1839, and later made several visits to Spain. In 1852-68 and 1874-78 he represented Perthshire in Parliament. He was rector of St. Andrews University in 1862 and of Edinburgh in 1872, and in 1875 was elected chancellor of the University of Glasgow. He was the author of *Annals of the Artists of Spain* (3 vols., 1848; 2d ed., 4 vols., 1891); *The Cloister Life of Charles V* (1852; 4th ed., 1891); *Velasquez and his Works* (1855; Ger. trans., 1856; Fr. trans., 1865). For his wife see **NORTON, CAROLINE**.

**STIRLINGSHIRE.** A west-midland county of Scotland, on the border between the Highlands and the Lowlands of the country, and bounded on the north by Perthshire and by the river and Firth of Forth (Map: Scotland, D 3). Area, 451 square miles. Much of it is occupied

by the carse of Stirling and Falkirk, formerly covered with unproductive moss, but now mostly converted into profitable agricultural lands. The chief elevation is Ben Lomond (q.v.). The rivers are the Forth, the Carron, and the Endrick. Loch Lomond is the only important lake. Stirlingshire is noted for its minerals, especially ironstone, which is wrought on an extensive scale at Carron, and there are extensive and valuable coal fields in the southeast. Woolen goods are manufactured at Alva and Bannockburn and in the neighborhood of Stirling. The capital is Stirling. Pop., 1801, 50,800; 1851, 86,200; 1901, 142,291; 1911, 160,991.

**STIRNER, shtér'nēr, MAX** (1806-56). A German philosophical anarchist, whose real name was Johann Kaspar Schmidt. He was born at Bayreuth, studied theology and philology at Berlin, Erlangen, and Königsberg, and at Berlin became an instructor in the Gymnasium and later in the higher girls' school there. His *Der Einzige und die Eigentum* (1845; 3d ed., 1900) is considered one of the earliest and best expositions of the views of the philosophical anarchists. He wrote also *Geschichte der Reaktion* (2 vols., 1852), and translated into German J. B. Say's *Traité d'économie politique* as *Lehrbuch der praktischen Oekonomie* (4 vols., 1845-46) and Adam Smith's *Wealth of Nations* as *Untersuchungen über den Nationalreichtum* (4 vols., 1846). Consult Mackay, *Max Stirner, sein Leben und sein Werk* (Leipzig, 1898), and E. Horn, *Max Stirners ethischer Egoismus* (Berlin, 1906); also J. G. Huneker, *Egoists* (New York, 1909).

**STIRRUP CUP.** See **DRINKING USAGES**.

**STITCHES.** See **EMBROIDERY**.

**STITCH/WORT** (*Stellaria*). A genus of annual and perennial plants of the family Caryophyllaceæ, having weak stems and white flowers, which in some are minute, and in others are large enough to be ornamental. To this genus the common chickweed is generally referred.

**STITH, WILLIAM** (1689-1755). An American Colonial historian, born in Virginia. He went to England, studied theology, was ordained priest in the Established church, and on his return (1721) was made master of the grammar school at William and Mary College, Williamsburg, Va. He won a distinguished place among the clergymen of the Colony, was chosen chaplain of the House of Burgesses in 1738, and rector of Henrico Parish, and president of William and Mary College (1752-55). He is known for his scholarly but unfinished *History of Virginia from the First Settlement to the Dissolution of the London Company* (1747, reëdited with a bibliography 1866). This work is highly praised for its accuracy and much blamed for its diffuseness.

**STOA, stō'ā** (Gk. *στωά, στωά*, a roofed colonnade, piazza, porch). One of the extended colonnades surrounding the market place and often extending through the principal streets of Greek cities. It was always roofed (for shelter in bad weather), and its floor was above the street level. At the back was usually an inclosed wall, and in front a single or double colonnade facing the street. Later, when broader spaces were to be roofed, the stoa became an independent structure. Sometimes a dividing wall was placed between the two rows of columns; the more usual form was the stoa diplo, in which a row of columns replaced the wall. The forms of the stoa multiplied; two inner rows of col-

umns were often used and additional stories were added. The stoa originated among the Ionian Greeks in Asia Minor, whence it was introduced into Greece. Celebrated examples were the simple Stoa Poecile (many-colored) upon the market place of Athens, the walls of which were decorated with scenes from the battles of Marathon and Ctenoë by Polygnotus; the stoa diple of Thoricos; the three-aisled basilica of Paestum; and the two-storied stoa of King Attalus II at Athens. Stoas were frequently adorned with statuary and painting.

**STOAT.** The British name for a weasel (q.v.).

**STOBÆUS**, JOANNES (Lat., from Gk. Ἰωάννης ὁ Στοβαῖος, *Iōannēs ho Stobaios*) (c.450–c.500 A.D.). A Greek writer, apparently a native of Stobi, in Macedonia. To him we owe the preservation of a large number of our fragments of over 500 early Greek poets and prose writers. This most valuable collection of excerpts, in four books, bore the name *Florilegium* ('*Ἀνθολόγιον*, *Anthologion*), but in the course of the Middle Ages was divided into two parts, one of which is known as the *Eclogæ*, the other as the *Florilegium*. The best critical edition is by Wachsmuth and Hense (Berlin, 1884–1909). Consult Christ-Schmid, *Geschichte der Griechischen Literatur*, vol. ii, part ii (5th ed., Munich, 1913).

**STOCK** (AS. *stocc*, OHG. *stoc*, Ger. *Stock*, post, trunk). In corporation law, the rights or interest which the members of a corporation, or persons who contribute to its capital, have in its assets, franchises, management, and profits. The amount fixed by the charter of a corporation as the sum which is to be paid into its treasury for use in its business operations is called the capital stock. The latter term is sometimes inaccurately applied to the actual property owned by a corporation, as the capital stock of a corporation may not represent its actual assets, even at the time of its organization. The total capital stock of a corporation is divided into shares, which are represented by certificates, and the latter are distributed to subscribers according to the amounts of their respective subscriptions. Shares of stock may be made of any value, the par value being fixed by dividing the number of shares issued into the total amount of capital stock. The usual par value is \$100, but shares representing other sums, even so small as \$1 each, are sometimes issued, especially in industrial enterprises. Many States require stock to be issued at its par value.

Treasury stock is that which is not allotted to subscribers, but retained by the corporation for the purpose of selling it from time to time to raise funds.

Stock may be divided into preferred and common shares. The amount in dividends which the former can receive in each year is usually fixed and certain, and if more is paid as dividend it must be paid on the common stock. Preferred stock may be cumulative or noncumulative. If the former, any deficiencies in dividends in one year must be made up later, before a dividend can be declared on the common. For example, if 7 per cent cumulative preferred stock is issued, and the earnings are only sufficient to pay 5 per cent on it in a given year, the deficiency of 2 per cent must be made up later. If such stock were noncumulative, the preferred stock would only receive 5 per cent for that year, even though the earnings the next year were

sufficient to pay 15 per cent on the amount of the capital stock, and an 8 per cent dividend were declared on the common stock.

The name of each person to whom a share of stock is issued is entered upon the books of the corporation.

Shares of stock are generally considered personal property even where the sole assets of the corporation consist of real property, and they are transferable by assignment. The transferee obtains a right to have his name entered upon the books of the company as a stockholder in the place of his transferor. Where the stockholder after having assigned the certificate fraudulently induces the corporation to place the name of another person, represented to be the true transferee, on the books as stockholder, the latter is then the stockholder and the holder of the certificate is confined to his action against the corporation for damages. For this reason a bond of indemnity is now generally required where the certificate is lost. However, shares of stock are not negotiable instruments in the strict sense of that term, but they are commonly indorsed in blank and transferred from one person to another as if such transfer were protected by the same rules of law. For this reason the courts in the United States generally protect an innocent purchaser for value, on the ground of estoppel. The English courts do not go so far in this respect, and the only safe course there is for a purchaser of stock to have the transfer entered on the books of the corporation immediately. Dividends are paid to the record owner of stock irrespective of who holds the certificates. A record owner of stock is called a stockholder. See Cook, *Treatise on the Law of Corporations* (5th ed., Chicago, 1903); Dos Passos, *The Law of Stock Brokers and Stock Exchanges* (2d ed., New York, 1905); also CORPORATIONS and authorities there cited; STOCK EXCHANGE and authorities.

**STOCK** (so called from its woody stem), GILLIFLOWER, or GILLYFLOWER (*Matthiola*). A

stock (*Matthiola incana*).

genus of about 30 species of herbs or half shrubs of the family Cruciferae, natives of the Mediterranean regions. *Matthiola incana*, in-

digenous in southern Europe, is probably the parent of the greater number of the cultivated hoary-leaved kinds known as Brompton stock, etc., while those with smooth leaves, called ten-week stock, German stock, etc., are referred to *Matthiola fenestralis*, which, perhaps, is a variety of the species *Matthiola incana*. The sandy shores of Wales and of Cornwall produce a species (*Matthiola sinuata*) the large purple flowers of which are fragrant only at night, a characteristic also of several other species. The hoary-leaved stocks are usually treated in planting as biennials, although they may almost be reckoned perennial. The smooth-leaved stocks are treated as annuals.

**STOCK, FREDERICK AUGUST** (1872- ). An American composer and orchestral conductor, born at Jülich (Rhine Province). He began his musical studies under his father, a German bandmaster. From 1886 to 1891 he was a pupil of the Cologne Conservatory, where he studied violin with Japha and composition with Zöllner, Wüllner, and Humperdinck. For the next four years he was a violinist in the Municipal Orchestra of Cologne. In 1895 he came to Chicago as a member of the Theodore Thomas Orchestra (viola). In 1901 Thomas selected him as his assistant. After the death of Thomas he became the conductor. As a composer he showed a decided predilection for the larger forms, which he handled with mastery. He wrote a set of *Symphonic Variations*; several symphonic poems; an overture, *Life's Spring Tide*; a violin concerto; a Symphony in C minor; a *Festival Prologue* (for the 25th anniversary of the Chicago Symphony Orchestra, 1915); a string quartet in C minor.

**STOCKADE**. A means of defense consisting of stakes, logs, timbers, tree trunks, etc., firmly set in the ground and adjoining each other, and provided with loopholes through which the fire of the defenders may be delivered. Stockades are one of the oldest forms of fortifications, having done duty since the time of arrows and javelins.

**STOCK BRIDGE**. See MAHICAN.

**STOCKBRIDGE**. A town, including three villages, in Berkshire Co., Mass., 17 miles by rail south of Pittsfield, on the Housatonic River, and on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, A 3). It is picturesquely situated in the Berkshire Hills. Noteworthy features are the Chimes Tower, commemorating the early Indian Mission; a fine park, the gift of Cyrus W. Field; the Edwards Monument; the Indian Burial Ground; Williams Academy; the Jackson Library and Reading Room; Prospect Hill, commanding an extended view; and Lake Mahkeenac, near which are the remains of the house where Hawthorne wrote the *House of the Seven Gables* and other works. Pop., 1900, 2081; 1910, 1933.

An Indian mission was established here in 1735, and two years later the place was incorporated as a town under its present name (from Stockbridge, England). Jonathan Edwards was a missionary here from 1750 to 1758, and here he wrote his famous *Freedom of the Will*. In 1785 the Indians moved to New Stockbridge, N. Y. Consult Jones, *Stockbridge Past and Present* (Springfield, 1854), and *History of Berkshire County* (New York, 1885).

**STOCKBRIDGE, HENRY** (1822-95). An American political leader, born at North Hadley, Mass. He graduated at Amherst in 1845,

and was admitted to the bar in Maryland in 1848. He remained with the Union during the Civil War, and in 1864 became a member of the State Legislature. He was a member of the Constitutional Convention to plan for abolition of slavery in the State, was active in securing the adoption of the constitution it framed, and defended it before the courts. It was largely by his exertions that the indentures of apprenticeship, which threatened to take the place of slavery, were omitted from the statutes, and enfranchisement fully secured to the negroes of Maryland.

**STOCKDOVE** (so called either because formerly regarded as the parent stock of the domestic pigeons, or because it breeds in the trunks of trees). A wild pigeon (*Columba anas*) of Europe, gray, with a burnished metallic purple breast, scarlet eyes, orange-colored bill, and red legs. It is about 14 inches in length.

**STÖCKER, shtëk'ër, ADOLF** (1835-1909). A German theologian and politician, born in Halberstadt. He studied theology and philosophy in Halle and Berlin, entered the ministry, and in 1874 became cathedral preacher and court pastor in Berlin. In 1879 he was elected to the Prussian Chamber of Deputies, and from 1881 till 1893 he was a member of the Reichstag. During this period he was a leader of the agitation against the Jews. In 1890, because of his activity as a Socialist agitator, he was removed by the Emperor from his position as pastor of the court. Six years afterward, with a considerable number of followers, he seceded from the Conservative party, to which he had hitherto belonged, and organized the Christian Socialists. In 1892 Dr. Stöcker became the editor of the *Deutsche evangelische Kirchenzeitung*. He published *Dreizehn Jahre Hopprediger und Politiker* (1895).

**STOCK EXCHANGE**. An institution where sales and purchases may be made of securities of corporations and municipalities, and in some cases of certificates representing commodities of trade, such as silver bullion, petroleum, etc. In their origin stock exchanges appear to have been free to the use of any one who wished to buy or sell, and it was probably with this function in view that some of the older exchanges, notably the Paris Bourse, were located in buildings erected at the public expense. It was quickly discovered, however, that in order to enforce bargains some formal organization was necessary. Membership in stock exchanges therefore came to be limited on the general basis used by clubs or other associations. As the profits of the use of the Exchange became large, possession of membership became valuable.

The London Stock Exchange has for many generations occupied the most conspicuous place in the history of finance, as the transactions on its floor were conducted by the great aggregations of capital, home and international, located in that city. Originally confining its dealings to British government stock, the London Exchange became active, at the opening of the nineteenth century, in securities of other nations which applied to London capitalists for the placing of public loans; to these were later added railway shares. After 1888 stocks of incorporated industrial enterprises, and more recently of mining and exploration companies, grew into high favor, the Stock Exchange merely acting as the medium for the transfer of such

shares from the capitalists behind the enterprise to the general public.

The New York Stock Exchange devoted itself during most of its history almost exclusively to securities of railway enterprises, even dealings in United States government bonds and other American public securities being chiefly conducted outside the Exchange. In recent years, along with the development of the London movement of industrial incorporation, the New York Stock Exchange has been largely utilized for the exploiting of shares of American companies of this nature. This movement, depressed during the hard times of the early nineties, was renewed in enormous volume during the great boom in trade which followed 1897. In the course of this time listing of industrial securities on the New York Exchange attracted an immense business to that branch of its activities. The New York Stock Exchange has never dealt to any noteworthy extent in foreign securities, thereby reflecting the general tendency of American investors. Even the large purchases of British consols by American bankers during the Exchequer's loan issues of 1900, 1901, and 1902 were disposed of privately, and were never allowed a place in the formal trading of the Stock Exchange. The same thing is true of the Anglo-French loan of 1915, and of the various lesser loans extended to the belligerents.

There has been some diversity in the business of the New York Exchange and other American exchanges. The Philadelphia Stock Exchange has long been noted as the market for various street-railway securities, as Philadelphia capitalists had interested themselves particularly in that form of investment. For similar reasons the Boston Stock Exchange, though not an organization commanding the resources and capital of New York, had for many years, and largely controls now, the trading in shares of copper-mining companies.

Stock exchanges of continental Europe have in general devoted themselves to transportation enterprises of their own countries, to their own government's securities, and to securities of other European governments coming to those markets to raise capital. More recently the stock exchanges of Paris, Berlin, and Vienna have followed London's example in taking up on a large scale shares of incorporated industrial enterprises—particularly so with Berlin, where the iron industry has been extensively exploited in this form.

**History.** Stock exchanges as institutions had their origin at the time of the creation of public debts on the modern plan, at the close of the seventeenth century. The incorporation of the East India Company in London further developed the possibilities of the raising of public capital for corporate uses through stock exchange trading. In 1720 the enormous public speculation in the shares of the South Sea Company in London and of the Mississippi Company in Paris brought stock trading to a height never before conceived. No city at that time, however, possessed a stock exchange in the sense now attached to the term. In London transactions were conducted through stock brokers, whose headquarters were at Jonathan's and Garraway's Coffee Houses in Change Alley. There does not appear to have been any formal organization among these brokers. The London Stock Exchange Building was not erected until 1801; the Paris Bourse not until 1826.

The New York Stock Exchange membership, even after the formal organization, conducted its business in hired rooms until December, 1865, when the building was erected on Broad and Wall streets, which was replaced by the new structure on the same site, dedicated in April, 1903. The history of stock exchanges is very largely a mirror of the financial history of the community in which they are situated. The New York Stock Exchange rose to a position of real prominence only after the Civil War. Even then the fact that it did not deal in gold as a commodity threw a great part of the community's highly speculative business over to the Gold Exchange, which was formed for that purpose exclusively. The dramatic incident of this period was the gold panic on Black Friday in September, 1869, when a combination of several unscrupulous speculators, among them James Fisk, Jr., and Jay Gould, attempted to corner and put to extravagant figures the gold supply of the market. Operations on the Stock Exchange proper at that time were largely made up of the personal struggles of rival capitalists, notably in connection with the Erie and New York Central railroads.

The completion of the Pacific Railway (1869) caused extensive speculation in shares of the two transcontinental railways, and as capital increased and the railway mileage of the country extended the transactions of the Exchange became national rather than provincial. Leading operators of that time were Gould, Fisk, Daniel Drew, Cornelius Vanderbilt, and their associates. None of the capitalists named was accustomed to trade personally on the Stock Exchange; indeed, that has always been a rare exception among active financiers.

The crisis of 1873 was heavily felt on the New York Stock Exchange, which was obliged to close for two days at the height of the panic in order to stem the tide of liquidation in securities. With the great trade revival which followed the resumption of specie payments and the profitable grain harvests of 1879 the New York Exchange entered upon a period of renewed activity. During the year 1880 (the climax of the boom of that period), trading on the Exchange reached an enormous volume, and the value of seats in the Stock Exchange rose unprecedentedly. In 1881, when a reaction in the tide of prosperity began, the Exchange reflected the change by a contraction in volume of business and by an extensive fall in prices. Speculation by the general public was again rife in 1882, but was violently checked by the sudden fall in railway and industrial profits at the close of the year. The severe reaction of 1883 was followed by the panic of May, 1884, in which half a dozen Stock Exchange houses failed and two important banks were compelled to close their doors.

The period from 1886 to 1888 was marked by large issues of securities to provide funds for the extensive railway building then in progress. There were several excited markets on the Stock Exchange, though the tendency at the close of the period was towards depression of values, largely because of the enormous creation of new securities. The year 1890 was again marked by great activity and rising prices. This boom was checked by the Baring panic of November, 1890, in London, which was reflected by a prompt recall of English capital from the United States, and by a New York Stock Ex-

change panic, in the course of which two or three brokerage houses failed. From then until the outbreak of the more serious panic of 1893, a shrinkage in business was the chief characteristic of the New York Stock Exchange's history.

The panic of 1893 was in many respects one of the most dramatic episodes in financial history. During July of that year there was talk of repeating the expedient of 1873 and closing the Exchange. This turned out to be unnecessary, as foreign capital came to the market's relief in the moment of emergency. The following year, 1894, was a period of great depression, when the volume of Stock Exchange business fell to the lowest point since 1878. Recovery followed in 1895, when foreign capital was again commanded in connection with the international syndicate to float the United States government's bond issue and protect the Treasury gold reserve. A panic of smaller proportions swept over the Stock Exchange at the close of this year, in connection with the collapse of the protective operations and the international clash between America and Great Britain over Venezuela. The two ensuing years were chiefly characterized by the reorganization of the great number of important railways which had failed during 1893 and 1894, and whose new securities, largely increased in quantity, were placed through the medium of the Stock Exchange in 1896 and 1897.

The financial revival which began at the close of the last-named year introduced a new epoch in the history of the New York Stock Exchange—an epoch in all respects the most remarkable of its history. Supply of American capital available for investment purposes seemed suddenly to have become unlimited—largely because of the country's immensely profitable harvests at a time of European famine, but also on account of a wholly unprecedented increase in its general export trade, in manufactures as well as in agricultural products, which gave its markets a command over foreign capital they had never before possessed. This increase in capital was made use of by promoters of all kinds of enterprises, and their shares found active reception on the Exchange. A highly excited movement for the rise at the opening of 1899 converged chiefly on shares of industrial companies organized to buy up independent plants. Checked by the excess of the speculators and by an industrial reaction during the presidential contest of 1900, this movement was renewed with immense force at the opening of 1901. At that time all precedents of every kind in Stock Exchange history were broken. The real force underlying the movement was the purchase of stock companies by other companies which pledged their credit to raise the funds requisite to provide for the purchase. This movement culminated in the famous Northern Pacific corner of May 9, 1901, when the efforts of two rival groups of capitalists to get hold of that railroad property forced its shares to the price of \$1000, the stock having never touched \$100 until three weeks before. Apprehension that operators who were unable to deliver stock which they had pledged would be dealt with summarily, caused one of the most violent collapses of values in the Stock Exchange's history. Recovery was prompt, and both 1901 and 1902 were characterized by numerous sensational movements for the advance, the second of those years

scoring as a rule the higher values. In the autumn of 1901 and in the fall of 1902 and the early part of 1903 severe reaction in values supervened.

After a powerful upward movement beginning in 1903 and culminating in 1906, an extraordinary decline of values set in with the panic of 1907-08. Recovery from the panic was slow and nothing of the character of a boom was experienced until after the readjustment of American business to the European War. In the period from July 31 to Dec. 7, 1914, the Stock Exchange was closed. It had been found that the sale of American stocks held abroad would be so heavy as to cause an unprecedented slump in values, and at the same time to create a commercial balance against the United States that would threaten the gold reserves of the banks. In this period stock trading was conducted privately in large volume. Upon the re-opening of the Stock Exchange the privilege of fixing minimum prices was reserved by the directors, but it was found that there was no need of such action, the threatened foreign selling movement having failed to materialize. The year 1915 was characterized by a remarkable boom in so-called "war stock"—shares in companies having contracts for munitions and other war supplies.

**Volume of Business.** Stock exchanges keep no official record of transactions on their floor. In New York such records are carefully kept by unofficial chroniclers; but as this is not done in London or on the Continent, comparison is impossible. It is safe to say, however, that in recent years the volume of business done on the New York Stock Exchange has far exceeded that in any other institution of the world. Following is the unofficial record of sales in that institution during a series of years:

YEAR	Stocks (Shares)	Bonds (Par value)
1892.....	86,726,410	\$352,741,950
1895.....	66,440,576	519,142,100
1900.....	138,880,184	578,253,280
1905.....	263,040,993	1,022,455,670
1910.....	163,970,440	634,746,503
1911.....	126,515,547	889,686,000
1912.....	131,051,359	677,254,000
1913.....	83,467,176	501,514,520
1914.....	47,420,327	460,949,200
1915.....	173,349,824	955,713,500

**Method of Business.** Stock exchanges as at present constituted are limited in membership and governed by strict rules which cover both methods of business, rates of commission to be charged, and conduct on the floor. The rules governing methods of business in New York prescribe a minimum commission of one-eighth of one per cent on the face value of securities purchased for outside customers, one thirty-second of one per cent for purchases made on account of fellow members, and one-fiftieth of one per cent for purchases made on the order of another member on the floor.

In London commissions vary from 1s. per hundred to 2s. 6d. per hundred, according to the nature of the security. The Paris *agents de change* charge one-fourth of one per cent. In New York the Stock Exchange member may both transact business on the floor of the Stock Exchange and solicit business from outside customers. In London these functions are divided

between the two functionaries known as "jobber" and "broker." Members of the London Stock Exchange are forbidden to advertise; New York Stock Exchange houses advertise freely. *Agents de change* in Paris are forbidden to solicit outside business.

Acceptance of a bid or offer of stock makes the transaction official on a stock exchange and binds each participant to the fulfillment of his bargain. Stocks thus sold must be delivered to the buyer by 2.15 p.m. of the ensuing day. The New York Stock Exchange practices daily settlement of such accounts. In London settlements are made fortnightly, the bargain being carried for the account, i.e., on credit, during the intervening period.

No security may be dealt in on the Stock Exchange which has not been formally "listed" by the committee. In New York a statement of the company's condition with a balance sheet is required before listing; also proof that proper facilities for transfer and registry of shares have been provided, and that with bonds the mortgage has been properly drawn and recorded. Corporations unwilling to make public statements were, however, formerly allowed to obtain a place in what was called the "unlisted department." This department was abolished in 1910.

**Membership Prices and Rules.** With the limitation of Stock Exchange membership, title to a seat in the Exchange becomes valuable property. In New York the price of Stock Exchange seats has fluctuated with great irregularity. In 1879 their price was \$9000; they rose to \$20,000 in 1881 and to \$37,000 in 1883, but by 1893 had declined to \$15,250. During the boom of May, 1901, they sold for \$66,000, and subsequently, in 1905, went as high as \$95,000. In the panic of 1907 seats were sold as low as \$51,000, and in 1913 there was a still lower record, \$37,000. The highest price paid for a seat in 1915 was \$74,000, the lowest, \$38,000. Ownership of a New York Stock Exchange seat does not necessarily imply the privilege of the floor; for that the owner must apply in due form to the committee on admissions. In the London Stock Exchange applicants for admission must be recommended by three members of at least four years' standing, who pledge themselves to the extent of £500 apiece to reimburse the member's creditors in case of his default within four years. If he is of foreign birth he must have been two years naturalized. In Paris, where the number of *agents de change* is limited to 60, an applicant must be proposed by his predecessor or that predecessor's heirs, and must be approved by the governing committee and the Minister of Finance.

**Stock Exchange Seat as Property.** Owing to the peculiar personal nature of a member's rights and privileges, the exact legal status of a seat as a property right is not settled in all jurisdictions. By the general weight of authority, however, a seat may be considered as a species of incorporeal property held subject to such rules and regulations as may be adopted by the Exchange. This gives a seat an anomalous position in the law of property because of the qualified and restricted character of an owner's rights. As it cannot be transferred except with the consent of the Exchange, and to a person acceptable to the latter, it is held that it cannot be seized and sold upon an execution; but it seems settled in most jurisdictions where the

question has arisen that a receiver appointed in proceedings supplementary to execution may apply to the court for an order requiring the judgment debtor to arrange for a transfer of his seat to a person acceptable to the Exchange and apply the proceeds to the satisfaction of the judgment. This may also be done by a judgment creditor's bill in some jurisdictions. Thus it will be seen that the courts do not assume to proceed against the seat itself, but attain the desired end through their power over the debtor. The United States Supreme Court has held that the rights of a member to his seat in an exchange pass to his assignee in bankruptcy, and the latter may take such steps as may be necessary to compel the bankrupt to procure a transfer of his seat subject to the rules of the Exchange. By the rules of probably all exchanges the claims of members must be first satisfied upon the sale of a seat. A seat cannot be bequeathed or devised by will, nor is it strictly descendible, as the person to whom it might be thus given or descend might not be acceptable to the Exchange; but the rules generally provide for the sale of a seat on the death of a member, an application of the proceeds to any claims the other members may have against the deceased, and a distribution of the proceeds to his personal representatives. The courts are loath to interfere with any reasonable rules and regulations of a stock exchange and with any action it may take to maintain discipline or enforce its rules, and their aid could probably only be invoked in cases of gross fraud or imposition upon a member.

**Discipline.** Strict discipline over the conduct of members is maintained by all the larger exchanges. The penalty is suspension from the privileges of the Exchange for a given period or expulsion in the case of serious offense. On the New York Stock Exchange these penalties may be imposed for fictitious sales, for trifling bids, for acceptance of smaller commissions than those prescribed by the Exchange, and for "obvious fraud." More recently discipline has been exercised for dealing with a rival exchange contrary to the regulations of the member's own exchange, and for questionable business conduct outside of the Exchange. In London the same penalties are made applicable on the general ground of failure to comply with the committee's decision or of dishonorable and disgraceful conduct. The rules of the Paris Bourse prescribe penalties in case the member "does not confine himself strictly to his duties" or "introduces injurious innovations."

**Curb Trading.** An institution which has grown to considerable proportions in recent years has been the so-called "curb trading," so named because the transactions are usually conducted on the street outside the entrance to the Stock Exchange. In London, Paris, and New York this trading has at times reached large proportions, though the system it represents is radically different in the three cities. In London curb trading is utilized for the sake of dealing in foreign shares whose home market is open after the official closing of the London Exchange. For example, trading in American securities is conducted in Shorter's Court, behind the London Stock Exchange, frequently until 6 p.m. or later, the New York Stock Exchange, on account of the five hours' difference in time, being actively at work at that hour. In Paris the curb market, under its French title of the *Coulisse*, has had a longer history. It has

represented virtually a rival exchange, not subject to the numerous and rather vexatious limitations of the older Bourse. The Coulisse has frequently been suppressed by law, but has invariably revived, and has probably conducted a larger total business than the Bourse itself, except, perhaps, in government securities. At present the Coulisse conducts its operations on the portico of the Bourse and is a recognized institution. In New York curb trading devotes itself exclusively to securities which have not been admitted to the list of the Stock Exchange. In this category are comprised many important enterprises, including shares of the Standard Oil Company and of the various banks. The curb also provides a market for newly organized enterprises which have not reached a stage where they can apply for a place on the Stock Exchange list, and it gives an opportunity for fixing values of a forthcoming security before the share or bond certificates are formally issued.

**Stock Exchange Clearing House.** In recent years the system of "clearing" Stock Exchange transactions, on the plan of the bank clearing house, has been generally adopted by stock exchanges. As introduced on the New York Exchange in 1892, the system provides for the offsetting of securities which a broker has contracted to deliver by an equivalent amount of the same securities he may have contracted to receive. Thus, if Broker A has sold 1000 New York Central shares to B and bought 1000 of the same shares from C, the two transactions are settled by the delivery of 1000 shares by C to B. The price may vary in the two transactions, but such differences are adjusted by the clearing house, the broker being "debtor" or "creditor" on his daily sheet. The same principle is followed even where the amounts bought and sold do not agree. Thus A, in the above case, may have sold only 500 shares to B and bought 1000 from C. In that case C delivers 500 shares to A and 500 to B, and payment is made accordingly. The economy consists in the lessening of the number of individual checks which must be drawn for settlement, and against which bank balances must be maintained. The aggregate saving in checks drawn, during an ordinary year, has exceeded \$500,000,000.

The plan was adopted by the Frankfort Stock Exchange in 1867, at Berlin in 1869, at Hamburg in 1870, at Vienna in 1873, at London in 1876, and by various American stock exchanges between 1880 and 1887.

**Stock Exchange Terms.** The Stock Exchange has a dialect or slang of its own, many of the terms in which had their origin at the time of the South Sea speculation in 1720. A "bull" is a buyer of stocks which he hopes to sell at higher prices. He may buy altogether with his own capital; but if he is merely a Stock Exchange speculator, he borrows most of the requisite funds, depositing the purchased stock as security. He can usually borrow 80 per cent of the cost value of his shares, the difference, 20 per cent, being his "margin." If the price falls, the lender calls on him to "make good his margin." If he fails to do so, and the margin continues "impaired," he is "closed out" by the sale of his collateral. A "boom" is a successful upward movement of prices; this term is of American origin. The opposite of a "boom," in Stock Exchange phraseology, is a "slump." The "bear"

is a seller of stocks which he hopes to obtain, later on, at lower prices. He may be selling his own holdings and delivering them to the purchaser. But if a speculator, he may borrow stocks as the "bull" borrows money. Generally he obtains the stocks by lending their equivalent in money to the owner. He is said to be "short" of stocks, where the bull is "long." The bull "realizes" when he sells to take his profits; similarly, the bear "covers" when he buys on the market the stock in which he has been speculating, and returns the shares which he has borrowed. Stocks are said to be "carried" when they are accepted as security from a bull speculator. A "manipulated" market is one in which speculators have caused an artificial appearance of real buying or selling. A "rigged" market is much the same thing, though in a more intensified form. "Puts" are contracts sold at a fixed percentage by capitalists to bull speculators, whereby the capitalist undertakes to pay a set price for a given number of shares within a stipulated time. This insures the speculator against more than a certain amount of loss if he buys stocks. "Calls" are contracts similarly sold by capitalists, who agree within a given time, and at a set price, to deliver the shares agreed upon to the speculator. This is a guarantee against losses on a falling market. Both sorts of contracts are classified as "privileges." "Wash sales" are transactions in which buyer and seller are employed by the same person, with a view to creating a semblance of activity. They are prohibited under severe penalties by the stock exchanges, but are rarely detected and are very frequently utilized. Consult: W. C. Van Antwerp, *The Stock Exchange from Within* (New York, 1913); C. A. Legg, *Law of Commercial Exchanges* (ib., 1913); S. P. Goldman, *Handbook of Stock Exchange Laws* (ib., 1914); Douglas Campbell, *The Law of Stockbrokers* (ib., 1914).

**STOCKFISH.** See HAKE.

**STOCKHAUSEN**, shtōk'hau'zen, JULIUS (1826-1906). A German singing master, born in Paris. His musical talent showed itself early and was carefully fostered by his parents, both of whom were musicians of ability. Before he had reached his twentieth year he was an excellent performer upon the piano, organ, violin, and cello. In 1845 he entered the Paris Conservatoire, where he studied piano with Hallé and Stamaty and singing with Manuel García. In 1849 he again studied with García in London. He quickly won fame as a remarkable concert singer (barytone). From 1862 to 1869 he resided in Hamburg as conductor of the Philharmonic Society and Singakademie. The next five years he spent in Stuttgart as Kammer-sänger to the King of Württemberg. In 1874 he became conductor of Stern's Gesangverein at Berlin, where he remained until 1878, being then called to Hoch's Conservatory at Frankfort as professor of singing. Differences with Raff, the director, led to his resignation the following year and the establishment of his own school, which immediately became world famous. After Raff's death, in 1882, he again returned to the conservatory, but continued his own school. Many of the most famous German singers were his pupils. He wrote an excellent *Gesangsmethode* (1886), translated into English by his pupil Sophie Löwe (new ed., 1907).

**STOCKHOLD'ER.** In the strict sense of

the term, a person who owns one or more shares of stock in a corporation, and who has been recognized by the latter as having the rights commonly incidental to such ownership. Entry of a person's name on the books of a corporation as the owner of stock is the best evidence of his standing as a stockholder, and as long as his name remains there he may generally exercise all a stockholder's privileges. However, a person to whom shares of stock have been transferred, but whose name has not yet been entered on the books, is sometimes treated as if he were a stockholder and spoken of as such. A corporation is protected in paying dividends to a person whose name remains on its books as a stockholder, even if he has transferred his shares of stock, provided the purchaser has not given notice of that fact. A stockholder of record has the right to vote in certain meetings, the most important of which, perhaps, is one for the election of officers. Each stockholder may vote the number of shares he owns, and thus one person owning the majority of the stock of a corporation may control its elections and policy against the wishes of a great number of holders of a small number of shares aggregating less than the majority. Among the rights of a stockholder are: the right to protest and invoke the aid of the courts against a misuse of the funds of the corporation, or against fraud by the majority stockholders or the officers; to object to a change in the kind of business which the charter authorizes it to carry on; the right to inspect all or any of the books of the corporation at reasonable times and places; and to receive dividends out of the earnings, when a surplus has accumulated, which is not needed for running the business or for improvements. In many States a stockholder is only liable for the debts of the corporation to the amount of his stock, that is, he only loses what he has paid in, assuming he has paid in the par value of his stock, in case of insolvency of the corporation. If a subscriber to the stock of a corporation has not paid in the full par value of the amount of stock subscribed for by him, creditors of the corporation may hold him for the balance remaining unpaid. A stockholder is not strictly a creditor of the corporation to the amount of his stock, as he is deferred to corporate creditors on a final distribution of assets; but he may become a creditor by a loan of money or sale of goods, and thus stand on an equal footing with the others as to such claims, in most jurisdictions. In the case of banking corporations a creditor is generally given a statutory right to recover from stockholders in addition to the amount unpaid on their stock, the full amount of the par value thereof. This right is also given in many States to laborers and wage earners who become creditors of ordinary corporations. See CORPORATION; STOCK; and consult authorities there referred to.

**STOCKHOLM**, stök'hölm. The capital of Sweden, situated at the outlet of the Mälars Lake into the Baltic Sea (Map: Sweden, F 7). The city is built partly on a number of islands, partly on peninsulas cut off from the mainland by deep fiords, while the waterways both towards the Mälars and towards the sea lead through labyrinths of fiords and islands. Stockholm has been called the "Venice of the North," but its aspect is entirely different from that of Venice. Both the islands and the mainland are rocky and hilly, with granite knolls exposed on all sides.

while a primeval forest penetrates almost to the heart of the city. The old nucleus, known as Staden (The City), is built on an island lying across the mouth of the Mälars channel, and connected by bridges with the northern and southern shores and with the little Riddarholm (knight's island) on the west. It has narrow streets falling steeply on all sides from the central Stortorget. Skeppholmen, to the east of Staden, is almost wholly occupied by military and naval depots. The remaining parts of the city, Södermalm on the south shore, Normalm and Östermalm on the north shore, and Kungsholmen in the northwest, are for the most part regularly laid out with broad and straight streets. Here are also a number of handsome squares, parks, and promenades, such as the Gustaf Adolfs Torg, with an equestrian statue of Gustavus Adolphus, the Kungsträdsgård on the water front with a handsome fountain, and the Humlegård, a large and beautiful pleasure garden, containing a colossal bronze statue of Linnæus. From Östermalm a bridge leads to the easternmost part of the city—an island about two miles long and three-fourths of a mile wide, known as Djurgården from its having formerly been a deer park. It is now laid out as a city park.

The principal churches are the Storkyrka (great church), founded about 1264 by Birger Jarl, rebuilt in the eighteenth century and restored in 1892; the Riddarholms Kyrka, founded about 1280 by Magnus Ladulås, a Gothic structure with a perforated iron spire 290 feet high, and the burial place of Swedish kings; the Tyska Kyrka (German Church), a German Renaissance building of the seventeenth century; and the conspicuous Katarina Kyrka crowning the heights of Södermalm. The royal palace, on the northeast corner of the Stadsholm, was begun in 1697 in the Italian Renaissance style, and is a large and beautiful rectangular building with four wings inclosing a quadrangle. At the west end of the island stands the Riddarhus (knight's house), containing portraits and armorial bearings of Swedish nobles. Noteworthy also are the opera house; the handsome Renaissance building of the National Museum, built in 1850-66, opposite the royal palace on the Blasieholm; and the large and imposing building of the Northern Museum, in the Djurgård.

Although Stockholm has no university, it has numerous establishments for higher technical and popular education and an excellent elementary school system. The Royal Library had in 1913, 400,000 volumes, 1,000,000 pamphlets, and 11,000 manuscripts. There are the National Museum, containing fine-art collections and a collection of Swedish antiquities; the Northern Museum (Nordiska Museet) for Scandinavian ethnology and archaeology; a museum of natural history; a biological museum showing groups of Scandinavian mammals in their natural surroundings; an astronomical observatory; and numerous scientific and literary associations, the principal of which are the Swedish Academy, the Academy of Sciences, and the Academy of Fine Arts, History, and Archaeology.

Stockholm is the largest industrial and commercial centre of Sweden. There are iron foundries and machine shops, breweries, sugar and cotton mills, and tobacco factories, and manufactures of furniture, soap, food products, and miscellaneous articles, while shipbuilding is also carried on. The city ranks first among Swedish

ports in the value of imports, and second in exports; the imports in 1910 amounted to \$179,102,000, and the exports to \$158,097,000. The chief exports are iron and timber. In 1910 the shipping at the port amounted to 2046 entries and clearings with a total of 999,810 tons, but in the number and tonnage of its home vessels the city is exceeded by Göteborg. The approaches to the harbor are intricate and rendered somewhat dangerous by rocky reefs, but the harbor itself is good, and provided with dry docks and extensive wharfage accessible for large ships. An ice breaker keeps the harbor open. The city in general is very progressive in the matter of public works. Pop., 1850, 93,000; 1890, 246,454; 1910, 342,323; 1913 (est.), 382,085; 1921, 419,429.

Stockholm was founded in 1250 by Birger Jarl, and was for centuries confined to the Stadsholm and Riddarholm, which were fortified. It was several times besieged and taken by Danish armies, and its wooden buildings were often destroyed by fire until they were supplanted by stone structures. In 1520 the city was the scene of the "Stockholm Blood Bath," when the Danish King Christian II, in order to strengthen his position in Sweden, had a large number of Swedish nobles decapitated on the Stortorg. Consult Wattenbach, *Stockholm, ein Blick auf Schwedens Hauptstadt* (Berlin, 1875), and Beyron Carlsson, *Hela Stockholm* (Stockholm, 1912).

**STOCKING FRAME.** See **KNITTING**.

**STOCKINGS.** See **HOSIERY**.

**STOCKPORT.** A manufacturing town in Cheshire, England, on the Mersey, at the junction with the Tame, 6½ miles southeast of Manchester (Map: England, D 3). Its prosperity is of modern date. The streets lie on the slopes of a narrow gorge, and are irregular and occasionally precipitous; to the south they rise in terraces above the river. The principal buildings are the courthouse, market hall, mechanics' institute, infirmary, and the institution for the blind, deaf, and dumb. The free grammar school was founded and endowed in 1487. The town possesses seven fine parks, the chief of which is Vernon Park, which contains a museum. Stockport owns an electric-lighting plant, street railways, sewage works, gas, water supply, and markets. It has extensive manufactures of cottons, woollens, silks, hats, machinery, brass and iron goods, shuttles, and brushes. Pop., 1901, 92,832; 1911, 108,693.

**STOCK-QUOTATION TELEGRAPH.** See **TELEGRAPHY**.

**STOCKS.** An apparatus of wood, formerly used for punishment. The culprit was placed on a bench, with ankles fastened in holes under a board, fixed, but removable later. The first use of stocks in England is uncertain, but in the second Statute of Laborers, 25 Edward III (1350), provision is made for applying them to unruly artificers. Sometimes a whipping post was combined. The use of stocks was general in the English colonies of North America—employed often as punishment for common scolds.

**STOCKS AND BONDS.** See **RAILWAYS**, *Railway Capitalization and Finance*.

**STOCKTON.** A city and the county seat of San Joaquin Co., Cal., 78 miles east by north of San Francisco; on an arm of the San Joaquin River, at the head of navigation, and on the Atchison, Topeka, and Santa Fe, the Southern Pacific, the Stockton Terminal and Eastern, the

Tidewater Southern, and the Western Pacific railroads (Map: California, D 4). The State Hospital for the Insane is here, and there are also a public library with over 70,000 volumes, the San Joaquin County Law Library, St. Mary's College, and St. Agnes Academy. The county courthouse, the high school, the post office, county jail, opera house, Masonic Temple, St. Joseph's Home, the County and the Dameron hospitals, and the mineral baths are noteworthy features. In addition to having large grain, live-stock, and fruit interests, Stockton is important industrially. Agricultural and mining machinery and implements, flour, foundry products, boxes, lumber, leather, beer, wine, canned goods, and soap constitute the leading manufactures. The commission form of government was adopted in 1911. Stockton was founded in 1847 by Charles M. Weber, the owner of a large Mexican grant, and was named in honor of Robert Field Stockton, of the United States navy, who took possession of California for the United States. In its early days it was the starting and outfitting point for miners bound for Calaveras, Tuolumne, and Mariposa counties. Pop., 1900, 17,506; 1910, 23,253; 1915, 34,508; 1920, 40,296. This does not include a considerable portion of the outlying territory which was incorporated in the city limits in 1914.

**STOCKTON, CHARLES G.** (1853- ). An American physician. He was born at Madison, O., and graduated M.D. from the University of Buffalo in 1878. Settling in Buffalo, he was professor of materia medica and therapeutics at Niagara University from 1883 to 1887, when he became professor of medicine at the University of Buffalo. He was a president of the Medical Society of the State of New York. His writings deal especially with diseases of the stomach.

**STOCKTON, CHARLES HERBERT** (1845-1924). An American naval officer, educator, and international law scholar. He was born in Philadelphia. In 1865 he graduated from the United States Naval Academy, and subsequently was promoted through the various grades to commander in 1892, captain in 1899, and rear admiral in 1906. He was a member of the Naval War College in 1891-94, and its president from 1898 to 1900. In 1901-03 he commanded the *Kentucky*, and in 1903-05 was naval attaché in London. He then served as president of the Board of Inspection and Survey in 1906, and of the Naval Examining and Retiring Boards in 1906-07. In the latter year, after commanding the Special Service squadron that visited Bordeaux, France, he was retired. In 1911 Stockton became president of George Washington University. He is author of the United States Naval War Code; *A Manual of International Law* (1911); *Outlines of International Law* (1914).

**STOCKTON, FRANCIS RICHARD** (1834-1902). A popular American writer of humorous tales, born in Philadelphia; generally known as Frank R. Stockton. In early life he was a wood engraver and designer. Meanwhile he busied himself also with literary and journalistic work. He was first employed on the *Philadelphia Morning Post*, and in 1872 gave up designing to join the New York *Hearth and Home*. Soon he joined the staff of the *Century Magazine* (then *Scribner's Monthly*) and in 1873 was made assistant editor of the newly founded magazine for children, the *St. Nicholas*, remaining here till about 1880. He was a prolific

writer. His books for children include: *Roundabout Rambles* (1872); *What Might Have Been Expected* (1874); *Tales Out of School* (1875); *A Jolly Fellowship* (1880); *The Floating Prince* (1881); *The Story of Viteau* (1884); and *Personally Conducted* (1889). Other books of his are: *Rudder Grange* (1879), which brought him into prominence; *The Lady or the Tiger?* (1884), perhaps his most popular story; *The Late Mrs. Null* (1886); *The Christmas Wreck* (1886); *The Casting Away of Mrs. Lecks and Mrs. Aleshine* (1886); *The Bee-Man of Orn* (1887); *The Hundredth Man* (1887); *The Dusanter* (1888); *Amos Kilbright* (1888); *Ardis Claverden* (1890); *The House of Martha* (1891); *The Squirrel Inn* (1891); *The Watchmaker's Wife* (1893); *The Girl at Cobhurst* (1898); *Afield and Afloat* (1900); and *The Captain's Toll-Gate*, with memoir by his wife (1903). A collected edition of his works, *Novels and Stories* (New York, 1899-1904), appeared in 23 volumes. Stockton's humor has a flavor all its own. His situations are whimsical and his characters often grotesque. There is little beneath the surface of his work, which is, however, genuinely ingenious and entertaining.

**STOCKTON, RICHARD** (1730-81). An American lawyer, and a signer of the Declaration of Independence. He was born near Princeton, N. J., graduated at the College of New Jersey (Princeton) in 1748, was admitted to the bar in 1754, visited England in 1766-67, where he made the acquaintance of many distinguished men, and in 1774 became a judge of New Jersey's Supreme Court. He at first advocated a reconciliation between the colonies and England, and in December, 1774, wrote to Lord Dartmouth, proposing a scheme of colonial self-government; but he soon began to take an active part in the opposition to the British Ministry and as a member of Congress in 1776 voted for and signed the Declaration of Independence. Consult John Sanderson, *Biography of the Signers to the Declaration of Independence* (new ed., Philadelphia, 1847).

**STOCKTON, ROBERT FIELD** (1795-1866). An American naval officer, grandson of Richard Stockton (q.v.). He was born at Princeton, N. J., studied there for a time and in 1811 became United States naval midshipman. He joined Commodore Rodgers on the frigate *President* in 1812, was for a time an aide to the Secretary of the Navy, took part in the defense of Baltimore, and was promoted to be lieutenant in September, 1814. In 1815 he distinguished himself in the Algerine War on the *Spitfire*. He returned home in command of the *Erie* in 1821, and in the fall of that year sailed in the *Alligator* for the African coast, where he negotiated successfully for the land upon which the American Colonization Society founded Liberia (q.v.). Early in the Mexican War he commanded the Pacific squadron. To his energy, and that of Frémont, with whom he cooperated, was due the success of the American operations on the coast. He captured Los Angeles and San Diego, organized a civil government for California, and installed Frémont as Governor, relinquishing the command to Shubrick in 1847. He resigned from the navy in 1850, and was a United States Senator from New Jersey (1851-53). Resigning in 1853, he became president of the Delaware and Raritan Canal Company. Consult *Life and Speeches of Robert Field Stockton* (Philadelphia, 1856).

**STOCKTON, SOUTH.** See THORNABY ON TEES.

**STOCKTON, THOMAS HEWLINGS** (1808-68). An American clergyman, born at Mt. Holley, N. J. He first studied medicine, but in 1829 entered the ministry of the Methodist Protestant church, which his father, W. H. Stockton, had helped to found. He was chaplain of the national House of Representatives from 1833 to 1835 and from 1859 to 1861, and in 1862 was chaplain of the Senate. From 1856 until his death he was pastor of the Church of the New Testament in Philadelphia. For some years he edited the *Christian World* and also the *Bible Times*. He was an ardent antislavery advocate and social reformer, and wrote on religious and other subjects. Consult Alexander H. Clark, *Memory's Tribute to the Life, Character, and Work of Rev. Thomas H. Stockton* (New York, 1869), and J. G. Wilson, *The Life, Character, and Death of Rev. Thomas H. Stockton* (Philadelphia, 1869). T. H. Stockton was a half-brother of Frank R. Stockton, the novelist.

**STOCKTON-ON-TEES.** A seaport in the County of Durham, England, 11 miles east-northeast of Darlington, on the left bank of the Tees (Map: England, E 2). The broad and handsome High Street is nearly a mile in length. A new town known as South Stockton has sprung up on the right bank of the river, the two being connected by an iron bridge of three arches, built in 1887. Shipbuilding, chiefly in iron, is carried on; and blast furnaces, foundries, engine works, extensive potteries, and iron works are in operation. Sailcloth, ropes, and linen are manufactured; and there are corn mills and spinning mills. At Stockton the Tees is navigable for vessels of large tonnage. The moated Norman castle, long an episcopal residence, was taken for the Parliament in 1644, and totally destroyed by the Roundheads in 1652. At the Restoration it had become so poor a place that it contained only 120 houses. Its growth and prosperity date from the development of the iron and steel industry. The Stockton and Darlington Railway, the first line to convey passengers as well as goods, was opened Sept. 27, 1825. Pop., 1901, 51,500; 1911, 52,154.

**STODDARD, CHARLES AUGUSTUS** (1833- ). An American Presbyterian clergyman, born in Boston. After graduating from Williams College in 1854, he studied at Edinburgh in the University and Free Church Seminary, and graduated from Union Seminary, New York, in 1859. He was pastor of the Washington Heights Presbyterian Church, New York City, from 1859 to 1883. In 1869 he became connected with the *New York Observer*, and in 1885 succeeded Samuel I. Prime as editor, retiring in 1902. His publications include: *Across Russia from the Baltic to the Danube* (1891); *Spanish Cities, with Glimpses of Gibraltar and Tangier* (1892); *Beyond the Rockies* (1894); *A Spring Journey in California* (1895); *Cruising among the Caribbees* (1895; 2d ed., 1903).

**STODDARD, CHARLES WARREN** (1843-1909). An American traveler and author, born at Rochester, N. Y. As a youth he was in business in San Francisco, Cal., and in 1864 visited the Hawaiian Islands, where he subsequently lived for long periods. He traveled much about the world from 1873 to 1878 as correspondent of the *San Francisco Chronicle*. In 1885 and 1886 he was professor of English at Notre Dame College, Ind., then spent some time in travel, and be-

came lecturer on English literature in the Catholic University at Washington, D. C. His books were chiefly poetry and sketches of travel, and include: *Poems* (1867); *South Sea Idylls* (1873); *Mashallah: A Flight into Egypt* (1880); *The Lepers of Mevra* (1885); *Troubled Heart* (1885); *Hawaiian Life; or Lazy Letters from Low Latitudes* (1894); *The Wonder Workers of Padua* (1896); *A Cruise Under the Crescent* (1898); *Over the Rocky Mountains to Alaska* (1899); *In the Footprints of the Padres* (1902); *Exits and Entrances* (1903); *The Island of Tranquil Delights* (1904). Consult G. W. James, "Appreciation of Charles Warren Stoddard," in *Apostrophe to a Skylark*, etc. (Los Angeles, 1909).

**STODDARD, JOHN L. (AWSON)** (1850- ). An American traveler and author, born at Brookline, Mass., graduated from Williams College in 1871, and later studied at Yale Divinity School. He traveled extensively and for nearly 20 years gave himself largely to lecturing in the United States on travel subjects. In 1897 he retired from the lecture platform. He published: *Red Letter Days Abroad* (1884); *Glimpses of the World* (1892); *Stoddard Lectures on Travel Abroad and in America* (15 vols., 1898-1909); *The Stoddard Library*, an anthology (12 vols., 1910); *Poems* (1913); *Poems on Lake Como* (1914).

**STODDARD, JOHN TAPPAN** (1852- ). An American chemist, born in Northampton, Mass. He graduated from Amherst in 1874 and took his Ph.D. at Göttingen in 1877. He became professor of physics and mathematics at Smith College in 1878, of physics and chemistry in 1881, and of chemistry in 1897. He published many papers on inorganic and electrochemistry, and the following books: *Outlines of Qualitative Analysis* (1883); *Lecture Notes on General Chemistry* (2 vols., 1884-85); *Quantitative Experiments in General Chemistry* (1908); *Introduction to General Chemistry* (1910); *Introduction to Organic Chemistry* (1914).

**STODDARD, RICHARD HENRY** (1825-1903). An American poet, critic, and journalist, born at Hingham, Mass. He was educated in the public schools of New York City, worked in an iron foundry, gained attention in 1849 by a privately printed volume of verse, *Footprints*, obtained a place in the Custom House (1853-70), and was confidential clerk to George B. McClellan (1870-73). During this period he was also a literary reviewer. Among his numerous publications are: *Songs of Summer* (1857); *The Children in the Wood*, verse (1865); *Abraham Lincoln*, a commemoration ode (1865); *Putnam the Brave* (1869); *The Lion's Cub and Other Poems* (1890); and *Under the Evening Lamp* (1892). A collected edition of his verses was issued in 1880. Stoddard also edited several anthologies, among them *Poets and Poetry of America* (1872) and *Female Poets of America* (1874). For many years he was a prominent figure in the literary life of New York. His wife, ELIZABETH (BARSTOW) (1823-1902), collaborated with him in editorial work and wrote three novels, *The Morgesons* (1862), *Two Men* (1865), and *Temple House* (1867). Her *Poems* were collected in 1895. Consult Stoddard's *Recollections Personal and Literary*, ed. by R. Hitchcock (New York, 1903).

**STODDARD, WILLIAM OSBORN** (1835-1925). An American author and journalist, born at Homer, N. Y., and educated at the University

of Rochester, where he graduated in 1858. After three years of farming and newspaper work in Illinois, where he edited the *Chicago Daily Ledger* and the *Central Illinois Gazette*, and three months' service as a volunteer at the outbreak of the Civil War, he acted from 1861 to 1864 as private secretary to President Lincoln and then engaged in literary work. His publications include: *The Heart of It* (1880); *Abraham Lincoln* (1884); *Lives of the Presidents* (10 vols., 1888-89); *The White House in War Time* (1890); *Table Talk of Lincoln* (1892); *The Swordmaker's Son* (1896); *With the Black Prince* (1898); *Lincoln at Work* (1899); *Jack Morgan* (1901); *The Boy Lincoln* (1905); *Two Cadets with Washington* (1906); *In the Open* (1908); *Dab Kinzer* (1909); *The Captain of the Cat's-Paw* (1914).

**STODDART, J. H.** (1827-1907). An actor, born in Yorkshire, England. He was the son of an actor and during his youth in Glasgow he often took juvenile parts with his father. He came to the United States in 1854 and became a member of Wallack's company. Afterward for a time he played with Laura Keane; then with Dion Boucicault; and subsequently for 20 years was under the management of A. M. Palmer. Among his most popular characters were Mr. Moneybags in *The Long Strike*, Colonel Preston in *Alabama*, the curate in *Saints and Sinners*, and later Lachlan Campbell in *The Bonnie Br. or Bush* (1901). He wrote *Recollections of a Player* (New York, 1902). Consult McKay and Wingate, *Famous American Actors of To-day* (New York, 1896).

**STODDERT, BENJAMIN** (1751-1813). An American soldier and cabinet officer. He was born in Charles Co., Md., joined the Continental army in 1776, became a captain in January, 1777, and was severely wounded at Brandywine in September, resigning his command in April, 1779. He then served as secretary of the Board of War until 1781, and from 1798 to 1801 was Secretary of the Navy, being the first to discharge the duties of this office.

**STOESSEL, shtēs'sel, ANATOLY MIKHAILOVITCH** (1848-1915). A Russian soldier, born in St. Petersburg. In 1904 he was placed in command of the Russian garrison at Port Arthur, was defeated by General Oku at Kinchow or Nan-shan, May 26-27, 1904, and surrendered Port Arthur to General Nogi on Jan. 2, 1905. (See RUSSO-JAPANESE WAR.) He was tried by court-martial in 1906 and sentenced to death. This sentence was commuted to ten years' imprisonment in 1908 and a year later he was pardoned and permitted to resign from the service. He died from paralysis.

**STOHMANN, shtō'mán, FRIEDRICH KARL ADOLF** (1832-97). A German agricultural chemist, born in Bremen, and educated at Göttingen and London. He was Graham's assistant at University College, London, from 1853 to 1855, and afterwards assisted Henneberg at Weende. In 1862 he started the agricultural experiment station at Brunswick. He was called to Halle in 1865 and in 1871 to Leipzig, where he was director of the agricultural physiological institute of the university. He wrote: *Handbuch der technischen Chemie* (1872 and 1874); *Biologische Studien* (1873); *Handbuch der Zuckerfabrikation* (1878; 4th ed., 1899); *Die Stärkefabrikation* (1878); *Die Milch- und Molkereiprodukte* (1898).

**STOICS** (Lat. *stoicus*, relating to a colonnade, stoic). The name of the school of ancient philosophers opposed to the Epicureans in their views of human life. The stoical system dates from the end of the fourth or beginning of the third century B.C.; it was derived from the system of the Cynics, whose founder, Antisthenes, was a disciple of Socrates. Indeed, the doctrines, but still more the manner of life, and most of all the death of Socrates, were the chief foundations of the stoical philosophy.

The founder of the system was Zeno (q.v.), who opened his school in a portico called the Stoa Poëile ("painted porch") at Athens, whence the origin of the name of the sect. Zeno had as disciple Cleanthes, from Assus, in the Troad (died c. 220 B.C.), whose Hymn to Zeus is the only fragment of any length that has come down to us from the early Stoics, and is a remarkable production, setting forth the unity of God, His omnipotence, and His moral government. Chrysippus, from Soli in Cilicia (c. 280-207 B.C.), followed Cleanthes, and both defended and modified the Stoical creed. He was regarded as a second founder of the school. Chrysippus was succeeded by Zeno of Tarsus and Diogenes of Babylon; then followed Antipater of Tarsus, who taught Panætius of Rhodes (died B.C. 112). Panætius introduced Stoicism to Rome, and also made such modification in the system that it is customary to regard Stoicism as entering with him upon a second period, characterized by "near approach to the Peripatetic and Platonic teaching" (Windelband). Among the most prominent Stoics of this period are to be mentioned Boëthius of Sidon and Posidonius of Apamea in Syria. The third period of Stoicism is the Roman period, represented by L. Annaeus Cornutus, L. Annaeus Seneca, Epictetus, and the Emperor Marcus Aurelius Antoninus.

Stoicism was mainly an ethical theory, but it had a logic and a physics as well. Under logic it included both dialectic and rhetoric. Dialectic was predominantly a theory of knowledge. The main question here was: How can we test truth? In answer to this question the Stoics worked out a sensationalistic epistemology. The soul is originally like a blank wax tablet. Things cause alterations or impressions on the soul, and those alterations or ideas which refer to particular things compel assent. These impressions are kept in memory, and, partly without and partly with conscious intention, concepts arise. These are entirely subjective. The highest value is attached to the involuntarily formed concepts, for these compel assent from all men (*consensus gentium*).

Physics included, for the Stoics, cosmology, psychology, and theology. All reality is corporeal, but falls into two classes, the active and the passive, which, however, are inseparable. The active principle is sometimes represented as fire, sometimes as spirit. The spirit fire is God, and is self-conscious. Out of it is developed air, water, earth, the whole universe of separate beings; hence all nature is rational. Every individual soul is a part of the universal world soul for a time individualized, but ultimately to be absorbed into the world soul again, at the time when all the differentiation of the universe is consumed in all-devouring fire. This process takes place by Fate, i.e., in accordance with irreversible laws, but is also purposeful, —that is, mechanism is conceived of as compatible with teleology. When one cycle of differ-

entiation and absorption is complete, another begins.

The Stoic ethics was the ethics of apathy. The soul or the divine principle in man should not allow itself to be carried away by the passions aroused in it by external things. A man must be self-controlled. The passions are due to false judgments and mental disturbances, hence they can be overcome by wisdom and by a refusal to yield to their dictation. A man is not, indeed, master of his fate but he can be master of himself. The Stoic formula was a life in accordance with nature, or as nature is all rational, to live in accordance with nature was to live in accordance with reason. Such a life is happy. Pleasure is an accessory, not an end, of a reasonable life. The Stoics took a very rigorous view of virtue, which they claimed admitted of no degree. One may be virtuous, but if he is not thoroughly so he is not so at all. Only very few men are virtuous: the vast majority are fools. The four cardinal virtues of the Stoic system are insight, courage, temperance, and justice, a classification which in essence does not depart from the Platonic. One very distinctive feature of Stoicism was its cosmopolitanism. Because all men are manifestations of the one universal Spirit, they should live in brotherly love and in readiness to help each other. Differences of rank and wealth are external, and should not interfere with social relations. Thus, long before Christianity Stoicism had recognized and lived up to the brotherhood of man.

**STOJOWSKI**, stô-yôf'ski, SIGISMUND (1870-

). A Polish-American pianist and composer, born at Strelzy. He began his musical studies with Zelenski in Cracow, and in 1890 went to Paris, where he studied piano under Diémer and Paderewski and composition under Dubois and Massenet. Having won an excellent reputation as a concert pianist on his tours of France, Belgium, Russia, and England, he was engaged, in 1906, as principal professor of pianoforte at the Institute of Musical Art in New York. In 1913 he resigned and accepted a similar position with the Von Ende School of Music. His tours of the United States were very successful, especially his series of historical recitals. His compositions include: a *Symphony in D minor*; a *Suite* for orchestra; three piano concertos; a violin concerto; a *Konzertstück* for cello and orchestra; a *Romanza* for violin and orchestra; several violin sonatas; a choral work with orchestra, *Der Frühling*; studies and pieces for piano.

**STOK**, stók, JOHANNES PAUL VAN DER (1851–). A Dutch meteorologist, born in Zuylen. He was director of the Royal Magnetic and Meteorological Observatory in Batavia from 1882 to 1889 and thereafter was director of the Royal Dutch Meteorological Institute at Bilt. He became a member of the International Polar Commission, and an officer of the Orange Nassau. He wrote on the seasons in the Dutch East Indies and on the climate of the North Sea and Dutch coast.

**STOKE-ON-TRENT**. A manufacturing town in Staffordshire, England, 15 miles north of Stafford (Map: England, D 4). The principal public buildings are the town hall, New Market hall, and Minton Memorial building. There are statues to Wedgwood, Minton, and Colin Minton Campbell. The town is the centre of the "Potteries" district, and owes its importance to porcelain and earthenware manufactures, carried on in about 300 factories. It has manufactures of iron, engines, machinery, and bricks, and in the vicinity are numerous coal and iron mines. The town of Stoke-upon-Trent was incorporated in 1874, in 1910 it amalgamated with Burslem, Fenton, Hanley, Longton, and Tunstall and its name was changed to Stoke-on-Trent. Pop., 1901, 30,450; 1911, 234,553.

**STOKER**, AUTOMATIC MECHANICAL. A mechanical appliance driven by power, for supplying fuel to a furnace, and for cleansing the fire and grates from ash and clinker. The fuel is usually supplied to the furnace mouth by gravity. Here it is received and mechanically spread over the surface of the stationary fire on fixed grates; or it is delivered in a layer of uniform and controlled thickness on the first grate bar of an endless chain of such bars which lie across the furnace from side to side. These bars are mechanically propelled or travel from the front of the furnace towards the rear, and are close enough together so as to leave no vertical interstices through which fuel can drop unconsumed. The travel of the bars and the thickness of the fuel on each are so adjusted that combustion shall be completed just before the bar and its load reach the back of the furnace. The ash and incombustible matter remaining on the bar are dumped off the bar as it turns around the supporting drum of the endless chain (or traveling grate) at the back. For softer and caking coals, the grate-bars are a series or flight of steps, and each bar tilts its contents at intervals to a next lower step, the last or lowest one carrying only ash and incombustible residue. The air passes in between the steps in the spaces which separate them. In a third form, the fuel is fed by a screw or a piston element working in a steel tube below the centre of grate level, and forcing the fuel upwards so that it is continually rolling down the slope from the high centre to the lower sides.

The mechanical stoker feeds fuel uniformly and constantly, with no opening of fire doors with attendant cooling and stresses upon plates and tubes of the boiler. Their use therefore will diminish or eliminate smoke from chimneys. They can handle more fuel than men can in a given time, or in a limit or space where enough men could not be gotten together for the necessary work. In heavy firing of great locomotives carrying trains over long divisions of track, the service of mechanical stokers is a great boon.

The firing of liquid fuel or gas supplied under pressure is mechanical stoking, but the term is

usually restricted to the mechanical supply of solid fuel. If the speed of the engine driving the grate and regulating the supply of air is interconnected to the steam pressure, so that a rise of pressure lowers the rate of combustion and of fuel supply, and a fall of pressure speeds up both fuel and air supply, the stoker becomes an automatic mechanical stoker. Mechanical and automatic stokers are rarely supplied in installations of less than 1000 horse power on account of the expense of installation.

**STOKES**, stöks, ANSON PHELPS (1838–1913). An American banker and reformer, father of J. G. Phelps Stokes. He was born in New York City. He became a partner in Phelps, Dodge and Company, merchants, and later in Phelps, Stokes and Company, bankers, and was connected with many other important financial interests. Stokes was the first president of the Reform Club of New York City, vice president for a time of the Civil Service Reform Association, and president in 1900 of the National Association of Anti-Imperialists Clubs. He did much to better social conditions and gave large sums to charity, and was prominent in the movement for tariff reform in the direction of free trade. He was author of *Joint-Metallism* (1894; 5th ed., 1896); *Cruising in the West Indies* (1902; 2d ed., 1903); *Cruising in the Caribbean with a Camera* (1903).

**STOKES**, FREDERICK ABBOT (1857–). An American publisher, born in Brooklyn, N. Y., and educated at Yale University, where he graduated in 1879. In 1881 he founded the publishing house of White and Stokes, which became successively White, Stokes, and Allen (1883), Frederick A. Stokes (1887), Frederick A. Stokes and Brother (1888), and the Frederick A. Stokes Company (1890), of which he became president. He served as president of the American Publishers' Association in 1912–14, and as president of the MacDowell Club from 1913. A book, *College Tramps*, came from his pen in 1880. He also edited *The Poems of Sir John Suckling* (1886) and from 1898 to 1901 was editor of the *Pocket Magazine*.

**STOKES**, SIR GEORGE GABRIEL (1819–1903). A British mathematician and physicist, born in Skreen, County Sligo, Ireland. He was educated at Cambridge, became fellow of Pembroke College in 1841, and was elected in 1849 to fill the Lucasian chair of mathematics at Cambridge. His jubilee celebration in 1899 was attended by many European and American scientists. From 1887 to 1892 he represented the university in Parliament and in 1902 was elected master of Pembroke. In 1885 he became president of the Royal Society, of which he had been secretary for 30 years. He was created a baronet in 1889. Stokes was the first to explain in his lectures the scientific principles on which spectrum analysis depends, while to him is due also the first thorough study and explanation of the phenomena of fluorescence, in his paper *On the Change of the Refrangibility of Light* (*Philosophical Transactions* for 1852–53), for which he received the Rumford medal. He greatly extended and improved the application of mathematics to physico-mathematical treatment of questions connected with the distortion of elastic solids, the motion of waves in water, and undulatory theory of light, the summation of series, the internal friction of fluids, and other subjects in hydrodynamics, etc. He also discussed the variation of gravity over the sur-

face of the earth and wrote an important paper on the nature of Röntgen rays. For his work in optics Stokes stood preëminent among the scientists of the nineteenth century, and he did much to mold current thought and theory in this field. His works include: *On Light* (1887), Burnett lectures; *Natural Theology* (1891), Gifford lectures; *Memoirs Presented to the Cambridge Philosophical Society* (1900); and *Mathematical and Physical Papers* (5 vols., 1880-1905), vol. v containing an obituary notice by Lord Rayleigh. In 1907 appeared (2 vols.) *Memoir and Scientific Correspondence of the Late Sir George Gabriel Stokes*, edited by Sir Joseph Larmor. Consult also biographical sketch by E. W. Brown, in Smithsonian Institution, *Annual Report, 1904* (Washington, 1905).

**STOKES, GEORGE THOMAS** (1843-98). An Irish divine and author, born in Athlone, Westmeath, Ireland. He was educated at Queen's College, Galway, and Trinity College, Dublin, and was vicar at Newtown Park, County Dublin, from 1869 until his death. In 1883 he was called to the chair of ecclesiastical history in Dublin University, and in 1893 he was elected prebend and canon of St. Andrew by the chapter of St. Patrick's Cathedral, Dublin. Among his publications are: *Ireland and the Celtic Church* (1886); *Sketch of Mediæval History* (1887); *Ireland and the Anglo-Norman Church* (1889); *Bishop Pocock's Tour around Ireland in 1752* (1891); *The Acts of the Apostles* (1891); *Greek in Gaul and Western Europe down to A.D. 700* (1892); and, with H. C. G. Wright, *The Writings of St. Patrick*, an annotated translation (1887).

**STOKES, HENRY NEWLIN** (1859- ). An American chemist. He was born at Moorestown, N. J., and was educated at Haverford College and at Johns Hopkins, Munich, and Zurich. In 1889-92 he was an assistant chemist in the United States Geological Survey, to which he returned after a year as assistant professor in the University of Chicago. He was associate chemist in the Bureau of Standards from 1903 to 1909. His researches include studies in inorganic chemistry, especially on phosphimic and metaphosphimic acids and the compounds of silicon.

**STOKES, JAMES GRAHAM PHELPS** (1872- ). An American Socialist and social worker, earlier known as a capitalist. He was born in New York City, a son of Anson Phelps Stokes (q.v.), and graduated from the Sheffield Scientific School, Yale (1892), and from the College of Physicians and Surgeons, New York (1896), and then took up graduate work in political science at Columbia. He rapidly rose to high office and responsibility in many of the corporations in which his family was interested. He became deeply interested in the problems of the poor and identified himself with various charitable organizations. Although a capitalist, he began to criticize the capitalistic system severely as unsocial. After 1906 he was an active member of the Socialist party. In 1904 he ran for the presidency of the Board of Aldermen of New York City and in 1908 for the New York Assembly. He published many articles in defense of his party and in support of social work.

His wife, **ROSE PASTOR STOKES** (1879- ), was born at Augustava, Suwalk, Russia, and in 1883-90 lived in London, where she attended the Jewish Free School in 1887-89. She came

to the United States in 1890 was a cigar maker at Cleveland, Ohio, from 1890 to 1903, and then for two years served as assistant editor of the *New York Jewish Daily News*. After her marriage to Mr. Stokes in 1905 she became identified with Socialist propaganda.

**STOKES, WHITLEY** (1830-1909). A British Celtic scholar and authority on Anglo-Indian law. He was born in Dublin, a son of William Stokes (q.v.), was educated at Trinity College, Dublin (1847-51), and became a barrister of the Inner Temple in 1855. In 1862 he went to India, where he occupied various legal positions under the government. He drafted the Anglo-Indian codes (4 vols., 1887-91) and did other important legal work, but became best known for his contributions to Celtic scholarship, a branch of research which he took up before he went to India, and continued during his sojourn there. The greater part of his work deals with early Irish, but his studies included the other Celtic languages, such as Cornish and Breton. It is probable that his researches have done more than those of any other scholar to make accessible the literary and historical monuments of the ancient Irish language. His writings are intended mainly for scholars, but some of his translations deserve mention for their literary worth. Conspicuously good are his renderings of the "Death of the Sons of Usnach" (*Irish Texts*, vol. ii) and of the "Bruden Da Derga" (*Revue celtique*, vol. xxii). His principal publications are: *Irish Glosses* (1859); *Three Irish Glossaries* (1862); *The Passion, a Middle-Cornish Poem* (1862); *The Creation of the World: A Cornish Mystery* (1864); *Goidelica* (2d ed., 1872); *The Life of St. Meriasek* (1872); *Middle-Breton Hours* (1876); *The Calendar of Angus* (1880); *The Tripartite Life of Saint Patrick* (2 vols., 1887); *Lives of Saints from the Book of Lismore* (1890); *Urkeltischer Sprachschatz* (1894), with Bezzenberger; *The Martyrology of O'Gorman* (1895); *Thesaurus palæohibernicus* (2 vols., 1901-03), with John Strachan; and, in collaboration with E. Windisch, the *Irish Texts* (5 vols., 1880-1909), the last volume of which contains a posthumous work, being an edition of the Irish prose version of Lucan's *Pharsalia*, known as *Cath Catharda*.

**STOKES, WILLIAM** (1804-78). A British physician, born in Dublin and educated there and in Edinburgh (M.D., 1825). In 1845 he succeeded his father, Whitley Stokes (1763-1845), as Regius Professor of Medicine at Dublin University. In 1861 he was appointed physician-in-ordinary to the Queen in Ireland. Six years later he was elected president of the British Medical Association and in 1874 president of the Royal Irish Academy. Stokes was one of the most distinguished British physicians of the nineteenth century, being not only a great practitioner and diagnostician, but also a teacher, writer, and observer of diseases and their symptoms. He introduced auscultation into England in 1825—*An Introduction to the Use of the Stethoscope*; wrote on typhus fever and cholera, ravaging epidemics of which he observed respectively in 1826-27 and 1832. But he is best known through his report on the so-called "Stokes-Adams disease," which appeared in 1846 in the *Dublin Journal of Medical Science* (see **HEART, DISEASES OF THE, Heart Block; CHEYNE-STOKES RESPIRATION**). Stokes was an au-

thority on diseases of the heart and lungs. His best-known works are: *A Treatise on the Diagnosis and Treatment of Diseases of the Chest* (1837); *Lectures on the Theory and Practice of Physic* (1838); *The Diseases of the Heart and Aorta* (1854); *Lectures on Fevers* (1854), edited by John William Moore, all of which have seen many editions and have been translated into German, French, and other languages. In 1834 Stokes became editor of the *Dublin Journal of Medical Science*. He was the father of the Celtic scholar Whitley Stokes (q.v.)

**STOKES, SIR WILLIAM** (1839-1900). A British surgeon. The son of William Stokes (q.v.), he was born in Dublin, studied medicine there (M.D., 1863) and at Berlin, London, Paris, and Vienna, and in 1871 became professor of surgery at the Royal College of Surgeons of Ireland. Of this institution he served as president in 1886-87. In 1886 he was knighted and in 1892 was appointed surgeon in ordinary to the Queen in Ireland. In 1900 he went to South Africa as consulting surgeon to the British forces in the war against the Boers. While there he was attacked with pleurisy, and he died in Pietermaritzburg. He wrote, among other works, *Contributions to Practical Surgery* (1865 et seq.) and *Selected Papers on Operative and Clinical Surgery* (1902), edited by William Taylor.

**STOKES-ADAMS DISEASE** or **SYNDROME**. See **HEART, DISEASES OF THE, Heart Block**.

**STOKE-UPON-TRENT**. See **STOKE-ON-TRENT**.

**STOKOWSKI**, stô-kôf'ski, LEOPOLD (1882- ). An American orchestral conductor, born of Polish parentage in London. After graduating from Queen's College, Oxford, he entered the Paris Conservatoire. In 1905 he came to New York, where for three years he occupied the position of organist and choirmaster at St. Bartholomew's. In 1908 he conducted a series of concerts in London, and returned the following year to the United States as conductor of the Cincinnati Symphony Orchestra. He succeeded Carl Pohlig in the conductorship of the Philadelphia Symphony Orchestra in 1912. Among many novelties which he introduced in the United States his first performance of Mahler's Eighth Symphony, in 1916, with a body of 1000 instrumentalists and singers, was especially noteworthy. In 1911 he married the pianist Olga Samaroff (q.v.).

**STOLBERG**, shôl'bërk, CHRISTIAN, COUNT (1748-1821). A German poet, born at Hamburg, of an ancient family, originally from Thuringia. He studied at Göttingen (1769-74), where he and his brother Friedrich joined the literary Hainbund, for 23 years was in the public service, and lived after 1800 on his estate near Eckernförde, Schleswig. He translated Sophocles (1787), and wrote several volumes of poems (*Gedichte*, 1779, 1782, 1787, 1810) noteworthy for their pictures of family life. All of his poetic works appeared with those of his brother in *Werke der Brüder Stolberg* (20 vols., Hamburg, 1820-25).

**STOLBERG, FRIEDRICH LEOPOLD, COUNT** (1750-1819). A German poet and translator, brother of Christian. He was born at Bramstedt, Holstein, studied at Halle and Göttingen, and from 1777 to 1780 was Ambassador of the Prince-Bishop of Lübeck at Copenhagen. He

became Ambassador of the Danish court at Berlin in 1789, and filled other official positions until in 1800, with his whole family, he became a convert to Roman Catholicism. During his later years he lived in comparative retirement, devoted mainly to literary work ranging from verse to translations of Greek authors, prose romance, travels, and a fifteen-volume history of Christianity (1807-18). Consult biographical studies by T. Menge (Gotha, 1862), J. H. Hennes (Frankfort, 1876; Mainz, 1875), and J. Janssen (3d ed., Freiburg, 1900).

**STOLE** (Lat. *stola*, long robe). A narrow band of silk worn over the shoulders by the clergy of the Roman Catholic and Anglican communions. See **COSTUME, ECCLESIASTICAL**, and **Plate**.

**STOLEN GOODS**. In law, chattels which have been the subject of larceny and have not been restored to the possession of their owner. Inasmuch as the larceny does not divest the owner of his property in the stolen goods, a buyer cannot acquire title to them even if the purchase be made in good faith. In England, however, this rule does not apply if stolen goods were bought in market overt (q.v.), and the owner had not prosecuted the thief, in which case the bona fide purchaser acquires valid title. In the United States there are no markets overt, and any person buying stolen goods acquires no better title to them than the thief has. That is, the owner has a right to take them wherever he may find them. This rule is subject to the qualification that current money and negotiable papers payable to bearer or indorsed in blank may pass to and become the absolute property of a bona fide purchaser even if they have been stolen from their lawful owner. See **NEGOTIABLE INSTRUMENTS**.

Where goods are stolen by means of false pretenses, an innocent purchaser from the thief acquires good title, since the former owner actually intended to transfer the property to the wrongdoer. Thus to constitute the crime of receiving stolen goods, the goods must have been stolen and not acquired by embezzlement or false pretenses. The receiver must either know that they have been stolen or have reasonable grounds for believing that they have been unlawfully taken from their owner. The crime becomes complete when the receiver takes them into his possession or they are taken for him with his knowledge by a servant or agents. If the goods after being stolen come back into the possession of the owner or are delivered to the receiver by the owner's authority, they cease to be stolen goods.

In England it early became the law that if goods were stolen in one county and carried into another by the thief, he was deemed to have committed larceny in both counties, and could be indicted and placed on trial in either. As the offense, wherever committed, was an offense against the same sovereignty, this rule as to larceny amounted simply to a convenient method of determining the place of trial. The English courts refused to apply the rule where goods were stolen in a foreign country and brought to England. Courts in many of the United States have somewhat illogically applied this rule to the several States, holding that if goods are stolen in a sister State and then brought within the State larceny is committed in both States, notwithstanding the fact that the original offense was committed against an

independent sovereignty so far as the administration of the criminal law is concerned, and that the having in possession of stolen goods is a very different offense from the larceny of the goods. (See LARCENY.) The crime of receiving stolen goods is now generally defined by statute and the punishment imposed varies in the different States. In most States the offense is deemed a felony. See CRIME; JURISDICTION; RECEIVING STOLEN GOODS.

**STOLO**, GAIUS LICINIUS. See LICINIUS STOLO, GAIUS.

**STOLP**, štölöp. A town in the Province of Pomerania, Prussia, on the Stolpe, 12 miles from the Baltic Sea, and 65 miles west by north of Danzig (Map: Germany, G 1). The fourteenth-century Marienkirche, with its lofty tower, is worthy of note. Its most important industries are amber turning and carving, and linen weaving. Machinery, furniture, leather, and cigars are also manufactured. Stolp was a member of the Hanseatic League, and belonged to the dukes of Pomerania until 1637, when it passed to Brandenburg. Pop., 1900, 27,272; 1910, 33,762.

**STOLYPIN**, štöl-yé'pén, PETER ARKADIEVITCH (1862-1911). A Russian statesman. He studied law at the University of St. Petersburg, and in 1885 entered the Department of Public Domains, transferring later to the Interior Department. In 1889 he settled in the Government of Kovno, where he rose to be president of the provincial court and marshal of the nobility. In 1902 he was made Governor of Grodno and in the following year Governor of Saratov. In May, 1906, he became Minister of the Interior under Goremykin, the first constitutional Premier, and on July 22, after the dissolution of the first Russian Duma, succeeded Goremykin. He initiated a policy of "liberal pacification," in accordance with which the greater part of the Empire was placed under military law. On August 25 a bomb was exploded in his residence, killing a large number of persons but leaving the Premier unharmed. He did meet a violent death, however, in 1911, when he was assassinated. See RUSSIA, History.

**STOLZ**, shtölts, FRIEDRICH (1850- ). An Austrian classical scholar, born at Hall, Tirol, and educated at Innsbruck and Leipzig. He became docent at the University of Innsbruck in 1879, and was appointed associate professor in 1887 and professor in 1890. Besides his great work, the first volume of the *Historische Grammatik der lateinischen Sprache* (1894-95), he wrote *Zusammengesetzte Nomina in den homerischen und hesiodischen Gedichten* (1874); *Die lateinische Nominalkomposition* (1877); *Studien zur lateinischen Verbalflexion* (1882); *Lateinische Laut- und Formenlehre* (in Müller's *Handbuch*, 4th ed., 1910); *Homeri Odyssea Eptome* (1893); *Entwicklung der indogermanischen Sprachwissenschaft* (1899); an ethnographical study, *Die Urbevölkerung von Tirol* (2d ed., 1892); *Geschichte der lateinischen Sprache* (1910).

**STOMACH**, stüm'ak (Lat. *stomachus*, from Gk. *στόμαχος*, throat, stomach, from *στόμα*, *stoma*, mouth). The principal organ of digestion, receiving the food through the esophagus, and, after certain digestive changes have taken place, emptying it into the intestines, where the process is completed. The stomach is irregularly conical, curving somewhat upon itself so that the lower curvature is much greater than the

upper curvature. The size varies according to the amount of food received, but when empty the walls are in apposition. It lies in the left hypochondriac and epigastric regions, behind and partly protected by the ribs and in close relation with the left lobe of the liver and the diaphragm. The stomach has an external peritoneal coat, a muscular coat consisting of longitudinal, circular, and oblique fibres, a submucous or areolar layer, and a lining mucous membrane. In this mucous membrane are the so-called pyloric and peptic glands, which secrete the gastric juice. The main blood supply is through the gastric artery, and the nerve supply is derived from the pneumogastric nerves and the sympathetic system. See ALIMENTARY SYSTEM; DIGESTION; FOOD; GASTRITIS.

**STOMACH, DISEASES OF THE.** The organic diseases of the stomach with constant lesions include gastritis (q.v.), ulcer, erosions, and cancer. The functional diseases, with variable lesions, include hyperchlorhydria, gastrosuccorrhæa, achylia gastrica, and isochymia.

Ulcer of the stomach is usually characterized by a deep circumscribed loss of substance of the mucous membrane lining the stomach, the wound refusing to heal, and occasioning pain after taking food, vomiting, and hemorrhage. It is twice as frequent in females as in males, and occurs most generally during middle life. Ulcers generally occupy the posterior surface, the lesser curvature, and the pyloric sac. When they heal they leave behind scars with contractile tendency. When they do not heal, corrosion of neighboring blood vessels may ensue, with hemorrhages, possibly fatal; or there may arise adhesions to neighboring organs, or perforations. The symptoms named increase in severity till death occurs from perforation, hemorrhage, or starvation; or, they gradually disappear and the patient recovers. The prognosis is good if the condition is recognized early. Modern surgery has materially reduced the mortality. The treatment of ulcer calls for absolute rest in bed, a period of fluid, but nourishing diet, followed by a "soft" diet of nonirritating and easily digested food. Rectal feeding may be tried for a short time, but the amount of nourishment absorbed by this means is practically negligible. The stools should always be examined for occult blood, and if this is found repeatedly, surgical measures are indicated. The ulcer may be simply excised, or, better, an anastomosis between the stomach and intestine—gastrojejunostomy—may be performed.

Erosions of the stomach consist really of small, superficial ulcers of the mucous lining. They occur commonly in chronic gastritis. The patient may suffer from erosions for many years. The treatment consists of the use of silver nitrate, intragastric galvanization, diet, general hygiene, and out-of-door exercise.

Cancer of the stomach is very common and is apparently on the increase. In the United States registration area, during the decade from 1904 to 1913, there was an increase of 19 per cent in the mortality from cancer of the stomach and liver, as against a general increase in the cancer mortality of 12.5 per cent. Gastric cancer occurs more frequently at the age of 50; it is rare before 30. It is more frequent in men than women. The tendency to cancer is possibly hereditary and the most constant factor in its production is ulcer of the stomach. The new growth may be an epithelioma, a medullary

carcinoma, a scirrhous, or a colloid carcinoma. See TUMOR.

The general symptoms of cancer of the stomach (appearing after a more or less indefinite period of indigestion) are pain, loss of appetite, vomiting, hemorrhage, tumor, constipation, a decided cachexia, and a moderate leucocytosis. Examination of the stomach contents after a test meal reveals decrease of the free hydrochloric acid as well as of the total acidity, and the presence of lactic acid. The prognosis is hopeless for cure. If the disease be of slow progress and diagnosed early the patient may gain relief enough from surgical interference to live several years. The medical treatment is purely symptomatic. The diet should be at once nutritious and easily digested.

Of the functional diseases, hyperchlorhydria is a condition in which the gastric juice possesses more acidity and ferments than it should. A test of the stomach contents decides the diagnosis, and the condition is met by hygiene, diet, alkalies, bromides, and in some cases opiates and electricity.

Gastrosuccorrhœa is a periodical and continuous production of the normal gastric juice, causing vomiting and intense pain, restlessness, nausea, and a feeling of pressure in the epigastrium. The treatment of this rare affection is almost exclusively dietetic and hygienic. The most useful drug is atropine; galvanization and lavage have also been employed.

Achylia gastrica is a condition in which there is a constant absence of gastric juice, accompanied by atrophy of the stomach, and following severe catarrhal disease of that organ. The gastric contents decide the diagnosis. Lavage, faradization of the stomach, and attention to diet constitute the treatment. Diet must be soft or fluid and adapted to intestinal digestion, since the small intestine acts vicariously for the stomach.

Isochymia is a distressing condition in which food is always found in the stomach, even when fasting. The stomach is dilated and the mechanical insufficiency of the organ is so great as to fail of emptying the chyme into the intestines. Paresis of the gastric muscular coat or contraction of the pylorus is the cause of this condition. See CARDIALGIA; INDIGESTION; SARCINA. Consult C. G. Stockton, *Diseases of the Stomach* (New York, 1914), and H. J. Paterson, *Surgery of the Stomach* (ib., 1914).

**STOMACH, RUPTURE OF.** See HORSE.

**STOMACH PUMP.** An instrument used to remove poisons from the stomach, to feed persons who cannot swallow or who attempt to starve themselves, or to wash out the stomach during disease. It is a flexible rubber tube, inserted into the stomach through the œsophagus, by which fluid is injected and removed. See LAVAGE.

**STOMACH STAGGERS.** See HORSE.

**STOMATA** (Neo-Lat. nom. pl., from Gk. *στόμα*, *stoma*, mouth). The so-called breathing pores especially numerous in foliage leaves and developed in any epidermis overlying green tissue. Each stoma consists of two crescentic guard cells whose concave surfaces face one another, leaving a slit which is opened or closed as required by the plant, hence the name "automatic gateway." See AÉRATION; LEAF.

**STOMATITIS** (Neo-Lat., from Gk. *στόμα*, *stoma*, mouth + *-itis*). An inflammation of the mucous membrane lining the mouth, assuming

many forms and occurring in various degrees of severity. For a detailed description of the clinical varieties of stomatitis with their pathology and treatment, see MOUTH, DISEASES OF THE.

**STOMATOLOGY.** See DENTISTRY.

**STOMATOPODA, or STOMAPODA.** See CRUSTACEA; MANTIS SHRIMP.

**STONE.** See BUILDING STONE.

**STONE.** A British unit of weight equivalent to 14 pounds. See WEIGHTS AND MEASURES.

**STONE.** See CALCULUS.

**STONE, AMASA** (1818-83). An American railroad builder and philanthropist. He was born at Charlton, Mass., and early engaged in the building of railroads and bridges, being made superintendent of the New Haven, Hartford, and Springfield Railroad in 1845. He was one of the contractors for building the Cleveland, Columbus, and Cincinnati and the Cleveland and Erie railroads, and during the Civil War he was often an adviser of the government in matters of transportation of men and material. Stone gave \$600,000 to Adelbert College of the Western Reserve University at Hudson, on condition of its removal to Cleveland, and also made many charitable benefactions in the city of Cleveland. Consult *Amasa Stone, a Memorial* (New York, 1883).

**STONE, ARTIFICIAL.** The name given to various artificial compositions of which the basis is hydraulic cement or plaster of Paris, which are plastic when first made and by hardening assume a stonelike hardness and consistency. Some of these compositions possess undeniable merit for certain kinds of work and are considerably used. Among the older well-known stones of this type was the Béton-Coignet, Portland stone, McMurtrie stone, Ransome stone, and Sorel stone. Béton-Coignet was invented by Coignet, a Frenchman, and as made by him was composed of Portland cement, siliceous hydraulic cement, and clean sand very thoroughly mixed with a small amount of cold water. This plastic mixture is then placed in molds to harden for use. Portland stone is a mixture of Portland cement and sand or sand and gravel wet to make a plastic mixture and rammed into molds to harden. Under various trade names Portland stone has been used in the United States. McMurtrie stone is formed by adding alum and potash soap to the mixture for Portland stone. Ransome stone is made by mixing sand and silicate of soda, molding the mixture into blocks or slabs, and setting them to harden under pressure in a hot solution of chloride of calcium. Sorel stone is a French product, and is made by adding to oxide of magnesium a solution of chloride of magnesium; it is, in other words, an oxychloride type of cement. Artificial sandstone, Caen stone, and artificial marble, made of plaster of Paris or its derivatives, are the most widely used stones of this class in the United States. Consult H. H. Rice, *Concrete-Block Manufacture* (New York, 1906); I. O. Baker, *Treatise on Masonry Construction* (10th ed., ib., 1909). See CONCRETE; PAVEMENT.

**STONE, CHARLES POMEROY** (1825-87). An American soldier, born at Greenfield, Mass. He graduated at West Point in 1845, entered the ordnance department, and served under General Scott during the Mexican War. On the outbreak of the Civil War he organized the District of Columbia Volunteers, and in May, 1861, was made brigadier general. He was in several

actions during June and July, 1861, took part in General Patterson's operations in the Shenandoah valley, and commanded at the disastrous affair at Ball's Bluff (q.v.). Though charges were never preferred, he was confined for six months in military prisons. In 1862 he was released, and in May, 1863, was assigned to the Department of the Gulf. He served at Port Hudson in 1863, and then for nearly a year was chief of staff to Major General Banks. On Aug. 21, 1864, he was given command of a brigade before Petersburg, and on Sept. 13, 1864, resigned his commission. In 1870 he entered the service of the Khedive of Egypt as chief of staff and with the rank of brigadier general, was later general aid-de-camp to the Khedive. In 1883 he returned to the United States.

**STONE, DARWELL** (1859- ). An English clergyman and author. Educated at Merton College, Oxford, he was vice principal and then principal of Dorchester Missionary College between 1885 and 1903; was Pusey librarian (1903-09); and in the latter year became principal of Pusey House, Oxford. In 1912-14 he served as examiner in the Theological Honour School, Oxford University. His publications include: *Outlines of Christian Dogma* (1900); *The Church, its Ministry and Authority* (1902); *The Invocation of Saints* (1903); *An Appeal to Facts and Principles* (1903), with Canon Newbolt; *The Discipline of Faith* (1904); *A History of the Doctrine of the Holy Eucharist* (1909); *Episcopacy and Valid Orders* (1910); *Divorce and Remarriage* (1913); *The Authority of the Church* (1914).

**STONE, EDWARD JAMES** (1831-97). An English astronomer, born in London. He was educated at Queens' College, Cambridge, and in 1859 was elected fellow of the college. In 1860 he became chief assistant at the Royal Observatory at Greenwich. From 1866 to 1870 he was secretary of the Royal Astronomical Society, and president from 1882 to 1884; he was awarded the gold medal of the society in 1869. In 1870 he was appointed her Majesty's astronomer at the Cape of Good Hope, and in 1879 Radcliffe observer at Oxford, which position he retained till his death. From observations made in 1862 Stone deduced a value of the solar parallax, which fixed the solar distance as slightly over 91,000,000 miles. The reversal of the Fraunhofer spectrum, a confirmation of Young's spectroscopic discovery of the reversing layer of the sun, was observed by him during the solar eclipse at Klipfontein in 1874.

While at the Cape Observatory he prepared a catalogue of 12,441 stars (1880), containing all stars down to the seventh magnitude between the South pole and 25° S. declination, for which he was awarded the Lalande prize of the French Academy in 1881. This survey of the southern heavens was completed in the *Radcliffe Catalogue* for 1890, in which he gives the places of 6424 stars to the seventh magnitude between the equator and 25° S. declination. Consult Royal Society, *Catalogue of Scientific Papers* (London, 1867-1902).

**STONE, ELLEN MARIA** (1846- ). An American missionary teacher, born at Roxbury, Mass. She taught school at Chelsea, Mass., in 1866-67, and was a staff member of the Boston *Congregationalist* in 1867-78. In the latter year she became a Congregational missionary at Samokov, Bulgaria, later was sta-

tioned at Philippopolis, and in 1898 removed to Salonica, Macedonia. In 1901 Miss Stone and Madame Tsilka, the wife of an Albanian Protestant preacher, were kidnapped by brigands on a mountain road between Bansko and Djumia, Macedonia, in European Turkey. The brigands demanded a ransom of \$110,000, and a sum of nearly \$65,000 was finally raised by subscription in the United States and paid. The captives were then released after nearly six months of captivity. Miss Stone published the story of her captivity in *McClure's Magazine* in 1902. Subsequently she lectured and contributed articles on foreign missions, and raised money for missions in Bulgaria, Macedonia, and Albania.

**STONE, GEORGE** (1708-64). An English archbishop, born in London. He was educated at Christ Church, Oxford; in 1733 was appointed dean of Ferns; and in the following year was transferred to the deanery of Derry. He served as Bishop of Ferns (1740-43), of Kildare (1743-45), and of Derry (1745-47), and thenceforth as Archbishop of Armagh. Active in politics, he was a rival of Boyle (afterward Earl of Shannon), and supported the claim of the crown to the surplus revenues in 1749-53. He was excluded from participation in the government in 1756, but after 1758 shared control of Irish affairs as lord justice along with Shannon and John Ponsonby.

**STONE, HARLAN FISKE** (1872- ). An American legal scholar and educator, born at Chesterfield, N. H. He graduated at Amherst College in 1894, and at Columbia Law School in 1898. Admitted to the bar, he became a member of the firm of Satterlee, Canfield, and Stone, and also gained interests in certain corporations. From 1898 to 1902 he was lecturer in law at Columbia, from 1902 to 1905 he was professor of law, and in 1910 he became dean of the law school of the university. He contributed to law journals and published *Law and its Administration* (1915), Hewitt lectures at Cooper Union.

**STONE, JOHN TIMOTHY** (1868- ). An American Presbyterian clergyman. He was born in Boston and graduated at Amherst College (1891) and at Auburn Theological Seminary (1894). He was pastor of churches at Utica and Cortlandt, N. Y., until 1900; then of the Brown Memorial Church, Baltimore, until 1909; and in that year became pastor of the Fourth Presbyterian Church, Chicago. In 1913-14 he was moderator of the general assembly of the Presbyterian church. He published: *Footsteps in a Parish* (1908); *Recruiting for Christ* (1910); also monographs on educational and religious subjects.

**STONE, LUCY** (1818-93). A pioneer American woman suffragist. She was born at West Brookfield, Mass., and graduated at Oberlin College in 1847. She went to Oberlin because she wished to learn Hebrew and Greek in order to know at first hand whether the biblical texts quoted against the equal rights of women were true translations. In 1848 she lectured on woman's rights at Gardner, Mass., and in the same year toured the New England States and Canada in behalf of the antislavery movement. She married Henry B. Blackwell, brother of Elizabeth Blackwell (q.v.), in 1855, but retained her maiden name with her husband's consent. In 1857 she removed to New Jersey, where the seizure of her property for taxes caused her

to write a pungent protest, using as a logical weapon the motto of the Revolution, "no taxation without representation." She lectured during the political campaigns for the woman's suffrage amendments (1867-82), took the most prominent part in founding the American Woman's Suffrage Association in 1869, was president thereof in 1872, and was chairman of its executive committee in 1869-89. In 1870-72 she was coeditor of the *Boston Woman's Journal*, and from 1872 to the year of her death she was its editor in chief, assisted by her husband and her daughter, Alice Stone Blackwell (q.v.). She died at Dorchester, Mass.

**STONE, MELVILLE ELIJAH** (1848- ). An American newspaper executive, born at Hudson, Ill., and educated in the Chicago public schools. In 1864 he was a reporter for the *Chicago Tribune*, and in 1869-71 conducted a foundry and machine shop. He was then editor successively of several Chicago dailies until 1874, in 1875 he established the *Chicago Daily News*, and in the following year became a partner of Victor F. Lawson (q.v.), together with whom he established the *Chicago Morning News* (later known as the *Record-Herald*) in 1881. After selling out his interest to Lawson in 1888, he spent three years in Europe. Of the Globe National Bank, which he organized in 1891, he was president until it was consolidated with the Continental Bank in 1898. After 1893 he was general manager of the Associated Press, with headquarters at New York.

**STONE, THOMAS** (1743-87). A signer of the Declaration of Independence. He was born in Charles Co., Md., studied law at Annapolis, began practice at Frederickton in 1764, and was a delegate to the Continental Congress in 1775-77, and again in 1783-84, being president pro tempore in 1784. He was a member of the Committee on Confederation in 1776-77, and, returning to Maryland in 1777, urged the State Convention to ratify the Articles of Confederation. Consult Sanderson, *Signers of the Declaration of Independence*, vol. ix (Philadelphia, 1823-27).

**STONE, WALTER KING** (1875- ). An American illustrator. He was born at Barnard, Monroe Co., N. Y., and studied at Rochester (N. Y.) Mechanics' Institute and at Pratt Institute, Brooklyn. For leading magazines, such as *Harper's*, *Scribner's*, and the *Century*, he did many illustrations, crisply individual, and decorative in style. He also designed many book covers and illustrated a number of books.

**STONE, WARREN SANFORD** (1860-1925). An American labor leader. He was born at Ainsworth, Ia. In 1879 he became a fireman on the Rock Island System, and in 1884 was promoted to engineer. In 1903 he was appointed to succeed Peter M. Arthur as grand chief of the International Brotherhood of Locomotive Engineers, was elected to that office in 1904, and reelected for a term of six years in 1912. Stone became also a member of the Industrial Peace Committee.

**STONE, WILLIAM JOEL** (1848-1913). An American lawyer and statesman, born in Madison Co., Ky., and educated at the University of Missouri. After 1869 he practiced law at Jefferson City, Mo. A Democrat, he became prominent in politics, serving in Congress from 1885 to 1891. His administration as Governor of Missouri (1893-99) was progressive and able. Elected United States Senator in 1902, he was reelected in 1908 and 1914. As Senator, he be-

came known for quiet persistency. After 1913 he was chairman of the committee on foreign relations and thus was consulted in many of the important problems arising from the great war of 1914. He was thought to be a spokesman for President Wilson, whose legislative programme received his support. But in January, 1916, he stated that he had supported the policy of "watchful waiting" towards Mexico against his convictions, and later he championed the view that Americans should be warned not to take passage on armed belligerent merchant vessels.

**STONE, WILLIAM LEETE** (1792-1844). An American journalist and historical writer, born at New Paltz, New York. After editing several provincial journals he became editor of the *New York Commercial Advertiser* in 1821. He earnestly furthered a plan for collecting the Colonial documents of New York, and was defendant in a famous suit brought by James Fenimore Cooper (q.v.) for criticisms that had appeared in his journal on the novelist's *Home as Found* and the *History of the Navy*. Stone was active in furthering benevolent institutions for the deaf and dumb and for juvenile delinquents. Among his many publications the *Revolutionary Tales and Sketches* (2 vols., 1834), *Maria Monk and the Nunnery of the Hôtel Dieu* (1836), and a social satire *Ups and Downs in the Life of a Distressed Gentleman* (1836), are still not without interest. Better known probably are his *Life of Joseph Brant* (1838); *Life of Red Jacket* (1840); and *Uncas and Miantonomah* (1842). An account of his other works is given in *Life and Writings of Col. William L. Stone* (1866), by his son, WILLIAM LEETE STONE, JR. (1835-1908), himself the author of many works of antiquarian research connected with the Revolutionary epoch, among which the more noteworthy are: *The Life and Times of Sir William Johnson, Bart.* (1865); *The Campaign of Gen. Burgoyne* (1877); *History of New York City* (1872); *Reminiscences of Saratoga and Ballston* (1875); and *Washington County, New York: Its History* (1901). He edited also *Ballads Relating to the Burgoyne Campaign*.

**STONE AGE.** A term commonly used to denote the earliest recognized stage in the development of human culture as defined by the materials used by man for weapons, utensils, etc. The phrase is somewhat misleading, since it is probable that primitive man made use of wood and other perishable materials to a far greater extent than of stone, and consequently the stage is defined by the prevailing material of the relics, not by that of actual implements in common use.

The term Stone age represents in no sense a chronological division of human progress, but is a loose equivalent for a stage of cultural development varying widely in duration in different parts of the world. There are, e.g., tribes still in the Stone age, while, on the other hand, some groups had outgrown it before the dawn of history. It is also worth noting that some tribes commonly classed as belonging to the Stone age produced objects of a superior artistic and industrial merit to those who had advanced to the use of metals. The evidence for the existence of such an age in most parts of the world is conclusive, but it is from the prevalence and character of the relics in certain parts of Europe rather than in America that the idea and term have come into general use. Consult

H. F. Osborn, *Men of the Old Stone Age* (New York, 1915). See *ARCHAEOLOGY, AMERICAN*; *NEOLITHIC PERIOD*; *PALEOLITHIC PERIOD*.

**STONE CAT.** See *CATFISH*.

### STONE CUTTING AND DRESSING.

Processes employed in preparing quarried stone for structural and ornamental purposes. These processes range in character from rough shaping of the stone into squared blocks, generally performed at the quarry, to the cutting and polishing of carefully modeled and ornamental pieces such as columns, cornices, moldings, and balustrades, and they may be carried out either

STONE-WORKING HAMMERS.

by means of hand tools or by stone-working machines. The hand tools used in stone cutting and dressing are variously shaped hammers and chisels and simple forms of measuring instruments, templates, and gauges.

After a block is broken from its bed by one of the methods described in *QUARRY, QUARRYING*, it is trimmed to the desired size and shape by a variety of means according to the hardness of the stone and the finish desired. By means of the pitching chisel the rough block is trimmed down to a line, then the irregular surface is worked down by the point, after which it is finally dressed. If the stone is to be polished it is first scoured with wet sand. Small blocks are now usually ground with wet sand on a re-

STONE-WORKING CHISELS.

volving iron bed, while large blocks are ground by dragging a slab of stone back and forth across them with wet sand as an abrasive. For securing finer polish, emery, hones, pumice stone, and polishing putty (oxide of tin) are used. A high grade of polish can be secured by skilled workmen only, each man using his own peculiar method.

In most large establishments grinding and polishing machines are much employed. For flat surfaces a circular horizontally revolving iron plate or grating, attached to the lower end of a vertical shaft, with an elbow joint, is used, the workman guiding the plate to various parts of the surface, and using sand or emery for abrading material. By attaching felt to the plate the same machine is used for polishing. Blocks of such small size as can be handled by the workmen are usually ground upon horizon-

tally revolving iron beds eight or ten feet in diameter. Pendulum machines are used for polished simple moldings. The moldings being first cut as smoothly as possible with the chisel, a plate of cast iron, fitted as accurately as possible, is made, by means of a long arm, to travel back and forth along the molding, with sand, emery, putty powder, or other abrasive.

For turning posts and pillars lathes are now generally used. For the softer stones a simple pointed cutting tool similar to that used in turning metals and held and operated by a similarly constructed machine is employed. In turning hard stones like granite the cutting tool is in the form of a thin steel disk some 6 inches or 8 inches in diameter, so arranged as to revolve with the stone when pressed against it at a sharp angle. Lathes of this type are used, capable of turning a block 25 feet long and 5 feet in diameter to a perfect column. Planers for rough work, such as flagstone, resemble the same machine for planing metals. See *METAL-WORKING MACHINERY*.

Stone-sawing machines are made in various forms, the most familiar consisting of a smooth flat blade of soft iron which is given a reciprocating motion by machinery and fed with sharp sand and water. Such saws are commonly worked in gangs of ten or a dozen blades set parallel the desired distances apart and operated by a single saw frame. This method of sawing is not applicable to cutting granite, on account of its hardness. Frequently, in place of sand, use is made of small globules of chilled iron or of crushed steel as an abrasive. Circular saws set with diamonds have proved very efficient tools, but their use is generally too expensive. Slate is sawed by circular saws such as are used for sawing lumber. In Europe considerable use has been made of twisted cords of steel made to run around pulleys like a band saw. Among other machines for stone cutting and dressing mention may be made of pneumatic hammers and the sand blast. Consult: G. P. Merrill, *Stones for Building and Decoration* (3d ed., New York, 1903); I. O. Baker, *Treatise on Masonry Construction* (10th ed., ib., 1909); W. G. Renwick, *Marble and Marble Working* (ib., 1909); T. N. Dale, "Slate Deposits of United States," in *United States Geological Survey, Bulletin No. 586* (Washington, 1914).

**STONE FALCON.** See *MERLIN*.

**STONE FLY.** One of the aquatic insects of the family Perlidae and order Plecoptera—flat-bodied insects with two pairs of wings. The hind wings are very broad and when folded lie flat on the back of the insect. The larvae live in water, clinging to the under sides of stones, and in general appearance are much like the adult insects, except in the lack of wings and ocelli; they are carnivorous, living largely upon the nymphs of May flies (q.v.). The well-aerated water in which the nymphs live is correlated with a peculiar rudimentary tracheal system for breathing. The eggs are produced in enormous numbers and a single female may deposit more than 5000; they are small, and are probably dropped during flight upon the surface of the water as with the May flies.

**STONEHAM.** A town in Middlesex Co., Mass., 8 miles north of Boston, on the Boston and Maine Railroad (Map: Massachusetts, E 3). It has a large public library, a fine high school building, sanitarium, State armory, and a public park and zoo. Boots and shoes, boxes, paper

sizing, and laboratory supplies are manufactured. Pop., 1900, 6197; 1910, 7090. Settled about 1670, Stoneham was under the jurisdiction of Charlestown and was called Charlestown End until 1725, when it was incorporated under its present name. Consult Stevens, *History of Stoneham* (Stoneham, 1890).

**STONEHENGE** (AS. *Stanhengist*, hanging stones). A celebrated stone circle, or cromlech, the ruins of which stand on Salisbury Plain, 1½ miles from Amesbury, in Wiltshire, southern England. When entire it consisted of two concentric circles of monoliths, the outer 100 feet in diameter, inclosing two smaller rows in form of a horseshoe, the opening to the northeast. Within there is a block of blue marble 15 feet long which is called the "Altar Stone." On a northeast line from the altar is a flat stone on the edge of the trench surrounding the whole ruin, and the line prolonged cuts another large stone some distance away called the "Friar's Heel." This arrangement points to a means of determining the time of the summer solstice, and it is thought that Stonehenge was connected with sun worship. In any case the monument, whether temple, court of justice, or battle ring, was designed with reference to the northeast. Modern research proves that the structure dates from as early as the Bronze age. Tumuli in the vicinity yield Bronze age remains. Stonehenge is in private possession. It was bought at auction in 1915 for \$35,000. Consult W. M. Flinders Petrie, *Stonehenge: Plans, Descriptions, Theories* (London, 1881); J. N. Lockyer, *Stonehenge and Other British Monuments Astronomically Considered* (ib., 1906). See MEGALITHIC MONUMENTS.

**STONEHOUSE, EAST.** See EAST STONEHOUSE.

**STONE LILY.** See CRINOIDEA and Plate.

**STONE LUGGER.** See STONE ROLLER.

**STONEMAN, GEORGE** (1822-94). An American soldier and Governor of California. He was born at Busti, Chautauqua Co., N. Y., and graduated at West Point in 1846. Just before the Civil War he was in command of Fort Brown in Texas, and was ordered by his superior officer, General Twiggs, to surrender to the Confederates, but refused, and escaped with his troops on a steamer to New York. After service in West Virginia he was appointed chief of cavalry in the Army of the Potomac. By overtaking the Confederate troops after the evacuation of Yorktown in May, 1862, he brought on the battle of Williamsburg. During Hooker's Chancellorsville campaign he led a cavalry raid towards Richmond. In April, 1864, he was put in command of a cavalry corps in the Army of the Ohio, and in the Atlanta campaign undertook raids against Macon and Andersonville. He was captured with a part of his force at Clinton, Ga., and was a prisoner three months. In December, 1864, he led a raid from East Tennessee into southwestern Virginia. In the following March he again entered southwestern Virginia. In April he moved into North Carolina, took Charlotte and other towns, and at Salisbury captured about 1400 prisoners. In recognition of his service he was brevetted major general. In 1871 Stoneman retired from the army and settled in California. There he served as a railroad commissioner, and in 1883 was elected Governor.

**STONE MARTEN.** See MARTEN.

**STONE MOUNTAIN.** A massive dome of

muscovite granite, said to be the largest in the world, in DeKalb Co., Georgia, about 16 miles east of Atlanta. It rises about 700 feet above the comparatively level surrounding country, and its bulk has been estimated as over 7,000,000,000 cubic feet. It does not seem to have been known to civilized man until about 1820, when that part of the State was first settled, the wooded condition of its surroundings previous to that time having kept it from being sighted at a distance. See paragraph *Topography and Scenery*, under GEORGIA, and *Bulletin 94 of the Geological Survey of Georgia*, pp. 113-119, 1902.

**STONE OF DESTINY.** See CORONATION CHAIR.

**STONE RIVER, BATTLE OF** (otherwise known as the BATTLE OF MURFREESBORO). A battle of the Civil War, fought Dec. 31, 1862, to Jan. 2, 1863, between the Army of the Cumberland, 47,000 men, under Rosecrans, and that of Tennessee, 38,000, under Braxton Bragg. After his retreat from Kentucky, Bragg moved his army through Knoxville and Chattanooga to Murfreesboro. Rosecrans, who had relieved Buell in the command of the Army of the Cumberland, had sent McCook's corps to the relief of Nashville, and late in November had his whole force there. He refused, in spite of most urgent letters from the War Department, to move against Bragg until he had sufficient rations to make him independent of the railroad from Nashville to Louisville, feeling sure he could not keep the Confederate cavalry from cutting this line.

Rosecrans put his army in march on December 26 in three columns, commanded by McCook, Thomas, and Crittenden. The Confederate cavalry under Wheeler at once opposed Rosecrans' advance, and so successfully that it was not until the 29th that the heads of the columns got within three miles of Murfreesboro, though the distance was only 30 miles. The field of battle lies 2 miles west of Murfreesboro, intersected by the sharp turns of Stone River, bridged at various points, fordable at others; the highroad from Nashville and the Nashville-Chattanooga Railway cross it from northwest to southeast.

On December 29 Bragg took a position guarding the western approaches, with Hardee's corps forming the right wing on the east bank, and Polk's the left, on the west bank of the river. McCown's division was held in reserve in the centre. Late in the afternoon Crittenden, advancing, found the Confederates in position; he formed line about a mile from the enemy. On the 30th the Union army stood as follows: Crittenden, Thomas, and McCook in the order named, from left to right, reaching from Stone River to the Franklin Road, and facing southeast. The Confederate position was as just given, save that McCown had been moved to Polk's left. Disappointed in not being attacked in this position on the 30th, Bragg resolved to take the offensive himself on the 31st, and to make his main effort against the Federal right. He accordingly moved Cleburne from his right to his left. The general plan was to swing to the right, with the pivot on the river. The Federal plan was similar: to attack the Confederate right. But as Bragg got the start, the contest took the development imposed by this condition. The Confederate attack was in so far successful, that the Union right wing and centre and the right of the left wing were driven out of their positions, and at noon had taken another parallel to the Nashville

and Chattanooga Railroad, with the river behind them. The left of this position under Hazen held its ground and repulsed all Confederate attempts to crush it. Meanwhile the attack on the Confederate right had opened, as originally planned; but when it was found that the Union right was suffering, the attacking troops were recalled to reinforce it. As early as 10 A.M. Bragg had ordered Breckinridge to cross the river and come to Hardee's assistance, but that subordinate reported that the Union troops were advancing upon him and that he could not obey. When the order was repeated he moved forward only to find that the Federals had returned across the river. It was now too late to go to Hardee's help; Breckenridge, however, could cross the river, and this he did, though slowly; twice were his troops sent by Polk against Hazen, but repulsed. These belated attacks ended the battle proper. The armies remained on the field; the 1st of January passed without result, save that Crittenden crossed the river and formed line before Breckinridge, who had resumed his former position.

On the 2d Bragg, finding the enemy showed no disposition to move, ordered Breckinridge to carry a hill they held and then to entrench. The hill was captured, but the men rushed after the returning Federals only to be met by heavy artillery fire from batteries masked on the opposite bank. The Federals then crossed the river and recaptured the position. Late on the 3d Thomas broke the centre of the Confederate line, whereupon that night Bragg retired on Tullahoma. Rosecrans entered Murfreesboro on the morning of the 4th, but made no attempt to pursue. The losses were serious, over 13,000 for the Union and about 11,500 for the Confederate forces: in point of results the advantage lay with the Federals. Consult: Bickham, *Rosecrans's Campaign with the Fourteenth Corps* (Cincinnati, 1863); T. B. Van Horne, *History of the Army of the Cumberland* (2 vols., ib., 1875); Johnson and Buel, editors, *Battles and Leaders of the Civil War* (New York, 1887); J. C. Ropes, *Story of the Civil War*, vol. ii (ib., 1898); M. F. Steele, *American Campaigns* (Washington, 1909).

**STONE ROLLER**, or **STONE LUGGER**. One of two fresh-water fishes of the Mississippi valley: (1) A small and worthless sucker (*Catostomus nigricans*), which inhabits clear streams throughout the West. It usually rests quietly on the bottom, but darts swiftly away when alarmed, scattering the pebbles. It is olive green with brassy sides, and has a flattened, concave head and thick lips. (2) A small brown cyprinoid (*Compostoma anomalum*), remarkable for the fact that in the nuptial season the males become covered about the head and often over the whole body with large rounded tubercles. They frequent the deep pools of small streams.

**STONES**, **PRECIOUS** AND **SEMPRECIOUS**. A trade distinction is made among gem experts, jewelers, and lapidaries between the more valuable gem stones, diamond, ruby, sapphire, pearl, and emerald (qq.v.), which are classed as distinctly precious stones, and such gems as amethyst, peridot, garnet, tourmaline (qq.v.), which are ordinarily of less value than the former group and are known as semiprecious stones. Turquoise and opal (qq.v.) are sometimes included under the precious stones, but are more often classed as semiprecious. See **AGATE**; **AMBER**; **AQUAMARINE**; **AZURITE**; **BENITOITE**;

**STONES**, **STANDING**. See **MEGALITHIC MONUMENTS**.

**STONES OF VENICE**, **THE**. A treatise on the art and architecture of Venice by John Ruskin (1851-53). It had great influence on the appreciation of Venetian art and on the Gothic revival of that day, and especially on William Morris.

**STONEWARE**. An opaque, highly fired, vitrified pottery, composed of plastic clay and sand, varying in color, and so hard that it cannot be scratched with steel. Stoneware is of three varieties—glazed, unglazed, and salt glazed.

Glazed stoneware has been made by the Chinese from a very early period, native writers claiming for it an antiquity reaching back almost two thousand years. Much of the so-called porcelain (q.v.) of the Chinese was in reality a vitrified, opaque stoneware which in later periods was frequently covered with a porcelainous glaze. The celadons of the Sung and Yuan dynasties were brown stoneware, quite different from true porcelain. To the same category belong the large vases with pierced designs and low reliefs and touched with purple and blue enamels, of the Ming dynasty, and the still more recent wares with transmutation, or splash, glazes of red, blue, and variegated coloring. Much of the early Japanese pottery, with heavy, slow-flowing glazes, and the more modern Satsuma and Kyoto wares possess a stoneware body.

Unglazed stoneware, of dense, fine texture and dark red or chocolate color, called by the Portuguese *Boccaro* ware, was produced by Chinese potters during the Ming dynasty. It is usually embellished with relief designs, or painted with colored enamels. Frequently the ground of panels is composed of impressed diaperwork. The Dutch potters of the latter half of the seventeenth century, of whom Ary de Milde was one of the most prominent, attempted to imitate the Chinese ware. The shapes and decorations were closely copied, but the body of the ware was more of the nature of hard pottery than true stoneware. The Elers brothers, John Philip and David, who are believed to have come from Holland, began the manufacture of a similar ware in England some time between 1690 and 1710. Their red ware was characterized by great hardness, delicacy of form, careful potting, and a smooth, velvety surface, the fine relief ornaments being formed in separate molds and applied. Johann Friedrich Böttger first began his experiments at Meissen in 1707 in search of a substitute for the Chinese ware, and in the following year succeeded in obtaining a body which closely resembled in all particulars the Oriental *Boccaro* ware, which he incorrectly named red porcelain.

To the group of unglazed stonewares belong the jasper and basaltes, originated by Josiah Wedgwood (q.v.) in the latter half of the eighteenth century, and copied by his numerous imitators, of whom William Adams and John Turner

were among his most prominent contemporaries. Wedgwood himself divided his productions into two groups: Wedgwood, which name he applied to his ornamental wares, including the jasper and basaltes, and Wedgwood ware, a term which covered his useful pottery and creamware (see POTTERY). Jasper is a vitrified stoneware of exceedingly fine grain, which is either tinted throughout the substance, or covered with a colored dip and decorated with molded ornaments, either white or colored, applied to the surface. Basaltes is similar in composition but jet black throughout. Both of these are of great hardness and devoid of glaze, except occasionally in the interiors of vessels. Among Wedgwood's most important achievements were the reproductions in jasper of the famous Barberini or Portland vase (q.v.).

To the group of unglazed stoneware may be assigned the white stoneware of Adams, Turner, Spode, and Hollins, and the apostle stoneware of Charles J. Meigh, all of which were produced in Staffordshire in the first half of the nineteenth century.

Salt-glazed stoneware, known as *grès* by the French, differs from all other ceramic wares in that it is glazed by vaporization instead of by dipping, by the use of a brush, or by insufflation. After the pieces have been placed in the kiln, and when the heat has reached its highest point, common salt is thrown in from above, which vaporizes and settles upon the surface of the ware in minute drops, forming an exceedingly thin coating which is so hard that it cannot be scratched by the usual tests and so transparent that it does not obscure the finest markings. This glaze is impervious to water and resists the action of acids. It resembles in texture the granular surface of an orange skin or the pitted shell of an ostrich egg. The body of the ware may be gray, buff, brown, or white, or it may be covered with a brown or almost black ferruginous wash.

There were several important centres of manufacture in Germany and Flanders where distinctive styles of art stoneware were produced. As early as the fourteenth century Frankish pottery was being made in the vicinity of Cologne, which, although true stoneware, was unglazed. At Siegburg, opposite Bonn, a coarse brownish-gray stoneware of similar character was later developed, and in the following century glazing with salt was introduced. The Siegburg stoneware of the second half of the sixteenth century is of light-colored, almost white, clay embellished with applied reliefs, the most common forms being tall, cylindrical canettes or tankards, and small baluster jugs with crimped feet.

Raeren, in the old province of Limburg, near Aix-la-Chapelle, was the earliest seat of the stoneware industry in Flanders. Dated pieces of the sixteenth century are known. The ware is of a reddish-brown color running into gray. This was one of the most important centres of stoneware manufacture and noted modelers were employed to give an artistic touch to a homely art. Among the more celebrated artists and master potters were Baldem Mennicken, Jan Emens, and Jan Baldems. Eminent patrons of the pottery were accustomed to order pieces with their coats of arms upon them. Among the best-known designs are jugs, with reliefs representing "Peasants' Dances," "Works of Mercy," arms of towns and ancient families, inscriptions, and

frequently dates. Some of the larger pieces were most elaborately decorated in relief.

At Kreussen, Bavaria, a dark-brown stoneware, embellished with reliefs—figures of the Apostles, cherubs, heraldic shields, etc.—was largely produced in the seventeenth and eighteenth centuries. Tankards and hexagonal drug jars were among the most characteristic shapes. One variety of the Kreussen ware was painted in colored enamels. A contemporary stoneware, closely resembling that of Kreussen, but of a darker color, was produced in Saxony.

The Westerwald district of the Rhine, which includes Grenzhausen, Grensau, and Höhr, near Coblenz, has been one of the largest centres of the industry since the end of the seventeenth century. The earlier wares reveal the influence of the Raeren potters, but at a later period a more original style was developed and cobalt blue and manganese purple, or brown, enamels (see ENAMEL) were used to some extent on the gray color of the clay. This ware was exported to England and other countries, and is frequently found in association with the remains of native production. The most common forms were bartmans or jugs with bearded heads in front, also pilgrim bottles, saltcellars, inkstands, and tankards. A great profusion of molded, stamped, incised, and champlévé ornaments, in all varieties of combination, often cover the entire surface.

Salt-glazed stoneware of distinctive character was manufactured at other places in Germany: at Frechen; at Bunzlau, where white pipe-clay reliefs were applied to a smooth, reddish-brown glaze of somewhat metallic lustre; at Dreyhausen, where vessels with numerous small movable rings were made; at Bouffloux, Belgium, where jugs and other articles of brown, mottled glaze were embellished with bearded masks and embossed medallions, and frequently smeared with blue enamel.

In England salt-glazed stoneware was produced at Fulham, near the end of the seventeenth century, by John Dwight, who took out a patent in 1671 for his discovery of the mysteries of the Cologne ware. Some of his figures, notably those of Meleager, Saturn, Mars, and Jupiter, colored in imitation of bronze, and busts of Prince Rupert, James II, and an effigy of his deceased daughter, are among the best works of their kind ever produced, and rank, in point of modeling, with some of the finest sculptures of the porcelain factories. Near the close of the same century Thomas Miles, of Shelton, improved the body of salt-glazed ware by adding feldspar to the composition, which resulted in the development of a white ware which in its thinnest parts was translucent, and during the eighteenth century many other Staffordshire potters engaged in the manufacture of this purely English product. At first molded and applied ornaments were used to decorate thrown and turned pieces, but later they were formed in molds which had previously been used by the silversmiths, the thinner examples being formed by the casting process in engraved molds. Teapots, dishes, and other objects were made in an infinite variety of shapes, in imitation of animals, such as camels, squirrels, and cats, and representations of houses. Finally color was added to the decorations by scratching patterns in the unbaked clay, into which blue was rubbed, a popular style known as scratched blue. Enamel colors were used in painting flowers and Chinese figure

scenes, or in touching up reliefs, and transfer printing was also employed to some extent.

Dornbusch, *Die Kunstgilde der Topfer in der abtheilichen Stadt Siegburg* (Cologne, 1873); Eliza Meteyard, *The Wedgwood Handbook* (London, 1875); L. M. Solon, *Art of the Old English Potter* (ib., 1885); id., *The Ancient Art Stoneware of the Low Countries and Germany* (2 vols., ib., 1892); Otto von Falke, *Das rheinische Steinzeug* (Berlin, 1908); Ernst Zimmermann, *Die Erfindung und Frühzeit des Meissner Porzellans* (ib., 1908); L. M. Solon, *Ceramic Literature: An Analytic Index to the Works Published in All Languages* (London, 1910).

**STONEWORK.** Structural and decorative work in stone, whether for buildings of an architectural or of an engineering character; including, therefore, all kinds of masonry (q.v.) for foundations, piers, walls, vaults, etc., and all kinds of stonemasonry, both constructive and decorative. All such stonework is first roughed out, either at the quarry or at the stone-cutting yard, into blocks rudely approximating the intended form. If the stone is soft and friable, and the decorative detail complex or delicate, it is usually built into the structure in this rough form and finished afterward. The harder kinds of stone, bluestone, granite, and hard marble, and all moldings and blocks of simple form, are cut at the yard, or even at the quarry, carefully crated or packed and delivered finished at the building.

**STONEWORKS.** See CHIMNEYS.

**STONINGTON**, ston'ing-ton. A town, including the borough of Stonington and the villages of Pawcatuck, Mystic, and Old Mystic, in New London Co., Conn., 49 miles southwest of Providence, R. I., on Long Island Sound, and on the New York, New Haven, and Hartford Railroad (Map: Connecticut, H 4). A good harbor, protected by three government breakwaters, makes it of considerable commercial importance. It is the headquarters of a large fishing industry. There are machine shops, printing-press works, thread mills, and manufactories of silk machinery, cotton, woolen, and silk goods, velvets, and fertilizers. Pop., 1900, 8540; 1910, 9154; 1915 (U. S. est.), 9477; 1920, 10,236.

In 1649 William Chesebrough of Plymouth Colony made the first permanent settlement in Stonington at what is now Wequetequock. At first within the bounds of Massachusetts, whose General Court chartered it as Southertown in 1658, it passed to Connecticut in 1662, was named Mystic in 1665, and Stonington in 1666. In 1775 it was attacked by the British frigate *Rose*, under Commodore Sir James Wallace, and in 1814 it was bombarded for four days by Admiral Hardy, Nelson's favorite officer. For many years Stonington was prominent for its participation in the seal-catching and whale-fishing industries, and was also a shipbuilding centre. Consult Wheeler, *History of the Town of Stonington from 1649-1900* (New London, 1900), and Palmer, *Stonington by the Sea* (Stonington, 1913).

**STONO FERRY, BATTLE OF.** An engagement near a ferry over the Stono River, a short distance from Charleston, S. C., on June 20, 1779, during the Revolutionary War, between a small force of British, strongly intrenched, under Lieutenant Colonel Maitland, and a superior American force under General Lincoln. General Pre-

vost, on withdrawing from his invasion of South Carolina, left temporarily a small force of about 800 men at Stono Ferry and another small force on John's Island. In the early morning of June 20 General Lincoln attacked the British at Stono Ferry, but, owing to General Moultrie's neglect of Lincoln's orders to have everything in readiness, the garrison was reinforced from John's Island, and the American attack was repulsed. Lincoln then withdrew, beating off the attacks of the British, who followed for a short distance. The loss of the British in killed, wounded, and missing was about 130; that of the Americans was about 150.

**STONYHURST COLLEGE.** A leading Catholic college, at Stonyhurst, Lancs., England. It had its inception in the English college at St. Omer, in the Province of Artois, France, founded by Robert Person, S.J., in 1592, under the patronage of Philip II of Spain, to which that province then belonged. The school prospered, and when Artois was ceded to France in 1659 a clause in the capitulation insured its safety. In 1760 it obtained from Louis XV the much-desired title of "Collège Royal." At the expulsion of the Jesuits from France the college was removed to Bruges in the Austrian Netherlands. When the Society of Jesus was suppressed by Pope Clement XIV in 1773 the Austrian government attempted to conduct the school with the aid of English Dominicans, but such was the attachment of the pupils to former teachers that the college had to be closed owing to their attitude. Some of the masters and pupils took refuge in Liège, where the authorities were kindly disposed towards the Jesuits. In 1794, when the Revolutionary armies marched upon Liège, the college was offered a resting place by Thomas Weld—his estate at Stonyhurst, England. In 1808 the attendance had increased, and the construction of the first of five buildings was begun. In 1832-36 a church was erected and in 1837 the college library received the famous Arundel collection. The well-known observatory was erected in 1838. Since 1840 preparation has been given for the examinations of the University of London leading to degrees. The sciences were then introduced, and the curriculum, which was based on the Ratio Studiorum (q.v.), was generally enlarged. The courses cover a period of seven years. Consult Gruggen and Keating, *Stonyhurst* (London, 1901).

**STONY POINT.** A town in Rockland Co., N. Y., 35 miles north of New York City, on the Hudson River, and on the New York, Ontario, and Western, and West Shore railroads. Bricks are manufactured here. Pop., 1910, 3651; 1915 (State census), 3721. Stony Point was fortified by the Americans early in the Revolutionary War and was captured May 31, 1779, by Sir Henry Clinton. On July 16 it was recaptured by General Anthony Wayne, who, with 1200 men, stormed the works and took 543 prisoners, the American loss being 15 killed and 83 wounded, and the British 63 killed besides prisoners and wounded. Two days later the fortifications were dismantled and the place abandoned, the British soon reoccupying it. The site of the Revolutionary fort and battlefield has been converted into a reservation. Consult Johnston, *The Storming of Stony Point* (New York, 1900). See UNITED STATES, *Revolutionary War*.

**STOPPING.** See MINING.

**STOPPAGE IN TRANSITU.** The stoppage by an unpaid seller of goods while on their way

from him to the buyer, after title has passed to the latter. The right so to stop goods is not founded on any contract between the parties, nor upon any principle of equity, but upon mercantile usage. Its first recognition in the judicial reports of England appears in an equity case decided in 1690. Prior to this it was a well-established rule of the law merchant (q.v.). From courts of equity it was adopted by the courts of common law, and for three centuries has been a recognized rule of English jurisprudence. The term "unpaid seller" is here employed in a broad sense. It includes not only the ordinary seller, but the factor of the buyer, who has paid for goods placed to his credit for the price—any one, indeed, whose position can be shown to be analogous to that of an ordinary seller, who is unpaid, wholly or partly.

A requisite is that the buyer shall have become insolvent, and that the knowledge of this insolvency shall have come to the seller after dispatching the goods. Insolvency, in this connection, is used in its popular sense, meaning the financial condition of one who cannot pay debts falling due in the ordinary course of business; and if he lets commercial paper go to protest, or by other conduct affords the ordinary opponent evidence of insolvency, the unpaid seller is safe in treating him as insolvent.

Another requisite is that the goods shall have left the possession of the seller, but shall not have reached the possession of the buyer—they shall be in transit. Transit begins as soon as they have left the seller's possession for transportation to the buyer. It continues as long as they are in possession of a carrier, or other middleman, on their way to the buyer. "Such middleman may be the buyer's agent for certain purposes; and yet if, by the agreement of the parties or by the usage of trade, he is not a mere servant of the buyer, but is a person interposed between the seller and the buyer, having a possession of his own and liable, in his capacity as bailee, to an action by the buyer, in case the goods are carelessly lost or misdelivered, the goods are still in transit." Such transit may be intercepted by a new and distinct agreement between the carrier and the buyer, under which the carrier is thereafter to hold the goods subject to new orders from the buyer. It is not intercepted, however, by the levy of an execution or an attachment on the goods on behalf of a creditor of the buyer. Such a levy gives the creditor only the right of the buyer; and that right is subject to the unpaid vendor's right to stop the goods. If a bill of lading (q.v.) has been given to the buyer by the seller, its transfer to a bona fide purchaser cuts off the seller's right. This comes from the quasi negotiable character of the bill of lading under the law merchant. Hence where the bill of lading is marked "nonnegotiable" the seller's right is not cut off by a transfer to an innocent purchaser.

Although no particular form of notice is required, a valid stoppage in transitu cannot be made without a notice of some kind to the carrier. If the goods are in the hands of an agent of the carrier, notice that the seller stops the goods may be given to either the agent or the principal. If given to the latter it must be given at such time and under such circumstances that the principal, by the exercise of reasonable diligence, may communicate it to the agent in time to prevent a delivery to the buyer.

The exercise of this right restores to the seller

the possession of the goods, but does not revert title in him. The buyer or his transferee is entitled to the goods upon paying cash for them, but not otherwise. See SALE, and consult authorities there referred to.

**STOPPER.** A short length of rope or chain or an iron contrivance used on board ship for checking the running of a rope or chain, or for holding it firmly. A stopper for ropes is a short

STOPPER FOR  
CHAIN CABLE.

STOPPER FOR ROPE.

a, rope stopper; b, rope held by the stopper; c, point where a grips b; d, loose end of a. This is usually held in place by a man until the stopper a is removed from b.

length of soft manila secured at one end to the structure of the ship; the other end is passed around the rope to be stoppered with a jamming hitch. It is used to keep the rope from slipping while it is being belayed or secured. A stopper for a chain cable is usually of wire rope and four to six feet long. At one end it is spliced into the eye of a hook, and at the other has an eye formed around a short bar of iron. The hook is placed in a ringbolt in the deck, and the body of the stopper lashed to the chain by two tails of soft manila rope. When ships are at anchor the chain is held by such stoppers.

**STOP SOUNDS.** See MUTES.

**STORAGE** (from *store*, OF. *estorer*, *estaurer*, from Lat. *instaurare*, to renew, make, provide, from *in*, in + *\*staurare*, to set up; connected with Gk. *σταυρός*, *stauros*, stake). Since most plants absorb or produce food in excess of immediate needs, they provide for temporary or long-continued storage. These foods are transformed for permanent storage and mobilized for subsequent translocation by specific activities of the cell, self-regulated through irritability (q.v.). Means of storage are spores, seeds, fleshy fruits, roots, tubers, bulbs, leaves, and stems. As a rule the regions of the higher plants specially adapted for storage are thick, fleshy, and abundantly supplied with thin-walled parenchyma

cells. (See HISTOLOGY.) Storage occurs only in living cells. Occasionally the cell walls in storage regions are thick and woody, and in some cases, e.g., in the endosperm of seeds, the walls themselves are made up mainly of the stored material, reserve cellulose. The chief forms in which reserve food is stored are as follows:

**Carbohydrates.** Reserve carbohydrates are either soluble, such as sugars (saccharose, glucose, fructose, mannose, and galactose) and inulin, or insoluble, as starch and cellulose (q.v.). Starch is organized into granules by the leucoplasts (q.v.). Reserve cellulose is deposited upon the cell walls as a complex carbohydrate, whose composition is unknown, though it seems to have somewhat the same relations to ordinary cellulose as the most complex of the dextrins, amylopectin, holds to starch. It is found especially in the endosperm, or in various parts of the embryo, in bud scales, etc.

**Fats.** Fats occur in the form of minute droplets (oil) in the protoplasm, not infrequently accumulated by special organs of the cell, the leucoplasts. They are found in the endosperm or embryos of seeds (probably in the seeds of nine-tenths of all seed plants), in spores, tubers, and the wood of trees.

**Proteins.** Proteins are found either as amorphous grains, the so-called aleurone, or as crystals, which are not infrequently associated with or embedded in aleurone grains. These are sometimes formed by leucoplasts, but at other times appear to be deposited in the sap cavity (vacuoles) of cells, where the protein appears to accumulate in increasing concentration until it solidifies in the form of the vacuole, or in one or several crystals. (See ALEURONE.) Crystals of protein are also found in chromatophores, nuclei, and even in the cytoplasm itself. They are often distinguished as crystalloids, because they have the capacity of swelling (see IMBIBITION), a rare quality among inorganic crystals.

**Amino Acids.** Amino acids are nitrogenous compounds and are often called building stones of the proteins. They are the final products of hydrolysis of proteins. Most nitrogenous materials are ordinarily translocated as amino acids. They are rare in seeds, but, along with other plant bases, are especially abundant in the sappy reservoirs, such as bulbs, tubers, rhizomes, etc., where they constitute 40 to 70 per cent of the total food.

The different kinds of storage materials are more or less definitely associated. Thus the reserve food may consist of proteins and sugar (e.g., the pea and onion); proteins and starch (e.g., the potato, the embryo of beans, pea, etc.); proteins and oil (e.g., the endosperm of the castor bean and the cotyledons of the soja bean); or proteins, oil, and reverse cellulose (e.g., the endosperm of the date and coffee); or proteins with oils in the cotyledons and mucilage in the endosperm walls (e.g., clover). The reason for the special association of reserve foods is not known. Insoluble reserve foods are only transportable after digestion (q.v.).

**STORAGE BATTERY.** A so-called storage battery or accumulator when acted upon by an electric current undergoes certain chemical changes. The chemicals which are thus separated recombine again when the circuit is closed, and in uniting give off a current about equal to that by which they were decomposed. Lead for many years was the metal most commonly used in accumulators, the positive plate having a coating

of lead peroxide,  $PbO_2$ , and the negative plate a surface of spongy lead, but now the alkaline type of storage cell is extensively used where an iron-nickel element is immersed in a caustic potash solution.

In 1801 Gautherot showed that platinum wires used in the electrolysis of saline solutions developed secondary currents, and in 1803 Ritter constructed a secondary pile of copper disks separated by cloths moistened with a solution of sal ammoniac. By charging this a few moments with a powerful galvanic battery the pile gave a strong shock. Volta, Becquerel, and others discovered that platinum and other metals—gold, silver—gave secondary electric currents when subjected to electrolytic action in certain solutions. In 1842 Grove produced his celebrated gas battery, which gave a current by means of the difference in polarity of oxygen and hydrogen, the constituents of water. In Faraday's *Researches* he mentions the high conductivity of peroxide of lead at the negative pole. Gaston Planté was the first to apply this principle, and constructed in 1860 his cell with coiled plates, the first practical storage battery, which was afterward developed and modified by Faure, Metzger, Brush, Edison, and others.

Lead storage batteries may be divided into two general classes: Those in which the active material is formed on the surface of the plates by chemical or electrochemical action, and those in which some easily reducible salt of lead is applied mechanically. The former are known as the Planté type, and the latter as the pasted or Faure type. In either case the electrolyte is a diluted solution of sulphuric acid. While there may be various secondary chemical reactions the final result is shown by the following equation:

Reading from left to right the process of discharge is indicated and from right to left that of charging.

**Planté Cell.** The Planté cell is the simplest form of storage battery, and in an improved form is still much used where weight and space are of little importance. The earliest cells were formed of two lead plates immersed in dilute sulphuric acid in water. The plates were formed by repeated charging and discharging, resulting in the conversion of the surfaces of the two plates into lead peroxide and spongy lead respectively. The voltage of a lead-sulphuric acid cell is about two volts. The Planté accumulator is a very efficient cell when once formed, but the time it requires for forming is its chief drawback. Numerous methods have been devised for hastening this process, one of the most successful being the cutting of fine, deep grooves on the surface of the plate, thus increasing the active surface exposed to the electrolyte. The leading types of Planté plates are the central web; the cast lead, which has a number of vertical and transverse ribs cast in the plate; and the composite or pellet type where pellets of rolled lead are forced into holes in a grid of a hard lead antimony alloy. The Planté type renders good service in a central station or where it can have expert attention and where it is regularly charged and discharged.

**Pasted Cells.** To avoid the great loss of time consumed in forming the Planté cells, Camille A. Faure in 1880 devised the method of pasting

a layer of chemically prepared oxide of lead to the surface of the plates. After charging, the salt on the positive plate is reduced to peroxide of lead, while that on the negative plate is converted into porous lead. The chief fault of the early Faure cells was the disintegration of the active material, which would drop away from the plate. Many methods have been devised for holding the active material on the plates, the most common of which is to cast a grid, or plate with cells or perforations, into which the active material is pressed. Most modern cells are made with perforated negative plates of this description; the positive plates are usually made by some modification of the Planté process. The pasted type is lighter and is preferred for stand-by service, and where high capacity and minimum weight are desired, as in electric vehicles, for lighting and starting motor vehicles and similar purposes.

In one of the most improved forms of batteries of the pasted type, the Exide, the positive plate is formed by a grid composed of a number of parallel vertical metal rods united to top and bottom frames, the former provided with the usual connecting devices. Each vertical rod forms a core which is surrounded by a cylindrical pencil of peroxide of lead, this being inclosed by a hard rubber tube with horizontal slits through which the electrolyte has access to the active material, but which are so fine as to prevent the latter washing out. The negative plates are of the usual lead incased in rubber and separated from the positive by a wood veneer and rubber.

**Edison Battery.** Numerous attempts have been made to devise a storage battery of lighter materials, and of more robust construction, but, with the exception of Edison's iron-nickel battery, such batteries give little promise of commercial success. The plates of the Edison battery consist of shallow perforated pockets or tubes of nickel-plated steel held in a sheet-steel frame or grid. The perforated steel tubes forming the positive plate contain alternate layers of pure nickel flake and nickel hydrate. The boxes forming the negative plate contain finely divided oxide of iron. The tubes and pockets are fastened firmly in the grids, and the plates thus formed are placed on connecting rods and held firmly by nuts, the positive and negative plates being separated by strips of hard rubber. All are inclosed by a steel container. The electrolyte is a 21 per cent solution of potassium hydrate with a small amount of lithium hydrate added. The operation of the battery depends upon the oxidation and reduction of metals in an electrolyte which does not dissolve and does not combine with the metals or their oxide. In charging, the current decomposes the solution, releasing oxygen, and oxidizes the nickel compound to the peroxide state, and reduces the iron compound in the negative plates to a spongy mass. In discharge the action is reversed. The average voltage during discharge is about 1.25. For equal capacity the Edison battery occupies about the same volume but weighs much less than a lead battery. Among the advantages claimed for it are that it may be charged and discharged without expert attention, for it is not injured by occasional improper charging nor is it permanently injured by short circuits. It is stronger mechanically, for the steel container will withstand hard usage and it is not affected by severe vibration and concussion. It does not

give off obnoxious gases, though the hydrogen and oxygen produced must be taken care of, as they may form an explosive mixture. The Edison battery can be left idle either charged or uncharged for months, and does not require frequent examinations of the density of the electrolyte.

Storage batteries have found application for propulsion of electric vehicles and boats, for industrial trucks and tractors, for mining locomotives, for house lighting, for railway block-signal systems, for car lighting on railways, for miners' lamps, for regular or emergency use with wireless-telegraph installations, and for ignition purposes with gas or gasoline engines. Their use in submarine torpedo boats to supply energy for the motors when running submerged is now an important application. The cells must be charged by generators driven by internal combustion engines.

Storage batteries are employed also in many central stations to aid the dynamos in case of an emergency—stand-by service—or at the time of the maximum output, and to act as equalizers or reservoirs of electrical energy, taking the peak of the load, or in the case of a small system carrying the day load. In large central stations storage batteries are also used for reserve current for exciters. The efficiency varies considerably in laboratory tests, but in commercial practice runs from 70 per cent down.

**STORAX** (Lat. *storax*, *styrax*, from Gk. *στυράξ*, a fragrant resin). A fragrant resinous substance, the styrax of the ancients, obtained from the storax tree (*Styrax officinale*) of the family Styracaceæ, native of the Mediterranean region. Storax, which exudes from wounds in the bark and hardens in the air, appears in the form of reddish-yellow, opaque, soft, adhesive tears about the size of a pea, or in dry, brittle masses, wrapped in the leaves of a kind of reed. It has a pleasant odor and an aromatic taste, and was formerly much used in medicine. Benzoin gum (q.v.) is the product of a species of *Styrax*. Several species of *Styrax* shrubs, and small trees, with showy white flowers, occur in the southern United States.

**STORER, BELLAMY** (1847-1922). An American lawyer, born in Cincinnati, Ohio. He graduated at Harvard in 1867, practiced law in Cincinnati, and was a member of Congress in 1891-95. He served as Minister to Belgium in 1897-99, and to Spain in 1899-1902, and in the latter year was appointed Ambassador to Austria-Hungary. The reported activity of Storer, and particularly of Mrs. Storer, in Roman Catholic efforts on behalf of Mgr. Ireland, whose friends

wished to see him Cardinal, led to Storer's dismissal by President Roosevelt early in 1906. Consult *Letter of Bellamy Storer to the President and the Members of his Cabinet, November, 1906* (1906) for the correspondence of President Roosevelt and the Storers relative to their controversy.

**STORER, DAVID HUMPHREYS** (1804-91). An American physician and naturalist. He was born in Portland, Me., and graduated at Bowdoin in 1822. After studying medicine he settled in the practice of his profession in Boston. In 1854 he was called to the chair of obstetrics and medical jurisprudence in the Harvard Medical School. Storer was president of the American Medical Association in 1866. He published: *Report on the Ichthyology and Herpetology of Massachusetts* (1839); *Synopsis of the Fishes of North America* (1846); *History of the Fishes of Massachusetts* (1867). For D. H. Storer's son see STORER, FRANCIS HUMPHREYS.

**STORER, FRANCIS HUMPHREYS** (1832-1914). An American agricultural chemist, son of David H. Storer. He was born in Boston and studied at Harvard (S.B., 1855), and abroad at Heidelberg, Freiberg, Tharand, and Paris. In 1851-53 he was assistant to Prof. J. P. Cooke in Harvard, in 1853-54 chemist to the United States North Pacific Exploring Expedition, and in 1857-65 analytical and consulting chemist in Boston. In 1865 he accepted the chair of general and industrial chemistry in the Massachusetts Institute of Technology, and in 1870 that of agricultural chemistry in Harvard, becoming dean of the Bussey Institution in 1871. He retired in 1907. Storer was a fellow of the American Academy of Arts and Sciences and a member of many other scientific societies. The researches on the hydrocarbons which he carried on with C. M. Warren have become classic, but he is especially well known for his work on the methods of teaching chemistry, which he developed in conjunction with Charles W. Eliot (q.v.) while at the Massachusetts Institute of Technology. Their book, *A Manual of Inorganic Chemistry* (1869), representing a great advance in the methods of treating the subject, became very popular. Of notable importance also was Storer's *Agriculture in Some of its Relations with Chemistry* (1887; 7th ed., 3 vols., 1897). He also published *A Dictionary of Solubilities of Chemical Substances* (1864); *Manual of Qualitative Chemical Analysis* (1868; 16th ed., 1892), with Eliot; *Elementary Manual of Chemistry* (1894) and *Manual of Qualitative Analysis* (1899), both with W. B. Lindsay.

**STOREY, MOORFIELD** (1845- ). An American lawyer and publicist, born at Roxbury, Mass. He graduated at Harvard in 1866, studied at the Harvard Law School, and in 1869 was admitted to the bar. In 1867-69 he was private secretary to Senator Charles Sumner, and in the latter year began the practice of his profession in Boston. He was prominent in the "Mugwump" movement of 1884. In 1900 he was defeated for Congress. Storey served as president of the American Bar Association in 1896, of the Anti-Imperialist League after 1905, and of the National Association for the Advancement of the Colored People in 1910-13. He published *Charles Sumner* (1900) in "American Statesmen Series"; *The Reform of Legal Procedure* (1911); *Ebenezer Rockwood Hoar, a Memoir* (1911), with E. W. Emerson.

**STORK** (AS. *stora*, OHG. *stora*h, Ger. *Storch*,

stork). The popular name for a family of birds, the Ciconiidae, allied to the herons and ibises. They are large birds, with long legs, half-webbed toes; the bill longer than the head, straight, strong, pointed, and without any groove; the nostrils pierced longitudinally in the horny substance. The species are about 25 in number. The common white stork (*Ciconia alba*, or *ciconia*), a migratory native of the greater part of the Old World, is about three and a half feet in length. The head, neck, and whole body are pure white; the wings partly black; the bill and legs red. The neck is long, and generally carried in an arched form; the feathers of the breast are long and pendulous. and the bird often has its bill half hidden among them. The stork frequents marshy places, feeding on eels and other fishes, batrachians, reptiles, young birds, and small mammals. It makes a rude nest of sticks, reeds, etc., on the tops of tall trees, or of ruins or disused chimneys. The stork has no voice. Its flight is powerful and very high in the air. Another species, the black stork (*Ciconia nigra*), rather smaller, the plumage of the upper parts glossy black, the under parts white, is also common in many parts of Europe, Asia, and Africa. The South American stork (*Dissoura* or *Euxemira maguari*) is very similar to the common stork. It is found on the pampas of Argentina; and where mice and frogs are abundant, hundreds of these birds will congregate.

The only birds of this family occurring in North America are the wood ibises of the Southern States and the jabiru (q.v.). They are large birds, three and a half feet long, with the head and neck bare, wings and tail black, and rest of plumage white. They are found in large flocks and nest in colonies. See ADJUTANT; MARABOU; SHOEBILL; etc.; and Colored Plate of WADERS.

**STORM** (AS. *storm*, Ger. *Sturm*, storm; probably connected with Gk. *ὄρη*, *hormē*, attack). Any unusual, severe, or destructive atmospheric phenomenon—a windstorm, sandstorm, tornado, typhoon, or hurricane, in which wind is the destructive agent; rain, hail, or snow, monsoon, cloudburst, or flood, in which the precipitation is the prominent feature; a thunderstorm in which the thunder is impressive and the lightning is destructive; a blizzard, in which combined cold wind and snow is the prominent feature. All these storms attend the flow of air from areas of high to those of low barometric pressure—so-called storm centres or "lows." In general the winds blow around and in towards these low areas, thereby generating still lower barometric pressures near the centre. The air below, being forced to rise above the earth's surface, expands, cools, and precipitates its excess of moisture, thereby producing rain, snow, or hail.

Storms are often classified as attending areas of low pressure (cyclonic storms); or as attending areas of high pressure (anti-cyclonic). In all cases the flow of the air is primarily due to differences of density; the denser air is drawn by gravity to the earth's surface. The centrifugal tendency due to the diurnal rotation of the earth also pushes the denser air towards the equator harder than it does the lighter moist air. For both reasons, therefore, the lighter is raised by the denser air, and overflows towards the pole. Now a body on the earth's surface and in motion relative to it, while at the same time

rotating with it, will appear to an observer on the earth to be deflected towards the right hand as it moves forward in the Northern Hemisphere, but to the left hand in the Southern Hemisphere. By virtue of this deflection the winds that are blowing towards a region of low pressure acquire, each for itself, a deflection towards the right or the left respectively, so that instead of flowing radially inward towards the centre they whirl around it in an inflowing spiral curve. The direction of the whirling inflow in extensive storms is invariably the same in each hemisphere because of the constant action of

and especially to the so-called general circulation of the atmosphere. The frequency of storms and the general types of storm paths are, of course, best known for the continental portions of the Northern Hemisphere, but there are also sufficient data for the oceanic regions to justify an attempt at presenting the accompanying sketch chart of the Northern Hemisphere showing the general character and track of the storm paths. (See Fig. 1.) This chart shows by its numerous lines and arrow heads the occurrence and the direction of motion of storm centres along the lines of greatest frequency, so far as

FIG. 1. CHART SHOWING STORM PATHS.

the earth's deflective influence upon each individual particle of air in motion. By reason of this circulation an outward centrifugal pressure is produced, and the pressure gradient over the region of the storm is much greater than it would be if the winds flowed directly to the centre, without any spiral circulation. In extensive storm areas this general tendency of the lower winds to circulate around a centre may exist over a region a thousand miles or even more in diameter.

As far as possible the paths pursued by storm centres during past years are plotted upon charts, then classified according to their general characteristics and studied with reference to their relations to the topography of the continents and the general distribution of the barometric pressure, temperature, and moisture,

now known. The Arctic region, northern Africa, and Central Asia must be considered as blanks; we have no daily maps for these regions, and only know that general cyclonic storms are infrequent in Africa and Asia. The chart shows that storm centres move slowly westward when within the tropics and also slowly towards the pole, but move more rapidly eastward between the tropics and the Arctic circle, as well as more rapidly northward. The zone of greatest storm frequency lies between lat. 45° and 55°. In general the path of any observed storm may be predicted on the basis of a simple study of this chart of storm tracks. But individual temporary departures from average conditions are so great that in actual weather forecasts it is necessary to allow these general maps of types and averages to have only a very slight influence

upon the work. It is, in fact, always necessary to consider what a special storm has been doing during the preceding few days, and to what extent it is normal, and to what extent abnormal, as to the direction and velocity of its motion, and the rate of its increase or decrease in intensity. This can only be done by a careful comparison of several successive weather maps. As these maps are made up at least twice a day (sometimes oftener), the forecaster is in a position to say how fast the storm is moving and whether it is intensifying or dying away.

The great irregularities in individual storm paths may be appreciated by studying the accompanying chart (Fig. 2) showing the tracks of centres of low pressure over the United States. The most severe storms are the hurricanes that begin in the tropical portion of the Atlantic,

A full presentation of work upon this subject by students during the past century will be found in *Lehrbuch der Meteorologie*, by Prof. Dr. Julius Hann (3d ed., Leipzig, 1914-15). In his recent work *A Meteorological Treatise on the Circulation and Radiation in the Atmospheres of the Earth and the Sun* (New York, 1915) Professor Bigelow brings together in their most revised form all his mathematical conclusions. Consult, also: "Contributions to Meteorology," by Professor Loomis, as revised and published in the *Memoirs of the National Academy of Sciences*, vols. iii, iv, and v (Washington, 1885, 1887, and 1889). The details of current storm phenomena are published regularly by the Weather Bureau in the *Monthly Weather Review*. The physical-mathematical theories have been further developed in numerous memoirs.

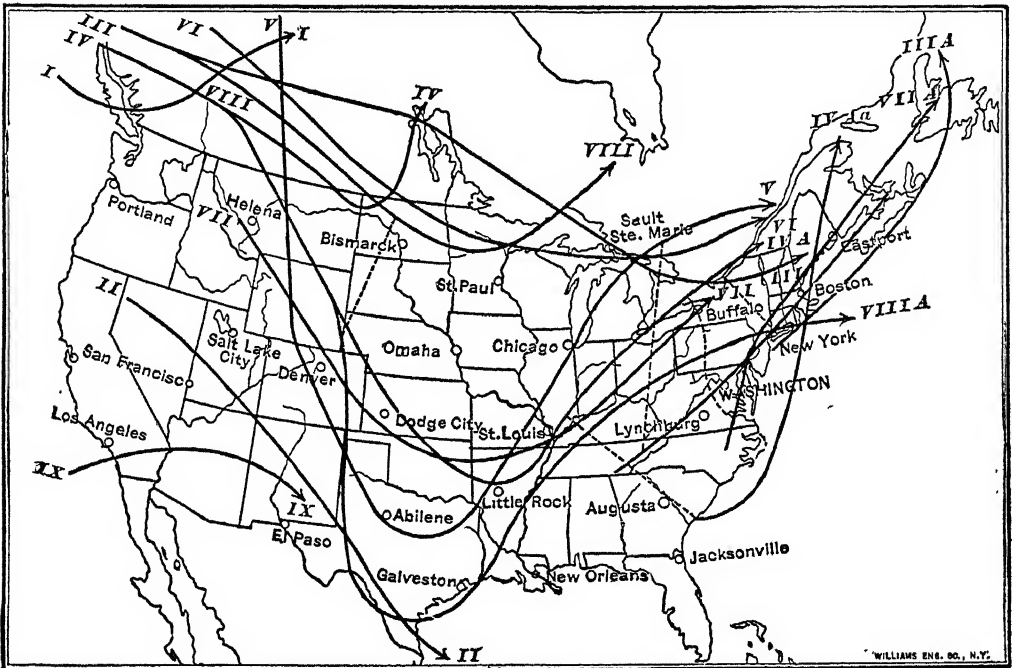

FIG. 2. TRACKS OF CENTRES OF LOW AREAS.

move westward and northward into the South Atlantic or Gulf States, then turn towards the northeast and disappear while still moving towards Europe. The paths pursued by general cyclonic storms are apparently determined by the so-called general circulation of the atmosphere, but are modified considerably by the formation of cloud and rain or snow attending the storm. For the annual and geographical distribution of cyclones of high velocity in the United States, consult a paper by Hanzlik in *Monthly Weather Review* for August, 1904.

**Bibliography.** The mechanical and thermal problems connected with the generation and maintenance of storms are set forth without technical mathematics by Prof. William Ferrel in his *Popular Treatise on the Winds* (2d ed., New York, 1898). They are discussed most elaborately in a technical manner by Prof. F. H. Bigelow in his *Report on International Cloud Work* (published as vol. ii of the *Report of the Chief of the Weather Bureau for 1898*). See also his *Storms, Storm Tracks and Weather Forecasting*, U. S. Weather Bureau Bulletin 20 (1907).

The current literature is contained in the successive volumes of the *Meteorologische Zeitschrift* (Berlin); Bowie and Weightman, *Types of Storms of the United States and Their Average Movements* (Washington, 1914).

**STORM, störm, GUSTAV** (1845-1903). A Norwegian historian, born in Lom. He studied at Christiania, becoming professor of history in 1877. His publications include many historical articles in German and Scandinavian journals. They include *Sagnkredsene om Karl den Store og Didrik af Bern* (1874), *Kritiske bidrag til vikingetidens historie* (1878), and a translation of Snorre Sturluson's *Kongesagaer* (1897), on which he had previously written his *Snorre Sturlasons historieskrivning* (1873). He edited *Monumenta historica norvegica* (1880). In 1900 the Norwegian Storting appropriated 20,000 kroner for a popular edition of Storm's Dano-Norwegian rendering of the *Heimskringla* (1886-89).

**STORM, shtörm, THEODOR** (1817-88). A German poet and novelist, one of the great masters of that peculiarly German creation, the short

story of character and sentiment. He was born at Husum, Schleswig, on Sept. 14, 1817, studied jurisprudence at Kiel and Berlin, and, returning to Kiel in 1839, became intimate with the brothers Theodor and Tycho Mommsen, poetry being the bond of union, especially their mutual admiration for the Swabian poet Mörike. The result was the publication of the *Liederbuch dreier Freunde* (1843), now very rare, which contained Storm's first essays in poetry. For ten years he practiced law in his native town and returned to it as Landvogt in 1864, having entered the Prussian civil service in 1853, and occupied judicial offices at Potsdam and Heiligenstadt, near Göttingen. In 1880 he retired and settled at Hademarschen, in Holstein, where he died on July 4, 1888.

Storm began his literary work at Husum by collecting popular sagas and stories of Schleswig-Holstein, then assisted Biernatzki in editing his *Volksbuch*, in which, besides some exquisite lyrics, his first three important stories, *Martha und ihre Uhr* (1848), *Im Saale* (1849), and *Imensee* (1850; 66th ed., 1907), appeared. The last-named novelette, the author's most popular and perhaps his most characteristic work, was the crowning achievement of his first period. Through various translations it has become familiar to English readers. Of about a dozen stories written during the 11 years of absence from his native soil, *Im Sonnenschein* (1854) and *Angelica* (1855) are sketches of by-gone days, tinged with the elegiac melancholy which pervades most of the author's stories; *Im Schloss* (1861) and *Von jenseits des Meeres* (1864) boast of happy endings, and *Auf der Universität* (1862) is the most ambitious story of this period—scenes from his own student life being charmingly interwoven. *Die Regentruhe* (1864) is the best of several delicious fairy tales. With Storm's return to Husum in 1864 his work enters an essentially new phase, in which the passive retrospective novel gives place to a more active and dramatic form of romance. On the one hand is here to be considered a series of chronicle tales, written in a quaint style, comprising *Der Spiegel des Cyprianus* (1865), a romantic tale of the Thirty Years' War, *Aquis Submersus* (1876), *Renata* (1878), *Zur Chronik von Grieshuus* (1884), and *Ein Fest auf Haderslevhuus* (1885); on the other hand some artist tales, such as *Ein stiller Musikant* (1874) and *Psyche* (1875). On psychological lines are *Viola Tricolor* (1873), *Carsten Curator* (1878), *John Riew* (1885), *Ein Bekenntnis* and *Der Schimmelreiter* (1888). Nor should the delightful children's story *Pole Poppenspäler* (1874) be forgotten. Consult Schütze, *Theodor Storm, sein Leben und seine Dichtung* (Berlin, 1887); Wehl, *Theodor Storm, ein Bild seines Lebens und Schaffens* (Altona, 1888); Stern, *Studien zur Litteratur der Gegenwart* (Dresden, 1895); Robertson, in *The Gentleman's Magazine* (London, 1895); Remer, *Theodor Storm als norddeutscher Dichter* (Berlin, 1897); and Gertrud Storm, *T. Storm* (2 vols., Berlin, 1911-12).

**STORM AND STRESS** (Ger. *Sturm und Drang*). The name of an emancipatory movement in German literature, usually considered as reaching its height in the decade 1770-80. It received the title from that of a typical drama by Klinger (1776), who wrote under the influence of Rousseau, with "nature," "originality," and "genius" as his watchwords. To this movement belong Goethe's *Götz von Berlichingen*,

Schiller's *Die Räuber*, and countless works of similar striving but inferior worth. Consult A. Sauer, *Stürmer und Dränger*, in Joseph Kürschner, *Deutsche National-Litteratur*, vols. 79-81 (Stuttgart, 1883). See GERMAN LITERATURE.

#### STORM AND WEATHER SIGNALS.

Flags, semaphores, lanterns, steam whistles, and other devices exhibited or sounded to inform mariners and others of approaching storms or unusual weather conditions. The use of such warnings resulted from personal studies in more or less coöperation about 1850-60. Storm and weather signals, properly so called, began to be displayed about 1863 in England by Captain Fitzroy; in France by Leverrier; and in Belgium by Buys-Ballot. The American system of observations began in 1870 and storm signals were first displayed in the autumn of 1871. At the present time every civilized nation and every port of any importance has some method of signaling or otherwise informing navigators of approaching storms. Among the systems that are now in use are the following:

The semaphore is a simple vertical post having two or more arms attached that can be set at different angles with the vertical. The semaphore was introduced as a telegraphic apparatus about 1790, and numerous semaphore stations are still maintained in Europe and in various colonies. See SIGNALING AND TELEGRAPHING, MILITARY.

The Dutch and Belgian aëroclinoscope (q.v.) was a modified semaphore, in which the position of the arm indicated the direction of the barometric gradient and consequently of the wind that is nearly perpendicular to that.

In 1910 the International Meteorological Committee, meeting at Berlin, adopted a system of international local day signals which they recommended to the weather services throughout the world. The signals are shown below and indicate that a gale is to be expected beginning with the wind stated:

Cones to be hoisted in vertical line separated by a distance equal to the length of the slant line of the cone.

In 1913 the same committee, meeting at Rome, adopted two codes of international storm signals, one for stations using three lanterns and one for countries using two lanterns. As with the day signals these indicate a gale beginning with the wind stated.

The lanterns to be not less than two meters apart. No night signal for a hurricane selected for recommendation.

These international storm-warning signals are not obligatory on the nations represented at the Meteorological Congresses, and have not been widely adopted (*in toto*) as yet. Great Britain announced her intention of adopting the above

code, using three lanterns, beginning in 1914. Germany uses the international day signals (omitting the hurricane signal) and supplements them with a cautionary sphere or red flags: 1 red flag means the wind will veer, 2 red flags mean the wind will back. The night signal is one red light. Holland follows the German system, but uses black flags instead of

(For countries using three lanterns)

Red	White	Red	White
Red	White	White	Red

red. France uses the international day signals but has no night signals. Spain has tried the international signals for day and night (two-lantern). Canada proposed to adopt the international day signals, but used the United States night signals in 1913. The symbols and signals used at the ports of the Orient depend upon the nationality of the port.

The arrangement of flags used in the United States by the United States Weather Bureau for storm warnings differs from that for weather forecasts and is shown in the accompanying illustrations.

Storm warnings

NE. Winds

SE. Winds

NW. Winds

EXPLANATION OF UNITED STATES WEATHER BUREAU STORM AND HURRICANE WARNINGS.

*Small craft warning.*—A red pennant indicates that moderately strong winds are expected.

*Storm warning.*—A red flag with a black centre indicates that a storm of marked violence is expected.

The pennants displayed with the flags indicate the direction of the wind; red, easterly (from northeast to south); white, westerly (from southwest to north). The pennant above the flag indicates that the wind is expected to blow from the northerly quadrants; below, from the southerly quadrants.

By night a red light has indicated easterly winds, and a white light below a red light, westerly winds.

*Hurricane warning.*—Two red flags with black centres, displayed one above the other, indicate the expected approach of a tropical hurricane, or one of those extremely severe and dangerous storms which occasionally move across the lakes and northern Atlantic coast. Neither small craft nor hurricane warnings are displayed at night.

A new system of night signals was formulated by the United States, to go into operation on the Great Lakes during 1916. This system

is the two-lantern type but employs a three-lantern signal for severe storms or hurricanes.

Signals for the weather forecasts are as follows:

INTERPRETATION OF DISPLAYS.

No. 1, alone, indicates fair weather, stationary temperature. No. 2, alone, rain or snow, stationary temperature. No. 3, alone, local rain or snow, stationary temperature.

No. 1, with No. 4 above it, fair weather, warmer. No. 1, with No. 4 below it, fair weather, colder. No. 2, with No. 4 above it, rain or snow, warmer. No. 2, with No. 4 below it, rain or snow, colder. No. 3, with No. 4 above it, local rain or snow, warmer. No. 3, with No. 4 below it, local rain or snow, colder.

When a steam whistle is used for weather signals a warning blast of from 15 to 20 seconds' duration is first sounded and then the longer blasts (4 to 6 seconds), which refer to weather, and the shorter blasts (1 to 3 seconds), which refer to temperature, the former being sounded first. The signals are as follows: One long blast, fair weather; two long, rain or snow; three long, local rain or snow. One short blast, lower temperature; two short, higher temperature; three short, cold wave. The signals may be repeated to avoid error. For an account of storm and weather signals which have been used in the United States consult *Monthly Weather Review* (Washington, September, 1914).

The international code of maritime weather signals together with a list of the weather signals in use by various countries is given in a publication of the Meteorological Office, London (M. O. 206), entitled *Codes of signals adopted and recommended . . . together with a list of the maritime*

*weather signals at present in use in the various countries of the globe* (London, 1914).

**STORMCOCK.** See MISTLE THRUSH.

**STORM KING.** A rocky peak of the Highlands of the Hudson, 1530 feet in height, 4 miles north of West Point. Its Dutch name was Boterberg, Butter Mountain.

**STORM VAN 'SGRAVESANDE,** van sgrá'-ve-zân'de. See GRAVESANDE.

**STORNOWAY.** The chief town of Lewis-with-Harris (q.v.), an island of the Outer Hebrides, Scotland (Map: Scotland, B 1). Its chief feature is the palatial Stornoway Castle, completed in 1870. It is an important fishing station, shipping large quantities of fish to home and Baltic ports, and has a fine harbor, covering a square mile. Urban pop., 1901, 3711; 1911, 3806; of parish, 1901, 12,983; 1911, 13,438.

**STORRS, RICHARD SALTER** (1821-1900). An American Congregational minister, born at Braintree, Mass. He graduated at Amherst College (1839) and at Andover Theological Seminary (1845); and was minister of the Harvard Congregational Church, Brookline, Mass., and, from 1846 till his death, of the Church of the Pilgrims, Brooklyn. He was much sought after

as an orator and lecturer, and his best-known writings represent the substance of what had earlier been spoken. They show learning as well as oratorical power. Collections were made as follows: *Bernard of Clairvaux, the Times, the Man, and his Work* (1892), eight lectures; *Addresses on Foreign Missions* (1900); *Orations and Addresses* (1901). In 1848 Dr. Storrs helped to found the *Independent*, and in 1896 he was president of the American Historical Association. Consult Charles Storrs, *The Storrs Family* (New York, 1886), and the *Memorial Address* by E. A. Park (ib., 1900).

**STORRS, WILLIAM LUCIUS** (1795-1861). An American jurist, born at Middletown, Conn. He graduated at Yale College, 1814; studied law at Whitestown, N. Y.; was admitted to the bar in 1817; resided and practiced law in Middletown; and was a member of Congress 1829-33 and 1839-40. He was a Whig in politics. In the latter year he was appointed associate judge of the State Supreme Court of Errors; Chief Justice, 1856; and was professor of law in Yale College, 1846-47. His decisions are printed in the *Connecticut Reports*.

**STORTHING, stôr'ting**. The legislative assembly of Norway (q.v.).

**STORY, GEORGE HENRY** (1835-1922). An American portrait and genre painter and museum official. He was born in New Haven, Conn., where he studied wood engraving under Charles Hine; later he studied painting for a year in Europe. Upon his return to America he settled in 1863 in New York, and became an associate of the National Academy in 1875. His portrait of Alexander S. Murray and one of himself are in the Metropolitan Museum, where he was curator of paintings from 1889 to 1906 and acting director in 1904-05.

**STORY, JOSEPH** (1779-1845). An eminent American jurist and judge, born at Marblehead, Mass. He graduated from Harvard College in 1798, studied law, and was admitted to the bar in 1801. For a time he gave considerable attention to general literature and poetry. In 1804 he published *The Power of Solitude*, and other poems, which were not favorably received. Thereafter he devoted himself to law and politics. He was elected to the State Legislature in 1805 and became a leader of the Republican (afterward called the Democratic) party, and defended the measures of Jefferson. In 1808 he was elected to Congress, and although not in sympathy with Madison's administration, the President, in 1811, appointed him associate justice of the Supreme Court of the United States. He was then only 32 years of age. In 1820, as a member of the Massachusetts Constitutional Convention, he advocated a property basis for the Senate. In 1829 he was appointed professor of law at Harvard, and taught law for 16 years, at the same time serving on the Supreme Court bench. He was opposed to slavery, and was unpopular in certain sections of the country. He presided as acting Chief Justice of the Supreme Court for some time after the death of Marshall, and probably only his attitude towards Madison's administration prevented his selection as permanent Chief Justice. During his long service on the bench he decided many admiralty and patent law cases which are authority at the present time, and he shared with Chancellor Kent the distinction of molding American equity jurisprudence. He wrote the opinion in the celebrated Dartmouth College case, which has

been the subject of much criticism, although recognized as an able effort. He received the degree of LL.D. from Brown in 1815, from Harvard in 1821, and from Dartmouth in 1824. Story continued his labors on the bench and in the law school until his death at Cambridge in 1845. His legal writings and decisions are still frequently quoted in the highest courts of the United States and England. He published the following legal works: *Commentaries on the Law of Bailments* (Boston, 1832); *Commentaries on the Constitution of the United States* (1833); *Conflict of Laws* (1834); *Commentaries on Equity Jurisprudence* (1835-36); and works on *Bills and Notes, Partnership, Agency, and Equity Pleadings*, at later dates. His works have gone through many editions, and are still used. Consult W. W. Story, *Life and Letters of Joseph Story* (Boston, 1851).

**STORY, JULIAN**. See STORY, WILLIAM WETMORE.

**STORY, MRS. JULIAN**. See EAMES, EMMA.

**STORY, T. WALDO**. See STORY, WILLIAM WETMORE.

**STORY, MRS. WILLIAM CUMMING** (?- ). An American women's club leader, born in New York City. Her maiden name was Daisy Allen. She was active in women's clubs and in patriotic societies for many years, and served as president of the New York City Federation of Women's Clubs, as first vice president of the New York State Federation of Women's Clubs, and as vice president of the National Society of Patriotic Women of America. She was principally known, however, in connection with the Daughters of the American Revolution, of which she was elected president general in 1913 and re-elected in 1915.

**STORY, WILLIAM EDWARD** (1850- ). An American mathematician, born in Boston. He graduated at Harvard in 1871, and studied at the universities of Berlin and Leipzig (Ph.D., 1875). He taught at Harvard and at Johns Hopkins until 1889 and thereafter was professor of mathematics at Clark University. In 1878-82 he was editor in charge of the *American Journal of Mathematics*, and later edited the *Mathematical Review*. Story was elected a member of the National Academy of Sciences in 1908. His contributions deal with the theory of errors, algebraic invariants, finite differences, etc.

**STORY, WILLIAM WETMORE** (1819-95). An American sculptor, legal scholar, and author. He was born at Salem, Mass., the son of Joseph Story (q.v.). After graduating from Harvard College in 1844 he studied law under his father's direction, but although he was admitted to the bar and wrote several learned works, he never practiced. In 1851 he took up sculpture as a profession and removed to Italy, where he spent the remainder of his life. Residing principally at Rome, he maintained a studio famous for its brilliant hospitality. Among the many monuments, statues, ideal figures, and portrait busts by him are the statues of Cleopatra (1864) and Semiramis (1874) in the Metropolitan Museum of Art, New York; a statue of his father (Mount Auburn Cemetery); Edward Everett (Boston Public Gardens); a bronze statue of George Peabody, erected in London (replica, Baltimore, 1888); William Prescott (Bunker Hill); Professor Henry (Washington); and Francis Scott Key, Golden Gate Park, San Francisco. Story's work, as a whole, while possessing some dignity

of conception, lacks in technique and real inspiration. A man of varied talents and accomplishments, he published a number of books and pamphlets, including poems, essays, etc. His *Works* are to be had in eight volumes.

One of his sons, JULIAN STORY (1858-1919), a portrait painter, was a student of Duvencek in Munich, and of Boulanger and Lefebvre in Paris. He received a gold medal in Berlin in 1891 and a silver medal at the Paris Exposition of 1900, and was elected an associate of the National Academy. Among his sitters were King Edward VII and Emma Eames, whom he married but from whom he was later divorced. Another son, T. WALDO STORY (died 1915), a sculptor, designed the bronze doors for the library of the late J. P. Morgan in New York. His statue of Sir William Harcourt was the first ever placed in the House of Commons. Consult: M. E. Phillips, *Reminiscences of William Wetmore Story* (New York, 1898); Henry James, *William Wetmore Story and his Friends* (Boston, 1903); Lorado Taft, *History of American Sculpture* (New York, 1903).

STOSCH, štôsh, ALBRECHT VON (1818-96). A German general and naval administrator, born at Coblenz. He received a military education and was commissioned lieutenant in 1835. He entered the general staff in 1855, and became chief of staff of the Fourth Army Corps in 1861 and major general in 1866. In the Seven Weeks' War he was quartermaster-general of the Second Army. In the same year he was appointed director of the commissary department with the rank of lieutenant general, which position he held during the Franco-Prussian War in 1870-71, and was chief of staff with the army left in France after the conclusion of peace. In 1872 he was appointed chief of the admiralty and in 1876 received the title of admiral. While holding these offices he greatly increased the power and efficiency of the German navy. He retired in 1883.

STOSS, štôs, VEIT (c.1440-1533). A celebrated German sculptor and engraver, chief master of wood carving in Germany. His birthplace, whether at Cracow or Nuremberg, is disputed, but it was more probably Nuremberg, where he certainly received his artistic education. In 1477 he renounced his Nuremberg citizenship and removed to Cracow to execute commissions of great importance. An honored citizen, he was repeatedly chosen master of the artists' guild, and in 1485 was granted freedom from taxation by the city. He again practiced his art in Nuremberg in 1487-89, then at Cracow until 1496, in which year he resumed his Nuremberg citizenship. With the wealth acquired at Cracow he purchased in 1499 a house with spacious grounds and made divers investments. In one of these he was defrauded of 1200 gulden, and in order to recoup his losses he forged an obligatory note in the name of the burgher who had advised and profited by the investment. This crime, punishable by death, was commuted by the council of Nuremberg in 1503 to having both cheeks branded. From then on he was in constant quarrel with the council, which twice imprisoned him and refused to pay what he considered his just dues for work done. He finally secured a letter of pardon with restoration of civic rights from Emperor Maximilian, which the council in 1508 had to recognize. Stoss's activity as an artist continued unabated, not only in works for

Nuremberg churches and elsewhere but for the Emperor himself, at whose court he appeared. He left a large estate at his death.

His earliest work on record is the "High Altar," in St. Mary's at Cracow, executed in 1477-89, with the "Death of the Virgin" and the "Assumption" in the middle shrine, a work praised as a wonder of art by the master's contemporaries and still reckoned among the best creations of its kind, exhibiting the artist's chief characteristics: vivid description, varied and animated figures, and rich drapery. Next followed, in 1492, the red marble "Monument of King Casimir IV," in the cathedral, a work of solemn splendor and simplicity. The earliest of his sculptures executed at Nuremberg are the three stone reliefs of the "Last Supper," "Christ on the Mount of Olives," and "Taking of Christ" (1499), in the ambulatory of St. Sebaldus. Over the high altar in the same church rise the "Crucifix" (1520) and the large and imposing Renaissance "Figures of Mary and Saint John" (c.1532), largely destroyed by restoration. In the Germanic Museum may be seen the noble high relief of the "Crowning of the Virgin by God and Christ," clear in composition and executed with masterly perfection; and the wooden paneling known as the "Rose Garland," in the Germanic Museum, Nuremberg, which contains numerous examples of his work. Seven more reliefs, which formed part of this work, are now in the Berlin Museum. Noteworthy is the large "Pietà" in the Jacobskirche, which also contains several smaller but very able works of the master, but his best-known work in carved wood is "The Angel's Salutation" (1518), in the church of St. Lawrence, the central group of heroic size surrounded by a chaplet of roses in which are set seven medallions with the "Joys of the Virgin" in bas-relief, a work unique in beauty and conception. He designed also the superbly carved altarpieces in the parish church at Schwabach (1506) and in the upper parish church at Bamberg (1523). His engravings, scenes from the Passion, severe in style and dating from his early period, are now very rare.

**Bibliography.** The best-known monographs on Veit Stoss are by Berthold Daun (Bielefeld, 1906), F. Köpfer (Cracow, 1907), and Max Lossnitzer (Leipzig, 1912).

STOTHARD, stôth'rd, CHARLES ALFRED (1786-1821). An English antiquarian draftsman, the second son of the painter Thomas Stothard. He was born in London, studied at the Royal Academy schools, and exhibited his best painting, "The Death of Richard II," in 1811. Afterward he worked on the *Magna Britannia* (1815), and became historical draftsman to the Society of Antiquaries. In that capacity he made drawings of the Bayeux tapestry, which were published in the society's *Vetusta Monumenta* (1821-23). His most important work was the *Monumental Effigies of Great Britain* (10 parts, 1811-21), which was completed by other artists, and republished in 1876. His drawings are all of remarkable accuracy. He married Anna Eliza Kempe in 1818. See BRAY. MRS. ANNA ELIZA KEMPE.

STOTHARD, THOMAS (1755-1834). An English illustrator and painter. He was born in London and studied at the Royal Academy schools. In 1779 he entered upon his career as an illustrator. More than 3000 of his designs, the greater number of which are in the British Museum, were engraved. Although somewhat

superficial, his illustrations are characterized by grace and charm and by a sympathetic touch, especially when he depicted the loveliness of childhood. Stothard illustrated the works of Fielding, Richardson, Sterne, Goldsmith, Shakespeare, and Milton, as well as *Pilgrim's Progress*, *Don Quixote*, *Robinson Crusoe*, and other standard works. As a painter he is less important. He executed decorations at Burghley House (1799-1802), and in the Signet Library (1822) at Edinburgh. Sixteen of his easel pictures are in the National Gallery. Consult his *Life* by Mrs. Bray (London, 1851) and the monograph by A. C. Coxhead (ib., 1906).

**STOTT, HENRY GORDON** (1866-1917). An American electrical engineer, born in the Orkney Islands, Scotland. He was educated at the College of Science and Arts, Glasgow, and at the Glasgow and West of Scotland Technical College. Between 1885 and 1891 he was engineer for various corporations in Britain and Spain. From 1891 to 1901 he was an engineer with the Buffalo General Electric Company, and in that connection did much notable construction work. After 1901 he was superintendent of motive power of the Interborough Rapid Transit Company of New York, and after 1912 held also the same position with the New York Railways Company. Stott served as president of the American Institute of Electrical Engineers in 1907-08.

**STOUGHTON**, stō'ton. A town, including several villages, in Norfolk Co., Mass., 16 miles south of Boston, on the New York, New Haven, and Hartford Railroad (Map: Massachusetts, E 4). It has a public library and a handsome town hall. Boot and shoe making, and the manufacture of woollens, rubber goods, boxes, knitted goods, and fountains are the chief industries. Pop., 1900, 5442; 1910, 6316. Stoughton, named in honor of Gov. William Stoughton, was set off from Dorchester and incorporated in 1726. Consult Hurd, *History of Norfolk County* (Philadelphia, 1884).

**STOUGHTON**. A city in Dane Co., Wis., 16 miles by rail southeast of Madison, on the Chicago, Milwaukee, and St. Paul Railroad (Map: Wisconsin, D 6). It has a Carnegie library. Carriages and wagons, agricultural implements, sleds, shoes, flour, etc., are manufactured. Pop., 1900, 3431; 1910, 4761.

**STOUGHTON, ISRAEL** (?-1645). An American colonist, born in England. He was one of the founders of Dorchester, Mass., and in 1633 he became a freeman of the Colony. Though a member of the General Court in 1634-35, he wrote a pamphlet denying the right of the assistants to act as magistrates. As a punishment the government debarred him from holding public office for three years, but upon his making a humble submission revoked the sentence. From 1637 to 1643 he himself was an assistant, and in 1637 he was appointed commander of the Colony's troops in the Pequot War. In 1639 he was a commissioner in the boundary controversy with Plymouth. Five years later he went to England, where he entered the Parliamentary forces with the rank of lieutenant colonel, and probably fought at the battle of Naseby. At his death he left 300 acres of land in Dorchester to Harvard University. Consult Josiah Quincy, *The History of Harvard University* (2 vols., Boston, 1860).

**STOUGHTON, JOHN** (1807-97). An English dissenting preacher and ecclesiastical historian.

He was born in Norwich, and after an elementary education entered a law office. He abandoned law for the ministry, and after preparation in Highbury College he was ordained (1833). In 1872 he was elected professor of historical theology in New College, Saint John's Wood. In 1862 he published *Church and State, Two Hundred Years Ago . . . 1660-63*. Other works are: *Ecclesiastical History of England from the Opening of the Long Parliament to the Death of Oliver Cromwell* (1867); *Religion in England under Queen Anne and the Georges* (1878); *Religion in England from 1800 to 1850* (1884). Consult his *Recollections of a Long Life* (London, 1894), and G. K. S. Lewis, *John Stoughton, a Short Record of a Long Life* (ib., 1898).

**STOUGHTON, WILLIAM** (c.1632-1701). A Colonial Governor of Massachusetts. He graduated at Harvard in 1650, and as a fellow at New College, Oxford, from 1652 until ejected at the time of the Restoration (1660). Returning to Massachusetts, he was an assistant from 1671 to 1686—though in 1684 he refused to serve—and a commissioner of the United Colonies from 1674 to 1676, and again from 1680 to 1686. In 1677 he went to England as the agent of his colony in a boundary dispute with New Hampshire. He was a member of Governor Andros's Council, and from 1692 until his death was Lieutenant Governor of Massachusetts, being acting Governor from the recall (1694) of Sir William Phipps until the arrival (1699) of Lord Belmont. In 1692 he was Chief Justice of the Special Court of Oyer and Terminer by which the Salem "witches" were tried, and, as such, treated the accused with relentless severity. He was a liberal benefactor of Harvard, and it was for him that Stoughton Hall was named. Consult J. L. Sibley, *Biographical Sketches of Graduates of Harvard University*, vol. i (Cambridge, 1873).

**STOUGHTON MUSICAL SOCIETY**. See CHORAL SOCIETIES.

**STOUP**, stōop. See HOLY WATER VASE.

**STOURBRIDGE**, stēr'brij. A town in Worcestershire, England, 20 miles north-northeast of Worcester, on the Stour (Map: England, D 4). It contains iron, glass, earthenware, and fire-brick factories. Stourbridge clay, upon which the action of fire has less effect than upon most varieties of clay, is an article of export. In the grammar school founded in 1552, and rebuilt in 1864, Samuel Johnson received part of his education. Pop., 1901, 16,302; 1911, 17,312.

**STOURM**, stōorm, RENÉ (1837- ). A French economist, born and educated in Paris. He was employed in a department of the Ministry of Finance, became professor of finance in the Ecole Libre des Sciences Politiques in 1885, and in 1896 became a member of the Academy of Political and Moral Sciences. In 1913 he succeeded A. de Foville as permanent secretary of the academy. On the history of finance, and more especially of taxation, he wrote *Les finances de l'ancien régime et de la révolution* (1885); *Cours de finance, le budget* (1889; 6th ed., 1909); *Systèmes généraux d'impôts* (1893); *Bibliographie historique des finances de la France du XVIIIème siècle* (1895); and *Les finances du consulat* (1902).

**STOUT**. See BEER.

**STOUT, GEORGE FREDERICK** (1859- ). An English psychologist, born at South Shields, and educated at the Charlotte Terrace School in his native town and at St. John's College, Cam-

bridge. He was made a fellow of St. John's College in 1884, and succeeded Croom Robertson as editor of *Mind* in 1891. After holding various academic positions in the field of philosophy and psychology, he was appointed in 1903 professor of logic and metaphysics in the University of St. Andrews. He became a fellow of the British Academy in 1903. His chief published works are: *Analytic Psychology* (1896, 1902); *Manual of Psychology* (1901; 3d ed., 1913); "Truth and Error," in *Personal Idealism* (1902); *Groundwork of Psychology* (1903). As a pupil of James Ward (q.v.), Stout infused into the traditional English psychology something of his teacher's critical spirit. His *Analytic Psychology* is planned, however, as a preliminary to a larger work on genetic psychology, in which especial attention is to be devoted to ethnographical evidence.

**STOVAINE**, stô'vâ-in. An anæsthetic drug, a substitute for cocaine (q.v.) but having an advantage over the latter in being more stable, less toxic, and a vasoconstrictor, while equally powerful as an anæsthetic. Its composition is indicated by its chemical name, benzoylethyl-dimethylaminopropanol hydrochloride. Stovaine is safer than cocaine for spinal anæsthesia. Locally it may be applied to the mucous membrane or injected hypodermically.

**STOVE**. See HEATING AND VENTILATION.

**STOW**, stô, JOHN (c.1525-1605). An important English historian and antiquary. As a boy he learned the tailor's trade, probably the occupation of his father, but he seems to have abandoned it for antiquarian pursuits. His principal works are his *Summary of English Chronicles*, first published in 1565, and frequently reprinted until his death, with a continuation to the date of each new publication; *Chronicles or Annals of England*, 1580, and reprinted in 1592, to which year the annals are brought down; and *A Survey of London*, the most important of his writings, published in 1598 (ed. by W. J. Thoms, London, 1876, and by C. L. Kingsford, Oxford, 1908). Besides these original works Stow assisted in the continuation of Holinshed's *Chronicle* (1585-87), Speght's edition of Chaucer (1561), etc.

**STOWE**, CALVIN ELLIS (1802-86). An American clergyman, born at Natick, Mass. He was educated at Bowdoin College and at Andover Theological Seminary. In 1830-32 he was professor of Greek at Dartmouth, and in the latter year became professor of sacred literature at Lane Theological Seminary, Cincinnati, where in 1836 he married Harriet, the daughter of Lyman Beecher, then president of the seminary; his wife became famous as Harriet Beecher Stowe (q.v.). In 1850-52 he was professor of divinity at Bowdoin and from 1852 until his retirement in 1864 professor of sacred literature in Andover Seminary. Among his works are: *Lectures on the Sacred Poetry of the Hebrews* (1829), from the Latin of Lowth; *Introduction to the Criticism and Interpretation of the Bible* (1835); *Elementary Education in Europe* (1837); *The Religious Element in Education* (1844); *Origin and History of the Books of the Bible* (1867).

**STOWE**, EMILY HOWARD (née JENNINGS) (1831-1903). A Canadian woman suffragist and pioneer woman physician. She was born in South Norwich, Ontario. Educated at the Provincial Normal School, Toronto, she became a school teacher at an early age. In 1856 she

married John Stowe, of Norwichville, Ontario. She studied medicine, graduated at the New York Medical College for Women in 1867, but, owing to strong and persistent opposition, was not registered as a member of the Ontario College of Physicians and Surgeons until July 16, 1880. She was then the first woman in Canada to be officially recognized as a physician. In 1877 she organized the Toronto Woman's Literary and Science Club, which some years later became a woman's suffrage club. By vigorous effort municipal suffrage for widows and spinsters in Ontario was won in 1883. Ten years later, mainly through her efforts, the Dominion Woman's Suffrage Association was incorporated and she became its president. She was likewise instrumental in securing the admission of women to the University of Toronto. She was highly successful as a public lecturer.

**STOWE**, HARRIET (ELIZABETH) BEECHER (1811-96). An American novelist and Abolitionist, born in Litchfield, Conn., the daughter of the Rev. Lyman Beecher and sister of Henry Ward Beecher. She attended school at Litchfield Academy and later at Hartford. In 1832 her father became president of Lane Theological Seminary at Cincinnati, Ohio. While living there she gained some acquaintance with the ways of slavery, especially as to fugitive slaves and the attitude of the South towards the Abolitionists. The impression was strengthened by journeys into the slave States with her husband, the Rev. Calvin E. Stowe (q.v.), a strong anti-slavery man, whom she married in 1836. In 1843 Mrs. Stowe published her first book, entitled *The Mayflower, or Sketches of Scenes and Characters among the Descendants of the Pilgrims*. In 1850 her husband was called to Bowdoin College, Brunswick, Me., and in the interval before his transfer to the chair of sacred literature at Andover (Mass.) Theological Seminary, two years later, Mrs. Stowe wrote the book by which she is most widely known, *Uncle Tom's Cabin, or Life among the Lowly*. It appeared in the *National Era* of Washington, D. C. (June, 1851, to April, 1852), in the latter year being issued in book form in Boston. As a serial it attracted no unusual notice, but as a book its success, after a few weeks, was unprecedented. Five hundred thousand copies were sold in the United States in five years, and many more in England, and it has been translated into a score of foreign languages. In 1853 Mrs. Stowe, in reply to various inquiries, criticisms, and censures, published *A Key to Uncle Tom's Cabin*. She also wrote, in the same year, *A Peep into Uncle Tom's Cabin, for Children*.

Her health was somewhat impaired, and in 1853 she went to Europe. On her return she published (1854) *Sunny Memories of Foreign Lands*, two volumes of travel. She then returned to the attack against slavery in *Dred: A Tale of the Great Dismal Swamp* (1856; at one time entitled *Nina Gordon*), but without the vigor and success of her former work. In 1864 Professor Stowe resigned his professorship at Andover, and with his wife took up his residence at Hartford, which was Mrs. Stowe's home for the rest of her life. In 1868 she became associated with D. G. Mitchell (q.v.) in the editing of *Hearth and Home*. Her later writing consisted chiefly of novels of quiet New England life, with which she was familiar, and except for her polemic, *Lady Byron Vindicated: A History of the Byron Controversy* (1869), and her article

in *Macmillan's Magazine* which had occasioned that discussion, her works were comparatively free from the didactic spirit. Among her books should be mentioned: *The Minister's Wooing* (1859); *The Pearl of Orr's Island* (1862); *Agnes of Sorrento* (1862); *Religious Poems* (1865); *Oldtown Folks* (1869); *Pink and White Tyranny* (1871); *My Wife and I* (1871); *We and our Neighbors* (1875); and *Poganuc People* (1878). Of these, the best are *The Minister's Wooing* and *Oldtown Folks*. Her collected works in nine volumes were published in New York in 1913.

Mrs. Stowe is remembered chiefly as the author of one of the most influential and widely read novels in literature. Though, like almost all her novels, rambling in structure, *Uncle Tom's Cabin* has abundant vitality, and is the work of a genuine story-teller. It also has the unusual fortune of being at once a cause and an outcome of a heated national struggle; no novel was ever better timed for an occasion, and few have aroused so much admiration and dislike. Soon after its publication the book was dramatized, and it still keeps the stage. The character Uncle Tom was drawn from the life of Josiah Henson (q.v.).

Consult: C. L. Stowe, *Life* (Boston, 1889); Mrs. Annie Fields, *Life and Letters* (ib., 1899); C. E. and L. B. Stowe, *Harriet Beecher Stowe: The Story of her Life* (ib., 1911).

**STOWELL**, stō'el, ELLERY CORY (1875- ). An American international law scholar. He was born at Lynn, Mass., and graduated at Harvard in 1898. He afterward traveled in the Orient and in Europe and studied in Berlin and Paris. Between 1908 and 1913 he taught at George Washington University and at the University of Pennsylvania, and subsequently at Columbia, where he was appointed assistant professor of international law in 1914. In 1910-12 he was assistant editor of the *Annals of the American Academy of Political and Social Science*. He attended the Second Peace Conference at The Hague (1907), and was secretary of the American delegation to the Naval Conference at London (1908-09). He published *Le Consul* (1909); *Consular Cases and Opinions* (1909); *The Diplomacy of the War of 1914* (vol. i, 1915).

**STOWELL**, WILLIAM SCOTT, BARON (1745-1836). A British admiralty and ecclesiastical judge and jurist. He was the eldest brother of Lord Eldon (q.v.). He was born at Heworth, Durham, was educated at Newcastle, went to Oxford in 1761, and became a college tutor. In 1779 he removed to London, was called to the bar (1780), and admitted to the faculty of advocates at Doctors' Commons. In 1788 he was appointed judge in the Consistory Court, knighted, and nominated Privy Councillor. In 1798 he became judge of the Court of Admiralty. As an ecclesiastical and admiralty judge he won high distinction. He practically created much of the admiralty law of England. He drew on the Roman law, and the maritime law of all nations, ancient and modern, and his opinions were very scholarly. He wrote no systematic treatise or textbook, but his judgments were admirably reported. He is the highest English authority on the law of nations, and his judgments—those especially relating to the rights of belligerents and neutrals—have been described as the most valuable contributions made by an English judge to general jurisprudence since the time of Lord

Mansfield. He represented Oxford in the House of Commons for 20 years, but he took no part in the business of Parliament, although he was a zealous supporter of the Conservative party and the Established church. At the coronation of George IV he was raised to the peerage as Baron Stowell of Stowell Park.

**STRABIS'MUS** (Neo-Lat., from Gk. στραβισμός, a squinting, from στραβός, *strabos*, crooked, from στρέφειν, *strephein*, to twist, turn about), or SQUINT. A well-known and common deformity which may be defined as a want of parallelism in the visual axes when the patient endeavors to direct both eyes to an object at the same time. The eye which is directed towards the object looked at is called the fixing eye, the other the squinting eye. The squint is said to be convergent, or internal, when the eye or eyes are directed towards the nose, divergent, or external, when they are directed towards the temple, and vertical when directed upward or downward. The last is often associated with convergent squint. The divergent form is rare, but occurs with myopia.

Squint is of two kinds: (1) paralytic and (2) concomitant. Paralytic squint is caused by paralysis of one or more of the ocular muscles. There is inability to move the affected eyeball away from the side towards which it is directed. The paralysis may be due to a lesion at any point between the cerebral cortex and the muscle. There is diplopia (double vision) unless the squinting eye is the one fixed on the object. Syphilis is the most common cause; others are acute infectious diseases from tumors, abscesses, and meningitis. The treatment is that of the cause. In concomitant squint there is the same deviation of the eyes in every position, and both eyes possess a normal range of movement. Squint may be alternating (to fix with either eye), fixed, or unilateral (squint confined to one eye); in regard to permanency it may be constant or periodic. In concomitant squint there is rarely double vision, one image being disregarded. Uncorrected errors of refraction, congenital feebleness of vision, opacities of the cornea or media, or other disease of the eye, combined with weakness of a muscle, leads to concomitant squint, for, as the sight in one eye is imperfect, there is little inducement to make the muscular effort to keep the two parallel. The treatment includes correction of errors of refraction by glasses, exercise of the muscles by prisms, and operative methods. The last may be division of the short tendon or advancement of that of the opposing muscle, or a combination of these procedures. Latent squint or *heterophoria* is a muscular anomaly differing from strabismus in degree, but not in character. The squint does not become manifest (except by appropriate tests) as in strabismus, but the nervous effort required to keep the eyes in focus results in asthenopia of a very severe type. The varieties of heterophoria are *hyperphoria*, a tendency of one eye to deviate upward; *esophoria*, a tendency of the eye to deviate inward; *exophoria*, a tendency to deviate outward; *hyperesophoria*, a tendency of one eye to deviate upward and inward, or of its fellow to deviate downward and inward; *hyperexophoria*, a tendency of one eye to deviate upward and outward, while the other deviates downward and outward. Perfect muscular equilibrium of both eyes is called *orthophoria*.

**STRABO** (Lat., from Gk. Στράβων, *Strabōn*)

(c.64 B.C.–19 A.D.). A famous Greek geographer and historian, born at Amasia, in Pontus. He received his education first at Nysa, on the Meander, from the grammarian Aristodemus, and appears to have come to Rome, about 29 B.C., with the Peripatetic Xenarchus and the grammarian Tyrannion, whose pupil he had also been. In 24 B.C. he left Rome in the train of Aëlius Gallus, and traveled in Arabia. Returning to Rome in 20 B.C., he made it his home until his death. Yet during this latter period he must have undertaken great journeys, for he informs us that he had traveled from Armenia in the east to Sardinia in the west, and from the Pontus Euxinus on the north to the borders of Ethiopia. While we lack certain information with regard to these journeys, Strabo's scanty knowledge of events in Rome in the latter half of Augustus' rule gives basis to the conjecture that he was absent during this period, very probably at the court of Pythodorus, Queen of Pontus, of whom he makes frequent mention. Strabo is famous for his valuable *Geography*, extant in 17 books, of which books 1 and 2 deal with physical geography, 3 to 10 with the geography of Europe, 11 to 16 with that of Asia, and 17 with that of Africa. It is quite clear from internal evidence that the author did not complete his original plan. The sources of his knowledge were his own observations made during his journeys, and the earlier geographers, of whom the most famous were Eratosthenes, Artemidorus, and Apollodorus of Athens. For Spain and Gaul his chief sources were Polybius and Posidonius.

His other work, of which we have but scanty fragments, was his *History*, in 43 books, intended as a supplement to the work of Polybius. The first part sketched the history down to the period at which Polybius began; the latter treated in greater detail the history from Polybius to 27 B.C. The fragments of this work are published by Müller, *Fragmenta Historicorum Græcorum*, vol. iii. Consult also Otto, "Strabonis Ἱστορικῶν Ἀπομνημόνων Fragmenta," in *Leipziger Studien*, vol. xi (1889). The *Geography* is edited by Kramer (Berlin, 1844–52); Meineke (Leipzig, 1866–77). It was translated into French for Napoleon I by Coraës, Lebronne, and others (Paris, 1805–19); very valuable is the translation into German by Grosskurd (Berlin, 1831–34). There is an English translation by Hamilton in Bohn's Classical Library (London, 1887) and a translation of selections, with introduction, maps, and plans, by Tozer (Oxford, 1893). Another translation into English is under way in the Loeb Classical Library. Consult Christ-Schmid, *Geschichte der griechischen Litteratur*, vol. ii, part i (5th ed., Munich, 1911), and the article "Strabon" in Fr. Lübker, *Reallexikon des klassischen Altertums*, vol. ii (8th ed., Leipzig, 1914).

**STRABO, WALAFRID.** See WALAFRID STRABO.

**STRACHAN, STRAWN, JOHN** (1778–1867). A Canadian Anglican bishop. He was born at Aberdeen, Scotland, and was educated at the city grammar school and at King's College, where he graduated in 1796. He emigrated to Canada in 1799 and opened a school at Kingston. Having decided to enter the ministry of the Church of England in Canada, he was ordained deacon in 1803, priest in 1804, and was made curate at Cornwall, where a school was established by him. In 1812 he removed to York (Toronto), of which he became rector, and, in 1827, archdeacon. Once a Presbyterian, he had become

the outspoken champion of an Anglican state church in a province essentially democratic. Having rendered valuable government service in the War of 1812, he was appointed a member of the Executive Council in 1815 and of the Legislative Council in 1820. The special task he set for himself was the establishment of ecclesiastical control of higher education. With this intention he obtained in 1826–27 an English charter for the University of King's College, under full Anglican direction. This was a signal for other religious denominations to protest against their exclusion from government endowments. The dispute was for some years in abeyance, but the attempt in 1836 to proceed against the Clergy Reserves lands (see CANADA) in behalf of Episcopal rectories provoked an outburst of popular resentment against the whole fabric of oligarchical rule. The rebellion of 1837–38, in part the result of this educational policy, won responsible government for the province, with an implied equality of religious denominations before the law. Strachan, who was appointed the first Bishop of Toronto in 1839, did not accept the political consequences of that uprising, nor would he consent to a division of the Clergy Reserves, although the Anglican church was offered the largest share. In 1843 he established the University of King's College on a privileged basis. The question of religious and educational monopoly was then transferred to the politics of the new province of United Canada, and in 1849 King's College was reorganized as the University of Toronto, a provincial institution free of religious tests. Nothing daunted, the Bishop founded Trinity University, opened in 1852 under Anglican control; but legalized preference of any church was irrevocably lost. Strachan's public labors, which had been predominantly those of an ecclesiastical politician, were afterward restricted to episcopal duties, performed with energy and acceptability. Consult A. N. Bethune, *Memoir of Bishop Strachan* (Toronto, 1870); J. C. Dent, *Canadian Portrait Gallery* (ib., 1880); C. H. Mockridge, *The Bishops of the Church of England in Canada and Newfoundland* (ib., 1896).

**STRACHAN, JOHN** (1862–1907). A British Celtic scholar, born near Keith, Banffshire. He was educated at Aberdeen (1877–81) and Cambridge (1881–85), also spending a summer at Göttingen (1880) and a year at Jena (1883). In 1885 he was elected professor of Greek at Owens College, Manchester, and after 1889 he was also professor of comparative philology. In 1903, in coöperation with Kuno Meyer (q.v.), he founded the Summer School of Irish Learning at Dublin, in which he taught Old Irish during several vacations. Though at first Strachan devoted his attention to the classics—his edition of Herodotus (1891) is said to contain an account of the Ionic dialect superior to anything preceding it—his reputation rests distinctly upon his work in Celtic. His interests centred mainly on grammar and syntax, in which he was probably the leading authority. From 1893 to 1900 he published a long series of articles on the Irish verb and similar grammatical subjects in the *Transactions of the Philological Society*. His most important works include the *Thesaurus Palæohibernicus*, in collaboration with Whitley Stokes (q.v.) (2 vols., 1901–03); *Selections from the Old Irish Glosses* (1904; 2d ed., 1909); *Old Irish Paradigms* (1905; 2d ed., 1909); *Stories from the Táin*, a posthumous work edited

by Kuno Meyer (1908); and *An Introduction to Early Welsh*, also posthumous (1909).

**STRACHAN-DAVIDSON**, JAMES LEIGH (1843-1916). An English classical scholar, born at Penrith. He was educated at Leamington College and at Balliol College, Oxford, and from 1907 was master of Balliol. He received the honorary degree of Doctor of Laws from the universities of St. Andrews and Glasgow. His publications include an edition of *Selections from Polybius* (1888); of Appian, *Civil Wars*, book i (1902); *Life of Cicero* (1901); *Problems of the Roman Criminal Law* (2 vols., 1914).

**STRACHEY**, strá'chí, JOHN ST. LOE (1860-). English editor and author, educated at Balliol College, Oxford. After 1884 he was actively engaged in journalistic work in London. The *Cornhill Magazine* was under his editorship in 1896-97, and subsequently he gained control of and edited the *London Spectator*. His publications include: *The Manufacture of Paupers* (1907); *Problems and Perils of Socialism* (1908); *The Practical Wisdom of the Bible* (1908); *A New Way of Life* (1909); *The Citizen and the State* (1913). Consult A. G. Gardiner, *Pillars of Society* (London, 1913).

**STRACHEY**, SIR RICHARD (1817-1908). A British soldier and administrator, born at Sutton Court, Somersetshire. He served in India from 1836 to 1850, lived in England for five years, and then returned to India, where he was connected with the public works department (1856-65) and was director general of irrigation (1867-71). In 1877-79 he was again in India to arrange for the purchase of the East Indian Railway. Between 1875 and 1889 he served as a member of the council of the Secretary of State for India. For his important investigations in the geology, botany, and physical geography of the Himalaya, he was made a fellow of the Royal Society in 1854, and in 1888-90 he was president of the Royal Geographical Society. He wrote *The Finances and Public Works of India* (1882), with his brother, Sir John Strachey, also an Indian administrator.

**STRACHEY**, WILLIAM. Colonist and historian of early Virginia—a member of Gray's Inn, London. In May, 1609, he sailed for Virginia with Sir George Somers, and was wrecked on the Bermudas on July 28. Strachey wrote an account of the Colonists' adventures, widely circulated in manuscript before being printed in 1625, in Purchas's *Pilgrims*. In May, 1610, he reached Virginia, becoming secretary and recorder of the Colony. He edited the code of laws drawn up by Gates and Dale, commonly known by the latter's name. Returning to England in 1612, he began his *Historie of Travaile into Virginia Britannia*. It was first printed in 1849, by the Hakluyt Society of London. It is the most reliable single narrative of events during the Virginian period with which he deals. Besides the 1849 edition of the *Historie*, consult Alexander Brown, *Genesis of the United States* (Boston, 1891).

**STRACHWITZ**, shtrá'g'vits, MORITZ, COUNT (1822-47). A German poet, born in Peterwitz, Silesia, and educated for the law in Breslau and Berlin. His early death occurred in Vienna, while he was returning from Italy. His first volume, *Lieder eines Erwachenden* (1842), was mostly written while he was still in the Gymnasium. More typical is the collection posthumously published, *Neue Gedächte* (1847), with its sharp attack on Heine and the other revolu-

tionists, its protests against the "Everlasting No," and its famous and popular lyrics, "Der Himmel ist blau" and "Germania." He wrote also some very good ballads. A complete edition of his poems appeared in 1850, and in Reclam's *Bibliothek* in 1878, Nos. 1009 and 1010. Consult Tielo, *Dichtung des Grafen M. von Strachwitz* (Berlin, 1902).

**STRACK**, shtrák, HERMANN LEBERECHE (1848-). A German theologian and Oriental scholar. He was born in Berlin and was educated there and at Leipzig. In 1877 he became professor in the theological faculty at Berlin. Among his more notable publications are: *Prophetarum Posteriorum Codex Babylonicus Petropolitanus* (1875); *Einleitung in das Alte Testament* (6th ed., 1906); *Lehrbuch der neuhebraischen Sprache und Litteratur* (1884), with Siegfried; *Einleitung in den Talmud* (1887; 5th ed., 1911); *Hebraisches Vocabularium* (1889; 10th ed., 1914); *Das Blut im Glauben und Aberglauben des Menschen* (8th ed., 1900); *Grammatik des biblisch-Aramäischen* (5th ed., 1911); *Das Buch Jesus Sirach im hebraischen Texte* (1903); *Das Wesen des Judentums* (1906); *Jesus, die Häretiker und die Christen nach den ältesten jüdischen Angaben* (1910); *Berakhoth* (1914). He also published editions of several Mishna tracts; became editor of the *Porta Linguarum Orientalium* (Berlin), for which he wrote the Hebrew grammar (10th ed., 1911; Eng. trans., 1886); and, with O. Zückler, editor of *Kurzgefasster Kommentar zu den Schriften Alten und Neuen Testaments* (Munich, 1886 et seq.). He prepared lexicons to the *Anabasis* (10th ed., 1908) and *Cyropædia* (2d ed., 1892) of Xenophon. From 1885 he edited *Nathanael*, a periodical devoted to Christian missionary work among the Jews; and from 1906 the *Jahrbuch der evangelischen Judenmission*.

**STRADELLA**, strá-dè'l'la, ALESSANDRO (c.1645-1681). An Italian composer, born in Naples. Of his life nothing is known beyond the story of his love affair, which, related by Bonnet-Bourdelot in his *Histoire de la musique et de ses effets* (1715), served as the basis of Flotow's opera *Stradella*. He was murdered in Genoa. His compositions include six operas, six oratorios, numerous cantatas and sonatas. The manuscripts of these works are in possession of various libraries in Italy, France, and England. Consult P. Richard, *Alessandro Stradella* (Paris, 1866); F. M. Crawford, *Stradella* (London, 1911).

**STRADIVARI**, strá'dè-vá'rè, or **STRADIVARIUS**, ANTONIO (1644-1737). The most famous violin maker of the Cremonese school. He was born in Cremona, and was probably apprenticed at a very early age to Nicola Amati, at that time regarded as the greatest of Cremonese masters. His first instruments were made between 1670 and 1685 and were of the Amati model, in consequence of which they are usually described as Amatese Strads. They are distinguished by their lack of symmetry compared with his later work, their plain wood, and generally squatty design. About 1685 his originality began to assert itself, and by the following year he had acquired his own peculiar style, since largely used as a model. The period known as the long Strad period was from 1690 to 1700, and it may be pointed out that the instruments made then were not longer in design than those of the following years, from which they differed only in their treatment. The middle bouts,

edges, and corners were longer and more graceful, and were possessed of a contour which has been described as a mingling of the feminine character of Nicola Amati's work and the masculine massive style of Stradivari from 1700 to 1737. In 1684 Nicola Amati died and bequeathed all his wood, models, and tools to Stradivari, thus providing the latter with a large and choice stock of tempered and seasoned wood, which was responsible for the improved quality of his later instruments. All the work of Stradivari was marked by minuteness of detail, high quality of material, and beauty of tone, which has a distinctly sympathetic quality. His violins must have numbered fully two thousand, although comparatively few specimens are now in existence. He died at Cremona. Consult A. Riechers, *The Violin and the Art of its Construction: A Treatise on Stradivari* (London, 1895; W. H. Hill and others, *Antonio Stradivari: His Life and Work* (2d ed., New York, 1909)). See article VIOLIN.

**STRADIVARI, FRANCESCO** (1671-1743). An Italian violin maker, the second son of Antonio. He was born at Cremona. He carried on his father's business, adopting Antonio's model of the period of 1700-1712, and produced instruments of a commanding style and an invariably good tone. Like his father, he was exceedingly careful in the artistic finish of his work, using wood of the finest quality and a rich red-brown varnish.—**OMOBONO STRADIVARI** (1679-1742), the fourth child of Antonio, was chiefly remarkable for his skill in repairing valuable instruments.

**STRADONITZ, KEKULE VON.** See **KEKULE VON STRADONITZ**.

**STRAFFORD, THOMAS WENTWORTH**, first **EARL OF** (1593-1641). An English statesman, born April 13, 1593, in London, of an old Yorkshire family. He was educated at St. John's College, Cambridge, and later (1607) became a student of the Inner Temple. He was married in 1611 and knighted in the same year, after which he traveled on the Continent. In 1614 his father died and he succeeded to the title of Baronet and to a large estate. He was a member of the last three Parliaments of James I. In the Parliaments of 1621 and 1624 he supported the crown against those who were trying to force England into a war with Spain. In the first Parliament of Charles I he opposed Buckingham, who had now adopted the same policy of war with Spain, yet he was not in sympathy with Eliot and the Puritans. In the Parliament of 1628 he became the real leader of the House of Commons, though no formal leadership was recognized then. He introduced a bill similar in tenor to the Petition of Right (q.v.), but containing no declaration that the law had been violated in the past. Charles, however, refused to accept it, and Wentworth, unwilling to resist the King further, allowed the opposition to pass into other and more hostile hands. He supported the Petition of Right and was then apparently satisfied that the ancient government of the Kingdom had been restored. In June, 1628, he was made Baron, on December 10 Viscount, and on December 25 President of the Council of the North. On Nov. 10, 1629, he was made member of the Privy Council. As President of the Council of the North he was the royal executive in that region and he exercised his authority vigorously in checking insubordination. His anti-Puritan sympathies had drawn him into intimate

relations with Laud, which became life-long friendship. On Jan. 12, 1632, Wentworth was made Lord Deputy of Ireland and went to Dublin in July, 1633. His administration lasted six years. His task was difficult and his actions were often harsh, but on the whole beneficial. Trade and industry were encouraged, disorders suppressed, and Ireland enjoyed unprecedented prosperity. In 1639 Wentworth visited England. On Jan. 12, 1640, he was created Earl of Strafford, and thenceforth was the King's most influential adviser. Already the Scottish troubles had reached an acute stage. On account of long absence, Strafford failed to appreciate the changed temper of the English people. He advocated the strongest measures and hurried back to Ireland to raise money and troops for Charles. This was made the basis of his impeachment on the meeting of the Long Parliament. Charles promised him that if he would come to London to meet the charges he "should not suffer in his person, honor, or fortune." Inasmuch as the charges against him, even if proved, did not constitute treason as defined by the statute of Edward III, Parliament changed the impeachment into a bill of attainder, though Strafford was still heard in his own defense. His doom was sealed when Parliament discovered that Charles was plotting to rescue him by force. On May 8, 1641, the attainder bill was passed and on the 10th Charles, daring to resist no longer, signed it with Strafford's consent. Strafford was beheaded two days later.

Our estimate of Strafford's high personal qualities will always rest principally upon his own recorded words. They will be found in *The Earl of Strafford's Letters and Despatches, with an Essay towards his Life*, edited by Radcliffe (2 vols., London, 1739). Consult also S. R. Gardiner, *History of England, 1603-42* (10 vols., New York, 1883-84); H. D. Traill, *Lord Strafford* (London, 1889); *Papers Relating to Thomas Wentworth, First Earl of Strafford*, edited for the Camden Society by C. H. Firth (ib., 1890); Robert Browning, *Prose Life of Strafford* (Boston, 1892).

**STRAIGHT, WILLARD DICKERMAN** (1880-1918). An American financier. He was born at Oswego, N. Y., and graduated as B.Arch. from Cornell in 1901. From 1902 to 1914 he was resident principally in China and Korea, being connected with the Chinese Customs Service; correspondent of Reuter's Agency and the Associated Press; American Vice Consul General at Seoul; Consul General at Mukden, and representative in China for a group of notable American financiers. In 1908-09 he had been at Washington, as acting chief of the Division of Far Eastern Affairs in the Department of State. After his return from China (1914) he was for a time connected with J. P. Morgan and Company of New York, but in 1915 withdrew from that firm to study international law at Columbia University. In 1909 he was elected a fellow of the Royal Geographical Society of London, and in 1914 he became president of the American Asiatic Association. In 1915 he became vice president of the American International Corporation, formed to develop the foreign trade of the United States. He married a daughter of William C. Whitney (q.v.).

**STRAIGHT COLLEGE.** A coeducational college for negroes, founded at New Orleans in 1869 by Seymour Straight. It has an endowment of about \$20,000, and is supported by

voluntary contribution through the American Mission Association. The buildings and the grounds are valued at \$10,000, and the library contains about 3000 volumes. The faculty in 1914-15 numbered 25, and the students in all departments about 570.

**STRAIN, ISAAC G.** (1821-57). An American naval officer and explorer, born in Roxbury, Pa. He entered the navy as a midshipman in 1837, in 1845 was in command of an exploring expedition that penetrated into the interior of Brazil, and in 1848 explored Lower California. In 1849 he made the overland journey from Valparaiso to Buenos Aires, publishing an account of the trip entitled *The Cordillera and Pampa: Sketches of a Journey in Chile and the Argentine Provinces in 1849* (1853). He became a lieutenant in 1850, served with the commission to locate the boundary line between Mexico and the United States, and in 1854 was in charge of a party to survey and explore the Isthmus of Panama and report upon the best route for an interoceanic canal. In 1856 in the *Arctic* he made soundings in the North Atlantic Ocean to ascertain the feasibility of a submarine cable. Returning to Panama, he died there the following year. Consult Headley, *The Darien Exploring Expedition under Command of Lieutenant Strain* (New York, 1885).

**STRAIT OF MESSINA.** See MESSINA, STRAIT OF.

**STRAIT OF SURIGAO.** See SURIGAO, STRAIT OF.

**STRAITS SETTLEMENTS.** A British colony, consisting of the settlements of Singapore, Penang, and Malacca (Map: Siam, D 6). The settlement of Singapore includes, besides the island of that name, the Cocos or Keeling Islands (since 1903) and Christmas Island (1900). The area of the colony is about 1600 square miles. Aside from its strategic value, the colony is important chiefly for its large transit trade, which passes almost entirely through Singapore and Georgetown. The principal exports include tin, spices, gambier, rubber, gum, tapioca, copra, rattan, coffee, pineapples, and sago. The tin comes from the Federated Malay States. Large imports are rice, cotton piece goods, coal, opium, petroleum, tobacco, flour, and fish. The ports are free. Imports and exports in 1905 were valued at 332,234,000 and 282,961,000 Straits Settlements dollars respectively (the Straits Settlements dollar is worth 56.776 cents); in 1913, 484,163,000 and 388,930,000. Exclusive of native craft, shipping entered and cleared in 1913 was 27,125,000 tons, of which 15,251,000 tons British. Revenue in 1913, 12,398,000 dollars; expenditure, 10,469,000. The Governor is assisted by an executive council, and by a legislative council composed of ten official and eight unofficial members, nominated by the crown. The Governor is also High Commissioner for the Federated Malay States, High Commissioner of Brunei, and British agent for British North Borneo and Sarawak. The population of the colony, as constituted in 1911, was 1891, 518,758; 1901, 582,009; 1911, 722,075 (474,874 males, 247,201 females). The estimate in 1914 was 761,521, of whom 7945 were whites, 8679 Eurasians, and the remainder Asiatics; of the latter Chinese form a very large part. There is an extensive migration to and from China and India, chiefly coolies. The Straits Settlements were transferred from the government of India to the colonial office April 1, 1867. The capital

is Singapore. See MALACCA; PENANG; SINGAPORE.

**STRAKOSCH**, shtrá'kòsh, MORITZ (1825-87). An Austrian composer and pianist, born in Lemberg, Galicia. He was the brother-in-law and teacher of Adelina Patti. He was educated in music at Vienna, and came to America in 1845, where he won considerable success as a teacher and concert pianist. In 1850 he became an impresario and introduced many great musicians to the American public. He was the composer of several salon pieces for the pianoforte and one opera, *Giovanni di Napoli*, which had its first presentation in New York. He died in Paris. —MAX STRAKOSCH, brother of Moritz, succeeded him in the management of the various concerts and opera undertakings. He died in New York in 1892.

**STRALSUND**, shtrál'zunt. A seaport in the Province of Pomerania, Prussia, situated on the Strelasund, which separates the mainland from the island of Rügen, 149 miles by rail north-northeast of Berlin (Map: Germany, E 1). It is entirely surrounded by water. The natural strength of the place was greatly increased by formidable fortifications, which, however, were converted into promenades in 1873. Stralsund has narrow but regular streets, and many of the houses are finely gabled, giving the town a quaint and ancient appearance. There are three splendid Gothic churches erected in the fourteenth and fifteenth centuries. The handsome town hall contains a picture gallery, a collection of antiquities, and a public library of 73,000 volumes. There is a school of navigation. Stralsund is noted for its manufactures of playing cards. Oil, soap, machinery, arc lights, furniture, and bricks are also produced. There is considerable shipping and a large export trade, chiefly in grain, sugar, fish, and malt. The city, founded in 1209, was in the fourteenth century an important member of the Hanseatic League. The most notable event in its history was its eleven weeks' siege by Wallenstein during the Thirty Years' War (May-August, 1628). It was a possession of Sweden from the Peace of Westphalia (1648) to 1815, when it passed to Prussia. Pop., 1900, 31,083; 1910, 33,988.

**STRAMONIUM** (Neo-Lat., of uncertain etymology), STINKWEED, JAMESTOWN WEED, JIMSON WEED, THORN APPLE (*Datura stramonium*). A common weed of the family Solanaceæ. De Candolle refers it to countries bordering on the Caspian Sea; others regard it as coming from Northern India. It is a coarse, strong, vigorous, branching weed, from two to six feet high, with ovate-toothed or angled leaves, large funnel-shaped flowers followed by prickly globular four-celled pods containing numerous angular black seeds which are narcotic. All parts of the plant have a disagreeable smell. The leaves and seeds are used in medicine to some extent. A second species, *Datura tatula*, is taller and the stems are purple instead of green. Both species are extensively distributed in the United States. See Colored Plate of POISONOUS PLANTS.

**STRANAHAN**, strán'a-an, JAMES SAMUEL THOMAS (1808-98). An American contractor and philanthropist, born at Peterboro, N. Y. He was successively school teacher, surveyor, and trader, and then became a railroad contractor in Newark, N. J., gradually acquiring large interests in the companies by accepting stock as payment for construction. He removed to Brooklyn in 1844 and until his death was closely iden-

tified with the city's commercial expansion and public improvement. From 1860 until 1882 he served as president of the Brooklyn Park Commission, during which time he devised a system of parks and boulevards for the city. His greatest achievement was the planning and laying out in Brooklyn of Prospect Park, at the main entrance of which is a statue of Stranahan by MacMonnies.

**STRAND.** See KNOTTING AND SPLICING; ROPE.

**STRAND, THE.** An important business thoroughfare of London, so named because it led through the marshy land bordering the former banks of the Thames. It extends from Charing Cross to Fleet Street.

**STRANDBERG,** stränd'bärj', KARL WILHELM AUGUST (1818-77). A Swedish poet, born in Södermanland, and educated at Upsala and Lund. The greater part of his earlier writing was of a patriotic nature. His works show great purity of form and depth of patriotism. Under the pseudonym Talis Qualis he published *Sånger i pansar* (1845); *Vilda Rosor* (1848); and his *Samlade vitterhetsarbeten*, edited by G. Ljunggren (5 vols., 1878). He translated Byron's *Don Juan* and selections from Molière.

**STRAND PLANTS.** See BEACH PLANTS.

**STRANG, WILLIAM** (1869-1921). An English etcher, engraver, and painter. He was born at Dumbarton, and was the pupil and assistant of Alphonse Legros at the Slade Art School, London. He first gained fame as a master of engraving in many mediums: etching, line and wood engraving, mezzotint, and silver and gold point. He also revived drawing on tinted paper in chalk and pencil (erroneously called the Holbein portrait) and later turned to painting. Although early influenced by Legros and also by Rembrandt, Strang's work is almost aggressively original. It shows him a skillful draftsman, with a fine sense of composition. Among varied subjects are the grotesque "Misery" and "War." His excellent portraits include etchings of Rudyard Kipling, Robert Bridges, and R. L. Stevenson, and oil portraits of Lord Fisher and John Masefield. Among his finest paintings are the "Love Song," "The Bath," and "A Bay in Brittany." His illustrations include those for Kipling's *Short Stories* (1901), and for *Don Quixote* (1903). He became a Royal Academician in 1906, and was one of the original members of the Royal Society of Painter-Etchers. Strang worked and exhibited not only in England, but in the United States and in Germany (gold medal, Dresden, 1897). Consult Frank Newbolt, *Etchings of William Strang* (London, 1907), and H. W. Singer, *William Strang: Zeichnungen* (Leipzig, 1912).

**STRANGE, SIR ROBERT** (1721-92). A Scottish engraver. He was born in Kirkwall, Orkney Islands, and was apprenticed to Richard Cooper, at Edinburgh, for six years. To gain the hand of Isabella Luminsden, he joined the Jacobite army, and after its defeat went, in 1747, to Rouen and studied under Descamps, and later to Paris, where he learned dry point under Le Bas. He moved to London in 1751, devoting himself to historical engravings, and in 1760 visited Italy, where he was made a member of the academies of Rome, Florence, and Bologna. During a subsequent stay in Paris he was elected to the French Academy, but on his return to London was refused membership in the Royal Academy. He was, however, knighted in 1787 for his en-

graving of West's "Apotheosis of the Royal Children." Strange's engravings are chiefly after the Italian masters, including Raphael, Correggio, Titian, and unfortunately many of the Eclectics. His masterpieces are "Charles I with his Horse," and "Charles I in his Robes," after Van Dyck. Though often defective in draftsmanship, his work is characterized by purity, breadth and vigor. Consult Dennistoun, *Memoirs of Sir Robert Strange* (London, 1855), and Charles Blanc, *L'Œuvre de Robert Strange* (Leipzig, 1848).

**STRANGE, ROBERT** (1796-1854). An American lawyer. He was born in Virginia; was educated at Hampden-Sidney College; studied law, and after his admission to practice, settled at Fayetteville, N. C. He served as a member of the North Carolina House of Delegates in 1822-23 and 1826, was judge of the Superior Court 1826-36, United States Senator 1836-40, and some time later Solicitor of the Fifth Judicial District. The Indian legends of the region about Fayetteville were attractively related in his novel, entitled *Eoneguski; or, the Cherokee Chief*.

**STRANGE CASE OF DOCTOR JEKYLL AND MR. HYDE, THE.** A story by R. L. Stevenson (1886). It illustrates the struggle between good and evil in a human soul. Dr. Jekyll, a physician, has learned to transform himself at will, by means of a certain drug, into "Mr. Hyde," a misshapen dwarf of debased propensities, who commits hideous crimes. An antidote, which restored Dr. Jekyll to his former character, finally fails him, and the baser nature rules.

**STRANGLES** (from *strangle*, Fr. *étrangler*, from Lat. *strangulare*; connected with Gk. *σπαραγμός*, *strangos*, twisted, Lat. *stringere*, to draw tight), DISTEMPER, or COLT ILL. An acute infectious disease of the horse, ass, and mule, most frequently observed in young animals, especially pure-bred, supposed to be due to *Streptococcus equi*. The animal seems dejected, has a capricious appetite, dry, staring coat, reddish eyes, and accelerated pulse and breathing. After about two days a cough and a nasal discharge are noted. A large puffy abscess is developed under the lower jaw, which opens later to the outside. Abscesses sometimes develop in other parts of the body. Light cases require little treatment except proper care and dieting, the opening of the abscesses, and the alleviating of fever when excessive. Consult: Leonard Pearson and others, *Special Report on Diseases of the Horse* (Washington, rev. ed., 1911); Hutyra and Marek, *Special Pathology and Therapeutics of the Disease of Domestic Animals*, vol. i (Chicago, 1912).

**STRANGULATION.** The mechanical constriction of the neck so as to prevent the passage of air and to suspend respiration, and consequently life. Strangulation may be produced by throttling or hanging. Death is sudden when the obstruction to respiration is complete but otherwise it is gradual in its onset. In hanging, especially in judicial executions where a long drop is used, death is probably due to fracture of the cervical vertebrae, with compression of the medulla oblongata, the seat of the nerve centre controlling respiration. When breathing has been interrupted for only a short time, and there is no mechanical obstacle to respiration, nor injury to the medulla, life may sometimes be restored by proper measures, such as artificial res-

piration, stimulant applications, and a plentiful supply of fresh air.

When death has taken place by hanging, proofs of this, concerning which medicolegal questions may arise, depend upon the position of the body when found, the presence of marks upon the neck, and of the signs of asphyxia in the internal organs, and the absence of any other possible cause of death. The mark on the neck is generally a hard, dry, yellowish, horny furrow running obliquely. The face is turgid, with blood-stained froth about the nostrils and lips; the tongue is swollen and protruding. The right side of the heart and the right lung are engorged with venous blood, while the left side is empty. See ASPHYXIA.

**STRANGURY** (Lat. *stranguria*, from Gk. *σπαγγουρία*, *strangouria*, retention of urine). Painful, scanty urination, due to spasm of the urethra. It occurs after the use of cantharides or oil of turpentine internally (both of which are eliminated by the kidneys) or even after blistering with these agents. Acute posterior urethritis is a common cause, but inflammatory conditions of the bladder or prostate gland may bring on attack. Hot applications to the perineum, a hot sitz bath, hot enemata, or an injection of morphine will give relief. See RETENTION OF URINE.

**STRANSKY**, strán'skí, JOSEF (1872- ). An American orchestral conductor, born at Humpoletz (Bohemia). He early studied medicine at the University of Prague. When he decided upon a musical career he went to Leipzig to study composition under Jadassohn. Subsequently he continued his studies in Prague and Vienna under Dvořák and Bruckner, and also had the good fortune of coming into closer relations with Brahms. He began his career in 1898 as first conductor at the Opera in Prague. From 1903 to 1910 he was conductor of the Opera at Hamburg, with frequent leave of absence to fill engagements as guest conductor (both in opera and in concert) in Germany, Austria, Holland, and England. In 1911 he was chosen to succeed Mahler as conductor of the Philharmonic Society of New York. So ably did he carry out the intentions and policy of his great predecessor, that after three seasons the Philharmonic Orchestra was regarded as the equal of the famous Boston Symphony Orchestra. He wrote an opera, *Beatrice and Benedict*, an operetta, *Der General*; symphonies; symphonic songs, and some chamber music.

**STRAPAROLA**, strä'pä-rō'lá, GIOVANNI FRANCESCO (?-c.1557). An Italian author, who was born at Caravaggio. Little is known of his life, and his name is only a sobriquet signifying loquacity. He published *Sonetti, strambotti, epistole, e capitoli* in 1508. He is remembered, however, for the 73 tales in his *Tredici piacevoli notti* (Facetious Nights) (Venice, 1550, 1554). This, one of the most amusing works of the Decameron type, is distinctive in the stress laid upon fantastic subjects and in inspiration from folk tales, such as the *Re Porco* and *Augellin bel verde*. Consult edition of his works by Gius. Rua (Bologna, 1898); *The Nights* (Eng. trans. by W. C. Waters (2 vols., London, 1894); Gius. Rua, *Tra antiche fiabe e novelle* (Rome, 1898); also J. C. Dunlop, *History of Prose Fiction* (2 vols., London, 1896).

**STRAP OYSTER**. See COON OYSTER.

**STRASBURGER**, shträs'bur-gër, EDUARD (1844-1912). A German botanist, born at War-

saw and educated at Bonn and at Jena, where he became professor in 1869 and director of the botanical garden in 1873. With Haeckel he visited the East, and in 1881 he accepted a call to the University of Bonn. In his special field of histology of plants he wrote: *Die Befruchtung bei den Koniferen* (1869); *Ueber Zellbildung und Zellteilung* (1875; 3d ed., 1880); *Ueber den Bau und das Wachstum der Zellhäute* (1882); besides *Das botanische Praktikum* (1884; 3d ed., 1897); *Histologische Beiträge* (1888-1900); and, with Noll, Schenck, and Schimper, *Lehrbuch der Botanik für Hochschulen* (8th ed., 1906). Conjointly with Pfeffer he edited the *Jahrbücher für wissenschaftliche Botanik* (Berlin, 1894 et seq.).

**STRASCHIRIPKA**, strä'shë-ríp'ká, JOHANN. See CANON, JOHANN.

**STRASSBURG**, shträs'burk. A city of Germany, the capital of Alsace-Lorraine. It is situated at the junction of the Breusch and the Ill, 2 miles west of the Rhine, 28 miles east of the French frontier, and 88 miles by rail north of Basel (Map: Germany, B 4). The Ill divides into five arms in the city. Strassburg is a fortress of the first class. A circle of 14 forts and an inner rampart defend the city. The centre of the city forms an oval, and is surrounded by two arms of the Ill. Here, and especially in the quarter called "Alt' Frankreich," the streets are narrow and crooked, and the picturesque ancient houses and frequent specimens of pure mediæval architecture reflect a period when the city was both art-loving and wealthy. In this section, on the southeast, rises the structure for which Strassburg is best known—the cathedral, or minster. It is said to have been founded about 600. The Romanesque choir dates from 1176, the splendid Gothic nave from 1250 to 1266; the façade was completed in 1365, except the upper part and spire, which date from 1429 to 1439. The remarkable façade, the work of Erwin von Steinbach (q.v.), with its galleries and rose window, especially commands admiration. Noteworthy also are the late Romanesque south portal with its sculptures and the still more splendid west portals. The tower is 465 feet high. A scarcely less celebrated feature of the minster is its astronomical clock, the mechanism of which was constructed in 1839-42 to replace that of the famous clock of the sixteenth century. (See CLOCK.) Southwest of the cathedral is the Protestant church of St. Thomas, a Romanesque and Gothic edifice, begun about 1200. It contains a marble monument to Marshal Saxe by Pigalle. Near the cathedral is the old episcopal palace (1731-41), identified with the Rohans, and now containing the unimportant municipal art museum. In the Grosse Metzger (the market hall) dating from 1588 is the Museum of Industrial Art.

North of the Ill extend the handsome new quarters of the city, where, in the Kaiserplatz, may be seen the Imperial Palace (1889-93), in the modern German Renaissance style. It was designed by H. Eggert and has a cupola 115 feet high. The Hall of the Provincial Diet (1888-92) and the provincial and university library are near by. The library has some 1,020,000 volumes. Farther on in a northeasterly direction is the Contades Park. Some little distance east of the city, and reached by the Ruprecht-sauer Allée, lie the beautiful municipal grounds of the Orangerie—a pleasure garden with Oriental features and beautiful promenades. Be-

STRASSBURG  
THE CATHEDRAL

tween it and the city is the extensive arsenal. Strassburg has a statue of General Kléber, who was born there, and of Gutenberg; also a bust of Goethe, which marks the house where the poet lived as a student.

The university (see STRASSBURG, UNIVERSITY OF) is situated across the Ill in the southeastern part of the city, covering a large area with its various buildings. There are, in addition, the important Protestant Gymnasium (1538), the academy with its collections, a lyceum, a Roman Catholic seminary, a very fine municipal conservatorium of music, a mechanics' school of art, and an industrial art school. The municipal theatre is an admirable institution. The Frauenhaus contains an architectural and sculptural collection. The city archives are very valuable. The numerous excellent hospitals are mostly situated in the southern part of the city.

The city government is administered by the burgomaster, with six associates, and a council of 36 members. The city is divided into four cantons. Strassburg is commercially important, and a considerable part of the traffic between France, Germany, and Switzerland passes through the city. The Ill is canalized; the Rhine-Marne and other canals traverse the city; and Strassburg is a railway centre. The port covers upward of 300 acres, with wharves and quays on the Rhine. Strassburg has long been famous for its production and exportation of *pâtés de foie gras*, averaging \$400,000 annually. Latterly manufactories have grown up to some extent and include foundries, locomotive works, tobacco factories, tanneries, piano factories, chemical works, etc. Much jewelry is manufactured. Pop., 1900, 151,041; 1910, 178,891, about one-half being Roman Catholics.

**History.** Strassburg is the Argentoratum of the Romans. A bishopric appears to have been established before the seventh century, when the name Stratisburgum began to be used. In 1262 its citizens threw off the yoke of the Bishop in a battle at Oberhausbergen. The city, free and independent, had reached a high degree of prosperity at the Reformation. The citizens embraced Protestantism at an early date (c.1523). In 1681 Louis XIV suddenly took possession of Strassburg, which was fortified by Vauban. It remained a French city until it became a part of the German Empire as a result of the Franco-Prussian War. It was an important military point under the French, and in 1870 held out against the Germans for over seven weeks under its gallant commander, Urich, who finally capitulated on September 28 with over 17,000 men. Great damage was wrought during the siege by the bombardment. Strassburg was bombarded by allied air craft during the Great War which began in 1914. See WAR IN EUROPE.

**STRASSBURG, GOTTFRIED VON.** See GOTTFRIED VON STRASSBURG.

**STRASSBURG, UNIVERSITY OF.** A German university, the outgrowth of an earlier Gymnasium, formally founded by privilege of Ferdinand II in 1621. It flourished greatly in the seventeenth and eighteenth centuries, and, though

Strassburg became French territory in 1681, the university retained much of its German character. Goethe and Herder studied here in 1770. It disappeared in the Revolution, rose again in 1802 as a Protestant academy, and in 1808 became part of the University of France by university reforms of Napoleon I. After the War of 1870 the institution once more became German and was reorganized as a university in 1872. It has since been greatly encouraged by the Imperial government as a centre of German influence and culture in reclaiming Alsace-Lorraine, and has been in a flourishing condition. Its budget amounted to 1,630,000 marks, and it had in 1913 about 2150 students. Its library contains more than 1,000,000 volumes. There are various institutes connected.

**STRASSBURG PIE.** See PÂTÉ DE FOIE GRAS.

**STRASSER**, shträs'ēr, ARTHUR (1854- ). An Austrian sculptor. He was born at Adelsberg, Carniola, and studied at the Vienna Academy and under Pilz, Tilgner, and Kundmann. He excels in small plastics, such as statuettes of Japanese jugglers and actresses and terra-cotta figures, often combined with animals, which, by skillful coloring, he succeeded in making impressively true to nature. These include the "Egyptian Snake-Charmer" and the "Hindu at Prayer." His figures in bronze, such as "Cleopatra" and "The Goose Girl," are equally lifelike. His chief monumental work is "Triumphal Chariot of Marcus Antoninus," before the Secession Building in Vienna, which won the Grand Prix at Paris in 1900. In this year Strasser became professor at the Industrial Art School, Vienna.

**STRATEGY** (Fr. *stratégie*, from Gk. *στρατηγία*, *stratēgia*, generalship, from *στρατηγός*, *stratēgos*, general). The word "strategy" has been variously defined. It is useful to recall some of the definitions, because their influence still subsists in some form. Thus, early in the nineteenth century strategy was held to be the science of the movements of an army at a distance from the enemy, while tactics was the same thing in the presence of the enemy, within gun range. Napoleon was apparently unacquainted with the word; he used the expression "hautes parties de la guerre" instead. Jomini defined the term as the art of all the operations in the theatre of war; for him tactics was the art of using troops in battle. Von Moltke, returning to the etymology of the word, called it the science of the commander in chief, indicating the best road to battle, while tactics tells us the best way of using troops in battle. As may be seen from these definitions, there seems to have existed in men's minds an appreciation of the difference between operations of war carried on over a wide theatre and more or less slowly and those condensed into a few hours of battle. Hence the instinctive classification of the whole subject of war into strategy and tactics. As a matter of fact, so complicated and varying are the elements, facts, and conditions of warfare that their exact division into, and inclusion within, the two great subdivisions in question are really impossible. War cannot be treated as an exact science, subject to rigorously formal definitions and rules. In the study of war to-day, two things are accepted almost generally: first, the *art of war*; and second, the business of giving this art concrete expression. The art of war breaks up into *strategy*, or the art of supreme

command (in battle as elsewhere); and *tactics* (without any qualifier), or the method of employing troop units of all arms in subordinate situations (on the march, etc., as well as in battle). The "business of war" in its turn is concerned with the tactics of the various arms and departments of an army. See TACTICS.

The modern conception of what is meant by strategy leads to certain deductions. Thus it may be regarded as a constant force operative in peace as well as in war, for certainly the supreme command must take into account such factors as the habits, *morale*, and even temper, not only of a possible enemy, but of its own people. The financial condition of the country and of its possible adversaries must weigh very heavily in any plans under consideration, not only on the outbreak of war, but also as the war wears on. Many of these factors almost defy evaluation in advance; their evaluation may increase in difficulty once operations are undertaken. Moreover, in peace to a certain extent, and assuredly in war, the situation may vary, and so rapidly that no general solution offers or can offer itself. Lastly, now that wars are carried on, not by professional armies as formerly, but by the entire armed nation or people, the masses engaged from the outset are so vast that, once set in motion in accordance with a strategical plan formed in peace, it is almost impossible to shift the objective, should that plan be found on trial to be defective. This condition, more clearly than any other perhaps, proves, or tends to prove, that strategy, as defined above, is a force operative in peace as well as in war; that it is, in other words, a function of government at all times, as much so as the operations of the Treasury. War merely puts the plan or plans into execution; without terminating what may be called the peace business of strategy, it adds to it the concrete facts and realities of campaigns and battles, both on land and on the sea. These facts and realities are subject to principles so obvious and so simple as to be almost truisms; they cannot however be confined or controlled by set or fixed rules. But these principles of themselves lead nowhere; the entire difficulty resides in their correct application to circumstances and conditions as they develop. In war it will ever remain true "that everything is simple, but the simple is difficult."

The "peace business" of strategy, all important though it is, evidently cannot be made a subject of study or research in the same way as actual warfare; involving as it does national policy, perhaps secular in scope, it is, or should be, a matter of statesmanship affecting all the organic relations of the state. The case alters when we pass from peace to war; the strategic policy now finds expression in the facts and realities of campaigns, and these may very properly be investigated and analyzed. Only one method of investigation is recognized to-day as having any value, the historic, in which a profound study is made of complete campaigns, especially of those conducted by great captains in recent times. Complete campaigns must be taken, because only thus may effects be traced to their causes, in the determination of principles to serve as guides in like cases should they arise in the future. For modern purposes it is perhaps unnecessary to go back of the time of Frederick the Great; Napoleonic campaigns, it is needless to say, call for the profoundest study,

for this reason, if for no other, that in them are to be found the germs of the modern strategy of national masses. We cannot here dwell on the methods either of Frederick or Napoleon. We may remark, however, as marking the evolution of the subject, that in the eighteenth century sieges played an important part in all campaigns. Thus, in the period 1701-35, 87 battles were fought and 366 sieges laid; i.e., it was not yet perfectly clear that the object of war is to beat the hostile army. From 1804 to 1815, if we leave Spain out of the account, we note 400 battles to 50 sieges. And although in the Great War that began in 1914 many fortified places fell to the Germans, it was nevertheless made absolutely evident that the great objective on all fronts was the destruction of the enemy's armies.

The actual business of destruction is a tactical matter, but the preparation and execution of plans, so as to make this destruction possible, is strategic; it is, to-day, the fundamental question of war strategy. Everything else is by comparison insignificant, for, if the enemy army is destroyed, his country is conquered, and with its fall go capital, provinces, and fortresses. Moreover, it is a condition of modern strategy that an army shall, if possible, deliver not only a crushing but a rapid blow as well, in contradistinction to the relatively slow and deliberate efforts of former days. Hence the existence of *general staffs* (see GENERAL STAFF), without which strategy, having in view the enormous masses engaged, would fail. Further, the characteristic rapidity of modern effort is determined wholly by transport facilities, such as rail and motor. To sum up, we have, as the elements with which modern strategy has to deal: plans laid in peace and involving national policy, finance, and commerce; a trained body of men to keep these plans up to date in peace, and to apply and execute them in war; armed masses coextensive, between certain limits, with the male population; and suitable transport to carry these masses to the theatre of operations and there to supply them. And since modern war is truly national in character, and the prize at stake is the very existence of nations, so is it the business of a state to-day to bring into play almost at once the sum total of the armed strength of the nation or nations concerned.

This implies the closest study of the questions of mobilization and formation of armies. If we imagine, as we may, the advanced guards of two opposing armies in contact immediately after the declaration of war, then this formation of armies, by the side assuming the offensive, takes on the character of a strategical deployment, adopted and prepared in advance with a view to the offensive. And since this plan once adopted is on the whole not susceptible of alteration should conditions change, or be found different from those assumed, it is easy to realize the gravity of the problem that strategy is called upon to solve even before a shot is fired, a gravity somewhat diminished perhaps to-day by the more or less exact knowledge each general staff possesses in respect of its possible adversaries. Thus the character of an enemy is known, the temper and quality of his troops, the nature of his armament, his resources in rail and other transport, the probable theatre of operations. If we place ourselves on the side compelled at first to remain on the defensive (e.g., France against Germany in 1914), then it becomes neces-

sary to form some idea, in advance, of the manœuvres of the enemy. Here we touch on a fresh difference between modern strategy and that of a century ago. Whereas in olden days manœuvring could force an enemy either out of a position or to accept battle under unfavorable conditions, the vast masses of to-day have reduced its possibilities. Given an army whose numbers mount into the millions with their attendant supply and ammunition trains, operating on a relatively narrow front, itself broken by obstacles and the nature of the terrain, almost the only thing possible, it would seem, is to march straight ahead with the main body and leave to a wing the task of outflanking the adverse wing. But the general nature of this movement could at any past time almost certainly be anticipated, and to-day, thanks to the application of aeronautics, cannot hope to escape detection. If now we take into account the tremendous efficiency of modern weapons and the difficulties of the frontal attack, it follows (and this result was in a limited fashion predicted years ago) that the assailant must literally lay siege to his adversary. And in fact practice has bettered the precept. We had in France the spectacle of two enormous armies each virtually in a state of siege, and strategy silent. This result is very largely due to the intervention of aeronautics, which must therefore be counted in present and future wars, as an element tending to reduce the value of strategical manœuvring by generally lessening the possibility of deriving any practical results therefrom.

It is a characteristic of modern war conditions that a general in chief of a group of armies must of necessity leave to his subordinate generals a greater strategic initiative than was the case when he commanded practically only a single army and could deal directly with his corps commanders. He must give up the hope of seeing everything himself; his instructions have practically ceased to be orders and consist now chiefly in general directions. But whatever may be the changes wrought in strategy by present-day conditions, changes the full weight of which cannot as yet be accurately measured, it still remains true that the object of strategy is success in war, and that this success must be sought in delivering a decisive blow upon the main body of the enemy at its weakest point, by troops as superior to his as it is possible to have them at the moment.

As conditions of success, it should be recollected that the defensive gains no victories; that only the offensive promises positive results, and that every effort must be made to collect at the decisive moment all the available forces, because it is impossible to be too strong for a decisive battle. The principles of strategy apply, due allowance having been made for sea conditions, with equal force to naval warfare.

**STRATFORD.** A town and suburb of London, in Essex, on the Lea, 4 miles east of St. Paul's (Map: London, D 8). It has a fine town hall and is the seat of various extensive manufactures. There are flour mills, distilleries, and chemical works. The prosperity of the town has increased through its connection with the Eastern Counties Railway and the extensive works the company established here. Pop., 1901, 44,825; 1911, 50,738.

**STRATFORD.** A city, port of entry, and the capital of Perth County, Ontario, Canada, on the Avon River, and a divisional point on the Grand Trunk Railway, 88 miles west-southwest of Toronto (Map: Ontario, D 7). The city contains five county buildings, a Provincial Normal School, a business college, a collegiate institute, and two parks. Grand Trunk Railway repair shops are located here. There is a variety of manufactures. Pop., 1901, 9959; 1911, 12,946.

**STRATFORD.** A town in Fairfield Co., Conn., 3 miles east-northeast of Bridgeport, which it once included within its limits, on the New York, New Haven, and Hartford Railroad (Map: Connecticut, C 5). There are manufactures of silverware, paint, brass goods, and wire-ironing machinery. Pop., 1900, 3657; 1910, 5712; 1920, 12,347.

**STRATFORD DE REDCLIFFE**, STRATFORD CANNING, VISCOUNT (1786-1880). An English diplomat, born in London. George Canning's influence secured for Stratford in 1808 the secretaryship of the Embassy at Constantinople, under Adair, on whose resignation in 1810 Stratford Canning was made Minister Plenipotentiary. Here at a critical moment in the struggle against Napoleon, he negotiated the Treaty of Bucharest between Russia and Turkey in 1812. In 1814-18 he was Minister to Switzerland. In 1819 he was made Minister to the United States, where he was successful in the settlement of the questions arising out of the War of 1812. After various diplomatic services and a seat in the House of Commons, he went in 1841 as Ambassador to Constantinople. The most important event of his service at the Turkish capital was his diplomatic contest in 1853 with Prince Menshikoff, Russian Ambassador Extraordinary. The result of the struggle was a victory for Canning. He remained at Constantinople through the Crimean War and until 1858 and exerted great influence upon the Turkish government with regard to its foreign relations and inauguration of political reforms. He became peer in 1852, as Viscount Stratford de Redcliffe. He wrote some creditable verse. In 1881 extracts from his papers and correspondence were published, with a preface by A. P. Stanley, under the title *The Eastern*

*Question.* Consult also Stanley Lane-Poole, *Life of the Right Honourable Stratford Canning, Viscount Stratford de Redcliffe* (London, 1888).

**STRATFORD-ON-AVON**, -āvon. A municipal borough and township in Warwickshire, England, 8 miles southwest of Warwick, on the Avon, famous as the birthplace of Shakespeare (Map: England, E 4). The town is neatly built, with wide, pleasant streets, containing numerous quaint half-timbered houses. The house in which Shakespeare was born is still preserved, and there is a Shakespeare memorial building, including a theatre and a gallery of Shakespearian paintings, and a library of rare Shakespeariana. The poet is buried in the parish church of the Holy Trinity, a fine cruciform structure partly early English and Perpendicular, dating from the twelfth century and built on the site of a Saxon monastery which existed before 691. Other interesting remains of Shakespeare's time are the grammar school endowed in 1482, in which he was educated, the guildhall, and the town hall. In the neighborhood at Wilmcote is the cottage of his mother, Mary Arden, and at Shottery, that of his wife, Anne Hathaway. Stratford is annually visited by 30,000 tourists, one-fourth of whom are from the United States, and to them is due the memorial clock tower erected in 1887. In 1916 a notable celebration of the tercentenary of Shakespeare's death took place at Stratford. This included a fortnight of performances by F. R. Benson's company in the memorial theatre. The town is an old free market borough with a governing charter since 1553. Pop., 1901, 10,600; 1911, 8531. Consult Sir Sidney Lee, *Stratford-on-Avon* (London, 1890), and Savage, *The Registers of Stratford-on-Avon* (ib., 1898).

**STRATH'CLYDE**. A British kingdom which first appears prominently in the seventh century as one of the strongholds of the original Celtic inhabitants against the invading Anglo-Saxons. It lay in the western part of the island between the Clyde River and the Derwent in what is now Cumberland, though the name is sometimes applied to the entire territory between the Clyde and the Mersey. It was from an early time closely connected with the Scottish crown, to which it was united in the eleventh century. Consult Sir John Rhys, *Celtic Britain* (London, 1904).

**STRATHCLYDE**, ALEXANDER URE, BARON (1853- ). A British statesman and jurist. He was born at Glasgow, Scotland, and was educated at Glasgow and Edinburgh universities. He was called to the Scottish bar in 1878. From 1895 to 1913, as a Liberal, he represented Linlithgowshire in the House of Commons. He was Solicitor-General for Scotland in 1905-09, Lord Advocate for Scotland in 1909-13, and in the latter year was appointed Lord President of the Court of Session and Lord Justice General for Scotland. Ure's intimate knowledge of the land question was of great assistance to David Lloyd-George and other members of Premier Asquith's administration in formulating their plans of land and social reform. Ure was made a member of the Imperial Privy Council in 1909, and became a life peer in 1914. Consult A. G. Gardiner, *Pillars of Society* (London, 1913).

**STRATHCONA AND MOUNT ROYAL**, DONALD ALEXANDER SMITH, first BARON (1820-1914). A Canadian capitalist, railway builder, and statesman. He was born at Forres, Morayshire, Scotland, was educated at the local schools,

and went to Canada in 1838 as a cadet in the service of the Hudson's Bay Company. After 13 years in trading posts on the Labrador coast he was stationed in the Canadian Northwest, where he was promoted through various positions until he became successively Chief Factor, resident Governor, and Chief Commissioner. By his many journeys in summer and winter he acquired a familiarity with the geography and resources of the vast region throughout which the company's activity extended; while his intercourse with the various Indian tribes proved to be highly useful to the Canadian government. In 1869 he was appointed a special commissioner to inquire into the causes of the first rebellion led by Louis Riel (q.v.). The task was so wisely accomplished that Smith received the thanks of the Governor-General in Council. After the organization of the Province of Manitoba in 1870 he was elected in the same year a Conservative member of the Provincial Legislature, became also a member of the Council of the Northwest Territories, and afterward represented Selkirk in the Dominion House of Commons. He resigned his seat in the Manitoba Legislature in 1874 on account of the prohibition of dual representation, and retained his seat for Selkirk until 1880. At the time of the so-called Pacific Railway Scandal (see MACDONALD, SIR JOHN ALEXANDER) Smith (as he was then known) withdrew from the Conservative party, but gave it an independent support after its return to power in 1879. He sat again in the House of Commons for Montreal West in 1887-96, resigning in the latter year upon his appointment as High Commissioner for Canada in London, which position he held until his death. He was the chief promoter and builder of the Canadian Pacific Railway at a time when the linking of the provinces from the Atlantic to the Pacific coast was essential to the political life of the Dominion. He became a director of the Canadian Pacific in 1880 and in 1886 was knighted (K.C.M.G.) for his services, receiving in 1896 the G.C.M.G. His exceptional experience in Canada and the Northwest as banker and railway builder gave him a special authority in his office of High Commissioner, and his advice commanded respect on questions of imperial trade and communications. He was a delegate to several important British cable and commercial conferences in London, and enthusiastically supported Imperial Federation. He was elected president of the Bank of Montreal in 1887, chancellor of McGill University in 1889, chancellor of Aberdeen University in 1903, and later became lord rector of the last-named institution. He was either president of, or a director in, a large number of financial and industrial corporations; with Lord Mount Stephen he endowed the Royal Victoria Hospital at Montreal, to which he bequeathed \$1,000,000. He also built and endowed at Montreal the Royal Victoria College for the higher education of women, gave to McGill University at various times over \$1,000,000, and made other large benefactions. In 1897 he was raised to the peerage. He published *Western Canada Before and Since Confederation* (1897) and *The History of the Hudson's Bay Company* (1899). Consult Beckles Willson, *The Life of Lord Strathcona* (2 vols., Boston, 1915); W. T. R. Preston, *Strathcona and the Making of Canada* (New York, 1915).

**STRATH'MORE**. In its most comprehensive sense, an extensive plain in Scotland (q.v.).

**STRATH'NAIRN'**, HUGH HENRY ROSE, first BARON (1803-85). An English general born at Berlin, Germany. He served in 1840-41 under General Michell with the Turkish troops against Mehemet Ali; in 1841-51 was British agent in Syria; and became chargé d'affaires at Constantinople in 1852. During the Crimean War he distinguished himself at Inkerman, and was promoted to major general in 1854. In the Indian Mutiny he commanded the Central India field force, and gained a great victory on April 1, 1858, over Tantia Topi, with 20,000 men, and captured Jhansi, the strongest fortress in Central India, April 5; Kalpi, May 23; and Gwalior, June 19. For these services he received the thanks of Parliament, was gazetted a G.C.B., and in 1860 was promoted to be lieutenant general. He returned to England in 1865, and was soon after given command of the forces in Ireland, where he prevented the Fenian troubles from becoming formidable. In 1867 he was promoted to be general, and in 1877 became a field marshal. Consult Sir O. T. Burne, *Clyde and Strathnairn* (London, 1891).

**STRATHROY**, stráth'roi'. A town in Middlesex Co., Ontario, Canada, situated on the Sydenham River and on the Grand Trunk Railway, about 75 miles west by south of London (Map: Ontario, D 8). It has a collegiate institute, armory, and park. Pop., 1901, 2933; 1911, 2823.

**STRATHSPEY**, stráth'spá' (so called from *Strathspey* in Scotland). A rapid Scotch dance in  $\frac{4}{4}$  time, somewhat resembling the reel (q.v.). Its music is composed of dotted eighths and sixteenths, and the dance itself is of a violent, abrupt character. It dates from the latter part of the eighteenth century.

**STRATIFICATION** (from *stratify*, from Lat. *stratum*, pavement, coverlet, neut. sing. of *stratus*, p.p. of *sternere*, to spread, extend, strew + *facere*, to make, do). The term used in geology to define the arrangement of certain rocks into more or less parallel layers. Stratification is a very general characteristic of sedimentary deposits, sandstone, shale, limestone, etc., which for the most part have accumulated on the shores of the sea and the beds of lakes and rivers. The rock materials in each layer are of homogeneous character, due to the uniformity of conditions during the time of deposition, but the passage from one layer to another may be marked by a change in the nature and size of the materials, indicating a variation in the process of deposition. The layers are separated by divisional planes which mark periods of interruption in the deposition. When the layers are very thin, as in shale, e.g., they are generally known as laminae. A stratum is a group of one or more layers of the same mineral substance. See GEOLOGY.

**STRATTON**, CHARLES SHERWOOD (1838-83). An American dwarf, born in Bridgeport, Conn. Owing to his smallness of stature he was engaged by P. T. Barnum, and was exhibited under the name of Gen. Tom Thumb. He was about two feet high. In 1863 he was married to Lavinia Warren (q.v.), also a dwarf, and in company with Minnie Warren and "Commodore" Nutt, was widely exhibited.

**STRATUM** (Lat., pavement, coverlet, bed). The term applied in geology to the smallest subdivision of sedimentary rocks, practically synonymous with layer, seam, and bed. The distinctive characteristics of a stratum are

homogeneity of composition and separation from adjacent beds or strata by well-marked divisional planes called bedding planes. A stratum represents a single uninterrupted period of accumulation, while the bedding planes are caused by longer or shorter pauses in the process. See BED; GEOLOGY.

**STRATUM VITEL'LIANUM**. See WATLING STREET.

**STRATUS**. See CLOUD.

**STRAUBING**, strou'bing. A town of Bavaria, Germany, 23 miles southeast of Regensburg, on the right bank of the Danube (Map: Germany, E 4). The late Gothic Church of St. James contains some notable paintings. The town has important manufactures of brick, lime, and cement. There are breweries and tanneries. Pop., 1900, 17,454; 1910, 22,021. Straubing stands on the site of the Roman colony *Sorbidurum*. The present town dates from 1208, when Louis I erected the Stadt-Thurm, which is still standing.

**STRAUS**, strous, ISIDOR (1845-1912). An American merchant and publicist, brother of Nathan and Oscar S. Straus. He was born in Rhenish Bavaria, Germany, and came to the United States with his parents in 1854. In 1866 he joined his father in forming the firm of L. Straus & Sons, importers of pottery and glassware, in New York City. With his brother Nathan he became a member of the department-store firms of R. H. Macy & Co., New York, in 1888, and of Abraham & Straus, Brooklyn, in 1892. While a member of Congress (1893-95) he was active in drafting the Wilson Tariff Bill. He declined the portfolio of Postmaster-General offered him by President Cleveland. In 1908 he was president of the National Democratic Business Men's League. He was much interested in civil-service reform, in improving the condition of immigrants, in education (he was president of the Educational Alliance), and in various charities. With his wife, who refused to be saved without her husband, he was lost when the *Titanic* sank in 1912.

**STRAUS, NATHAN** (1848- ). An American merchant and philanthropist, brother of Isidor and Oscar S. Straus. He was born in Rhenish Bavaria, and in 1854 came to the United States with his parents. After graduating from Packard's Business College he was employed in his father's importing business, and later for many years was a member of R. H. Macy & Co. and Abraham & Straus department-store firms of New York and Brooklyn respectively. He served as park commissioner of New York in 1893, and as president of the New York Board of Health in 1898. He established and maintained in New York a system of distribution of sterilized milk for the children of the poor, and a system of coal depots, and in 1912 he established soup kitchens in Jerusalem, and also a health bureau to eliminate malaria in Palestine. He retired from the Macy firm in 1913, and devoted most of his time thereafter to his philanthropies in Palestine. He wrote *Disease in Milk, the Remedy, Pasteurization* (1913).

**STRAUS, OSCAR** (1870- ). An Austrian composer, born at Vienna. In his native city he studied composition with Herman Grädener, and then went to Berlin to Max Bruch. From 1895 to 1900 he filled various positions as theatre conductor (at Brünn, Teplitz, Mainz, Berlin). In 1901 he associated himself with

Ernst von Wolzogen (q.v.), Otto Bierbaum, and Franz Wedekind, furnishing the music for their sparkling comedies dealing with modern life and thought, which for some years enjoyed immense popularity. Among the best of his operettas are: *Die Lustigen Nibelungen* (1904); *Zur Indischen Witwe* (1905); *Hugdietrichs Brautfahrt* (1906); *Ein Walzertraum* (1907); *Der Tapfere Soldat* (1908), based on G. B. Shaw's *Arms and the Man* and presented with tremendous success in the United States as *The Chocolate Soldier*; *Das Tal der Liebe* (1909); *Rund um die Liebe* (1915). Works of another type include an overture, *Der Traum ein Leben*; a serenade for string orchestra; a violin sonata; an opera, *Columbine* (1909).

**STRAUS, OSCAR SOLOMON** (1850-1929). An American diplomat and publicist, brother of Isidor and Nathan Straus. He was born at Otterberg, in Rhenish Bavaria, came to the United States in 1854, and lived in Georgia until the close of the Civil War. He graduated at Columbia in 1871 and at the Columbia Law School in 1873. Later he was associated with his brothers in the department-store firms of R. H. Macy & Co. and Abraham & Straus. In 1887-89 he was Minister to Turkey, and so distinguished himself that in 1897 he was reappointed to the same position by President McKinley, remaining in it till 1900. In 1902 he was named a member of the Permanent Court of Arbitration at The Hague to fill the place left vacant by the death of ex-President Harrison. Straus was Secretary of Commerce and Labor in President Roosevelt's cabinet (1906-09), Ambassador to Turkey (1909-10); Progressive candidate for Governor of New York; chairman of the arbitration commission that decided the wage dispute between the eastern railroads and their engineers (1914). In 1915 he was appointed chairman of the Public Service Commission (first district) of New York State. His published works include: *The Origin of the Republican Form of Government in the United States* (1885; 2d ed., rev., 1901); *Roger Williams, the Pioneer of Religious Liberty* (1894); *The Development of Religious Liberty in the United States* (1896); *Reform in the Consular Service* (1897); *United States Doctrine of Citizenship* (1901); *Our Diplomacy with Reference to our Foreign Service* (1902); *The American Spirit* (1913).

**STRAUSS, shtrous, DAVID FRIEDRICH** (1808-74). A distinguished German theological and philosophical writer, born at Ludwigsburg, near Stuttgart, Jan. 27, 1808. He was educated in the evangelical seminary of Blaubeuren (where F. C. Baur was then teaching), whence he passed to the University of Tübingen. Here his religious convictions became disturbed. The theories of Schelling, of Jakob Böhme, and, finally, of Schleiermacher and Hegel successively claimed his allegiance. He left the university in 1830 to become assistant pastor of a small church and then taught in the seminary at Maulbronn. Here he remained but six months, and then went to Berlin in order to hear Schleiermacher and Hegel. The death of Hegel and Schleiermacher's apparent lack of sympathy determined him to quit Berlin after a very brief stay to take up the work of a "repetent" at Tübingen (1832). Here his lectures on Hegelianism attracted attention. His skepticism was now quite pronounced, since his view of Hegelianism, which he accepted as the final philosophy, made a

miraculous Christianity impossible. His theory of the origins of Christianity was formulated in the work that made him famous, *Das Leben Jesu, kritisch bearbeitet* (1835-36; Eng. trans. by George Eliot, 1846), in which he sought to explain the gospel history on the mythical theory. The work aroused a storm of opposition, but nevertheless had a widespread influence. In consequence of his views he was removed from his position and given a subordinate place in the Lyceum of Ludwigsburg. From 1836 until his death Strauss lived a somewhat wandering life, holding no position, though he had accepted, in 1839, an appointment in the University of Zurich, which position, on account of popular opposition, he had not been permitted to fill.

After the publication of *Der Romantiker auf dem Thron der Casaren* (1847), a satirical criticism of Frederick William IV of Prussia, he was elected a member of the Württemberg Diet in 1848. But he was not sufficiently radical for his constituents and so resigned. His second chief work, *Die christliche Glaubenslehre in ihrer geschichtlichen Entwicklung und im Kampf mit der modernen Wissenschaft dargestellt*, was even more skeptical than his *Leben Jesu*. After the publication in 1848 of *Sechs theologisch-politische Volksreden* Strauss turned from theological to literary criticism and biography. He wrote critical biographies of Schubart (1849), Märklin (1851), Frischlin (1855), Ulrich von Hutten (1857; 6th ed., 1895), Reimarus (1862), and Voltaire (1870; 9th ed., 1907), the last a work of remarkable merit. Not until 1864 did he again turn to theology, when he published *Das Leben Jesu für das deutsche Volk*, following it in the next year by *Die Halben und die Ganzen und Der Christus des Glaubens und der Jesus der Geschichte*. His last work was *Der alte und der neue Glaube, ein Bekenntnis* (1872; 16th ed., 1904). In these last works Strauss gave up entirely the faith he once may have had in Christianity. Strauss's popularity was doubtless due as much to his clear and captivating style as to any logical force in his arguments. He died Feb. 8, 1874.

F. Strauss und die Theologie seiner Zeit* (Heidelberg, 1876-78); Albert Schweitzer, in *Von Reimarus zu Wrede* (Tübingen, 1906; Eng. trans., *The Quest of the Historical Jesus*, New York, 1910); F. W. Nietzsche, in *Thoughts Out of Season*, part i (ib., 1910).

**STRAUSS, JOHANN, the Elder** (1804-49). An Austrian composer of dance music, born in Vienna. He received an imperfect musical education. In 1819 he was received into Pamer's orchestra, and four years later joined the celebrated Lanner Quartet as viola player. He subsequently became assistant conductor of Lanner's orchestra, but in 1824 started an independent organization, with which he played at various resorts, and through which he gave to the world the waltzes which made him famous. In 1845 he was appointed conductor of the court balls at Vienna. Conspicuous among the 152 waltzes which he published were the "Lorelei," "Gabrielen," "Taglioni," "Victoria," "Kettenbrücken," "Bajaderen," and the "Donau-Lieder." Both as conductor and as composer he succeeded in raising the dance form to an artistic plane be-

fore unknown. Consult F. Lange, *J. Lanner und Joh. Strauss* (Vienna, 1904).

**STRAUSS, JOHANN**, the Younger (1825-99). An Austrian composer, born in Vienna, son of the preceding. His father was averse to his adopting the profession of music, but, aided by his mother, he was enabled to secure instruction on the violin and in composition, and at nineteen years of age severed his home connections and secured an engagement as conductor of an orchestra at a popular restaurant in Hietzing. He used the opportunity to play his own waltz compositions and soon became widely popular. After his father's death he united both orchestras and began a concert tour through many European countries. From 1855 to 1865 he was the conductor of the Petropaulovski Park summer concerts in St. Petersburg, and from 1863 to 1870 was also conductor of the court balls. He composed nearly 500 dance pieces, which for the most part possess the highest merit, and became immensely popular, especially *The Beautiful Blue Danube* waltz. In their own field many of his operettas may be regarded as classic. They include: *Indigo* (1871); *Der Carneval in Rom* (1873); *Die Fledermaus* (1874); *Cagliostro* (1875); *Prinz Methusalem* (1877); *Das Spitzentuch der Königin* (1880); *Der lustige Krieg* (1881); *Eine Nacht in Venedig* (1883); *Der Zigeunerbaron* (1885); *Simplicius* (1887); *Ritter Pasman* (1892); *Fürstin Ninetta* (1893); *Jabuka, oder das Apfelfest* (1894); *Waldmeister* (1895); *Die Göttin der Vernunft* (1897); and a ballet *Aschenbrodel*. Consult L. Eisenberg, *Johann Strauss, Ein Lebensbild* (Leipzig, 1894); R. von Prochazka, *Johann Strauss* (Berlin, 1900); F. Lange, *Johann Strauss* (Leipzig, 1912).

His brothers, **JOSEPH**, who became leader of the Vienna orchestra in 1863, and **EDUARD**, who assumed its direction in 1870, both did creditable work as musical conductors and composers of dance music.

**STRAUSS, RICHARD** (1864- ). A German composer, who became a dominating figure in his art. He was born in Munich, June 11, 1864. His musical talent showed itself at a very early age; indeed, when only four and a half years old he was receiving regular instruction on the piano. In his seventh year he wrote his first original composition, and before he had reached his eighth year he began the study of the violin with Benno Walter, the concertmaster of the Munich Court Opera. From 1875 to 1880 he studied composition and orchestration under court conductor F. W. Meyer. At the same time his father, the celebrated horn virtuoso Franz Strauss (1822-1905), influenced the boy's early development through systematic study of the classic masters. Together with this thorough musical training he enjoyed also the benefit of a liberal education at the Gymnasium, and subsequently attended courses in philosophy and aesthetics at the University of Munich. In 1885 he became assistant conductor to Bülow at Meiningen, and soon after the latter's resignation (in November of the same year) his successor. From 1886 to 1889 he was third conductor at the Court Opera in Munich. Becoming dissatisfied with the conditions prevailing at that time, he then accepted a call as court conductor at Weimar, where he remained till 1894. There he won such fame as composer and conductor that his native city once more secured him, this time as principal conductor ranking

with Levi. Conditions, however, had not been improved materially, and he found it difficult to realize his intentions. Consequently he gladly signed a ten-year contract with the Royal Opera of Berlin in 1898. Liberal leave of absence allowed him to make extensive and very successful concert tours of Europe and also of the United States (1904, 1921). From 1901 to 1909 he was president of the Allgemeiner Deutscher Musikverein. In 1903 he was appointed Generalmusikdirektor. He married, in 1894, Pauline de Ahna, an excellent interpreter of his songs.

To the date of writing, the works of Strauss exhibit three distinct styles. The compositions of the first period (1880-87) show the influence of the classic and romantic masters. The more notable ones are: a string quartet op. 2; a sonata for cello, op. 6; a piano quartet, op. 13; a sonata for violin, op. 18; serenade for wind instruments, op. 7; a concerto for violin, op. 8; a concerto for horn, op. 11; a symphony in F minor, op. 12; a symphonic fantasy, *Aus Italien*, op. 16; *Wanderers Sturmlied*, op. 14, for chorus and orchestra.

Through the influence of Alexander Ritter (q.v.) the views of Strauss underwent a radical change, so that in his second period (1887-1904) he espoused the cause of programme music (q.v.). He took up and still further developed Liszt's idea of the Symphonic Poem, and became an innovator as regards harmony and orchestration. As yet he introduced no new instruments, but by employing a very large orchestral apparatus he succeeded in obtaining from existing instruments new effects and sound combinations of striking beauty. The themes are well defined, expressive and plastic, and their contrapuntal development and combinations attest the hand of the consummate master. The works exhibiting these splendid qualities are the great Tone Poems (*Tondichtungen*) *Don Juan* (1889), *Tod und Verklärung* (1890), *Macbeth* (1890), *Till Eulenspiegels Lustige Streiche* (1895). The second and fourth of these compositions mark to this day the zenith of Strauss's creative power. After *Eulenspiegel* begins a period of steady decline. Mere technical skill usurps the place of inspiration. The boundary lines between music and the other arts become more and more obliterated. The themes in the successive works lose beauty and power. Originality gradually degenerates into sensationalism. What characterizes these works as still belonging to the composer's second period is the fact that each work, despite all objectionable features, yet contains passages of transcendent beauty. But the effect of such moments is marred by the juxtaposition, without compelling necessity, of passages that sound unnatural, forced, grotesque, or repellent. The works in question are: *Also Sprach Zarathustra* (1896); *Don Quixote* (1898); *Ein Heldenleben* (1899); *Sinfonia Domestica* (1904). In spite of Wagnerian influences the two operas, *Guntram* (1894) and *Feuersnot* (1901), also belong to Strauss's second period. In both the excellent qualities of his style predominate.

The third period is represented by only two works, both dramatic, *Salome* (1905) and *Elektra* (1909). The style here exploited, one of hopeless decadence, is the natural evolution of all the objectionable features of the preceding period. The repulsive texts naturally determine the character of the music. Ugliness and cacophony reign supreme. Characterization be-

comes caricature; dissonance degenerates into discord; brutality usurps the place of force. Thematic invention is at its lowest ebb. Generally the instrumentation is so overloaded that it produces little effect, because of lack of sufficient contrast. Strauss's better nature seems to have realized how far he had strayed beyond the furthest boundaries of art, for his next work, *Der Rosenkavalier* (1911), marks a decided return to his own second style and to recognized standards. In *Ariadne auf Naxos* (1912) he yields once more to the temptation of being original at all costs. But, fortunately, he experiments here with the external dramatic form rather than with the music itself. With the *Joseflegende* (1914) Strauss successfully ventured upon the field of the ballet; while his return to purely instrumental music—the field of his greatest achievements—with his *Alpensymphonie* (1915) augured well for the future. Yet his latest works show all the characteristics of a transition period. There is a decided weakness of the inventive faculty as compared with his masterpieces *Tod und Verklärung* and *Till Eulenspiegel*, and he seems to rely on his stupendous technical skill to cover this defect as much as possible.

From the very beginning of his career, throughout all changes of style, Strauss cultivated the song; and with such success, that in his best productions of this kind he reaches the level of the greatest lyric masters. The texts are chosen with unerring taste, the declamation is faultless, the musical inspiration flows freely, naturally, without interruption. The composer is happiest in his settings of words demanding for their proper musical interpretation deep feeling or great emotional intensity. While it is, as yet, too early to attempt to fix Strauss's place in the history of music, certain facts may be stated without fear of contradiction: his place among the great masters of song is securely established; he has advanced the art of orchestration even beyond Wagner; the greatest of his Tone Poems mark the highest achievement in the field of programme music. The following list includes his more important works not already mentioned: *Festliches Präludium* for orchestra; the two melodramas *Enoch Arden* and *Das Schloss am Meer*; *Taillefer*, ballad for soli, chorus and orchestra; *Deutsche Motette*, for soli and 16 part a capella chorus; *Bardengesang*, for male chorus and orchestra. He also edited his father's compositions for Horn, Gluck's *Iphigenie auf Tauris*, and revised and enlarged Berlioz' *Treatise on Instrumentation*.

**STRAVINSKY**, strá-vín'skí, IGOR FEDOROVITCH (1882— ). A Russian composer, born at Oranienbaum. At an early age he began the study of the piano. In 1902 he met Rimsky-Korsakov, with whom he then took up the study of composition. He first attracted attention in

1908, when Siloti produced at St. Petersburg his *Scherzo Symphonique*, which at once proclaimed him a disciple of the extremists. New works followed in rapid succession, and in each he advanced beyond the preceding, so that he came to be regarded as the leader of Futurism—a cult which even the extreme impressionists hesitated to accept as legitimate art (see MUSIC, HISTORY OF, *Twentieth Century Tendencies*). His other works are: a symphonic fantasy, *Fireworks*; the ballets *L'Oiseau de Feu* (1910), *Petrouchka* (1911), *Le Sacre du Printemps* (1913); a string quartet, *Grotesques* (1915). An opera, *Le Rossignol*, after Andersen's fairy tale, was produced in Moscow in 1914.

**STRAW**, PAPER AND OTHER MANUFACTURES OF. Prior to the introduction of mechanically-ground wood pulp in the manufacture of newsprint paper, rags and straw were widely used. Objections to the use of straw fibres for paper were due to the brittle character of the paper. Straw pulp fibres are so short and narrow as to make the paper weak. To-day, however, straw is widely used in the manufacture of paper board, chiefly because of its low cost. The straw is stripped of undesirable elements when originally prepared, and therefore needs no extra process for the pulp-making machines, where it is boiled up with lime and made into half stuff, just as any other raw material in the pulp process. See PAPER.

Strawboard, the principal paper product of straw, is made by the Fourdrinier process of paper making, except that the pulp is taken from the vats by a revolving wire covered cylinder instead of by a traveling wire or screen. The cylinder presses the pulp against a heavy felt which absorbs the moisture and under pressure welds the fibres together.

Occasionally straw is used with other materials in the manufacture of higher grades of paper, but its presence can always be determined by a peculiar rattle to the sheet and also a predominating characteristic of translucency. When chemical tests are applied the straw fibres stain this paper a grayish blue. Microscopic examination shows the peculiar kinky nature of the fibres. In all essentials the straw process is the same as that of Esparto (q.v.) grass. Strawboard is the cheapest paper board available for binding and mounting purposes. The boards are cut usually in sizes of 30 × 25 inches and 32 × 22 inches, and are made up into bundles weighing fifty-six pounds, the number of boards to the bundle being determined by the weight of the individual boards. The production of strawboard in America amounts to about 175,000 to 200,000 tons annually. The United States census of manufactures for 1909 showed that the production in 1909 was 171,000 tons valued at \$3,751,000. For Bibliography see PAPER.

**STRAW BAIL.** In old English law, the names of two or more fictitious persons entered on the records of a court as sureties for the appearance of a defendant in a civil action. In early times a defendant was first served with a summons, and if he did not appear he was considered to be guilty of contempt of court, for which the sheriff arrested him under a *capias*, and he was obliged to give bail for his appearance. Gradually, through the change of practice in serving only one process and the indulgence of the courts, this became a mere formality, and the fictitious names of John Doe and Richard Roe were entered as sureties. This was known

as common or straw bail. This practice no longer prevails, but the name is retained to denote a financially irresponsible surety on a bail bond. See BAIL.

**STRAWBERRY** (AS. *strēawberie*, *strēawberige*, strawberry; perhaps so called either because the long stems resemble straws, or because of an old custom of stringing the berries on straws). Certain perennial herbs of the family Rosaceæ, widely distributed mostly in temperate regions throughout the world. The cultivated forms are all derived by the hybridization and crossings of three principal species, *Fragaria vesca*, *Fragaria virginiana*, and *Fragaria chiloensis*, particularly the last named. The plants are low growing, have trifoliate leaves, white flowers either pistillate or polygamous, and numerous achenes on usually red, sometimes yellowish-white fleshy receptacles which constitute the edible part. The plants are hardy and may be

COMMON WILD STRAWBERRY (*Fragaria virginiana*).

grown in almost any region in America from Florida to Alaska. The varieties grown almost universally in America have a short season of fruitfulness, but several of the European varieties bear more or less continuously throughout the summer and early autumn. Nurserymen have been partially successful in developing strains of fall-fruited strawberries. With the varieties thus far introduced the fruit is medium to small in size and the fall-bearing habit must be encouraged by removing all blossoms after the spring setting of fruit until after midsummer, when the fall crop is allowed to develop.

Since young plants are most productive, the strawberry plantations are usually allowed to fruit only once, sometimes twice. The plants obtained from rooted runners are set in the field in spring or in late summer, and are allowed to form matted rows from their runners or are grown in so-called hills, in which case the run-

ners are cut off, and the plants made to form stools. The former method is by far the most popular, but finer and larger individual fruits, though in smaller number, are obtained by the latter method. The land may be any rich soil suitable for corn or potatoes, and should have been in cultivation for at least one year, preferably two or three, previous to the planting of the strawberries, in order to be free from the larvæ of certain insects that feed on the roots especially of grasses. The plants are usually set at about 18 inches distance, in rows three feet apart, and given clean culture throughout the season. When the ground has frozen hard straw, marsh hay, or similar substance free from weeds is spread upon the plants as a winter mulch. This is raked between the rows when growth starts in the spring and allowed to remain to protect the berries from dirt during rains. Usually in the spring of the second year complete fertilizers are applied, but no cultivation is given. After the crop is gathered, the plants are usually plowed under in commercial practice, but may be fruited for several seasons in the home garden. Land cropped with strawberries should be planted to other crops for two or three years before strawberries are again planted.

The whole industry has been developed since the introduction, in 1834, of the Hovey strawberry, a variety which originated in Massachusetts. Since that date thousands of varieties have been introduced. Strawberries are cultivated to a small extent under glass to supply a demand for forced fruits in some cities.

The principal disease to which the strawberry plant is subject is the blight or rust (*Mycosphaerella fragariae*), which appears on the leaves as small purple spots which increase in size and become brown with purple margins. Serious losses may follow severe attacks. Since the disease is carried over winter in the old leaves, all such should be collected and burned and the young foliage protected by two or three sprayings of Bordeaux mixture or other fungicide (q.v.). A mildew (*Sphaerotheca humuli*) sometimes appears on the leaves as a delicate cobweb which causes the crumpling of the leaves. It seldom causes much injury and is readily controlled as above indicated. A number of serious rots of strawberry fruits, which develop during shipment, were described by Stevens in 1915. Temperature control in shipment seems to be the only means for prevention of these rots. Consult: Fuller, *The Strawberry Cultivist* (New York, 1897); Terry and Root, *A, B, C of Strawberry Culture* (Medina, Ohio, 1902); S. W. Fletcher, *The Strawberry in North America* (New York, 1915); as well as literature of the United States Department of Agriculture and the State experiment stations.

**STRAWBERRY BLITE.** See CHENOPodium.

**STRAWBERRY BUSH.** See SPINDLE TREE.

**STRAWBERRY INSECTS.** The principal insect enemy of the strawberry in the eastern United States is the strawberry weevil (*Anthonomus signatus*), which appears just before the blossoms expand, lays an egg in the bud usually of the staminate varieties or those pistillate varieties rich in pollen, and then punctures the stem so that in a few days the bud drops to the ground. The larva develops within the severed bud and after pupation emerges as a dull

red or nearly black beetle, about one-tenth of an inch long. Both larvæ and adults feed upon the pollen. Covering the beds, cultivating pistillate varieties, and clean culture are the remedies recommended.

The larva of the strawberry leaf-roller, a small reddish brown tortricid moth (*Ancylis comp-tana*), rolls the leaves of the strawberry into cylindrical cases during June, becomes a chrysalis within the folded leaf, and appears as a moth in July. A second generation occurs during August. An arsenical spray is the remedy.

The strawberry sawfly (*Harpiphorus maculatus*), a small, black insect, lays its eggs in the substance of the leaf early in May. The pale green larvæ, which feed upon the leaves, and when full grown are nearly three-fourths of an inch long, burrow in the ground and form minute cocoons. A second generation appears in the late summer and hibernates under ground. Hel-lebore is recommended as a remedy. Consult: Saunders, *Insects Injurious to Fruits* (Philadelphia, 1889); Chittenden, *The Strawberry Weevil* (Washington, 1897); Slingerland and Crosby, *Manual of Fruit Insects* (New York, 1914).

**STREATOR**, stré'tor. A city in La Salle Co., Ill., 90 miles southwest of Chicago; on the Vermilion River, and on the Chicago, Burlington, and Quincy, the Chicago and Alton, the Wabash, the New York Central, the Chicago, Ottawa, and Peoria, and the Atchison, Topeka, and Santa Fe railroads (Map: Illinois, G 3). There is an attractive park in the heart of the city. Streator has important railroad interests, and is the centre of an agricultural region noted also for its deposits of coal and clay. Bottle and rough plate-glass works, foundries and machine shops, and manufactories of automobiles and accessories, sewer pipe, and brick and tile are the leading industrial establishments. Streator was settled in 1860, and was laid out in 1867. It was incorporated as a village in 1870, and organized as a city in 1882. Pop., 1900, 14,079; 1910, 14,253; 1915 (U. S. est.), 14,295; 1920, 14,779.

**STRECK**, shtrëk, KARL MAXIMILIAN (1873- ). A German Semitic philologist, born at Pfarrkirchen, Bavaria. He studied at Munich, Leipzig, and Strassburg, taught successively at Munich, Berlin, and Strassburg, and in 1908 became professor of Semitic philology at Würzburg. His writings include: *Armenien, Kurdistan, und Westpersien nach Keilinschrift* (1898-1900); *Die alte Landschaft Babylonien nach den arabischen Geographen* (2 vols., 1900-01); *Keilinschrift Beiträge zur Geographen Vorder-Asiens* (1906); *Ueber der ältesten Geschichte des Aramäer* (1906); *Lexikalische Studien* (1908); *Die Inschrift Assurbanipals mit Nach-folgen* (1912).

**STRECKER**, HERMAN (1836-1901). An American entomologist, born in Philadelphia. He acquired considerable skill as a sculptor and designer, but his chief claim to distinction is due to his study of butterflies. His collection of these insects was the largest in America and one of the largest in the world. He published *Lepidoptera, Rhopalocera and Heterocera. Indigenous and Exotic* (1872-77) and *Butterflies and Moths of North America* (1878).

**STRECKFUSS**, shtrëkfôos, KARL (1778-1844). A German poet and translator. He was

born at Gera, studied law at Leipzig, and occupied high positions in the Prussian civil service. His original works, not important, include *Gedichte* (1823), *Neuere Dichtungen* (1834), and *Erzählungen* (1830), but he is best known as the translator of *Ariosto* (1818-20), *Tasso* (1822 and often), and *Dante* (1824-26; 9th ed., 1871; and Reclam, Nos. 796-800).

His son ADOLF (1823-95), a novelist and historian, was the author of *Friedrich I und die Quitzows* (1859); *Vom Fischerdorf zur Weltstadt*; *500 Jahre Berliner Geschichte* (last ed., 1899); *Weltgeschichte, dem deutschen Volk erzählt* (1865); and *Das einsame Haus* (1888).

**STREET** (AS. *stræt*, from Lat. *strata*, street, highway, fem. sing. of *stratus*, p.p. of *sternere*). The term as here used denotes a way for foot and vehicular traffic in cities and other more or less closely inhabited areas. Some points to be observed in planning a city's streets are as follows: The radiation from a principal centre, and sometimes subradiations from local centres. This will save time and distance, and afford opportunity for better artistic effects in the way of commanding central features, as public squares, monuments, buildings, vistas. Placing pipes and wires in underground galleries is a modern means for relieving overhead congestion. Much relief has been gained by placing wires in inclosed underground conduits accessible from manholes, or covered chambers placed sufficiently near together to render excavation unnecessary. See SUBWAYS.

In building sidewalks care must be taken to secure an unyielding, well-drained foundation, to prevent uneven settlement, cracks, or breaks. Boards or planks are generally laid crosswise of the walk, on longitudinal stringpieces, or timbers, designed to keep the boards off the ground and postpone decay. On account of this decay, wooden sidewalks are, in the long run, decidedly uneconomical, and flags, brick, concrete, artificial stone, or asphalt are to be preferred, their selection depending upon local conditions and economy. Curbstones are from four to six inches thick and deep enough to form the necessary rise above the gutter and to extend into the earth sufficiently to give a firm foundation. They are often set on broken stone, to insure good drainage, or on concrete, to give a solid foundation. They may be of stone or of concrete. Where concrete is used it sometimes extends so as to form the gutter as well, and has the upper and outer edge of the curb protected with an iron bar or rod, embedded in the concrete. Consult Robinson, *The Width and Arrangement of Streets: A Study of Town Planning* (New York, 1911). See BOULEVARD; CITY PLANNING; ELECTRIC LIGHTING; ELECTRIC RAILWAYS; GAS; HEATING AND VENTILATION, *Central Heating Plants*; PAVEMENT; ROAD; ROAD AND STREET MACHINERY; SEWERAGE AND DRAINAGE; STREET RAILWAY; SUBWAYS FOR PIPES AND WIRES; WATER WORKS; ETC., and references given in these articles.

**STREET**, ALFRED BILLINGS (1811-81). An American author, born at Poughkeepsie, N. Y. For many years he was New York State librarian. His poems deal with the sights and sounds of the woodland and the life of the more primitive days of the settlement of America. Among his books of verse are: *The Burning of Schenectady*, and *Other Poems* (1842); *Drawings and Tintings* (1844); and *Fugitive Poems* (1846). His chief prose works are: *Woods and Waters*

(1860); *The Indian Pass* (1869); *Lake and Mountain*; or, *Autumn in the Adirondacks* (1870); *Eagle Pine*; or, *Sketches of a New York Frontier Village* (1871).

**STREET, GEORGE EDMUND** (1824-81). An English architect, born at Woodford, Essex. He studied under Sir George Gilbert Scott, from whom he got his partiality for the Gothic style and his talent in restoring mediæval monuments. He designed the theological college at Cuddesden, churches at Oxford and Liverpool, the Crimcan Memorial Church at Constantinople, St. Paul's (American) Church at Rome, and the Law Courts in London—his largest and most criticized work. Among his restorations are the cathedrals of York, Bristol, and Carlisle, Jesus College Chapel, Oxford, and Wantage church. Among his writings are *The Brick and Marble Architecture of North Italy in the Middle Ages* (1855), and *Gothic Architecture in Spain* (1865; new edition, 1914), which are classics in their fields.

**STREET, JULIAN LEONARD** (1879- ). An American author, born in Chicago. He was a reporter on the *New York Mail and Express* (now *Evening Mail*) in 1899, and had charge of its dramatic department in 1900-01. His writings, characterized by a rather obvious but yet a genuine humor, include: *My Enemy the Motor* (1908); *The Need of Change* (1909; 2d ed., 1914); *Paris à la Carte* (1912); *Ship-Bored* (1912); *The Goldfish* (1912); *Welcome to our City* (1913); *Abroad at Home* (1914), and contributions to magazines. In 1915 he published a book on Theodore Roosevelt, called *The Most Interesting American*.

**STREET RAILWAY.** A railway laid upon the public streets of a city or a town, and intended principally for the transportation of passengers. The street railway had its origin in the early tramways of Great Britain (see **RAILWAYS**), and such roads are still denominated *tramways* in all European countries. Street-railway cars are operated by electricity, either from a storage battery or from a trolley or conductors in a conduit, by cable, or are animal drawn.

A street railway was operated in New York City in 1831-32, on which a horse car, much like an old English stage coach in construction, ran from Prince Street on the Bowery to Yorkville and Harlem, following for some distance the route now occupied by the Fourth Avenue Railway, which still operates under the original charter granted in 1831. The road was known as the New York and Harlem Railroad, and it continued in operation as a horse-car line until 1837, when it was temporarily changed to a steam-car line. In 1845 the operation of the horse cars on the railway line was resumed, and it remained the only horse-car line in New York until 1852, when charters were granted for the Second, Third, Sixth, and Eighth Avenue lines. Street railways were first built in Boston, Mass., in 1856. Philadelphia, Pa., had its first line in 1857. The street railway was introduced into England in 1860 through the efforts of George Francis Train, the first line being started in Birkenhead opposite Liverpool. Roads were laid in Liverpool in 1868, in London in 1869-71, and afterward in Glasgow, Edinburgh, and Dublin. An authority (Dumont, *Automobiles sur rails*, 1898) says that the first horse tramway in France was built in 1856 on a line extending from Paris to Saint-Cloud, and was called the

American railway; but that the first horse-car line in Paris itself was not built until 1875. Street-railway enterprises began to be taken up by the South American countries in 1866.

The street-railway rail of 1832 was a wrought-iron bar about 5 inches wide, with a groove from  $1\frac{3}{4}$  inches to  $2\frac{1}{4}$  inches wide and from 1 inch to  $1\frac{1}{2}$  inches deep, for the wheel flange. The wide and deep groove in this rail gave trouble by catching the wheel tires of ordinary vehicles and wrenching them. To remedy this fault the step rail was adopted. This consisted of a flat bar having a flat surface from 3 inches to 5 inches wide flanked by a ridge or tread about 1 inch high and  $1\frac{3}{4}$  inches wide. This form of rail came into extensive use, especially in America. Another form of step rail had the tread in the centre flanked by a flat surface on each side. The next development was a return to the grooved rail, but with the groove wedge-shaped and narrow. These early forms of rails were simply iron bars spiked to the tops of longitudinal timbers. This timber was replaced by metal longitudinals, chairs, and supports of various sorts as experience suggested improvements, until finally the attempt of trying to maintain the tread or wearing surface of the rail

DIFFERENT TYPES OF STREET-RAILWAY TRACK CONSTRUCTION.

separate from the supporting body was abandoned and the modern girder rail was originated. The girder rail consists of a base and web like the ordinary T-rail for railways, but has a wide grooved head. With the advent of the girder rail the former difficulty of insecure and uneven joints was largely decreased and at the same time a rail was developed which gave the necessary stiffness for carrying the rapidly increas-

ing weights of cars which were made possible by the development of mechanical propulsion. The construction of modern street-railway tracks is shown in the diagram (page 589) from *Engineering News*, and is more fully described in the articles on ELECTRIC RAILWAYS and URBAN TRANSPORTATION.

The horse-drawn street car was the most common form of locomotion when street railways were first built in the United States. (There were horse-drawn street cars in New York City in 1916.) Later extensive installations of cable railways were made. With the development of the science of electricity it was found that cars could be operated much more cheaply by electricity than by cable. Cable cars are still in operation where street grades are so steep as to make electrical operation uneconomical. Thus in Seattle, Wash., which lies on a side hill, the cars running up and down hill are cable cars and the cars running along the side of the hill are electric cars.

In construction the cable railway consists of a standard street-railway track having an underground conduit between the rails. In this conduit there runs an endless wire rope cable guided by suitable pulleys. A slot at the top of the conduit permits a grip projecting downward from the bottom of the car to enter the conduit. This grip is provided at its lower end with jaws which can be so operated from the platforms of the car as to grasp and unloose the cable at will.

The accompanying table, which includes both urban and interurban street railways, shows that over 99 per cent of the mileage of the total is operated by electricity. For a description of interurban electric railways, see ELECTRIC RAILWAYS.

#### COMPARISON OF STREET-RAILWAY DEVELOPMENT 1890 TO 1912

(From the *United States Census Report*, 1912)

ITEMS	1912	1902	1890
Number of companies	1,260	987	789
Total miles of track...	41,065	22,577	8,123
Electric.....	40,808	21,902	1,262
Cable.....	56	241	488
Animal.....	58	259	5,661
Total employees...	282,461	140,769	70,764
Total passenger cars..	76,162	60,290	32,505

Urban electric railways are operated either with overhead trolleys or with the trolley wire put underground, the contact being made through a slot between the tracks, as with cable cars. For a description of the various types of cars and methods of operation, see URBAN TRANSPORTATION.

The distinguishing feature of the street railway is that it operates on public streets or highways and derives its franchise from the town or city in which it operates. In the larger cities it has been found necessary to put some of the passenger railways on elevated structures (see *Elevated Railways* under RAILWAYS) and some under the streets in subways. See PUBLIC UTILITIES, REGULATION OF.

**Bibliography.** Outside of the electric-railway field (see ELECTRIC RAILWAYS) there are few books of much value relating to street railways. There is available, however, a large volume of periodical literature of high class.

Among the sources of information of this class the following may be consulted with advantage: *Reports of the American Electric Railway Association* (Chicago); the *Electric Railway Journal* (New York); the *Engineering News* (New York); and *United States Census Report on Central Electric Light and Power Stations and Street and Electric Railways* (Washington, 1912).

**STREET-RAILWAY EMPLOYEES, AMALGAMATED ASSOCIATION OF.** See RAILWAY BROTHERHOODS.

**STREHLENAU**, shträ'le-nou, NIKOLAUS NIEMBSCH VON. See LENAUE, NIKOLAUS.

**STREITBERG**, shtrít'bérk, WILHELM (1864-). A German philologist, born in Rüdesheim, and educated at Münster and Leipzig, where he became docent in 1889. In the same year he was appointed professor of philology at Freiburg, Switzerland, a chair which he resigned in 1899 for a professorship at Münster. In 1909 he was appointed to the chair of Indo-Germanic languages at Munich. In comparative grammar he ranks close to Osthoff and to Brugmann. In 1892 he became editor of the *Anzeiger für indogermanische Sprach- und Altertumskunde*, the annual bibliography of the *Indogermanische Forschungen*, and of a series, entitled *Germanische Elementarbücher*, in 1896, in which he wrote "Urgermanische Grammatik" (1896; rev., 1903) and "Gotisches Elementarbuch" (1897; 4th ed., 1909). Other works by him are: *Zur germanischen Sprachgeschichte* (1892); *Entstehung der Dehnstufe* (1894); *Die gotische Bibel* (2 vols., 1907-10). After 1906 he edited, with Hermann Hirt (q.v.), the series entitled *Die indogermanische Bibliothek*; and from 1909 he was also one of the editors of the *Germanisch-Romanisch Monatsschrift*.

**STRELITZ**, shträ'lits. A town in the Grand Duchy of Mecklenburg-Strelitz (q.v.), about 2 miles south of Neustrelitz. It was formerly the capital of the country. It has some manufactures. Pop., 1900, 4165; 1910, 4307.

**STREL'TSI, STREL'TZI, or STREL'ITZ.** The Russian Imperial Guard, organized by Ivan IV in the second half of the sixteenth century. At that time and afterward they were the only standing force in Russia, and at times amounted to 40,000 or 50,000 men. They were stationed at Moscow in time of peace, in a special part of the capital. Incessant conspiracies rendered them in time dangerous. In 1698 a revolt of the Streltsi led to a bloody contest in which they were defeated. Peter the Great finally suppressed them (1705).

**STREMAYR**, shträ'mir, KARL VON (1832-1904). An Austrian statesman, born at Graz, where he also studied law, entered the government service, and subsequently was Attorney-General and docent at the University. In 1848-49 he was a member of the Frankfurt Parliament. In 1868 he was appointed counselor in the Ministry of the Interior, and in 1870-79 was Minister of Public Instruction, when he brought about the repeal of the Concordat of 1855. President of the Council after the going out of the Auersperg ministry in 1879, he entered the cabinet of Count Taaffe as Minister of Justice, but resigned in 1880, was appointed vice president and, after Schmerling's resignation in 1891, president of the Supreme Court. He retired in 1899. He was called to a seat in the House of Lords in 1889.

**STRENGTH OF MATERIALS.** The re-

sistance which materials offer against deformation. Every force or load produces in the structure an internal resistance which balances it, and this internal resistance is called a stress. Three kinds of direct stress may be produced by load or force: a stress tending to pull apart, or tensile stress; a stress tending to push together, or compressive stress; and a stress tending to slide on parallel planes, or shearing stress. Complex stresses (flexure and torsion) are capable of being resolved into tension, compression, and shearing stresses. A unit stress is the stress per unit of area; the unit of area is the square inch in English-speaking countries and the square centimeter in countries where the metric system prevails. In cases of direct stress the total stress is supposed to be uniformly distributed over the area of the cross section. When a tensile or compressive force is applied to a bar of metal, it elongates or is shortened, and up to a certain limit the elongation or shortening is proportional to the load. Beyond this limit the elongation or shortening increases more rapidly than the load. The unit stress at which deformations begin to increase in a faster ratio than the stress is called the elastic limit, or less commonly the elastic strength. When the unit stress in a bar is less than the elastic limit, the bar returns, when the stress is removed, to its original dimensions. When, however, the unit stress is greater than the elastic limit, the bar does not fully return to its original dimensions, but a permanent distortion remains. Therefore, if a material is strained beyond its elastic limit, a permanent injury results to its elastic properties; and for this reason it is the universal practice in designing engineering structures to make certain that the unit stresses never exceed the elastic limit of the material, as it would then be in an unsafe condition and would finally break.

The unit stress which occurs just before rupture takes place is called the ultimate strength of the material. Ultimate strength of materials are from two to four times as great as their elastic limits. Strength is determined by straining a piece of the material to rupture and observing the elastic limit, ultimate strength, and other phenomena.

**Tension.** In testing a material under tension a test piece or test specimen, usually 8 inches long and 1 square inch in section, is broken by direct pull. The loads are gradually applied. At first each increment of load produces a proportionate increment of elongation, but after the load has reached a certain amount the elongation begins to increase more rapidly than the load. The unit load recorded just as this change in the rate of deformation takes place is the elastic strength or elastic limit of the material. As the load increases the elongation increases more rapidly than the load and is commonly accompanied by a reduction in area of the cross section of the test piece. Finally the test piece breaks and its ultimate strength is recorded. Record is also taken of the total elongation of the piece and of the total reduction of area. These last two records are indices of ductility. These values vary greatly for different kinds of materials and considerably for different qualities of the same material. In printing figures for illustration, therefore, the best that can be done is to select rough average values. The following figures are taken from Merriman's *Strength of Materials*:

MATERIAL	Elastic limit, lbs. per sq. inch	Ultimate strength, lbs. per sq. inch	Ultimate elongation, per cent
Timber. . . . .	3,000	10,000	1.5
Cast iron . . . . .	6,000	20,000	0.3
Wrought iron . . . . .	25,000	50,000	30.0
Steel . . . . .	50,000	100,000	15.0

**Compression.** In testing for compressive strength the test piece used is short and thick, a cube and a short cylinder being common forms. The phenomena are substantially as in tension, first a distortion proportional to the load until the elastic limit is reached, and then a distortion increasing more rapidly than the load until rupture occurs. The manner in which rupture occurs is quite different from that in tension, where the material draws to a smaller diameter and finally parts by a ragged fracture at approximately right angles to the direction of the pull; in compression the test piece first bulges to an increased diameter and then ruptures with a fracture oblique to the direction of the pressure. This method of fracture occurs only when the test piece is thick compared with its height; when the height is great compared with the thickness, lateral flexure or bending occurs and the conditions of rupture are no longer those of simple compression, as it is explained in the succeeding paragraph on the strength of columns. As was the case with tension, only rough average figures of comparative strength can be given, owing to the fact that this strength varies for different materials and with different qualities of the same material. The following figures are quoted from Merriman's *Strength of Materials*:

MATERIAL	Elastic limit, lbs. per sq. inch	Ultimate strength, lbs. per sq. inch
Timber.....	3,000	8,000
Stone.....		6,000
Cast iron.....	20,000	90,000
Wrought iron.....	25,000	50,000
Steel.....	50,000	120,000

**Shear.** Shear is the stress produced by two parallel forces acting on the material in opposite directions, as, for example, do the blades of a pair of shears. If a weight be suspended by a bar which is composed of two shorter bars connected at one end by a rivet or bolt passing through them, the stress brought upon the rivet is a shearing stress. The same stress is exerted by a punching machine in punching holes in metal plates. The shearing strength of materials often differs according to the direction in which shearing forces are exerted. The shearing strength of timber is much less along the grain than at right angles to the grain. The following figures taken from Merriman give the average ultimate shearing strengths of common structural materials:

MATERIAL	Pounds per sq. inch
Timber, longitudinal.....	500
Timber, transverse .....	3,000
Cast iron . . . . .	18,000
Wrought iron.....	40,000
Steel.....	80,000

**Actual Values.** The figures given in the preceding tabular statements show rough average

values, useful chiefly to be memorized as a basis for approximation. In careful designing the engineer requires actual values as determined by authoritative tests upon the particular material he is using or proposes to use. These values vary within quite narrow limits for each kind or quality of any material and within broader limits for all kinds and qualities of the same material. The ultimate average strengths of common structural timbers are as follows:

TIMBER	POUNDS PER SQUARE INCH	
	Tensile strength	Compressive strength
Hemlock .....	8,000	5,000
White pine .....	8,000	5,500
Chestnut .....	12,000	5,000
Red oak .....	9,000	6,000
Yellow pine .....	15,000	9,000
White oak .....	12,000	8,000

These values have been obtained by testing small pieces. Timbers of large size such as are actually used in engineering structures will fall from 20 per cent to 50 per cent below these values in strength. These values are also subject to a variation of about 25 per cent according to time of cutting, place of growth, and methods of seasoning. The shearing strength of timber is more variable than either the tensile or the compressive strength. The values average about as follows:

TIMBER	POUNDS PER SQUARE INCH	
	Along the grain	Across the grain
White pine .....	500	2,500
Chestnut .....	600	1,500
Yellow pine and oak .....	600	4,000

The elastic limit of timber is not well defined; it varies from one-third to one-half the ultimate strength in tension. The elongation at the point of rupture in tension is from 1 per cent to 2 per cent.

Tensile and shearing tests of brick are seldom made, but the compressive strength varies from 500 pounds per square inch for soft brick to 10,000 pounds for pressed brick, and to 15,000 pounds for the best qualities of hard-burned paving brick. Concrete, whether reinforced or not, varies in strength, depending upon its mixture and age. This will be found fully discussed under concrete (q.v.). The crushing strengths of the principal building stones of the United States are about as follows:

STONE	POUNDS PER SQUARE INCH	
	Minimum	Maximum
Trap rock .....	20,000	24,000
Granite .....	12,000	21,000
Marble .....	8,000	20,000
Limestone .....	7,000	20,000
Sandstone .....	5,000	15,000

Cast iron is so variable in quality that similar specimens will vary from 10 per cent to 20 per cent in strength. Fair average values are 20,000 pounds per square inch in tension and 90,000 pounds per square inch in compression. The

elastic limit is poorly defined and the elongation is practically nil, indicating clearly the fact, known to every one familiar with this material, that it is a hard and brittle substance. A direct contrast to cast iron is afforded by wrought iron with a tensile and a compressive strength nearly equal and ranging between 45,000 and 60,000 pounds per square inch, and with an elongation of 20 per cent to 30 per cent and an elastic limit well defined at about 25,000 pounds.

Steel is manufactured in a variety of grades distinguished by the relative amounts of contained carbon, as mild steel, medium steel, hard steel, and extra hard steel. Ordinary structural steel for bridge and building construction has an ultimate tensile strength of from 60,000 pounds to 70,000 pounds per square inch and an elastic limit of from 30,000 pounds to 40,000 pounds per square inch. Nickel steel, or steel containing a small percentage of nickel, has been made with a tensile strength of 277,000 pounds per square inch and an elastic limit of 100,000 pounds per square inch. The later alloy steel is made with due regard to increased tensile strength, and for that reason the tonnage of such steel entering into structural work can be decreased or greater spans employed. The compressive strength of steel is always greater than its tensile strength. The maximum compressive strength recorded for hardened steel is 392,000 pounds or 196 tons per square inch.

The tensile strengths of the common metals are about:

MATERIAL	Pounds per sq. in.	MATERIAL	Pounds per sq. in.
Brass, cast .....	23,500	Gold wire .....	27,500
Brass wire .....	49,000	Lead, cast .....	2,050
Copper, cast .....	21,000	Lead wire .....	1,650
Copper wire .....	60,000	Platinum wire .....	56,000
Gold, cast .....	20,000	Aluminium .....	25,000

Common mortar composed of one part lime and five parts sand has a tensile strength of from 15 to 30 pounds and a compressive strength of from 150 to 300 pounds per square inch at the age of six months. Natural hydraulic cement will test from 100 to 200 pounds per square inch in tension when one month old, and Portland cement will test from 600 to 800 pounds per square inch at the same age. Mortars and pastes of cement and lime increase in strength with age.

**Working Stresses.** The loads carried by a structure should never strain the material to an amount at all close to its ultimate strength. Were they to do so the elastic limit of the material would be exceeded and distortion would ensue even though ultimate rupture did not occur. Therefore, in designing a structure a unit stress is adopted which is certain not to cause distortion or rupture, and the size of each member is determined by dividing this unit stress into the total load on the member. This assumed unit stress is called the working stress, and it varies for any material according to the character of the load it is to support. Thus the safe working stress for a varying load is less than for a steady load, and that for a sudden load or shock is less than for a varying load; a load producing tension and compression alternately requires the use of a smaller working stress than does a steady load or a varying load in tension only. In all cases the working stress must be less than the elastic limit of the material. It has long been the practice to call the ratio of the ultimate strength to the working stress the factor of safety. The factors of safety

commonly employed for different materials and for different forms of load are thus given by Merriman:

MATERIAL	For steady stress (buildings)	For varying stress (bridges)	For shocks (machinery)
Timber .....	8	10	15
Brick and stone....	15	25	40
Cast iron .....	6	10	20
Wrought iron.....	4	6	10
Steel .....	5	8	15

**Resilience.** One of the most important properties of a material is its capacity to resist the work of external forces, or its resilience. If a bar is placed in a testing machine and pulled by a force gradually increasing from 0 to  $F$ , and this pull produces an elongation equal to  $e$ , the work done on the bar is the product of the average pull into the elongation, or one-half  $F$  $e$ . Since the internal stresses in the bar resist the work done by the external force, they must also perform an amount of work represented by one-half  $F$  $e$ , and the measure of resilience of a material is the product of the average force exerted upon it multiplied by the elongation which this force produces. Elastic resilience is that internal work which has been performed when the internal stress reaches the elastic limit; ultimate resilience is that internal work which has been performed when the material is replaced. Resilience, like work (see **WORK**), is measured in foot pounds, or, more commonly, in inch pounds. The higher the resilience of a material is the greater is its capacity to resist the work of external forces. Cast iron has very low resilience and wrought iron and steel have high resilience.

**Bending Stress.** When a beam is loaded it is bent from its original form and takes a curved shape. The fibres on one side of a loaded beam are, therefore, shortened or compressed and the fibres on the opposite side are lengthened or subjected to tension. Midway between the sides, where compression ends and tension begins, there are fibres which are neither shortened nor lengthened, and this layer or surface of fibres is called the neutral surface. A simple beam is a bar resting upon supports at its ends and is the kind most commonly in use. A cantilever beam is a bar resting on one support at the middle, or if a part of a beam projects out from a wall or beyond a support it is called a cantilever beam. In a simple beam the lower part is under tension and the upper part is under compression; in a cantilever beam the reverse is the case. Beams almost universally fail by tearing apart under the horizontal tensile stress developed by bending. Mathematicians have calculated formulas for determining the resilience of beams to bending, the safe loads to be put on beams, etc., but a consideration of these is a matter of some intricacy and the reader is referred to the books mentioned at the close of this article for such information. From these studies, however, the following important laws regarding rectangular beams have been formulated: The strength varies directly as the breadth and directly as the square of the depth; the strength varies inversely as the length; a beam is twice as strong under a distributed load as under an equal load concentrated at its middle point.

**Fatigue of Materials.** When there is a decrease in the value of the breaking load with an

increase of repetition there results what is known as the fatigue of material, first enunciated by A. Wöhler as a result of experiments in a law in which he stated that "ruptures may be caused not only by a force which exceeds the ultimate resistance, but by the repeated action of forces alternately rising and falling between certain limits, the greater of which is less than the ultimate resistance, the number of repetitions requisite for rupture being an inverse function both of this variation of the applied force and its upper limit." This condition can only be determined by an elaborate series of tests and experiments.

**Strength of Columns.** A bar under compression whose length is greater than about 10 times its thickness is called a column. Columns generally fail under stresses produced by combined compression and bending. The phenomena are very complex, and their investigation is a problem of great intricacy, for whose solution the reader must consult special treatises on the subjects. Full information as to strength and other properties will be found in the handbooks of the Carnegie Steel Company, the Bethlehem Steel Company, and other manufacturers which have been prepared for the use of engineers and architects. Columns are of three kinds: Class *a* includes those with hinged ends; class *b* includes those with one end hinged and one end fixed (the piston rod of a steam engine is a column of this type); class *c* includes those having both ends fixed, these being used in bridge and building construction. It has been found by experiment that class *c* is stronger than class *b* and that class *b* is stronger than class *a*.

**Torsion.** Torsion is that kind of stress which occurs when external forces tend to twist a body round an axis. A shaft which transmits power is twisted by the forces applied to the pulleys and thus all its cross sections are brought into stress. This stress is a kind of shearing, but the forces acting in different parts of a section are not parallel. Special formulas have been developed by engineers for calculating strength against torsional stress.

**STREPH'ON.** In Sidney's *Arcadia*, a shepherd in love with Mania. In literature, a stock name for a lover.

**STREPSIP'TERA** (Neo-Lat., from Gk. στρέψαι, *strepsai*, aor. of στρέφειν, *strephein*, to twist + πτερόν, *pteron*, wing). A group of insects of rather uncertain rank and position, comprising the curious family Stylopidae, and now thought to fall in the Coleoptera. The

group consists of a small number of species, very singular in structure and habits, apparently forming a connecting link between Coleoptera and Hymenoptera. The species are all small, and in their larval state live parasitically in the bodies of bees, wasps, and certain Hemiptera, forming the genera *Stylops*, *Colacina*, and *Xenos*. The first infests bees of the genus *Andrena*, and *Xenos* occurs in a genus of wasps (*Polistes*). Bees that are carrying or have carried Strepsiptera are said to be stylopized, because the abdomen of the bee is deformed. These parasites do not cause the death of the host. When about ready to transform the larva pushes one end of the body out between two of the abdominal segments of its host. The metamorphosis of the female is very slight, while that of the male is complete. The male leads a short and extremely active life of a few hours only, or in some species of a day. The female never changes position and becomes little more than a sac filled with an enormous number of developing young. When the young emerge they are known as triungulins. How the triungulins find their way to the bee larvæ is not known. It is supposed by some writers that parthenogenesis occurs with the Strepsiptera, but there appears to be no definite proof. The Strepsiptera are also sometimes called Rhipiptera.

**STREPTOCOCCUS.** See BACTERIA; PYÆMIA; SEPTICÆMIA.

**STRÉPYAN.** See PALEOLITHIC PERIOD.

**STRESS.** See STRENGTH OF MATERIALS.

**STRETFORD.** A manufacturing town in Lancashire, England,  $3\frac{1}{2}$  miles southwest of Manchester (Map: England, D 3). Pop., 1901, 30,346; 1911, 42,496.

**STRETTO** (It., bound). In music, a term which signifies that the movement to which it is prefixed is to be performed rapidly, with a gradual acceleration towards the close. The term "stretto" is also applied to the finale of a fugue, where the subject and answer enter so closely together that they overlap. See FUGUE.

**STRICKLAND, AGNES** (1796-1874). An English historian, born in London. She was educated mostly at home under the direction of her father. After writing considerable verse and several historical tales for children, Miss Strickland planned a series of biographies of the Queens of England. In this undertaking she was helped by her sister Elizabeth (1794-1875). *The Lives of the Queens of England*, which historians do not take too seriously, appeared in sections between 1840 and 1848, and filled 12 volumes (rev. ed., 6 vols., 1864-65). Miss Strickland also published: *Letters of Mary Queen of Scots* (1842-43; complete ed., 5 vols., 1864); *Lives of the Queens of Scotland* (1850-59); *Bachelor Kings of England* (1861); *Lives of the Last Four Stuart Princesses* (1872); and a novel, *How Will it End?* (1865). Consult the *Life* by her sister Jane M. Strickland (Edinburgh, 1887), and *Pearls and Pebbles*, by another sister, Mrs. Catherine P. Traill (London, 1894).

**STRICKLAND, HUGH EDWIN** (1811-53). An English geologist. He studied at Oxford, and in 1850 became reader in geology at that university, succeeding Dr. Buckland, and retaining the post till his death. He was one of the founders of the Geological Society, and of the Ray Society, which, as a result of his influence, undertook the publication of Agassiz's *Bibliographia Zoologiæ et Geologiæ*, three volumes of which he edited. He was associated with Sir Roderick I.

Murchison in the recognition and study of the Silurian system.

**STRICT CONSTRUCTIONISTS.** In American politics those who maintain that the Federal Constitution should be construed strictly in accordance with its letter, as opposed to broad constructionists, who believe the Constitution should be construed liberally, and have claimed for the general government more or less extensive (implied) powers, not granted specifically by the Fundamental Law. Conflicts between the two groups have recurred frequently in the history of the United States, in controversies over the chartering of a United States Bank, over internal improvements, and over the power of the general government as to restriction or prohibition of slavery in Territories; and it is upon this that, directly or indirectly, party differences in the United States have been largely based. In this connection the decisions of Chief Justice Marshall were of the greatest importance in shaping the Constitution in its most plastic period. The strict constructionist view has been held by the Anti-Federalist and Democratic parties (qq.v.); the broad constructionist by the Federalist, National Republican, Whig, Free-Soil, and Republican parties (qq.v.); though there has been a tendency for the party in power to lean to broad or liberal construction, and for the party in opposition to lean to strict construction. Of recent years, however, this distinction has tended to disappear, and the Federal government has taken over the control of functions heretofore exercised by the States. A good example is seen in the powers of the Interstate Commerce Commission. See CONSTITUTION; UNITED STATES, *History*.

**STRICTURE** (Lat. *strictura*, from *stringere*, to draw tight). A contraction in the calibre of one of the mucous-membrane-lined tubular structures of the body, such as the urethra, the rectum, the œsophagus, or the larynx. The most common form of stricture and the variety generally referred to when the term is used alone is stricture of the urethra. Three varieties are recognized: (1) spasmodic; (2) inflammatory; and (3) organic. The first form is due simply to reflex muscular contraction caused by irritation of some portion of the urethra, as from an ulcerating spot or a sensitive organic stricture. The second form arises from simple inflammatory swelling of some portion of the urethral tract, such as occurs in acute gonorrhœa or after the internal administration of such drugs as cantharides and oil of turpentine. The third, and most frequent variety of stricture, is caused by permanent changes in the tissues of the urethra and those surrounding it. These changes usually consist either in inflammatory thickening of the urethral wall and periurethral tissues or else in actual cicatrization and narrowing of the channel from the accompanying contraction; or both of these conditions may be present at the same time. The initial causes in bringing these changes about are chronic urethritis (*gonorrhœa*) or injuries by caustic or irritant substances.

The results of stricture of the urethra if allowed to persist are often far reaching and disastrous. The bladder, ureters, and kidneys may in turn become the seat of disease from the continued retention of urine, which, unable to find free exit, undergoes decomposition and infection with pus germs; or rupture of the urethra may occur from prolonged retention, allowing

extravasation of urine into the surrounding tissues, with death resulting from uræmic poisoning.

The treatment of organic stricture of the urethra is mainly mechanical. It consists in dilation of the contracted area by means of sounds or bougies, and where this method is inapplicable division of the stricture by means of suitable cutting instruments is indicated. After division of the stricture the lumen of the urethra is kept open to the proper degree by the subsequent periodic passage of a sound. Consult Jacobson, *The Operations of Surgery* (6th ed., by R. P. Rowlands, New York, 1915).

**STRIEGAU**, shtré'gou. A town in the Province of Silesia, Prussia, 25 miles by rail southeast of Liegnitz (Map: Germany, G 3). Leather products, cigars, sugar, brushes, and whips are the principal manufactures. Basalt and granite are mined in the vicinity. Pop., 1900, 12,858; 1910, 14,587.

**STRIGEL**, stré'gel, BERNHARD (c.1461-1528). A German portrait and historical painter of the Swabian school, the most important of a family of artists established at Memmingen. He was born at Memmingen and was probably a pupil of Zeitblom at Ulm. He stood in high favor with the Emperor Maximilian I, in whose service he repeatedly journeyed to Augsburg, Innsbruck, and Vienna. His religious paintings, which include four altar wings with scenes from the "Life of the Virgin," in the Berlin Gallery, and 10 paintings illustrating the "Genealogy of Christ," in the Germanic Museum, Nuremberg, are historically interesting, but of less artistic value than his portraits, which, though detailed, are ably handled and luminous in color. Notable examples are those of Konrad Rehlinger (1517), Pinakothek, Munich; "Councilor Cuspinian and Family" (1520), Berlin Museum; "Count John of Montfort," at Donaueschingen; "An Unknown Lady," Metropolitan Museum, New York; and portraits of Emperor Maximilian, in the Strassburg, Munich, and Vienna galleries.

**STRIGEL**, VIKTORIN (1524-69). A theologian of the Reformation period. He was born at Kaufbeuren, Swabia, studied under Melancthon in Wittenberg, and became professor at Jena in 1548. He became involved in the synergistic controversy (see SYNERGISM) and was imprisoned for several months in 1559. Ultimately he was forced to leave Jena, and went to Leipzig, where he was charged with holding Calvinistic views (1562), and later to Heidelberg (1567). His chief work was the *Loci Theologici*, published posthumously (1581-84). Consult J. C. T. Otto, *De Victorino Strigelio* (Jena, 1843), and Döllinger, *Die Reformation*, vol. iii (Regensburg, 1848).

**STRIGONIUM**. See ESZTERGOM.

**STRIKE** (AS. *strican*, to advance quickly, Ger. *streichen*, to stroke, Goth. *striks*, stroke; connected with Lat. *stringere*, to draw tight). A term used in geology to indicate the line of intersection of a stratum with the plane of the horizon, the strike thus being at right angles to the dip. The line of strike coincides with the outcrop when the surface of the ground is level, or when the dip is vertical. If the dip is constant in one direction, the strike will be a straight line; but with a gradually changing dip, as from south through southeast to east, the strike will be a curve. In the case of a quaquaversal fold it is a complete circle. See **Dip**.

**STRIKES AND LOCKOUTS**. A strike, in industry, occurs when there is a cessation of work on the part of a body of employees acting in concert to enforce some demand upon the employer, or to resist some demand of his. The employees are here assumed to take the initiative in ceasing work. When, on the other hand, the employer shuts down his establishment in order to compel workmen to comply with some demand, it is called a lockout.

Certain popular movements in the Middle Ages bear resemblance to strikes, such as the disturbances in England in the second half of the fourteenth century. More like the modern strikes were the contests between different guild (q.v.) organizations, or between journeymen and guildsmen, in both English and continental towns. But as a social problem, as a frequent and apparently enduring feature of the industrial system, strikes belong to the nineteenth and twentieth centuries. The strike has usually been an essential part of the policy of trade unions (q.v.). The existence of the union as the directing agency of a strike has been the chief means in transforming local, half-insurrectionary outbreaks into carefully planned attempts to attain well-recognized ends.

The causes of strikes are manifold, but they chiefly concern the wage question. In prosperous times strikes for increase of wages occur; in times of depression, against a decrease. Demand for a reduction of hours is a frequent cause. They come also for the enforcement of union rules, for recognition of union against nonunion men, and in sympathy with strikes in other trades. The strike is often the first weapon employed by a newly organized body of laborers to strengthen their position. The sympathetic strike has not generally proved advisable, and is regarded with disfavor by some unions. To avoid or put down strikes employers may form organizations or use the lockout. They have at times been accused of instigating violence in order to bring the strike into public disfavor and obtain the aid of troops. On the employees' side boycotting (see **BOYCOTT**, **BOYCOTTING**) and picketing of all sorts are apt to occur in a serious strike. The bitter feeling against men who refuse to strike or who come to take strikers' places often makes the more peaceable forms of persuasion end in intimidation or violence. Public sympathy is an almost essential element in the success of any large strike, and is likely to be alienated by violence or the destruction of property. This is well realized, but when disorder or riots occur—often due to a semicriminal floating population—the public may probably fail to lay the blame elsewhere than on the strikers. The magnitude of some strikes in important industries has emphasized the harm done to general business, and the interest which the public has in labor disputes as a third and impartial party. Conciliation and arbitration have come prominently forward as remedies for strikes. In 1888 a Federal law provided for the appointment by the President of strike commissioners in disputes involving interstate commerce, and the Chicago Strike Commission recommended a permanent commission on the subject. The improved organization of trade unions, their increased responsibility, and the use of the trade agreement may lessen the waste of strikes in the future.

**Legal Aspect**. Any combination of laborers

to raise wages was illegal in England until 1824 and in France until 1864. In the United States strikes as such have never been illegal, but until after 1830 it was not definitely settled that strikers could not be arraigned for civil and criminal damages under the conspiracy laws. When a strike represents a combination to injure property or a definite person it is illegal, and the same is true of acts of intimidation, the destruction of property, or the forcible prevention of work. Some forms of sympathetic strikes and of the boycott have been held illegal. Riots are covered by the criminal law. In many States there are special statutes regarding strikes. Thus the common law of conspiracy has been expressly repealed in New York, Pennsylvania, New Jersey, and several Western States, but the statutes usually provide for punishment of the use of force or intimidation. Certain States have special laws regulating strikes on railways or in mines, a few make the municipality or county responsible for damages due to strikes, while Missouri and Wyoming forbid the employment of private officers from without the State for the protection of the employer's property against violence on the part of the strikers. The use of injunctions has been regulated by statute only in Kansas. A difficult question is often involved in determining how far workmen may go in persuading others to join a strike. A leading case is that of the Northern Pacific Railroad (*Arthur vs. Oakes*, 63 F. R., 310), in which the employees were enjoined from (1) intimidating, (2) persuading others to strike, or (3) combining to strike themselves in such manner as to cripple the railroad. On appeal, however, the second and third clauses were abolished. Since the passage of the Interstate Commerce Act (1887) and the Anti-Trust Law (1890) the courts of equity have acquired enlarged powers. Interference with the United States mails or with interstate commerce (in railroad strikes) may be a serious offense. The United States can obtain an injunction against strikers, who, if they violate its provisions, may be summarily punished for contempt of court. In cases where railroads are under receivers the receiver is regarded as an official of the court, and a strike against the road may be as such unlawful. The use of injunctions in labor disputes is by no means new, but was brought into special prominence by the Chicago strike of 1894. As a method of dealing with strikes the injunction is prompt and effective, but its execution practically involves arrest without indictment and trial without jury; it implies very great power in the hands of courts; and its frequent employment, not always in the wisest way, has created much bitter feeling and distrust of courts among workingmen.

**History.** In the United States there are a few records of strikes previous to 1800, such as those of the journeymen bakers in New York in 1741, and of the journeymen shoemakers in Philadelphia in 1796, 1798, 1799, and 1805. Something like a modern strike occurred in New York in 1802 among the sailors. They paraded the streets and compelled others to join them, but were dispersed by constables, and their leader was punished. From 1821 to 1834 there are accounts of only a few strikes each year, the records being doubtless very incomplete. These were generally among the building trades, hatters, tailors, shoemakers, and laborers on the

Chesapeake and Ohio Canal. "In 1835," says the report of the Commissioner of Labor (1901, p. 721), "strikes had become so numerous as to call forth remonstrant comments from the public press." A number of strikes for a 10-hour day occurred in the thirties, while strikes for eight hours were general in 1872-73. From 1881 to 1900, according to the Reports of the United States Department of Labor, there were 22,793 strikes, involving 117,509 establishments and 6,105,694 employees thrown out of employment. Of the latter 90 per cent were males. The duration of strikes varies of course within wide limits, the average for 20 years being 23.8 days. The statistics of wage loss to employees (\$257,000,000) and to employers (\$122,000,000) have very little significance. More than \$16,000,000 was contributed by labor organizations (the figure is probably too low). Considered by States, 28 per cent of all strikes occurred in New York, 12½ per cent in Pennsylvania, 11.6 per cent in Illinois, 7½ per cent in Massachusetts, and 6 per cent in Ohio. In New York City 5090 strikes are recorded, in Chicago 1737. Considered by industries 19½ per cent of all strikes occurred in the building trades, 11 per cent in coal and coke, 9 per cent in the metal trades, 6.6 per cent in tobacco, 5.6 per cent in transportation. The largest strikes usually occur in mining and railroading, as is shown by the fact that of the total number of striking employees 31 per cent were in coal and coke, 7.9 per cent in transportation, and only 10.9 per cent in the building trades.

Labor organizations ordered 63.46 per cent of the total strikes, and of these 52.86 per cent (of establishments involved) were successful, 13.6 per cent succeeded partly, and 33.54 per cent failed. The corresponding figures for strikes not ordered by organizations are 35.56 per cent, 9.05 per cent, and 55.39 per cent, this advantage of organization appearing for each of the 20 years. As to cause, 28.7 per cent of the strikes were for increase of wages, 11.23 per cent for the same with reduction of hours, 11.16 per cent for reduction of hours, 7.17 per cent against reduction of wages, 3.47 per cent in sympathy with a strike elsewhere, 2.34 per cent against employment of nonunion men, and 2.35 per cent involving recognition of the union.

Among historic American strikes have been the great strikes of 1877 on the Baltimore and Ohio, Pennsylvania, and other railroads, in which much damage to property was done and troops were called out; the telegraph operators' strike in 1883; the strike on the Gould system in 1885; the Homestead strike at the Carnegie works in 1892, the bitterest in American history and involving a sanguinary battle between Pinkerton detectives and unionists; the Chicago strike of 1894, which grew out of an effort of the newly organized American Railway Union to boycott Pullman cars in order to aid strikers at the Pullman works; the bituminous coal strike in the summer of 1894; street-railway strikes in several large cities (1900-01); the steel strike (1901); the great anthracite coal strikes of 1900 and 1902; the Colorado coal strike of 1903-04; the Fall River strike of 1904-05; the Chicago teamsters' strike of 1905; the bituminous coal miners' strike, involving 10 States, March to July, 1906, resulting in a six per cent wages advance for 300,000 men; the shirt-waist makers' strike of New York, 1909, in which 40,000 women, chiefly immigrants,

secured substantial concessions in wages and hours; the steel workers' strike at McKees Rocks, 1909, characterized by great violence; the cloakmakers' strike, New York, 1910, involving about 80,000 workers and resulting in the establishment of the preferential union shop; the coal strike in Westmoreland Co., Pa., March, 1910, to July, 1911, carried on with great violence, almost approaching civil war; the Lawrence strike, 1912, involving some 35,000 workers, notable as the first great Eastern strike conducted by the I. W. W.; the strikes of Augusta (Ga.) street-railway employees and of Georgia Railroad employees in the autumn of 1912; the Michigan Copper strike, 1913-14, for advance in wages and reduction in hours; 2700 militia were employed to quell violence, which proved to be due in large part to the action of company guards. In 1913-14 an exceedingly violent strike was carried on in the coal-mining industry of Colorado, the occasion being a demand for the eight-hour day, advance in wages, and removal of certain abuses, such as the truck system. During October and November, 1913, several sanguinary conflicts between strikers and militia and mine guards took place, and in April, 1914, occurred the "Ludlow Massacre," when the strikers' tent colony was fired and two women and 11 children suffocated. Order was restored by Federal troops, who remained on the scene until 1915. Serious disorders attended the West Virginia coal-miners' strike of 1913 and the Paterson silk-workers' strike of 1913, conducted by the Industrial Workers of the World (q.v.).

The outbreak of the world war had a tremendous effect on the industrial situation. While, in general, much more work was provided on account of the huge war orders, many strikes occurred because employees believed that unusual profits were accruing to employers and that the opportunity was ripe for improving working conditions and gaining an increase in salary. This was particularly true of the metal trades and accounted for a large number of strikes in Pennsylvania, New York, Connecticut, and Massachusetts. The results were general reductions in the length of the working day and increases in pay. Another cause of strikes, in general, during the period before the entrance of the United States into the war was the activities of foreign agents. Austrian and German officials connected with the embassies in the United States admitted that they had been instrumental in stirring up industrial unrest especially in munition plants.

Early in 1915 reports from various sources were made on the Colorado Coal and Fuel strike mentioned above. A final report was rendered in the investigation of the case by a subcommittee of the House Committee on Mines. According to the report both sides were prepared for the battle. Political conditions in the mining regions were found particularly bad and the manner of selecting juries unlawful. The companies were in supreme command in the mining villages on account of their extensive use of imported workers, and their control of the land and stores. Various persons connected with the management were severely criticized and a more reasonable attitude on their part in dealing with their employees was suggested. As an alternative stringent Federal interference and control was proposed in the report which declared, "If these strike troubles

continue to break forth, it will be plainly necessary to consider whether some method of regulation shall not be adopted with reference to the business as carried on in interstate commerce as is now done with the business of transportation." A deduction made from the hearing before the United States Commission of Industrial Relations stated that the Rockefellers, owning forty per cent of the stock of the companies, were responsible for what happened in that they could have prevented its happening. A long controversy followed between the critics who attributed the affair to the evils of absentee capitalism and its abuse of power and the companies which denied those allegations. Another long outstanding strike that was settled in 1915 was the Eastern Ohio Coal Strike. This involved 16,000 miners who held out for more than a year without committing a single act of violence. The struggle was originally a lockout but it later developed into a strike. It ended in a compromise.

A narrow escape from a complete industrial and transportation tie-up occurred in 1916. A conference (August) between representatives of the railroads and the four great railroad brotherhoods, Locomotive Engineers, Enginemen and Firemen, Railroad Conductors, and Railroad Trainmen, met to discuss hours of labor, wages, schedules, and overtime pay. After several days' discussion, the contending parties were unable to agree. Federal mediation resulted in a deadlock and, as 95 per cent of the employees involved had previously voted for a strike, a national calamity seemed inevitable. President Wilson called both sides to the White House and attempted to bring them together. His plan was approved by the unions but was rejected by the railroads. Thereupon he appeared before Congress and asked for remedial legislation. The result was the Adamson Law which provided that "eight hours shall, in contracts for labor and service, be deemed a day's work and the measure or standard of a day's work for the purpose of reckoning compensation" after January 1, 1917. Further, it required the President to appoint a commission of three to investigate the operation of the law for a period of six to nine months and to make a report to the President. The railroads at once made preparations to contest the constitutionality of the act. After a comparatively short contest the Supreme Court upheld its validity.

A peculiar strike occurred in New York State in 1916. The members of the Dairymen's League struck against the great distributing companies of New York City. The farmers demanded a six months' contract with an advance in the price of milk. The distributing companies offered a one month's contract with an increase in price. This was refused and the strike occurred. The dairymen ultimately forced the companies to accept their terms.

An important agreement was made July 26, 1916, between the Cloak, Suit and Shirt Manufacturers' Protective Association and the International Ladies' Garment Workers' Union, after several attempts at conciliation had failed. Both sides in the struggle gained something, the workers an increase in wages ranging from 55 cents to \$1.50 per week and a working week of 49 hours instead of 50, as well as a preferential union shop. The manufacturers gained the right to discharge any employee for cause.

During the same year agreements were made in the anthracite and bituminous coal fields which resulted in a slight increase in wages for the miners. Other important strikes of the year were those in the plant of the Republic Iron and Steel Company at East Youngstown, Ohio; another at the Standard Oil plant in Bayonne, N. J.; a street car strike in New York City and neighboring county of Westchester; a walkout of the employees of the Prudential Insurance Company; a strike of the jewelry workers in New York City; and a strike in the Westinghouse Electric and Manufacturing Company of East Pittsburgh. Conciliators from the United States Department of Labor played a prominent part in the settlement of difficulties.

After the United States entered the war, the energies of the Federal government were almost at once directed toward as great a settlement of industrial controversies as possible. The main purpose was to secure the patriotic cooperation between labor and capital. The Committee of Labor of the Advisory Commission of the Council of National Defense, of which President Gompers of the American Federation of Labor was chairman, appointed among others, subcommittees on wages and hours; mediation and conciliation; welfare work; and cost of living and domestic economy. All these sought to secure the proper standards and to engender the spirit of mutual confidence into industry. Finally there was created through the joint action of the government, the Council of National Defense and labor organizations, the Labor-Adjustment Commission to be composed of three representatives of the government, three of employers, and three of employees. This board went into action almost at once and prevented a strike of west coast shipyard workers and east coast longshoremen from becoming a national calamity. The year 1917 also saw some serious strikes in the copper regions which greatly curtailed the production of copper. Some fields were compelled to shut down altogether. The Labor-Adjustment Commission effected a settlement in the Arizona and New Mexico regions in October and later in the other regions.

New York City witnessed another big garment strike, when, on December 13, 1916, 60,000 members of the Amalgamated Clothing Workers of America struck, demanding a wage increase of two dollars per week and a 48 hour week. The dispute was ultimately settled by arbitration. The worker gained the 48 hour week and an increase of 12 per cent in salary.

During 1918, there were no strikes or lockouts of a nationwide importance although the aggregate number of strikes and lockouts was considerable. The greatest number of strikes occurred in New York, Massachusetts, Illinois, Pennsylvania, Ohio, New Jersey, and Connecticut. Most of these occurred in the cities of New York, Chicago, Philadelphia, Boston, and St. Louis. Strikes were most frequent in the following trades, in the order named—building, metal, clothing, textiles, mining, street railways.

The comparative industrial peace that existed during the war was broken shortly after the signing of the armistice, and the strike and lockout were resorted to rather than arbitration as a means of settling disputes between labor and capital. In Seattle, Washington a general strike was called on February 6, 1919, in sympathy with 25,000 shipyard workers, who had walked out on January 21. All industries ceased,

soup kitchens were established by the strikers, and many inconveniences suffered. The Mayor, Ole Hanson, took a firm hand toward the strikers, who ultimately had to call off the strike without gaining their objectives. In September a strike of the Boston policemen for recognition of their union occurred. The State militia was called out and the positions of the striking policemen were filled by new men.

A strike affecting almost 300,000 steel workers began on September 22, 1919. The men had advanced claims covering collective bargaining, wages, hours, conditions, and principles involved in the industry. Judge Gary refused to confer with these men on the grounds that the union leaders were not representatives of a large number of his men, and that a conference might be interpreted as a recognition of the closed shop. Federal troops had to be called up ultimately. After this the men gradually went back to work without obtaining their demands.

New York City went through the throes of an actors' strike (August-September, 1919); a longshoremen's strike (October-November); and a printers' lockout (October-November).

On November 1, 1919, a strike of 425,000 bituminous miners began largely because Fuel Administrator Garfield had refused them an increase in salary. The Federal Court at Indianapolis, at the request of Attorney General Palmer, issued a temporary injunction restraining the leaders from directing the strike and a few days later another injunction ordering the recall of the strike order. It was recalled and a joint conference opened on November 14, which ultimately cleared up the difficulties.

An "outlaw" strike occurred on the railroads in April, 1920. It began April 2, when 700 switchmen and yardmen on the Chicago and Milwaukee railway quit work. The strike spread rapidly and seriously tied up some of the larger roads of the country. It was condemned by the presidents of the four big brotherhoods. The strike was broken after the government had arrested several of the leaders and the railroad managements declared the positions of the strikers vacant. The Railroad Labor Board appointed by the President on April 13, refused a hearing to the "outlaw" strikers. Most of them went back to work.

An injunction issued against the Amalgamated Clothes Workers in Rochester was made permanent on June 19, 1920, and the Michaels, Stern, Co., was awarded \$100,000 for damages caused to its business by the union. The strike had followed the company's refusal to recognize this union as representative of its employees.

On December 8, 1920 there began a strike which almost completely tied up the clothing industry in New York City. The manufacturers caused the strike by refusing to abide by the system of joint government enforced in the industry. They announced that they intended to supplant collective bargaining with individual bargaining, reduce wages, institute the system of piece work, and exercise the unlimited right to discharge employees. The strike lasted until June 1, when a settlement was agreed upon reducing wages by 15 per cent.

The Department of Labor makes a scientific study of the statistics of strikes and lockouts in the United States and publishes them at stated intervals. The following tables show the number of strikes and lockouts from 1916 to 1920; the average duration of days, and the results.

In the summer of 1922, the coal industry and the transportation system of the United States were again tied up by serious strikes. The chief cause of these were the attempts to reduce the

	1916	1917	1918	1919	1920
Strikes .....	3,681	4,324	3,248	3,444	3,109

Lockouts .....	108	126	105	125	58
Average duration, days	64	56	19	38	69

wages of the workers. The attempts to have the difficulties arbitrated in the early part of the strikes met with little success. The situation became so serious that in July, President Harding called upon the Governors of the States to preserve law and order and promised them Federal aid if their own forces were inadequate.

#### RESULTS OF STRIKES AND LOCKOUTS ENDING IN EACH YEAR, 1916 TO 1920

RESULT	Strikes ending in—					Lockouts ending in—

In England the combination laws were repealed in 1824, and since then a number of statutes have defined the legal position and rights of workmen in labor disputes. The better-developed English unions have adopted a conservative policy in regard to strikes. Employers are more accustomed to dealing on equal terms with their men than is true in the United States. The formation of unions of unskilled laborers has been accompanied by many strikes, among which the great dock strike of 1889 attracted a remarkable amount of public sympathy and assistance. The engineering strike of 1896 roused much discussion as to the effect of unionism on English trade supremacy. In 1900 there occurred in Great Britain 648 strikes and lockouts, involving directly 135,145 employees; 202 of the disputes resulted in favor of the employees, 211 in favor of employers, and 221 were compromised. In 1909 there were 436 strikes, involving 2,773,000 men, of which 79 were won by the strikers and 144 compromised. In 1912 a strike tied up practically the whole coal-mining industry of Great Britain, and led to the enactment of the Coal Mines Act (Minimum Wage). The year 1913 was marked by great industrial unrest in England, 688,000 workers being involved in the strikes of that year. In Germany (1912) there were reported 2510 strikes of which 415 were successful, 1001 compromised. The highest number of men on strike at any one time was 406,000. In 1890 a famous strike occurred in New South Wales, beginning as a strike of the Shearers' Union against non-union men, but spreading to the railroads, and finally to nearly all industries. The report (Sydney, 1891) of the commission appointed to investigate it is a valuable document.

Among the more important strikes and lockouts which occurred in countries other than the United States during the war and post war period may be mentioned the following: 1915, Great Britain, coalheavers at Liverpool, the Yorkshire miners, the London Tramwaymen, and the Welsh coal miners; Germany, Silesian coal miners and Berlin tool makers: 1916, Norway, a general strike protesting against compulsory arbitration in labor disputes; Great Britain, building trades and textiles; Spain, railroad strike, general strike (July 17): 1917, Japan, general strikes as protest against high cost of food: 1918, Great Britain, engineers and tool makers, London metropolitan police force, women workers on London transportation system: 1919, Great Britain, coal miners, textiles, shipbuilders; Italy, general strike in Naples; Spain, lockouts and strikes in all the principal industries; Sweden, printers, match makers,

and a lockout in the woodworking trades: 1921, Great Britain, coal miners' strike, cotton textile strike.

**STRINDBERG**, strind'bér-i, (JOHAN). AUGUST (1849-1912). A Swedish author, the greatest of his day and country, whose insatiable curiosity and energy of intellect and imagination drove him through many fields of thought and life, and impelled him to record his experiences in works that represent a wide range of literary kinds and methods. He was born Jan. 22, 1849, at Stockholm—his father a small tradesman, his mother a barmaid. In 1867 he entered Upsala University, where his life was embittered by poverty and his contentious temper embroiled him with his professors, and whence, though he read with tremendous energy, he departed without a degree. Until 1874, when friends procured him a post in the Royal Library, Stockholm, he lived a necessitous Bohemian life, busy with school-teaching, tutoring, journalism, and acting. In his novel *The Red Room* (1879)—startlingly realistic to the Sweden of its day—he offers pictures and opinions, expressed with stinging satire, of the literary and artistic circles in which for some years he moved. In 1872 he repaired to the islands between Stockholm and the open sea, and during his sojourn there learned to know the fisher folk whom he was later to portray. While at the Royal Library he cherished for a time an ambition to be a *savant*, learning Chinese and studying the early relations of Sweden and the Orient, but the drama proved more alluring. His first important play, *Master Olof* (written 1872), was produced in 1878, and helped to inaugurate the revolution against the established conventions of Swedish literature. From 1883 to 1897 he

lived mainly abroad, in Switzerland, Germany, France, Denmark, and Italy, but in the last-named year returned to Stockholm, and thenceforth made that city his home. About 1895, while he was in Paris, a serious mental breakdown, induced by his titanic labors and domestic disasters, sent him to a sanitarium. He had plunged into chemical experiments and dreams of the transmutability of the elements, at which he worked like an alchemist of old, shunning everyone, with utter disregard of health. By 1897 he had recovered, and was again in full creative activity. He was thrice unhappily married, the third time to the talented Swedish actress, Harriet Bosse; and he was thrice divorced.

Strindberg's early work had strong romantic elements, and looked to Socialism for the cure of social ills. From the middle eighties to the middle nineties it tended to become naturalistic, and took a skeptical and individualistic turn. A confirmed misogynist, Strindberg developed in this period his case against feminism, and presented his convictions concerning the intellectual, moral, and biological inferiority of women. From his severe mental attack in 1897 he emerged a believing mystic. His complex development cannot here be traced. Suffice it to say that his thought swung from materialistic skepticism to a kind of Swedenborgian mysticism, while in literary method he ranged from romanticism to naturalism and Maeterlinckian symbolism. His interest in Swedish history was always keen, and an important part of his work centred about it. He died May 14, 1912.

A group of his writings which might be described as autobiographic fiction constitutes an illuminating commentary on his life and works. It includes, in addition to *The Red Room* above mentioned, *The Bondswoman's Son* (I-III, 1886-87); *The Author* (1887); *A Fool's Confession* (1888), which concerns his first marriage; *Inferno* (1897) and *Legends*, studies in morbid psychology, related to his own mental attack; *Fairhaven and Foulstrand* (1902); and *Alone* (1907). Among his novels and tales, representative books are the 17 stories in *Swedish Destinies and Adventures* (2 vols., 1882-91); the short realistic studies of married life in the two volumes of *Marriage* (1884 and 1886); *The Natives of Hemsö* (1887), perhaps second to none as a novel of Swedish peasant life, and displaying its author's descriptive powers; *Fisher Folk* (1888); and *Historical Miniatures* (1905). His *Utopias Realized* (1885) expressed his Socialistic views. Among his historical and miscellaneous writings should be mentioned *The New Kingdom* (1882); *The Swedish People* (1882); *A Blue Book* (1907-08), a collection of miscellanies in three volumes; and *Speeches to the Swedish Nation* (1910). Important among his historical plays are *Gustavus Vasa* (1899); *Eric XIV* (1899); *Gustavus Adolphus* (1903); *Charles XII* (1901); and *The Last Knight* (1908). *There are Crimes and Crimes* (1899), *Christmas* (1899), and *Easter* (1901) will be found in different ways characteristic. Realistic and powerful, if repellent, are the dramas *The Father*, in which the misogynist speaks again, and *Miss Julia*, described by the author as a naturalistic play. *Swanwhite* (1902), *The Dream Play* (1902), and *The Dance of Death* (I and II, 1901), with its wide symbolical sweep, were inspired by the example of Maeterlinck. The legendary play *Lucky Pehr*, if not

one of his most representative plays, proved widely popular. The trilogy *To Damascus* (I and II, 1898; III, 1904) symbolized his own soul's quest of peace, and points to a return to religion.

**Bibliography.** His collected writings *Samlade Skrifter*, were edited by John Landquist (40 vols., Stockholm, 1912 et seq.). There is a German translation by E. Schering and Strindberg (40 vols., Berlin, 1901). Many individual works have also appeared in English (especially since 1912) and in French translations. A translation of representative plays (New York, 1912 et seq.) was made by Edwin Björkman. Noteworthy also are the translations by Mrs. V. S. Howard—*Lucky Pehr*, and *Easter* (one a play and the other short stories, both Cincinnati, 1912). Consult also: Hansson, *Das Junge Skandinavien* (Dresden, 1891); Georg Brandes, *Menschen und Werke* (Frankfort, 1894); the essays by several distinguished authors in *En Bok om Strindberg* (Karlstadt, 1894); the introductions to the Björkman translations above mentioned; J. G. Huneker, *Iconoclasts* (New York, 1905); Lizzy Lind af Hageby, *Strindberg: The Spirit of Revolt* (London, 1913); H. B. Samuel, *Modernities* (ib., 1913); Archibald Henderson, *European Dramatists* (New York, 1913).

**STRING** (AS. *streng*, Ger. *Strang*, string; connected with Lat. *stringere*, to draw tight, Gk. *σπάργνός*, *strangos*, twisted). The strings of musical instruments are made either from silk, from the entrails of sheep, or from metal. Formerly the metal strings were made of brass or copper, but now they are generally made of steel (for the pianoforte). For the string instruments (violin, guitar) gut is mostly used. The thinner the string the higher the pitch. Excessive thickness for the lower strings is avoided by winding them with fine copper or silver wire. Recently strings, especially those overspun, have been manufactured from silk. For the violin the highest or E string is also sometimes made of silk, but its tone quality is inferior to that of a gut string. The silk strings are chiefly used by violinists for the purpose of practicing in warm weather, when the moisture of the fingers causes gut strings to snap.

**STRINGED INSTRUMENTS.** See MUSICAL INSTRUMENTS.

**STRINGEN'DO** (It., drawing tight, compressing). A term used in music to denote a rather sudden acceleration in the time.

**STRING'HALT'** (corruption of *spring + halt*, lame). An involuntary movement of one or both hind legs of a horse in which the foot is spasmodically lifted from the ground much higher than it is normally carried. It is most noticeable when the animal is first brought out of the stable, when he is excited, or made to turn suddenly round; it is a form of chorea or St. Vitus's dance. When due to local injury the habit may be corrected by local treatment. Where it remains after the local lesion has healed, the sectioning of the lateral extensor of the foot may relieve the condition.

**STRINGHAM**, string'am, SILAS HORTON (1798-1876). An American naval officer, born at Middletown, N. Y. He was appointed midshipman in the navy in 1809, served on the frigate *President* in her conflict with the *Little Belt*, and in the engagement in which she was captured by a British squadron; fought in the war with Algiers, and served on the *Hornet*

against the West India pirates. In 1847, commanding the *Ohio*, he was at the bombardment of Vera Cruz. When the Civil War began he became flag officer of the North Atlantic blockading squadron, and in August, 1861, coöperated with Gen. B. F. Butler to capture forts at Hatteras Inlet. In September he asked to be relieved of command, probably because of criticisms. In 1862 he became a rear admiral on the retired list.

**STRIPPING.** A term applied to mining operations where it is necessary to strip or remove the surface rock or soil (overburden) overlying a mineral deposit such as coal, copper ore, or iron ore. Beds of coal have been stripped to recover the coal left as pillars for support. The Utah Copper Company offers an example of one of the largest mining stripping operations—in 1909 1,526,000 cubic yards of surface was removed by steam shovels; the average thickness of capping, or surface, was 71 feet.

**STROBEL**, strö-bél', EDWARD HENRY (1855-1908). An American diplomat, born at Charleston, S. C. He graduated at Harvard in 1877 and at Harvard Law School in 1882. He was Secretary of Legation at Madrid (1885-90), and Minister to Ecuador (1894) and to Chile (1894-97). In 1897 he helped to arbitrate a dispute between France and Chile, and in 1899 was counsel for Chile before the United States and Chilean Claims Commission. He became Bemis professor of international law in the Harvard Law School in 1898, but in 1903 was granted a two years' leave of absence to accept the post of general adviser to the government of Siam, and in 1906 he entered the service of Siam. He published *The Spanish Revolution* (1898).

**STROBILUS** (Lat., pine cone). A conelike group of sporophylls (q.v.) differentiated from the rest of the plant body. Strobili occur in club mosses, are the well-known cones of conifers, and are the precursors of flowers, which are strobili with a perianth.

**STROBOSCOPE** (from Gk. στροβός, *strobos*, a whirling + σκοπός, *skopos*, watcher). An instrument used for studying the motion of a body where by means of a rapid succession of slits or other openings, or its illumination at regular intervals, the eye receives a series of images on the retina. Where these impressions occur with sufficient rapidity the illusion of motion is produced, and advantage of this is taken in certain toys, scientific instruments, and more particularly in the familiar moving pictures (q.v.). The stroboscope was first devised by Stampfer and Plateau, and consists of a disk or cylinder with a series of slits through which the observer looks at the pictures or moving object. As the disk or cylinder revolves the slits come successively before the eye and through them the observer gets a series of glimpses of the moving object. If each of the pictures represents a successive stage in an action such as the motion of a pendulum, a man or animal running, etc., the illusion of motion is produced, provided that the interval between the glimpses of the pictures is less than the duration of the image on the retina, a time which varies from  $\frac{1}{10}$  to  $\frac{1}{50}$  of a second. A simple stroboscope or zoetrope is illustrated in the article ILLUSION.

Anschtütz (q.v.), a German photographer, made an important application of the stroboscope principle in his "tachyscope," by rotating transparent pictures on a drum or disk, and

having them illuminated by the momentary glow of a spark from an induction coil through a Geissler tube. Although the period of discharge is very brief, yet the sparks follow with regularity, and as the successive pictures always occupy the same position relative to the eye of the observer, the illumination appears continuous, and the effect of motion is produced. A stroboscopic device is used as a slip meter with induction motors to measure the difference between the synchronous speed and actual running speed. See ILLUSION; KINETOSCOPE; MOVING PICTURES.

**STRODTMANN**, ströt'män, ADOLF (1820-79). A German author, born at Flensburg. He studied at Kiel, and, while taking part in the insurrection of 1848, was wounded and captured by the Danes. On being set at liberty he published *Lieder eines Gefangenen auf der Dronning Maria* (1848). He resumed study at Bonn under Kinkel, but was suspended on account of his political activity. He then published *Lieder der Nacht* (1850) and a biography of Gottfried Kinkel (1850). He went to Paris, to London, and in 1852 to America, where for four years he was by turns bookseller and journalist in New York City and Philadelphia. Returning to Germany in 1856, he became known as a biographer and editor of Heine and as war correspondent for several newspapers during the Franco-German campaign. He translated much from English writers. His most noteworthy volume in this field is *Amerikanische Anthologie* (1870), a group of successful renderings from American lyric poets. He also edited the correspondence of G. A. Bürger (4 vols., Berlin, 1874).

**STROGANOV**, strö'gä-nóf. A family of Russian nobles, descended from ANIKA, a wealthy merchant of Novgorod, who, in the beginning of the sixteenth century, owned extensive salt pits and ironworks in the Ural Mountains. His sons YAKOV and GRIGORI obtained from Czar Ivan IV important territorial grants and trade monopolies, founded several cities and fortified towns, and in 1574 received a deed of gift for the Siberian territory bordering on their possessions. The conquest was accomplished, however, after their death in 1581, by their youngest brother, SEMION ANIKITCH, with the coöperation of Yermak, ataman of the Don Cossacks, when Western Siberia was subdued within two years and annexed to the Russian crown. In 1722 the extraordinary privileges held by the family were taken from the then living representatives, the brothers ALEXANDER, NIKOLAI, and SERGEI, by Peter the Great, who in exchange conferred upon them only the baronial title. A great-grandson of Nikolai was SERGEI GRIGOROVITCH (1794-1882), the chief promoter of the archæological excavations on the shores of the Black Sea. He founded and endowed a school of design at Moscow, and acted as curator of the Moscow educational district in 1835-47. His sound judgment in the selection of professors, his munificence and liberal spirit, made this the most brilliant period in the history of the University of Moscow.

**STROMATOPORA** (Neo-Lat., from Gk. στρομα, *strōma*, covering + πόρος, *poros*, pore). An extinct genus of hydroid corals, which formed extensive coral reefs during some periods of Paleozoic time. The colonies formed rounded or incrusting and sometimes branching masses that show a concentric lamination and an irregular, cellular, microscopic structure. These hydroid

corals are found in fossil coral reefs in the Chazy, Niagara, Lower Helderberg, and Onondaga limestones of New York State, and large specimens, which when polished are of great beauty, have been obtained in the Upper Devonian of the Central States.

**STROMB** (Lat. *strombus*, sort of spiral snail, from Gk. *στρόμβος*, pine cone, snail, from *στρέφω*, *strephain*, to turn, twist). A large gastropod mollusk of the family Strombidae, or more particularly its shell. The species are numerous, found mostly in tropical seas. *Strombus gigas*, the "queen conch," is the largest known univalve. It occurs in the West Indies, on reefs in shallow water, and is fished both for the table and for the shell. Great numbers of shells are imported into Europe and America, and are sometimes called "fountain shell," from use as garden ornaments. Cameo makers cut the outer layer in relief. Pearls of a delicate pink are sometimes found in this shell.

**STROMBOLI**, ström'bō-lē. A volcanic island belonging to the Lipari Islands (q.v.).

**STROMEYER**, shtrō'mī'ēr, GEORG FRIEDRICH LOUIS (1804-76). A German surgeon. Born in Hanover, he studied medicine in Göttingen, Berlin (M.D., 1826), and Vienna, and became professor of surgery successively at Erlangen, Munich, Freiburg, and Kiel. As a surgeon-general he served in the Schleswig-Holstein war of secession from Denmark (1849-50), in the War of 1866 against Prussia, and in the Franco-Prussian War (1870-71). Stromeyer added much to the knowledge of war surgery. His achievements in connection with subcutaneous myotomy and tenotomy in locomotor surgery place him among the founders of modern orthopedics. He wrote much in his special field. His autobiography appeared in 1875 under the title *Erinnerungen eines deutschen Arztes*.

**STROMÖ**. See FAROE ISLANDS.

**STRONG, AUGUSTUS HOPKINS** (1836-1921). An American clergyman, educator, and author, born at Rochester, N. Y. He graduated from Yale in 1857, and in 1859 from the Rochester Theological Seminary. After Baptist pastorates at Haverhill, Mass., and Cleveland, Ohio, he returned to the seminary in 1872 to be its president and professor of biblical theology. He retired in 1912 after 40 years of service. Dr. Strong was president of the Baptist Missionary Union in 1892-95 and of the General Convention of Baptists of North America in 1905-10. Among his writings are: *Systematic Theology* (1886; 7th ed., 1903; rev. ed., 3 vols., 1908); *Philosophy and Religion* (1888); *Great Poets and their Theology* (1897); *Christ in Creation and Ethical Monism* (1899); *Miscellanies* (1912); *One Hundred Chapel-Talks to Theological Students* (1913); *Union with Christ* (1913); *Popular Lectures on the Books of the New Testament* (1914).

**STRONG, CALEB** (1745-1819). A Governor of Massachusetts, born at Northampton, Mass. He graduated at Harvard in 1764, and was admitted to the bar in 1772. During the Revolution he served in the Massachusetts General Court and on the Committee of Safety of his town, and in 1780-89 sat in the Massachusetts Senate. He was a member of the National Constitutional Convention at Philadelphia in 1787. In 1789-96 he was a United States Senator, and he was Governor of Massachusetts from 1800 till 1807 and again from 1812 till 1816. In politics he was an ardent Federalist, and bitterly op-

posed to the War of 1812. On June 26, 1812, he issued a proclamation for a public fast on account of a war "against the nation from which we are descended, and which for many generations has been the bulwark of the religion we profess." By the advice of the State Supreme Court he refused to comply with the President's request to call out the State militia to help in the prosecution of the war, saying that to the Governor, not to the President, belonged the power to decide when to call out the militia. He published *Speeches and Other Papers, 1800-07* (1808). Consult his biography by Alden Bradford (1820).

**STRONG, EUGÉNIE** (?- ). An English classical scholar, whose maiden name was Sellers. She was educated in France and at Girton College, Cambridge. In 1897 she was married to S. Arthur Strong, late librarian of the House of Lords. She was elected first fellow of Girton College in 1910. From 1909 she was assistant director of the British School of Archaeology in Rome. Her publications include: *Roman Sculpture from Augustus to Constantine* (1907); *Art in Rome* (1912); an edition, with Miss K. Jex-Blake, of Pliny, *Historia Naturalis*, xxxiv-xxxvi (includes notes, historical introduction, and translation).

**STRONG, GEORGE CROCKETT** (1832-03). An American soldier, born in Stockbridge, Vt. He graduated at West Point in 1857; was an ordnance officer with the rank of lieutenant on the staff of General McDowell in the first battle of Bull Run, and later served successively on the staffs of Generals McClellan and Butler. He commanded an expedition sent from Ship Island against Biloxi, Miss., in April, 1862, and another sent against Ponchatoula, and was commissioned brigadier general of volunteers in November, 1862. He commanded a brigade in the operations against Charleston, S. C., in June and July, 1863; made a successful descent on Morris Island on July 10; and on the 18th of the same month was mortally wounded while gallantly leading the assault on Fort Wagner. A commission as major general of volunteers was made out to date from the day of the battle. He published *Cadet Life at West Point* (1862).

**STRONG, JAMES** (1822-94). An American Methodist lay biblical scholar and educator. He was born in New York City, studied medicine, and graduated from Wesleyan University in 1844. He early taught at Poultney, Vt., and at Flushing, L. I., and was president of the Flushing Railroad and president of the village. He was professor of biblical literature and acting president of Troy University (1858-63), and professor of exegetical theology in Drew Theological Seminary (1868-93). He traveled in the East in 1874, and was a member of the Anglo-American Bible Revision Committee, 1871-81. In 1863 he became associated with Dr. John McClintock in the preparation of the *Cyclopaedia of Biblical, Theological, and Ecclesiastical Literature* (rev. ed., 1890), and in 1870 became editor in chief. For more than 35 years he was engaged on an *Exhaustive Concordance of the Bible* (1895).

**STRONG, JOSTAH** (1847-1916). An American religious leader and social worker, born at Naperville, Ill. He graduated from Western Reserve College in 1869, and later attended Lane Theological Seminary. He was pastor of Congregational churches in Wyoming and Ohio, secretary of a denominational Home Missionary

Society (1881-84), and general secretary of the Evangelical Alliance for the United States (1886-98). He became president of the League for Social Service, reorganized in 1902 as the American Institute for Social Service. Dr. Strong initiated the "Safety First" movement. After 1908 he edited a periodical called *The Gospel of the Kingdom*. His writings include: *Our Country* (1885; 140th thousand, 1891); *The New Era* (1893); *Religious Movements for Social Betterment* (1900); *Expansion under New World Conditions* (1900); *The Times and Young Men* (1901); *The Next Great Awakening* (1902; 8th thousand, 1905); *The Challenge of the City* (1907); *Our World* (1913); *New World Religion* (1915).

**STRONG, RICHARD PEARSON** (1872- ). An American pathologist. He was born at Fortress Monroe, Va., and was educated at Yale and at Johns Hopkins (M.D., 1897). In 1899 he was sent to the Philippines as president of a government board for investigating tropical diseases. There he remained until 1913, having been director of the government biological laboratory at Manila since 1901, professor of tropical medicine at the University of the Philippine Islands since 1907, and chief physician at the General Hospital in Manila from 1910. He also edited the *Philippine Islands Journal of Tropical Medicine*. In 1913 he was called to a chair at Harvard. In 1914-15, as head of an American Red Cross Sanitary Commission, he was in Serbia, directing an antityphus campaign.

**STRONG, SIR SAMUEL HENRY** (1825-1909). A Canadian jurist, born at Poole, England. He went to Canada in 1836 with his parents, was educated at the Quebec High School and privately, and in 1849 was admitted to the bar of Upper Canada. He practiced his profession in Toronto. In 1856 he was appointed a member of the commission for consolidating the statutes of Upper Canada and Canada; in 1863 he was created queen's counsel, and in 1869 was made a vice chancellor of the Ontario Court of Chancery. He was called to the Ontario Court of Error and Appeal in 1874 and in 1875 was made a puisne judge in the newly constituted Supreme Court of Canada, of which he served as chief justice in 1892-1902. In 1897 he was made a member of the Judicial Committee of the Imperial Privy Council. In 1893 he was knighted (K.C.M.G.).

**STRONG, THEODORE** (1790-1869). An American mathematician, born at South Hadley, Mass. He was educated at Yale, and after graduation (1812) became tutor in mathematics at Hamilton College, and in 1816 professor of mathematics. In 1827 he accepted the chair of mathematics and natural philosophy in Rutgers College, a position which he retained till 1862, when he retired from active life. Strong made many important contributions to mathematical science. A new geometrical demonstration of the values of the sines and cosines of the sum and difference of two arcs was given by him in 1818. His two principal systematic works are *A Treatise on Elementary and Higher Algebra* (1859) and *A Treatise on the Differential and Integral Calculus* (1869).

**STRONG, WILLIAM** (1808-95). An American jurist, born in Somers, Conn. He graduated at Yale in 1828, and was admitted to the bar in Reading, Pa., in 1832. In 1846 and again in 1848 he was elected to the national House of

Representatives as a Democrat; and from 1857 until 1868 he was a justice of the Pennsylvania Supreme Court. From 1870 till 1880 he was associate justice of the United States Supreme Court. He was a member of the Electoral Commission that decided the disputed presidential election of 1876 and in that capacity contended that Congress had no power to canvass State returns for presidential electors.

**STRONG, WILLIAM L.** (1827-1900). The last mayor of New York previous to the formation of Greater New York. He was born in Richland Co., Ohio; was a dry-goods salesman in Wooster and then in Manchester, Ohio; in 1853 went to New York City, where he engaged in similar business, and in 1869 became the head of the firm of William L. Strong & Co. In politics he was a Republican. From 1895 to 1898 he was mayor, elected on a fusion ticket by Republicans and anti-Tammany Democrats.

**STRONGBOW.** A surname of Richard Fitz Gislebert, Earl of Pembroke.

**STRONGYLUS**, strôn'jī-lūs (Neo-Lat., from Gk. *στρογγύλος*, round). A genus of nematode worms, parasitic in man and other animals. The only true *Strongylus* infesting man is *Strongylus bronchialis*. The male usually measures more than half an inch, while the female is upward of an inch in length. It is apparently an uncommon parasite, as few cases have been reported, though allied species occur in the lungs and air passages of pigs, calves, and sheep. Closely allied to *Strongylus* is the genus *Eustrongylus*, which contains the species *Eustrongylus gigas*, the largest nematode worm at present known to infest man or any other animal, the male measuring a foot in length, and  $\frac{1}{4}$  of an inch in diameter, while the female is more than 3 feet, its transverse diameter being fully half an inch. The body is cylindrical, more or less tinged with redness; the head obtuse, furnished with a simple oval aperture surrounded by six chitinous nodules. This worm occurs in the kidneys and bladder, sometimes in the abdominal cavity and the omentum, rarely in the lungs and liver of man and other animals. It is said to be most common in weasels.

**STRONTIANITE.** A strontium carbonate. It is an important source of strontium compounds.

**STRONTIUM**, strôn'shī-ŭm (Neo-Lat., from *Strontian*, Argyllshire, Scotland). A metallic element first obtained (in a somewhat impure state) by Davy in 1808, its earth having been recognized as a distinct chemical substance after Cruikshank (1787), Hope (1792), and Klaproth (1793) had discovered that it gives a peculiar coloration if introduced into a flame. Strontium occurs as the carbonate (strontianite), as the sulphate (celestite), as the silicate in combination with barium and calcium (brewsterite), also in small quantities in other minerals, such as aragonite, calcite, and dolomite. It further occurs in mineral and sea waters, and also in the ashes of certain plants. The metal may be obtained by the electrolysis of the moistened hydroxide of the chloride. Strontium (symbol, Sr; atomic weight, 87.6) is a yellow metal with a specific gravity of about 2.5; it melts at a moderate red heat. It is both malleable and ductile, is less electropositive than calcium and the alkali metals, oxidizes quickly on exposure to the air, and burns brilliantly when heated, forming the oxide. It combines with oxygen to form a monoxide (SrO) and a dioxide (SrO<sub>2</sub>).

The former is a gray-white, porous, infusible solid that is usually prepared by igniting the nitrate. The hydrate formed by the action of water on the oxide has the property of combining with crystallizable sugar to form a saccharate easily decomposed by carbon dioxide, and hence is extensively used for the separation of sugar from beetroot molasses. The nitrate, which may be prepared by dissolving the carbonate in warm dilute nitric acid and evaporating to crystallization, finds use for pyrotechnic purposes, owing to the red flame with which it burns.

**In Medicine.** Strontium is used in medicine in the form of the bromide, iodide, salicylate, and lactate. These salts are believed to be less irritating to the stomach and less apt to produce skin eruptions than the corresponding salts of sodium and potassium. They are eliminated more rapidly, but are less powerful. The lactate has been used in diabetes and in the albuminuria of Bright's disease, of rheumatic and scrofulous disorders, and of pregnancy. Where, however, the urine is scanty, or there are symptoms of uremia, the drug should not be administered.

**STROPHADES**, strôf'à-déz (Lat., from Gk. *Στροφάδες*). Two small islands in the Ionian Sea, now Strofadia and Strivali. The name was given from the legend that the sons of Boreas pursued the Harpies to the islands, thence returning (*στρέφειν*, to turn) from their expedition.

**STROPHANTHUS** (Neo-Lat., from Gk. *στροφος*, *strophos*, twisted, bent, from *στρέφειν*, *strephein*, to turn, twist + *ἄνθος*, *anthos*, flower). A drug consisting of the seed of *Strophanthus hispidus*, a climbing African plant of the order Apocynaceæ. From it certain African tribes prepare a toxic substance known as the Kombé arrow poison. From the seed is obtained its active principle, strophanthin, a bitter glucoside; a white, amorphous, or crystalline powder, soluble in water or alcohol. The physiological action of the drug is much like that of digitalis (q.v.). It slows the action of the heart, increases its contractility, and increases the arterial tension, though less than digitalis. Its action is more rapid, less protracted, and less certain than that of digitalis. It is also less diuretic. In large doses it is a direct poison to the voluntary muscles, which become tonically contracted and pass into a condition resembling *rigor mortis*. *Strophanthus* is a valuable cardiac stimulant and is used in cases in which digitalis is indicated, but in which, for any reason, it is necessary to substitute another drug. The official tincture is the form generally employed. It is particularly serviceable in nervous disturbances of the heart, as, e.g., that of exophthalmic goitre, when a sedative as well as stimulating action is demanded. It is also useful in cardiac dyspnoea.

**STROPHE**, strôf'é (Lat., from Gk. *στροφή*, a turning, from *στρέφειν*, *strephein*, to turn, twist). A term which originally designated the evolutions of the Greek chorus from one position to another in the orchestra; then the portion of the song which accompanied this movement. In its ordinary sense, as applied to Greek and Latin lyric poetry, it designates a combination of rhythmical periods to which a following combination corresponds exactly or very closely; these are known respectively as strophe and antistrophe (q.v.). The name is also often applied to the stanza of modern poetry. See **VERSIFICATION**.

**STROPHOMENA** (Neo-Lat. nom. pl., from *στροφος*, *strophos*, twisted, bent + *μήνη*, *mēnē*, crescent). An important genus of fossil long-hinged brachiopods of Paleozoic age, typical of the family Strophomenidae. The primitive members of this family are characterized by their general semicircular outline, long hinge lines,

1, *Orthothetes chemungensis* (view from the brachial valve); 2, *Strophomena filixia* (pedicle valve).

and well-developed cardinal teeth, distinct hinge areas, and low beaks. In the secondary derived members of the group the hinge line shortens, the beak lengthens, the hinge area increases in height, and the articulating processes undergo interesting modifications, while correlated modifications take place in the interior of the shell.

1, *Streptorhynchus pelargonatus* (profile); 2, *Derbya bennetti* (profile).

The simplest and earliest member is *Rafinesquina* (Ordovician), with valves normally concavo-convex dorsoventrally, and hinge line simple. *Strophomena* (Ordovician and Silurian) in its embryonic stages has the general form of shell seen in *Rafinesquina*, but the adults have the valves resupinate or recurved so that the dorsal valve is convex and the ventral valve flat or concave. From *Rafinesquina* arises a long line of descendants reaching into Carboniferous times. These genetically related types are *Strophomena* (Ordovician to Silurian), *Orthothetes* (Silurian to Carboniferous), *Derbya* (Carboniferous), *Streptorhynchus* (Upper Carboniferous to Permian). Consult Hall and Clarke, "An Introduction to the Study of the Genera of Palæozoic Brachiopoda," in *Palæontology of New York*, vol. viii, part i (Albany, 1892).

**STROPHULUS**. See **MILIARIA**.

**STROSSMAYER**, strôs'mi-ër, JOSEPH GEORG (1815-1905). An Austrian Roman Catholic bishop, born at Eszék, Slavonia. After being educated at Diakovár, Budapest, and Vienna he became professor in the seminary at Diakovár, afterward court chaplain in Vienna, and in 1849 Bishop of Diakovár. A leader of the Croatian national party, he promoted the cause of education in various ways, contributed largely to the establishment of the academy and university at Agram, and built the beautiful Romanesque cathedral at Diakovár. He came most prominently into notice at the time of the Vatican Council, in which he was considered the leader of the Inopportunist, or those who considered it inadvisable to define papal infallibility.

**STROTHER**, strôth-ër, DAVID HUNTER (1816-88). An American author and illustrator, born at Martinsburg, W. Va. Educated as an artist, he first became known to the public in 1852 as

**Porte Crayon**, the author of a series of amusing papers published in *Harper's Magazine*, descriptive of travel, scenery, and manners in the South. Many of these were afterward collected in *The Blackwater Chronicle* (1853) and *Virginia Illustrated* (1857). He entered the Union army as captain in 1861, became colonel, resigned in 1864, and in 1865 was brevetted brigadier general. From 1879 to 1885 he was consul general to Mexico.

**STROUD**, stroud. A town in Gloucestershire, England, 9 miles south-southeast of Gloucester, at the confluence of the Frome and Slade (Map: England, D 5). It is the centre of the woolen manufactures of Gloucestershire. The water of the Frome is peculiarly adapted for use in dyeing scarlet and other grain colors; and on this account cloth factories and dye works have been built along its banks for a distance of 20 miles. Pop., 1901, 9188; 1911, 8767. At the Domesday survey Stroud was part of Bisley Parish, from which it separated in 1304.

**STROUDSBURG**. A borough and the county seat of Monroe Co., Pa., 53 miles southeast of Scranton, on the Analomink River, and on the New York, Susquehanna and Western, the Wilkes-Barre and Eastern, the Delaware Valley, and the Delaware, Lackawanna and Western railroads (Map: Pennsylvania, L 5). It is in a beautiful region, popular as a summer resort. Five miles distant is the famous Delaware Water Gap. In East Stroudsburg is a State Normal School. There are car and engine works and flour, silk, and woolen mills. Pop., 1900, 3450; 1910, 4379.

**STROZZI**, strôts'sè. A noble Florentine family which first attained prominence towards the end of the thirteenth century. From that time until 1530 they appear as the rivals of the Medici, with whom they shared the great offices of state. Becoming very wealthy through their banking establishments in southern Italy, they were able to satisfy their political ambitions. At their most flourishing period towards the end of the fifteenth century they numbered 80 heads of families. Then was built from the plans of Benedetto da Majano and Cronaca that famous palace which has been ranked with the Farnese at Rome and the Vendramin at Venice as one of the three finest in Italy. Cosmo I de' Medici upon his accession in 1537 brought about the fall of the rival house. Various branches of the family took foreign service or settled in Naples, Mantua, and Ferrara. Descendants live in Florence and the title Prince of Forano has been in the family since 1722.

**STRUBE**, strôû'be, GUSTAV (1867- ). An American composer and violinist, born at Ballenstedt (Germany). He received his first instruction from his father, and his progress was so rapid that at the age of 10 he played in the Ballenstedt Orchestra. In 1883 he entered the Leipzig Conservatory, where his teachers were Hermann and Brodsky (violin) and Jadasohn and Reinecke (composition). After his graduation he played in the Gewandhaus Orchestra, and for a time taught violin at the Mannheim Conservatory. In 1889 he settled in Boston, and from 1891 to 1913 was a member of the Boston Symphony Orchestra, then resigning to become head of the violin department of the Peabody Conservatory, Baltimore. In 1916 he was appointed conductor of the newly founded Baltimore Symphony Orchestra. From 1909 he was one of the conductors of the Worcester

(Mass.) Music Festival. His compositions include two symphonies (C minor, B minor); the symphonic poems, *Longing*, *Fantastic Dance*, *Echo and Narcissus*, *Die Lorelei*; the opera *Ramona*; three overtures, *The Maid of Orleans*, *Fantastic*, *Puck*; two concertos for violin; one concerto for cello; an orchestral rhapsody, *Hymn to Eros*; a *Quintet* for wind instruments.

**STRUENSEE**, shtrôû'en-zâ, JOHANN FRIEDRICH VON, COUNT (1737-72). A Danish statesman and philosopher, born Aug. 5, 1737, at Halle, Saxony. He studied medicine, became the physician of King Christian VII (q.v.) of Denmark (1768), and rose to high favor. In 1771 he was made Minister of State with unusual powers. Since the Revolution of 1660 Denmark had been under the domination of the nobility, who governed the country. Struensee dissolved the council of state and proclaimed the establishment of the ancient royal power. These measures amounted to a revolution, and to a declaration of war against the aristocracy. The Queen and Struensee (now in full power) chose new ministers, and excluded the feeble Christian from management of affairs. In opposition to his predecessors' policy, Struensee endeavored to free Denmark from Russian influence, and to find an ally in Sweden. He put the finances in order, freed industry and trade, encouraged education, and mitigated the penal laws. Serfdom was partially abolished. This revolutionary course produced a reaction, while the clergy were aroused by Struensee's outspoken skepticism. The Queen and Struensee were accused of criminal relations and the King was prevailed upon to sign warrants for the arrest of Struensee. The minister was accused of having conspired against the person and throne of the King, and of being the lover of the Queen. He was sentenced to death and executed April 28, 1772. Queen Carolina Matilda left Denmark in May, 1772, and died in 1775 in the castle of Celle in Hanover. Consult *Struensee et la cour de Copenhague—mémoires de Reverdil* (Paris, 1858).

**STRUMA**. See SCROFULA.

**STRÜMPPELL**, shtrum'pel, LUDWIG (1812-99). A German philosopher, born at Schöppenstein. He studied philosophy at Königsberg, where he was influenced by Herbart, and continued his studies at Leipzig. From 1849 to 1871 he was professor at Dorpat. Known as a prominent representative of Herbart's philosophy, he published: *Erläuterungen zu Herbart's Philosophie* (1834); *Die Hauptpunkte der Herbart'schen Metaphysik kritisch beleuchtet* (1840); *Gedanken über Religion und religiöse Probleme* (1888); *Abhandlungen zur Geschichte der Metaphysik, Psychologie, und Religionsphilosophie* (1896); and *Vermischte Abhandlungen aus der theoretischen und praktischen Philosophie* (1897).

**STRUNSKY**, strún'skî, SIMEON (1879- ). An American essayist, born at Vitebsk, Russia. He was educated at the Horace Mann School, New York City, and at Columbia University, where he graduated in 1900. From 1900 to 1906 he was a department editor of the NEW INTERNATIONAL ENCYCLOPÆDIA. From 1906 to 1913 he was an editorial writer on the New York *Evening Post*, and subsequently was literary editor of that paper. In addition to many contributions to magazines, and to his *Through the Outlooking Glass with Theodore Roosevelt* (1912), a clever parody, he wrote: *The Patient*

*Observer* (1911); *Belshazzar Court, or Village Life in New York City* (1914); *Post-Impressions* (1914). These volumes, for the most part collections of essays originally written for the *Post*, are filled with social and political comment that is quietly humorous or satirical, and shrewdly discerning.

**STRUTT, JOHN WILLIAM**, third BARON RAYLEIGH. See RAYLEIGH.

**STRUTT, JOSEPH** (1749-1802). An English antiquary. He studied engraving and painting, but devoted himself mostly to research in the British Museum. He wrote a number of learned antiquarian works, but lives in literary history on the score of a curious historical romance, entitled *Queenhoo Hall*, edited and completed by Sir Walter Scott (1808) and not without its influence upon Scott's *Waverley*. Strutt's work as antiquary was so well done that it has not yet been superseded. His engravings in the chalk or dotted style are much sought after.

**STRUTT, ROBERT JOHN** (1875- ). An English physicist, born in Essex, eldest son of the third Baron Rayleigh (q.v.). He was educated at Eton and at Trinity College, Cambridge, where he was a fellow in 1900. Later he became professor of physics at the Imperial College of Science, South Kensington. Strutt published many papers in the *Proceedings* of the Royal Society (of which he was elected fellow in 1905) and in the scientific press, dealing particularly with the origin of radium, radium and the earth's heat, universal distribution of helium, and measurement of geological time from radioactive data. He wrote *The Becquerel Rays and the Properties of Radium* (1904).

**STRUVE, штрүүве, FRIEDRICH GEORG WILHELM VON** (1793-1864). A Russian astronomer, born at Altona, Germany. He was educated at the University of Dorpat, in 1813 was appointed to a post in the Dorpat Observatory, and in 1839 became director of the newly organized observatory at Pulkova. His observations and researches on double and multiple stars added immensely to the knowledge of these systems. Struve also executed a number of important geodetic operations, such as the triangulation of Livonia in 1816-19, and the measurement of an arc of the meridian in 1822-52. He published: *Observationes Dorpatenses* (1817-39); *Catalogus Novus Stellarum Duplicium et Multiplicium* (1827); *Stellarum Duplicium et Multiplicium Mensuræ Micrometricæ* (1837); *Etudes d'astronomie stellaire* (1847); *Stellarum Fixarum Imprimis Duplicium et Multiplicium Positiones Mediæ* (1852). All these works are fundamental in the history of double-star astronomy. He published also *Arc du méridien de 25° 20' entre le Danube et la mer glaciale* (2 vols. and 1 vol. plates, 1857-60).

**STRUVE, GUSTAV VON** (1805-70). A German revolutionist, born in Munich. He was an ardent Liberal, and in 1848 took part with Hecker and others in the first revolt in Baden. After the defeat at Staufen he was captured and sentenced to five years of solitary confinement. Released by the Revolutionists in 1849, he became the leader of the Republican party in the Constituent Assembly of Baden. Forced to flee again, he went first to Switzerland, then to England, and finally, in 1851, to the United States. Here he composed his *Allgemeine Weltgeschichte* (1853-60), a history of the world from the standpoint of radical republicanism. When the Civil War broke out he served for a

time as an officer in the Eighth New York Regiment, but in 1863 returned to Europe, where he lived for a time in Coburg, then in Vienna until his death. Among his numerous other works are: *Das öffentliche Recht des deutschen Bundes* (1846); *Geschichte der drei Volkskriegerheben in Baden* (1849); *Das Revolutionszeitalter* (1860; 7th ed., 1864); *Das Seelenleben* (1869).

**STRUVE, OTTO WILHELM VON** (1819-1905). A Russian astronomer, born at Dorpat. In 1862 he became director of Pulkova Observatory in succession to his father, whose chief assistant he had been since 1837. In 1889 he retired and settled in Karlsruhe. In his examination of the northern heavens he discovered 500 binary stars and also determined the parallax of several stars, and observed the variability of the light coming from the nebula of Orion and the several stars hidden in the nebula. He also determined a new value of the precession constant (1841), calculated the dimensions of the ring of Saturn, determined the mass of Neptune, and made observations on solar velocity and the extent of the corona. Struve made numerous contributions to the *Memoirs* of the St. Petersburg Academy, and edited 14 volumes of *Observations de Pulkova* (1869-93).

**STRYCHNINE**, strīk'nīn, or **STRYCH'NIA** (from Lat. *strychnos*, from Gk. *σπύχνος*, *strychnos*, plant of the nightshade kind). A poisonous alkaloid (C<sub>21</sub>H<sub>22</sub>N<sub>2</sub>O<sub>2</sub>) obtained from ripe seeds of *Strychnos nux-vomica* and the St. Ignatius bean. It occurs in right square octahedrons or prisms, colorless and inodorous, scarcely soluble in water, but easily so in alcohol, ether, and chloroform. Pure sulphuric acid forms with it a colorless solution, which, on the addition of bichromate of potash, acquires an intensely violet hue, speedily passing through red to yellow. If, indeed, the solution is diluted with water while it is red and ammonia is added, it becomes a violet purple, changing to yellow. Another test for strychnine depends upon its tetanic effect on the voluntary muscles of animals. Strychnine is intensely bitter, and will impart this quality to 20,000 times its weight of water. Its therapeutic actions are similar to those of *Nux Vomica* (q.v.). See ALKALOIDS; ANTIDOTE; BRUCINE.

**STRYCH'NOS** (Lat., from Gk. *σπύχνος*, *strychnos*, *τρυχνος*, *trychnos*, plant of the night-

NUX VOMICA (*Strychnos nux-vomica*).  
a, fruit; b, seed.

shade kind). A genus of about 100 species of trees, shrubs, and climbers of the family Loganiaceæ. To this genus belongs *Strychnos nux-vomica*, an East Indian tree of medium size,

whose fruit, produced in great abundance, is about the size of a small orange. Its disk-shaped seeds, the nux vomica of commerce, yield the alkaloids strychnine and brucine. The wood of the tree is very hard and durable. The clearing nut and St. Ignatius bean are produced by species of this genus, to which also belongs the South American tree (*Strychnos tozifera*) from the bark of which curare or woorali is obtained. Another species is the upas tieuté (*Strychnos tieute*) of Java, a large climbing shrub, whose bark is reputed poisonous. The wood of a climbing species (*Strychnos colubrina*), found in the north of India, is claimed to cure snake bites. The bark of *Strychnos pseudo-quina*, a Brazilian species, is used as a substitute for cinchona. The climbing species are provided with curious hooked tendrils by which they attach themselves to trees.

**STRYJ**, strî'y'. A town in Galicia, Austria, 40 miles south of Lemberg (Map: Austria, H 2). It has a castle. Its industries include the manufacturing of leather, matches, and iron products. Stryj was captured but later evacuated by the Russians in the war which began in 1914. See WAR IN EUROPE. Pop., 1900, 23,673; 1910, 30,206.

**STRYKER**, MELANCTHON WOOLSEY (1851-). An American clergyman and college president, born at Vernon, N. Y. He graduated at Hamilton College in 1872 and at Auburn Theological Seminary four years later. Between 1876 and 1892 he was pastor of churches in Auburn, N. Y.; Ithaca, N. Y.; Holyoke, Mass.; and Chicago. In the latter year he was elected president of Hamilton College. His publications include: *The Song of Miriam* (1888); a hymnal *Church Song* (1889); *Dies Iræ* (1893; new ed., 1910); *Lattermath* (1896); *The Well by the Gate* (1903); *Baccalaureate Sermons* (1905); *An Outline Study of the History of the Bible in English* (1914); *An Outline Introduction to the Sundry Parts of the Bible* (1915).

**STRYPE**, JOHN (1643-1737). A church of England historian and antiquary. He was born in London, studied at Cambridge, entered the church, and held for many years, with other smaller livings, the curacy of Leyton, in Essex. His works fill 13 large folio volumes. *Ecclesiastical Memorials*, relating to religion and the Church of England under Henry VIII, Edward VI, and Mary, is his best work, forming, with Burnet's more readable *History of the Reformation*, a consecutive and full account of the reformed Anglican Church. His complete works were reprinted with general index by R. F. Laurence (28 vols., Oxford, 1820-28). His *Memorials of Thomas Cranmer* were republished in 1848-54, and edited by E. P. Barnes in 1853.

**STUART**, or **STEWART**. A Scotch and English royal family. Its origin is traced to Fitzlaald, a Norman, who accompanied the Conqueror to England. His second son, Walter (died 1117), entered the service of David I of Scotland, who conferred lands on him, and the dignity of Steward of Scotland, which became hereditary, and his descendants bore this as a surname, some of the house later modifying it to Steuart or Stuart. For seven generations the stewardship continued from father to son. Walter, the third steward (grandson of the first), held, in addition, the office of Justiciary of Scotland. Alexander, fourth steward, was Regent of Scotland in Alexander III's minority. James, fifth steward, was one of the six regents of Scot-

land after the death of Alexander III; and Walter, sixth steward, by his marriage with Marjory, daughter of Robert Bruce, eventually brought the crown of Scotland to his family. His son, Robert, seventh high steward, was Regent (1338-41) and afterwards during the captivity of his uncle, David II, 1346-57. On the death of David II (1371) he ascended the throne as Robert II, and died in 1390. (For the subsequent history of the royal family see ROBERT II and III; JAMES I, II, III, IV, V; MARY STUART; JAMES I (of England); CHARLES I and II; JAMES II; MARY II; ANNE.) In the person of James II the line of Stuart was driven from the English and Scottish thrones. The claims of the house were upheld by James's son, the Old Pretender (see STUART, JAMES FRANCIS EDWARD), and by the latter's son, the Young Pretender. (See STUART, CHARLES EDWARD.) A brother of the latter was HENRY BENEDICT MARIA CLEMENT, Cardinal York, born 1725. After Culloeden (1746) he went to Rome, took orders, and was advanced to the purple by Benedict XIV in 1747. During his brother's life he was known as Cardinal York; but after his death he assumed the title Henry IX, King of England. The expulsion of Pius VI from Rome, and other events following the French Revolution, drove him to Venice, aged, infirm, and reduced to poverty. George III settled on him an annuity of £4000. He died in 1807 at the age of 82, the last direct descendant in the male line of the royal Stuarts.

The female line of the Stuarts is represented by the descendants of Henrietta Maria, daughter of Charles I, who was married to Philip, Duke of Orleans, brother of Louis XIV of France. This princess had two daughters, of whom the elder, Mary, was Queen of Charles II of Spain, and died childless; the younger, Anna Maria, married Victor Amadeus II, Duke of Savoy and King of Sardinia, and was mother of Charles Emmanuel III, King of Sardinia, and grandmother of Victor Amadeus III of Sardinia. See SAVOY, HOUSE OF.

The branch of the family which the Act of Settlement called to the throne on the death of Queen Anne was descended from the Electress Sophia of Hanover, granddaughter of James I (VI) by her mother, the Princess Elizabeth Stuart (q.v.), Electress Palatine and Queen of Bohemia.

The cadets of the House of Stuart, descendants of Robert II, are represented by some of the most noble titles in Scotch and English history. Consult: Mark Noble, *Historical Genealogy of the Royal House of Stewart* (London, 1795); Andrew Stuart, *Genealogical History of the Stuarts* (ib., 1798); Samuel Cowan, *The Royal House of Stuart from its Origin to the Accession of the House of Hanover* (2 vols., ib., 1908).

**STUART**, LADY ARABELLA, or ARBELLA (1575-1615). The daughter of Charles Stuart, Earl of Lennox, a younger brother of Lord Darnley (q.v.). She was next in the line of succession to her cousin James I of England, and her relationship to Elizabeth gave rise to plots, including one by Sir Walter Raleigh in 1603, to place her on the throne. Several schemes to marry her were defeated by Elizabeth, but in 1610 her secret marriage to William Seymour (q.v.), grandson of the Earl of Hertford, was discovered. Seymour was imprisoned in the Tower and his wife put in the custody of the

Bishop of Durham, but she fled to a French vessel, in which her husband, who had escaped from the Tower, was also to sail. He did not reach it, but took another vessel, while her ship was captured, and she spent the last five years of her life in the Tower, dying insane. Consult: E. T. Bradley, *The Life and Letters of Lady Arabella Stuart* (London, 1889); B. C. Hardy, *Arabella Stuart* (ib., 1913).

**STUART, CHARLES EDWARD LOUIS PHILIP CASIMIR**, often called the YOUNG PRETENDER (1720-88). A claimant to the British throne—the eldest son of James Edward, known as the Old Pretender, born at Rome. After military service on the Continent, Charles, encouraged by the French government, decided to make an armed attempt to obtain the British crown. The French aid did not come, and he landed almost alone, Aug. 2, 1745, on an islet in the Hebrides. The Highland clans joined him, and Charles pressed on to Perth, where he was aided by Lord George Murray. The government troops were defeated at Prestonpans, Sept. 21, 1745, and Carlisle was taken in November. Lord George Murray outmaneuvered his opponents, and soon had a clear road to London. Early in December the Highlanders were in Derby. Panic prevailed in London. But England did not witness the expected Stuart rising, and Murray was cut off from his base of supplies. In consequence his retreat began December 6, the Duke of Cumberland pursuing. On April 16 (new style April 27), 1746, the rebels were defeated at Culloden Moor. From April to September Charles Edward lay concealed in the north with a price on his head, hunted by soldiers, but safe with the clansmen. He finally reached France after many hairbreadth escapes. Thereafter his life was chiefly marked by dissoluteness. He was in London in 1750, and again in 1752 and 1754, in the vain hope of fomenting another rising. In 1772 Charles married Louisa, Princess of Stolberg (see ALBANY, LOUISA MARIA CAROLINE), but owing to his brutality they separated in 1780. Thereafter Charles lived chiefly at Florence in the company of a daughter born to him by Miss Walkenshaw, his mistress. He died at Rome. Consult: A. C. Ewald, *Life and Times of Prince Charles Stuart, Count of Albany* (2 vols., London, 1875); Andrew Lang, *The Prince Charles Edward* (ib., 1900).

**STUART, CHARLES MACAULAY** (1853- ). An American Methodist Episcopal clergyman, editor, and educator, born in Glasgow, Scotland. He graduated from Kalamazoo College (Mich.) in 1880 and from Garrett Biblical Institute in 1883. From 1896 to 1909 he was professor of sacred rhetoric in Garrett Biblical Institute, and then for two years he edited *The Northwestern Christian Advocate*. In 1911 he was chosen professor of ethics and philosophy of religion in Wesleyan University, and later in the same year he was elected president of Garrett Biblical Institute. He edited *The Methodist Hymnal* (1905) and *The Manifold Message of the Gospel* (1913), and wrote: *The Life and Selected Writings of Francis Dana Hemenway* (1896), with C. F. Bradley and A. W. Patten; *Gospel Singers and their Songs* (1891), with F. D. Hemenway; *The Vision of Christ and the Poets* (1896); *Story of the Masterpieces* (1912); *In Memoriam Charles J. Little* (1912).

**STUART, ELIZABETH** (1596-1662). See ELIZABETH STUART.

**STUART, GILBERT** (1755-1828). An early

and important American portrait painter. He was born at Middletown, near Newport, R. I., Dec. 3, 1755, and painted his first portraits when only 13, having had no instruction. In 1770 he was befriended and taught by Cosmo Alexander, who took him to Scotland, but upon Alexander's death Stuart was forced by poverty to return to America after a year's absence. A maturing talent brought him frequent commissions, and in 1775 he went to London for further study. After much adversity, during which he supported himself for a time as an organist, in 1778 he formed the acquaintance of Benjamin West, with whom he lived and worked for four years. He then began portrait painting independently, and soon became very successful, living in a most lavish manner. After a stay of five years in Dublin, whither he went in 1787 to escape his debts and other entanglements, he returned to America in 1792, his impelling motive being to paint the portrait of Washington. He remained in New York for two years, then removed to Philadelphia, where the first Washington portrait was painted in 1795; at a still later period he lived in the city of Washington, and finally from 1806 in Boston, where he died. The Stuart portraits of Washington, representing the subject in the later years of his life, are the most famous of both artist and sitter. One of the best is the well-known "Gibbs-Channing" portrait, now in the Metropolitan Museum, New York. After 1796 he painted the portrait known as the "Athenæum" portrait (Boston Museum), showing the left side. A full length was painted for the Marquis of Lansdowne in 1796. Nearly 40 replicas of his various Washington portraits have been traced. The historical societies of Boston, New York, and Philadelphia, and other American collections have many examples of his work.

Stuart was an entirely independent and original master. His execution is surprisingly sure, the color pure and delicate, with a pleasing freshness and diffused light effects. He devoted his chief attention to the heads, which are rendered with force and truth, and admirably characterized, the remainder of the picture being treated as merely accessory. The list of his sitters includes the first five presidents of the United States, Edward Everett, John Jay, Jacob Astor, Judge Story, W. E. Channing, Josiah and Edmund Quincy, O. H. Perry, Jerome and Madame Bonaparte. He is especially well represented in the Metropolitan Museum, by the early portraits of Josef de Jaudenes y Nebot, then Spanish chargé d'affaires, and his wife, and by many others, including a second strong likeness of Washington dated 1803. During his residence in England he painted King George III, also George IV while Prince of Wales, Louis XVI of France (at Paris), Mrs. Siddons, Sir Joshua Reynolds, Benjamin West, and many others. Consult: Mason, *Life and Works of Gilbert Stuart* (New York, 1879); *Masters in Art*, vol. vi (Boston, 1907); C. H. Caffin, *American Masters of Painting* (New York, 1913); Samuel Isham, *History of American Painting* (ib., 1915).

**STUART, HENRY**. See DARNLEY, LORD.

**STUART, HENRY BENEDICT MARIA CLEMENT**, Cardinal York (1725-1807). The second son of James Edward Stuart, the Elder Pretender. See STUART.

**STUART, JAMES**. Regent of Scotland after

the abdication of Queen Mary. See MURRAY OR MORAY, JAMES STUART, EARL OF.

**STUART, JAMES** (1713-88). An English painter, archaeologist, and architect, born in London. Until nearly 30 years of age he was a poor fan painter, but in 1741 he found means to go to Rome, where he studied Latin and Greek and became interested in archaeology. From 1751 to 1755, with Nicholas Revett, he studied antiquities in Athens. Upon their return to England they published, through the encouragement and aid of the Society of Dilettanti, *The Antiquities of Athens, Measured and Delineated* by James Stuart, F.R.S. and F.S.A., and Nicholas Revett, *Painters and Architects* (1762). The book, as the earliest accurate account of the monuments of Athens, attracted widespread attention; it still has great value. Through its influence the classical style in architecture became widely popular. A second volume of the *Antiquities* was published posthumously in 1789, a third in 1795, and a fourth in 1814. A third edition of the first three volumes was published in 1841 for Bohn's *Illustrated Library*.

**STUART, SIR JAMES** (1780-1853). A Canadian jurist and statesman. He was born at Fort Hunter, N. Y., was educated at King's College, Windsor, Nova Scotia, and was called to the bar in 1801. Having attained a wide reputation as a successful lawyer, he represented Montreal in the Lower Canada House of Assembly in 1808-17, and was leader of the English party who aimed at predominance in the Legislature and the reunion of the two provinces. He went to England in 1822 to advocate his views, and in 1825 was appointed Attorney-General for Lower Canada. By reason of his independent attitude he was suspended from office in 1831 by Lord Aylmer, the Governor-General, and the suspension was afterward confirmed by the British Colonial Secretary. Lord Durham, however, in 1838 approved of Stuart's course and appointed him Chief Justice of Lower Canada. Stuart drafted the Act of Union which became law in 1841. He was made a baronet in 1840.

**STUART, JAMES EWELL BROWN** (1833-64). An American soldier, prominent in the Confederate cavalry during the Civil War. He was born in Patrick Co., Va., attended Emory and Henry College, and graduated at the United States Military Academy in 1854. He was lieutenant on the Texas frontier, taking part against the Apache. In 1857 his regiment was sent to Kansas to maintain peace, and later he served against the Cheyenne. In 1859 he was sent out from Washington to assist Col. R. E. Lee in the putting down of the John Brown raid at Harper's Ferry. In April, 1861, he was promoted to the rank of captain, but resigned from the United States army upon receiving notice of the secession of Virginia, and was commissioned lieutenant colonel of Virginia troops. At the first battle of Bull Run he won distinction as a cavalry commander, and became brigadier general, in charge of the cavalry brigade of the Army of Northern Virginia. He made successful raids and was in the Seven Days' Battle. In July, 1862, he was commissioned major general of cavalry, and afterward made a dash upon General Pope's headquarters, making prisoners of several of his staff. This was followed the same night by a raid on Manassas Junction. He was distinguished in the sec-

ond battle of Bull Run and at Antietam, made a raid into Pennsylvania, guarded the Confederate right at Fredericksburg, and aided Stonewall Jackson at Chancellorsville. After the death of Jackson and the wounding of A. P. Hill, he commanded Jackson's corps temporarily. He took part in Lee's Gettysburg campaign. In the Wilderness he won several successes; and when Sheridan advanced upon Richmond Stuart confronted him at Yellow Tavern, where the Confederates were defeated and General Stuart mortally wounded. He died May 12, 1864. Consult H. B. McClellan, *Life and Campaigns of Major General J. E. B. Stuart* (Boston, 1885).

**STUART, JAMES FRANCIS EDWARD** (1688-1766). The son of James II of England by his second wife, Mary Beatrice, daughter of the Duke of Modena, known as the Chevalier St. George, or the Old Pretender. Prince James, born but a few months before his father's dethronement, was groundlessly alleged to be a supposititious child, and was involved in his father's exclusion from the crown. In 1715 his party, known in history as the Jacobites, endeavored to place him on the throne by force. In Scotland the Earl of Mar, with about 5000 men, was checked by royal forces under the Duke of Argyll at Sheriffmuir (q.v.), and in England the rising, headed by the Earl of Derwentwater, ended by the surrender of the insurgents at Preston, when Lords Derwentwater and Kenmore were beheaded and others executed and attainted. James escaped to France, and later resided in obscurity, principally at Rome. In 1719 he married one of the wealthiest heiresses in Europe, Maria Clementina Sobieski, granddaughter of John Sobieski, King of Poland. His son Charles Edward was the Young Pretender. Consult: Martin Haile, *James Francis Edward* (New York, 1907); Alice Shield, *The King over the Water* (ib., 1907).

**STUART, JOHN.** See BUTE, third EARL OF.

**STUART, JOHN McDOWALL** (1815-66). A British explorer, born at Dysart, in Fifeshire. In 1838 he emigrated to South Australia and in 1858 began his work of exploration in Central Australia. In October, 1861, he started northward, and in July, 1862, arrived at Van Diemen's Gulf. For this exploit he received from South Australia the grant of £2000, offered to the first colonist who crossed the continent. He published *Explorations in Australia* (2d ed., 1865).

**STUART, MARY.** See MARY STUART.

**STUART, MOSES** (1780-1852). An American scholar and teacher. He was born at Wilton, Conn., and graduated at Yale in 1799. He abandoned law for theology. He was pastor of a church in New Haven (1806-09), but is best known for his service as professor of sacred literature at Andover Theological Seminary (1810-48). He was an inspiring teacher, an indefatigable student, and one of the first to make German scholarship known in America. He prepared several Hebrew grammars, the last being a translation of Rödiger's *Gesenius* (1846). With Edward Robinson he translated Winer's grammar of New Testament Greek (1825), and he also translated writings of John and others on methods of biblical study (1821), and Ernesti's *Elements of Interpretation* (1822). A volume of *Exegetical Essays* was published in 1867. Consult Williston Walker, *Ten New England Leaders* (New York, 1901).

**STUART, RUTH MCENERY** (1856-1917). An American story writer, whose richly humorous

negro sketches have a leading place among their kind. She was born in Avoyelles Parish, La., and was educated at New Orleans. In 1879 she was married to Alfred O. Stuart, a cotton planter. In later life she made her home in New York City. Among her publications are: *A Golden Wedding and Other Tales* (1893); *Carlotta's Intended* (1894); *The Story of Babette* (1894); *Sonny* (1896); *In Simkinsville* (1897); *Moriah's Mourning* (1898); *Holly and Pizen* (1899); *The Woman's Exchange* (1899); *Napoleon Jackson* (1902); *George Washington Jones* (1903); *The River's Children* (1904); *Second Wooing of Salina Sue* (1905); *Aunt Amity's Silver Wedding* (1908); *Sonny's Father* (1910); *Daddy-Do-Funny's Wisdom Jingles* (1913); *Cocoon* (1915); *Plantation Songs* (1916).

**STUART-JONES, HENRY** (1867- ). An English classical scholar, born at Leeds. He was educated at Rossall School and at Balliol College, Oxford. In 1903-05 he was director of the British School of Classical Studies at Rome. Of Trinity College, Oxford, he was a fellow from 1890 to 1906, and in 1911 was elected research fellow, to undertake a revision of Liddell and Scott's Greek Lexicon. His publications include: *Select Passages of Ancient Writers Illustrative of the History of Greek Sculpture* (1895); *The Roman Empire* (1908); *Classical Rome* (1910); *Catalogue of Ancient Sculptures in the Capitoline Museum at Rome* (1912); *Companion to Roman History* (1912).

**STUBBS, CHARLES WILLIAM** (1845-1912). An English divine and author, born in Liverpool. He graduated at Sidney Sussex College, Cambridge, in 1868. Thereafter he held various livings in the Anglican Church until 1894, when he was appointed Dean of Ely. After 1906 he was Bishop of Truro. Among his writings are: *Christ and Democracy* (1883); *God's Englishmen* (1887); *The Land and the Labourers* (1890); *Christ and Economics* (1893); *Christus Imperator* (1894); *Charles Kingsley and the Christian Social Movement* (1898); *The Social Teaching of the Lord's Prayer* (1900); *Pro Patria* (1900); *Cambridge and its Story* (1904; 3d ed., 1912); *The Christ of English Poetry* (1905). He is also the author of four volumes of verse, *The Conscience* (1884), *Brightmoth's Prayer* (1899), *Castles in the Air* (1904), and *Cornish Bells* (1910). A selection of his *Sermons, Speeches, and Pastoral Letters* was published in 1915.

**STUBBS, GEORGE** (1724-1806). An English animal painter, engraver, and anatomist. He was born in Liverpool, and after studying independently in England and Italy, became the chief pioneer of animal painting in Great Britain. In 1758 he began his famous *Anatomy of the Horse* (completed 1766) for which he drew and engraved all the plates. He did some curious work in enameling on large plates and painted and engraved rustic and classical pictures, but is celebrated chiefly for his paintings of horses which, although of a type now obsolete and somewhat crude in color, have never been surpassed for truth and accuracy. He is represented in South Kensington Museum and the National Gallery, but his best known pictures, including "The Grosvenor Hunt," "Horse Affrighted by a Lion," "Warren Hastings," "Horses Fighting," and 16 famous race horses are in private collections.

**STUBBS, or STUBBE, JOHN** (c.1543-1591). An English Puritan zealot, born in Norfolk. He

was possessed of a fiery zeal against Catholicism, and was so opposed to the Queen's proposed marriage with the Duke of Anjou that, in 1579, he published a pamphlet entitled *The Discoverie of a Gaping Gulf wherein England is like to be Swallowed by Another French Marriage if the Lord Forbid not the Banes by Letting her Majestie see the Sin and Punishment thereof*. Though the pamphlet spoke of the Queen in respectful and loyal terms, Stubbs, his publisher, and the printer were found guilty on a charge of disseminating seditious writings and were sentenced to have their right hands cut off. This cruel punishment, was, in fact, inflicted upon Stubbs and the publisher in the market place at Westminster. Stubbs was, however, loyal to the Queen.

**STUBBS, or STUBBES, stübz, PHILIP** (c.1555-c.1610). An English Puritan pamphleteer. In 1583 he wrote, in denunciation of the social follies and vices of the age, *The Anatomie of Abuses*; and in the same year published *The Rosarie of Christian Prayers and Meditations*. He wrote also *A Christall Glasse for Christian Women* (1590), and numerous pamphlets. Both *The Anatomie* and *A Christall Glasse* were very popular, and were several times republished. The former was reprinted in 1836 by Trumbull, and both were edited with forewords and notes by Dr. F. J. Furnival (2 vols., 1877-82). Consult vol. ix of Henry Morley's *English Writers* (London, 1892).

**STUBBS, WILLIAM** (1825-1901). An English historian and prelate. He was born at Knaresborough, in Yorkshire, and educated at Ripon Grammar School and at Christ Church, Oxford, being elected to a fellowship at Trinity in the year of his graduation (1848), and ordained in the same year. His *Registrum Sacrum Anglicanum*, a calendar of the English bishops from St. Augustine (1858), won for him the appointment of librarian at Lambeth Palace. In 1866 he was appointed regius professor of modern history at Oxford, and during the 18 years of his tenure he had an exceedingly wide influence on historical study in England. His great *Constitutional History of England* (1874-78; 9th ed., 1913) at once took rank as the standard authority on the subject. He was appointed canon of St. Paul's in 1879, Bishop of Chester in 1884, and Bishop of Oxford in 1889. His historical work was all of the careful modern type, based on faithful study of contemporary documents, many valuable specimens of which he edited. His *Historical Introductions to the Rolls Series* have been published in one volume (ed. Hassall, London, 1903). Other notable works are: *Seventeen Lectures on the Study of Medieval and Modern History* (1886; 3d ed., 1900) and *Councils and Ecclesiastical Documents Relating to Great Britain and Ireland*, edited with A. W. Haddan (1869-73). Posthumous works are: *Lectures on European History* (1904); *Letters 1825-1901* (1905); *Lectures on Early English History* (1906); *Ordination Addresses* (1901), *Visitation Charges* (1904), and *Germany in the Middle Ages* (1908). Consult Gross, *Sources and Literature of English History* (New York, 1900), and W. H. Hutton, *Letters of William Stubbs* (London, 1906).

**STUC'CO** (It., from OHG. *stucchi*, Ger. *Stück*, piece, patch; connected with Ger. *Stock*, Eng. *stock*, stake, club). A term applied somewhat indiscriminately to the finer and more durable kinds of plaster and plastering, both

for external and internal use. In Europe, especially southern Europe, it forms the most common finish for the exteriors of ordinary buildings, especially in cities, where it is employed even for those of a monumental type, as in Vienna, and its use for the like purpose is increasing in the United States. Exterior stucco usually has a good proportion of cement in its composition, and should be applied in several coats. It may be kalsomined or painted with oil paint. Sgraffito (q.v.) decoration is frequently used upon stucco in Italy. For interior work it is used with an admixture of plaster of Paris (q.v.) or fine marble dust, and is then capable of receiving a high finish, and even of being polished. Scagliola or imitation marble is a variety of stucco. The Greeks used stucco to give a finer surface to their coarse stonework, even in their columns, before the finer marbles were used. The Romans of the Republican period often stuccoed the exterior surfaces of their temples. Stucco was later used for interior decoration both of vaults and ceilings, molded while wet into exquisite designs in low relief (e.g., Pompeii and Roman *thermæ*), tombs (on the Via Latina), and private houses. Those found near the Farnesina in Rome and now in the Museo delle Terme are among the most charming decorative works of any period. Early Christian art continued the style, as is shown by the well-preserved internal decoration of the baptistery of the cathedral in Ravenna. It was not unknown to the Middle Ages, witness the angels in the church at Hildesheim, and it again became popular during the Renaissance, being profusely used in the ceilings of the later period, often with rococo designs.

**STUCK**, shtuk, FRANZ, KNIGHT VON (1863- ). A German painter and sculptor, one of the most prominent German artists of his time. Born at Tettenweis, Bavaria, the son of a miller, he studied at the Munich Academy under Lindenschmit, but was most influenced by the works of Böcklin, and became first known through his drawings for *Fliegende Blätter*, and the two series of art-industrial designs which appeared in Vienna under the titles *Allegorien und Embleme* and *Titel und Vignetten*. His first paintings, "The Guardian of Paradise," "Innocentia," and "Fighting Fauns," exhibited in Munich in 1889, were awarded the gold medal, initiating a series of artistic successes attendant upon his well-known landscapes enlivened with centaurs, fauns, and nymphs, and his impressive delineations of human passions. Of the latter the figure of "Sin" (1893), Eve enfolded by a huge serpent, and, on a larger scale, the allegory of "War" (1894), both in the Pinakothek at Munich, have become particularly famous. In the meanwhile he had painted "Expulsion from Paradise," a "Pietà" (1892), and "Crucifixion" (1892, Stuttgart Museum), a startling deviation from the traditional treatment of this subject. Continued progress in the artist's power of expression was shown in "The Sphinx" (1895, National Museum, Budapest), "Evil Conscience" (1896), and "Procession of Bacchantes" (1897, Bremen); and in such later productions as "Pan" (1908), "Scherzo" (1909), "Innocentia," "Pallas Athene, Spring Procession" (1909), and "The Wounded Amazon." Among his very individual portraits are several of himself, one of his wife, and one of Fritz Scheff. His plastic work, small figures in bronze, exhibits the same powerful realism in the treatment of form as
